Reforms of Peter the Great.—Peter the Great's decision to turn Russia into a Western Power demanded a complete upheaval of existing conditions. The emperor (he assumed this title in 1721 at the close of the Swedish war) carried through his reforms against a stubborn resistance of the greater part of the nation, with hardly any efficient supporters to back him. The whole of his tremendous energy was aimed at making Russia strong, and at opening her to the influence of Western science and art. He started alone in the field, and the motto he chose for his seal during his journey abroad in 1697 is most characteristic; "I am of those who must be taught and am seeking for teachers." The work he performed between 1699 and his death in 1725 is astounding. He created an army and a fleet, transformed the country's culture by putting it on a secular instead of a religious basis, made the acquisition of riches and honour dependent upon services to the State instead of birthright, and enforced justice and legality independently of the persons concerned; he developed the natural resources of the country by encouraging industries, and opened schools and obliged his subjects to travel abroad so as to learn from other nations; he fought against ancient customs and costumes, which kept the people tied up in an atmosphere where any innovation was deemed impure, manifested absolute religious tolerance and encouraged the building of Roman Catholic and Protestant churches for the foreigners whom he invited to Russia, and dragged Russian women out of oriental seclusion; he tried every branch of knowledge himself and strove to impart all he knew to his subjects; he instituted a senate, supreme court of law and highest organ of administration and offices for all branches of public service; he founded a newspaper, opened a theatre, bought works of art, made some himself, ordered geographical maps, and sent naturalists to explore Siberia. Three weeks before his death, and already in ill-health and pain, he wrote instructions for Captain Behring, commissioning him to find out whether Asia and America were separated by a sea. He composed a multitude of laws, taught people how to build houses, erect stoves, extinguish fires, bridle horses, shave beards, pray in church, and generally how to behave under every probable circumstance. Catherine II. was wont to say that whenever she saw the necessity of a new regulation she first ordered a search to be made in Peter the Great's archives, where she invariably found a draft of what she had been pondering over. He not only set a marvellous example of what personal energy can accomplish, but he was also the first to put forward the idea of "citizen" or "servant of his country," as being the highest aim of a man's activity. The real motto of his reign is contained in the order of the day he addressed to his soldiers on the eve of the battle of Poltava, the turning point in his struggle against Charles XII. of Sweden: "As for Peter, remember that life is of no value to him unless Russia lives in happiness and glory," and this formula became the leading principle of all the most representative members of his dynasty. He never hesitated to sacrifice even his only son when he saw he would undo his father's work and lead a life of ignorant self-indulgence. Later in the century Catherine II. also seized every opportunity of showing that all her life and energies were devoted to the service of the country. Her grandsons, Alexander I. and Nicholas I., and her great grandson, Alexander II., proclaimed the same rule and symbolized it by always sleeping on camp-beds, with a soldier's great coat for a blanket, so as not to forget that they were ever ready to go where their duties might claim them. In this respect Peter the Great was ahead of his times, not only in Russia, but in Europe, since the first Western sovereign who prided himself on being the servant of his people was Frederick II., nearly half a century later. Peter's daughter, Elizabeth (1741–61) was also a pioneer in her way when she abolished capital punishment (1744), which from then on was not practised in Russia except in retribution for attempts to overthrow the existing order of government. She also opened a fine arts academy. The short reigns of Peter the Great's immediate successors, his widow and his grandson, during which favourites ruled in their stead, prompted a group of political men to offer the throne in 1730 to Anne, a niece of the great reformer's, but on the condition that she signed a promise to take no steps without the approval of a council of eight men (themselves) and this council would recruit its members by free election. Ann signed the paper and then, backed by the guards, destroyed it as soon as she reached Moscow for her coronation. That was the only attempt made in the 18th century for limiting autocracy in Russia.

The two 18th century sovereigns of the Romanoff dynasty whose political activity was not regulated by their sense of duty, but merely by their personal whims, Peter III. and Paul I. rapidly became so unpopular, that conspiracies at once arose which did away with them, the first after six months, the second after four years rule. The one law of Peter III.'s which it was not possible to abrogate was that which freed the members of the nobility from being obliged to serve the country, an obligation which was the only justification of the privileges they enjoyed.

Liberalism Under Catherine II.—The 34 years of Catherine II.'s reign produced a fundamental change in all paths of life. Liberal ideas, those of the French encyclopaedists, became the foundation of her reforms. She convened a commission for preparing a new code of laws and composed instructions to guide this assembly in its labours. The fundamental principles she propounded were mostly taken from the works of Montesquieu and Beccaria, but though the author of this treatise was an empress, Louis XV.'s Government forbade the sale of the French edition as being too liberal. Catherine accomplished a vast number of reforms tending to economic prosperity and encouraging certain manifestations of local self-government. She did a great deal for art, protected artists and formed the nucleus of a collection which, under the name of the "Hermitage museum," is well known all over the world, and has been a powerful instrument of culture in Russia.

III. THE 19TH CENTURY

The beginning of the century saw the last of Russia's expansion in Europe, as the annexation of the Swedish province of Finland took place in 1809. The changes which occurred in the redistribution of parts of Poland and of Bessarabia, in the first half of the century, partook more of the character of frontier rectifications than conquest. Russia's territorial acquisitions of the century were mostly in Asia. In 1801 the kingdom of Georgia was annexed to Russia, and that led to a gradual absorption of Transcaucasia, the last part of which was pacified in 1864. Central Asia (or Russian Turkistan with Bokhara and Khiva), that perpetual hotbed of raids and stronghold of the slave trade, was conquered between 1830 and 1876, with the addition of the Turkoman steppe in 1831. But Russia's advance to the Black sea had opened up a new question, that of the Straits (Dardanelles and Bosphorus), for, without a free passage into the Mediterranean, the Black sea was of small commercial value. Catherine II. had obtained from Turkey the right of protection over Turkish subjects of the Orthodox faith. This new principle, akin to the more modern idea of "spheres of influence," originated the efforts of the Romanoffs for the liberation of Slav nationalities from Turk-

ish rule; Russia participated in the war for the independence of Greece and bore the greater part of the burden in those which eventually led to the creation of Rumania, Bulgaria, Serbia and Montenegro. The same policy brought on the Crimean War, which was disastrous for Russia and bared her weakness, even in military matters, before the eyes of the world. For ever since the Napoleonic wars Russian military prestige had been on a high level. Paul I.'s admiration for Prussian discipline and uniforms was inherited by his sons, and under their personal guidance the art of military parades reached such perfection that it often concealed important drawbacks of organization. The staunch qualities of the Russian soldier had left a durable impression in Europe from the time of the Napoleonic wars, but the Crimean War led to a general revaluation of Russian methods, both inside the country and abroad.

Conservatism of Later Romanoffs.—However, the main characteristics of the Romanoffs' rule in the 19th and early 20th century is undoubtedly the opposition to the principles of revolution which had triumphed in France. When Alexander I. was confronted with them, as personified by Napoleon, he was beaten, then pretended to yield till his forces were ready for a second and triumphant struggle. He realized so well the true meaning of his victory that, though the halo of "liberator of Europe" put him in a situation in which he would hardly have met with a refusal on any point, he never turned Napoleon's downfall to any merely material advantage for Russia. All he had gone through; the disasters of Jena and Austerlitz, the humiliations of Tilsit and Erfurt, the fire of Moscow, the entry into Paris, the Congress of Vienna, he used all that to enhance Russia's prestige and to create a situation where his own voice would carry most weight against revolutionary propaganda. The Holy Alliance was the only harvest he sought to reap for having led his army from Moscow to Paris.

Growth of Revolutionary Sentiment.—But this moral comfort was of short duration, and the emperor very soon perceived that he and his allies were unable to cope with the tide. Moreover, in his own country a vast conspiracy was formed, of which he was aware in the last weeks of his life, though he took no steps against it. A military revolt was organized the very moment his brother and successor came to the throne (Dec. 1825), and though it was suppressed in the course of one day, the danger he had undergone left its imprint on the whole of Nicholas I.'s mind and behaviour. After 1848, when most European Governments gave way to political reform, the emperor of Russia remained almost the sole bulwark of legitimacy. His son, Alexander II., understood that however well the principles of his ancestors might have been adapted to the requirements of his country, they had to be exercised in conformity with the spirit of the times, and he effected a number of important reforms, such as abolition of serfdom, new courts of law with participation of a jury, local self-government (*zemstvo*) conscription for the army, education for the masses, etc. But the enemies of tsardom used these liberal measures merely as a broader basis for revolutionary propaganda, and this at once became so strong that it led to the murder of the emperor (1881).

His son, Alexander III., proclaimed his allegiance to reaction; the Constitution his father had elaborated and would have granted had he lived a few days longer, was forgotten, and a police régime was instituted which appeared to stifle a recrudescence of revolutionary activities but in reality drove them into underground channels. Outwardly, the country was quiet and prosperous. The political alliance with France, which was the personal achievement of the emperor, created an era of peace and permitted the whole force of the nation to be devoted to economic development. The building of railroads, without which no modern State can live, was bound in Russia, owing to her vast expanse, to be protracted over a much longer period than in other European countries; this work was, however, pushed on in gigantic strides; the trans-Siberian railway (due to the emperor's personal initiative) being the most notable achievement in this branch.

The last Romanoff emperor, Nicolas II., came to the throne at the age of 26, and strove to continue his father's work along the same lines. He succeeded in creating a wonderful economic prosperity. His desire to obtain a strong footing on the Pacific, and thereby to prompt the development of Eastern Siberia, led to a war with Japan (1904), which ended in disaster. A revolution broke out, and though it was suppressed by rapid and forceful measures, the emperor attempted to pacify the land by granting constitutional rights (Oct. 1905). This, however, was done but half-heartedly, and led to incessant misunderstandings between the Government and the people's representatives.

Final Success of Revolution.—Propaganda was already strong, and every liberal concession, instead of quieting public opinion, gave fresh opportunities of carrying it on. The emperor,

while well-intentioned, was scarcely strong enough in character to withstand the forces of unrest which from 1905 on became yearly more active. At last, Russia's participation in the World War and the emperor's wish to unite all classes in one effort against the enemy, cleared the ground for propaganda in the army; it was especially active in the hospitals, which were largely in the hands of volunteers. The general discontent and uneasiness produced by several years of war were put to use and a spark was sufficient for bringing on a general conflagration in the midst of which the last Romanoff emperor descended from the throne with chivalrous dignity. The three centuries of the Romanoffs' rule correspond to a period of expansion and brilliancy such as Russia had not hitherto known. (M. PAL.)

ROMANONES, ALVARO DE FIGUEROA Y TORRES, COUNT DE (1863–), Spanish politician, born in Madrid, Aug. 1, 1863. He was president of the Madrid municipality, cabinet minister and home secretary (1905), before thrice taking office as prime minister—in Nov. 1912; from Dec. 1915 to April 1917, and from Dec. 3, 1918, to April 15, 1919. He was minister of justice, Dec. 1922–Sept. 1923, and after Primo de Rivera's *coup d'état* in that month, he published in defence of the parliamentary parties *Las Responsabilidades Politicas del Antiguo Régimen de 1875 a 1922* (1924).

ROMANOS, called *ὁ μελῳδός*, Greek hymn-writer, was born at Emesa (Homs) in Syria. He resided in Constantinople during the reign of the emperor Anastasius, probably the first emperor of that name (491–518). Having officiated as a deacon in the church of the Resurrection at Berytus, he removed to Constantinople. According to the legend, when he was asleep in the church of Cyrus, the Virgin appeared to him and commanded him to eat a scroll. On awaking (it was Christmas Day), he immediately mounted the pulpit, and gave fourth his famous hymn on the Nativity. Romanos is said to have composed more than 1,000 similar hymns or *contakia* (Gr. *κοντάκιον*, "scroll"). The MS. of the hymns, written by his own hand, was said to have been preserved in the church of Cyrus, in which he was buried and celebrated as a saint on the 1st of October.

Editions: J. B. Pitra, *Analecta Sacra*, i. (1876), containing 29 poems, and *Sanctus Romanus Veterum Melodorum Princeps* (1888), with three additional hymns from the monastery of St. John in Patmos. *See* also Pitra's *Hymnographie de l'Église grècque* (1867); C. Krumbacher, *Geschichte der byzantinischen Literatur* (1897); and HYMNS.

ROMAN RELIGION. The Roman people were in origin a small community of agricultural settlers, which gradually won its way to the headship first of Latium, then of Italy and finally of a European empire. Its religion, which was always marked by an absence of dogmatism and a readiness to adopt foreign ideas, has therefore a shifting and ever widening character, which tends to obscure the original essentials; the genuine Roman religion becomes gradually buried or fossilized in formal observance. The careful analysis of survivals in literature and monumental remains, and in particular of the extant calendars, has enabled scholars, using the comparative method, to make good progress in separating the elements due to different periods and influences.

Survivals.—Broadly speaking, the religion of the early agriculture settlement was arrested at the stage of Animism. It had passed beyond the primitive stages of magic and Fetishism or "Animatism," which regards natural objects as themselves divine and the source of power, and had not yet entered the stage of Anthropomorphism, which recognizes "gods" (*dei*) as personal and independent beings; it is in essence a worship of "spirits" (*numina*) which are thought of as dwelling in external objects or localities. But it is in a state of transition. There are still traces of the earlier attitude in the recognition of the sacredness of stones, such as the *silex* (flint) which played a prominent part in the ceremonial of treaty-making, the *lapis* used in the rain-making ritual and the boundary-stones (*termini*) which marked the limits of properties. The sacred character of trees again is seen in the *ficus Ruminalis* (fig tree) and the *caprificus* (wild fig) of the Campus Martius and in the oak of *Iuppiter Feretrius*, on which the *spolia opima* were hung after a victory; and the sacred animals, such as Mars' wolf, later regarded as the attributes of deities, may themselves have been originally the objects of worship. At the other end of the scale at least two of the *numina* seem already to have developed the character of anthropomorphic *dei: Jupiter* the sky-god, possibly an inheritance from the time before the Greek and Roman stocks had separated, and Mars, god alike of agriculture and war, and possibly in origin the "spirit" of growth in crops, cattle and the young warriors.

Animism.—But notwithstanding survivals and anticipation, Animism is the true background of the Roman religion, which might be described as a polydemonism or more exactly in Latin phraseology as a "multinuminism." The "spirits" worshipped were primarily local in character: in the house they had their focuses of activity at the door, the hearth and the store-cupboard, in the countryside on hill-tops, in groves, in streams and springs. To this conception Roman religion added a characteristic or peculiar development in a kind of "Higher Animism" which associated the "spirit" not only with visible objects, but with states and actions in the life of the individual and the community: function is added to locality. Every "spirit" had thus in either a local or temporal sense or in both, its own sphere of action. The "spirits" were not conceived of in any anthropomorphic or theomorphic shape: their sex was often indeterminate (*sive mas, sive femina*, "whether male or female" was a frequent formula of prayer), they had no form of sensuous representation, nor did they need a home to dwell in: statue and temple were alien to the spirit of Roman religion. Nor could they have a personal history or relation to one another: there was no Roman mythology. But in their individual spheres they could influence the fortunes of men, and men could enter into relations with them. The primary attitude of men to the spirits was one of fear, expressed in the conception of *religio*, the sense of awe or "anxiety" in the presence of a superhuman power. But the practical mind of the Roman soon gave this relation a legal turn, and later the *ius divinum*, which regulated the dealings of men with the divine powers became a department of the *ius publicum*, the general body of civil law. The act of worship was a kind of contract: the "spirits," if they were given their due, were bound to make a return to man, and the object of worship and festival was to place them under this obligation and so to secure the *pax deum* (a state of peace between gods and men).

Ritual.—In such a religion exactness of ritual must play a large part—so large, indeed, that many modern critics have been misled into regarding the Roman religion as a mere network of formalities without any background of genuine religious feeling. This formalism shows itself in many ways. It was necessary in the first place to make quite certain that the right deity was being addressed: hence it was well to invoke all the spirits who might be concerned, and even to add a general formula to cover omissions. Place, again, was an essential element even in the conception of the *numen*, and was therefore all-important in ritual. So, too, was the character of the offering: male victims must be sacrificed to male deities; female victims to goddesses; white animals were the due of the *di superi*, the gods of the upper world, black animals of the gods below; the more rustic *numina*, such as Pales (q.v.), should be given milk and millet cakes rather than a blood-offering. All-important, too, was the order of ceremonial and the formula of prayer: a mistake or omission or an unpropitious interruption might vitiate the whole ritual, and though such misfortunes might occasionally be expiated by the additional offering of a *piaculum*, in more serious cases the whole ceremony had to be recommenced from the beginning.

Household Worship.—In the original agricultural community, the unit both from the legal and religious point of view was not the individual but the household. The household was thus at once the logical starting-point of religious cult, and throughout

Roman history the centre of its most real and vital activity. The head of the house (*paterfamilias*) was the natural priest and had control of the domestic worship: he was assisted by his sons as acolytes (*camilli*) and deputed certain portions of the ritual to his wife and daughters and even to his bailiff (*vilicus*) and his bailiff's wife. The worship was offered to the spirits indwelling in the sacred places of the round hut in which the family lived. Janus, the god of the door, came first in the prayer-formulae, though unfortunately we know but little of his worship in the household, except that it was the concern of the men. To the women was committed the cult of the "blazing hearth," Vesta, the natural centre of the family life, and it is noticeable that even Ovid (*Fast.*, vi. 291–92) describes Vesta as "nought but the living flame." The Penates (q.v.) were the *numina* of the store-cupboard, at first vague and animistic, but later on, as the *deus*-notion was developed, individualized by selection from the other divinities of household or state religion.

Lar and Genius.—To these *numina* of the sacred places must be added two other important conceptions, that of the *lar familiaris* and the *genius*. The *lar familiaris* has sometimes been regarded as the embodiment of all the family dead and his cult as a consummation of ancestor-worship, but a more probable explanation regards him as one of the *lares* (q.v.; *numina* of the fields worshipped at the *compita*, the places where properties marched) who had special charge of the house or possibly of the household servants (*familia*); for it is significant that his worship was committed to the charge of the *vilica*. The *genius* was originally the "spirit of developed manhood," the *numen* which is attached to every man and represented the sum total of his powers and faculties as the *iuno* does of the woman; each individual worshipped his own *genius* on his birthday, but the household-cult was concerned with the *genius* of the *paterfamilias*. In the ordinary religious life of the family there was a more direct connection with morality and a truer religious sense than in any other part of the Roman cult. The family meal was sanctified by the offering of a portion of the food to the household *numina:* the chief events in the individual life, birth, infancy, puberty, marriage, were all marked by religious ceremonial in some cases of a distinctively primitive character. The dead, too, though it is doubtful whether in early times they were actually worshipped, at any rate had a religious commemoration as in some sense members still of the family.

From the life of the household we may pass to the outdoor occupations of the fields, where the early Roman settler met with his neighbours to celebrate in religious ceremonies the various stages of the agricultural year. Here we have a series of celebrations representing the occupations of the successive seasons, addressed sometimes to *numina* who developed later on into the great gods of the State, such as Jupiter, Mars or Ceres, sometimes to vaguer divinities who remained always indefinite and rustic in character, such as Pales and Consus. Sometimes again, as in the Lupercalia (q.v.) the attribution was so indefinite that it is hard to discover who was the special deity concerned; at other festivals, such as those of the Robigalia and the Meditrinalia, the worship seems at first to have been addressed generally to any interested *numina* and only later to have developed a specific deity of its own. Roughly we may distinguish three main divisions of the calendar year, the festivals of spring, of the harvest and of winter. (1) In the spring (it must be remembered that the old Roman calendar began the year with March) we have ceremonials of anticipation and prayer for the crops to come: prominent among them were the *Fordicidia*, with its symbolic slaughter of pregnant cows, addressed to Tellus, the *Cerealia*, a prayer-service to Ceres for the corn-crop, and the most important of the rustic celebrations of lustration and propitiation, the *Parilia*, the festival of Pales. To these must be added the *Ambarvalia* (q.v.), the lustration of the fields, a movable feast (and therefore not found in the calendars) addressed at first to Mars in his agricultural character (*see* MARS). (2) Of the harvest festivals the most significant were the twin celebrations on Aug. 21 and 25 to the divinity-pair Consus and Ops, who were both concerned with the storing of the year's produce, and two vintage festivals, the *Vinalia Rustica* and the *Meditrinalia*, connected with Jupiter. (3) The winter festivals were less homogeneous in character, but we may distinguish among them certain undoubtedly agricultural celebrations, the *Saturnalia* (connected with the sowing of the next year's crop), and a curious repetition of the harvest festivals to Consus and Ops.

State Religion.—In passing to the religion of the State we enter on a later period and a more developed form of society. The loose aggregation of agricultural households gives place to the organized community with new needs and new ideals. Thus we find two prominent notes of the State influence, firstly, the adaptation of the old ideas of the household and agricultural cults to the broader needs of the city-community, especially to the new necessities of internal justice and war against external enemies; and secondly the organization of informal worship into a consistent system. Adaptation proceeded at first naturally enough on the lines of analogy. As Janus was in the household the *numen* of the door, so in the State he was associated with the great gate near the corner of the forum: the Penates had their analogy in the *Di Penates populi Romani Quiritium* by whom the magistrates took their oath on entering office, the *lar familiaris* in the *Lares Praestites* of the community, and the *genius* in the new notion of the *Genius populi Romani* or *Genius urbis Romae*. But the closest and most striking analogy is seen in the cult of Vesta. The Vesta of the State was in fact the king's hearth, standing in close proximity to the *Regia*, the king's palace; the Vestal Virgins, who had charge of the sacred fire, were the "king's daughters," and as such even in republican times were in the legal power of the *pontifex maximus*. But adaptation meant also the widening of old conceptions under the influence of reflexion. Thus, since the door is used for the double purpose of entrance and exit, the Janus of the State was represented as *bifrons* ("two-faced"): the thought of the door as the first part of the house to which one comes produces the more abstract idea of Janus as the "god of beginnings," in which character he had special charge of the first hour of the day, the calends of the month and the first month of the year in the later calendar. But development proceeded also on broader lines. Jupiter in the rustic-cult was a sky-god concerned mainly with the wine festivals and associated with the sacred oak on the Capitol. Now he developed a twofold character: as the receiver of the *spolia opima* he became associated with war, especially in the double character of the stayer of rout (*Stator*) and the giver of victory (*Victor*). As the sky-god again he was appealed to as the witness of oaths in the special capacity of *Dius Fidius*. In these two conceptions, justice and war, lie the germs of the later idea of Jupiter as the embodiment of the life of the Roman people, both in their internal organization and in their external relations. In much the same manner the agricultural character of Mars became submerged by his functions as war-god. Finally, we must notice, as the sign of the union of two settlements, the inclusion of the Colline deity, Quirinus, apparently the Mars of the originally rival community. In these three deities, Jupiter, Mars, Quirinus, we have the great triad of the earliest stage of the State religion.

Organization showed itself in the fixing of the annual calendar of festivals, the development of the character and functions of the priesthood and in a new conception of the legal relation of the gods of the State. The State now approached the gods through its duly appointed representatives, the magistrates and priests, and the private citizen was required to do no more on festival days than observe a ceremonial abstinence from work. The State religion had thus less direct connection with morality and the religious sense than the worship of the household, but it had its ethical value in a sense of discipline and a consecration of the spirit of patriotism.

External Influences.—The later stages represent not the spontaneous development of the genuine Roman religion, but its alteration and supersession by new cults and ideas introduced from foreign sources. Three periods may be recognized: (1) from the end of the regal epoch to the second Punic War—the period of contact with the peoples of Italy; (2) from the second Punic War to the end of the Republic—the period of contact with

Greece and the Orient; (3) the imperial epoch, opening with a revival of old religious notions and later marked by the official worship of the deified emperors and the wide influence of oriental cults.

Italian Influence.—By the end of the regal period Rome was a really developed city-state. There was a large artisan class, excluded from the old patrician *gentes* and therefore from the State cult. At the same time the beginnings of commerce had opened relations with neighbouring peoples. The consequence was the introduction of certain new deities, the *di novensides*, from external sources, and the birth of new conceptions of the gods and their worship. We may distinguish three main influences:—

(*a*) *Etruria.*—The last three kings of Rome were Etruscans and Etruscan influence under their rule was strong. From Etruria came Minerva, who, as the goddess of handicraft and protectress of the artisan guilds, was established in a temple on the Aventine. Soon a new Etruscan triad, Jupiter, Juno and Minerva, was enshrined on the Capitol in a magnificent new temple built by Etruscan workmen and decorated in the Etruscan manner. In this temple the deities were represented by images.

(*b*) *Latium.*—Secondly, in war and peace Rome formed relations with her neighbours of Latium, and, as a sign of the Latin league which resulted, the cult of Diana was brought from Aricia and established on the Aventine in the *commune Latinorum Dianae templum;* about the same time the temple of *Iuppiter Latiaris* was built on the Alban mount, its resemblance in style to the Capitoline temple pointing to Rome's hegemony. Latin cults were introduced even inside the *pomoerium*, the old city limits, the worship of Hercules, which came from Tibur in connection with commerce, was established at the Great Altar in the *forum boarium*, and the Tusculan cult of Castor as the patron of cavalry found a home close to the *forum Romanum*.

(*c*) *Magna Graecia.*—Later on contact with the cities of Magna Graecia brought about the wide-reaching introduction of the Sibylline books. They came from Cumae and were placed in the Capitoline temple under the care of a special commission; their "oracles," which were referred to in time of great national stress, recommended the introduction of foreign cults. In this way were brought to Rome the Greek triad Demeter, Dionysus and Persephone, who were identified with the old Roman divinities Ceres, Liber and Libera, Apollo, Mercury, and Aesculapius Dis and Proserpina, with their strange chthonic associations and night ritual. With new deities came new modes of worship: the "Greek ritual" in which, contrary to Roman usage, the worshipper's head was unveiled, the *lectisternium* (q.v.), an elaborate form of the "banquet of the gods" and the *supplicatio*, an appeal to the gods in which the whole people took part. In this period, then, we find first a legitimate extension of cults corresponding to the needs of the growing community and secondly a religious restlessness and a consequent tendency to more dramatic forms of worship.

Foreign Influence.—The two chief notes of the next period were superstition and scepticism: both the populace and the educated classes lost faith in the old religion, but they supplied its place in different ways. The disasters of the early part of the second Punic War revealed an unparalleled religious nervousness: portents and prodigies were announced from all quarters, it was felt that the divine anger was on the State, yet there was no belief in the efficacy of the old methods for restoring the *pax deum*. Accordingly recourse was had, under the direction of the Sibylline books, to new forms of appeal for the divine help, the general vowing of the first fruits (*Ver sacrum*) and the elaborate Greek *lectisternium* after Trasimene in 217 B.C., and the human sacrifice in the forum after Cannae in the following year. The same spirit continues to show itself in the introduction of Greek deities and their ready identification with gods of the old religion. Thus we hear of temples dedicated to Iuventas = Hebe (191 B.C.), Diana = Artemis (179 B.C.), Mars = Ares (138 B.C.), and find even the Bona Dea (q.v.) identified with a Greek goddess of women, Damia. At the same time cult statues are made in which the identified Greek type is usually adopted without change, with such curious results as the representation of the *Lares* under the form of the Dioscuri. But more far-reaching still was the order of the Sibylline books in 206 B.C. for the introduction of the worship of the *Magna Mater* (*see* GREAT MOTHER OF THE GODS) from Pessinus and her installation on the Palatine in 191 B.C.: the door was thus opened to the wilder and more orgiastic cults of Greece and the Orient.

Oriental Deities.—After *Magna Mater* came the secret cult of Bacchus, which had to be suppressed by decree of the senate in 186 B.C., and later on the cults of Ma of Phrygia, and the Egyptian Isis were established. In all these more emotional rituals, the populace sought expression for religious feelings which were not satisfied by the formal worship of the older deities. Meanwhile a corresponding change was taking place in the attitude of the educated classes owing to the spread of Greek literature. The knowledge of Greek legends set poets and antiquarians at work on the task of creating a Roman anthropomorphic mythology. In this way grew up the "religion of the poets," whose falseness and shallowness was patent even to contemporary thinkers. But more important was the influence of philosophy, which led soon enough to a general scepticism among the upper classes.

Scepticism.—In the last century of the Republic the two later Greek schools of Epicureanism and Stoicism laid hold on Roman society. The influence of Epicureanism was wholly destructive to religion, but not perhaps very widespread: Stoicism became the creed of the educated classes and produced attempts at a reconciliation of popular religion with philosophy. Since, however, the former was regarded as untrue in itself, but a presentation of truth suited to the popular mind, the way was opened for statecraft to use religion as its tool.

The result was twofold. Worship passed into formalism and formalism into disuse. Some of the old cults passed away altogether, others survived in name but were wholly devoid of inner meaning. The old priesthoods came to be regarded as tiresome restrictions on political life and were neglected: from 87 to 11 B.C. the office of *flamen Dialis* was vacant. On the other hand religion passed into the hands of the politicians: cults were encouraged or suppressed from political motives, the membership of the colleges of pontifices and augurs was sought for its social and political advantages, and augury was debased till it became the mere tool of the politician. Little survived but the household cult, protected by its own genuineness and vitality.

Imperial Religion.—The Augustan revival was largely political, a part of his plan for the general renaissance of Roman life focused no longer on the abstract notion of the State, but on the persons of an imperial house. He saw, however, that no revival could be effective which did not appeal to the religious sentiments of the populace. It was thus his business to revitalize the old forms with a new and more vigorous content. His new palace on the Palatine was to be the centre of the new popular religion. With this object he consecrated there his new temple of Apollo (28 B.C.), whom he had adopted as his special patron at Actium, and transferred to its keeping the Sibylline books, thus marking the new headquarters of the Graeco-Roman religion. Similar in purpose was his institution of the Secular Games (*ludi saeculares*) in 17 B.C. Horace's hymn written for the festival is a good epitome of Augustus's religious intentions. Further he established a new shrine of Vesta Augusta within the palace. Still more marked was the building of a great temple at the end of his new forum to Mars Ultor—Mars, the ancestor of the Julian family now to be worshipped as the avenger of Caesar's murderers. He also erected on the spot where Caesar's body had been cremated in the Forum a permanent temple to his adopted father, under the definitely religious title of *divus Iulius*. No doubt he also did much generally to revive the ancient cults. he rebuilt, as he tells us himself, 82 temples which had fallen into disrepair, he re-established the old priesthoods and filled once more the office of *flamen Dialis*. But religious feeling was now to be mainly diverted to the reigning house, and this project was aided by the natural prominence in the palace of the cult of the *genius* of the emperor himself. As the palace cults became national, the worship of the *genius* was bound to spread, and

ultimately Augustus sanctioned its celebration at the *compita* (crossways) together with the worship of the old *lares*. But here he and the wiser of his successors drew the line, and though under oriental influence divine honours were paid to the living emperor outside Italy, they were never permitted officially in Rome.

With this last period the story of the genuine Roman religion draws to a close. For, though the form of the old cults was long preserved, the vital spirit was almost gone. In the popular mind the many exciting oriental cults held undisputed sway; and with the more educated a semi-religious philosophy gave men a clearer monotheistic conception and an idea of individual relations with the divine in prayer. It was with these elements (fiercely antagonistic because so closely allied in character) that the battle of Christianity was really fought, and though, after its official adoption, the old religion lingered on as "paganism" and died hard at the end, it was really doomed from the moment when the Augustan revival had taken its irrecoverable bias in the direction of the emperor-worship.

(C. B.)

ROMANS, EPISTLE TO THE. The occasion of this New Testament epistle is revealed in i.8f, xv. 14f. St. Paul had finished his mission in Greece and was on his way to Jerusalem with the proceeds of the collection made by his churches for the poor Christians in Judaea. Casting about for a new sphere, he turns to the extreme West of the Mediterranean, to Spain, where evidently no one had preached the gospel. On his way to Spain, after settling the business at Jerusalem, he proposes to visit the Christians at Rome. This corresponds to the situation outlined in Acts xx. 2f; it is probable, though not certain, that the apostle wrote the epistle from Corinth or on his way from Corinth eastward, *i.e.*, after the Corinthian epistles. What is certain is that he takes this opportunity of stating his gospel in its width and range of appeal. In the light of his experience and in view of the fresh propaganda which he contemplated in the Western Empire, his aim is to reiterate the principles of the Christian religion as he preached it. There was an appropriate note in such an epistle being sent to Christians at the capital of the Empire. Besides, the apostle was not confronted here as, *e.g.*, in Galatia, with any attacks upon himself by the Jewish Christian party in the Church. Hence the breadth of view and the comparative absence of controversial references. He sets himself to put forward what he regards as vital Christianity rather than to counteract any policy of his opponents at Rome, and this vital Christianity is stated in its relations to the older Jewish religion, with the object of persuading the Roman Christians, most of whom seem to have been Gentile converts, that the hopes and promises of God as revealed in the Christian gospel rest upon His previous revelation to Israel, although they go far beyond that. The two main errors before his mind seem to have been a tendency to throw over the earlier revelation and a tendency on the part of Jews to depreciate Christianity as morally inferior to Judaism. The epistle therefore is more of a treatise than any other; it does not ignore the Roman Christians, but it is not written with them constantly in view, since their local situation offered no particular problems. But, while it is a tract, it does not contain any compendium of Christianity; topics like the sacraments, eschatology, and the resurrection, for example, are not discussed as they are in the First Epistle to the Corinthians. The predominating motive of the epistle is the desire to propound the faith as a faith for all men, which has its roots in the earlier revelation of God to the Jews and yet goes far beyond that. He pours out his very soul in expounding the glory of the gospel as the final and all-embracing revelation of God for mankind; every now and then the argument glows with passion, and the exposition thrills with the writer's joy in expressing convictions which had become for him living powers and hopes.

The outline of the epistle is as follows. After apologizing for his inability to visit the Roman Christians before now, he promises to visit them, bringing "some spiritual gift" to this world-famous church of the capital. Meantime he explains the gospel of which he is so proud, endeavouring to stir up his readers to a sense of its wonder and strength. Such is the theme of the first five chapters, God's "righteousness" or salvation for faith offered in Jesus Christ to all men, apart from national restrictions. To be right with God, to enjoy His fellowship and favour, is a position which is His gift. Both pagans and Jews have hitherto missed it, but in Jesus Christ (iii. 21f) it is now brought within reach of all men, as they believe. Not that faith and revelation had been absent from the earlier history of God's people; the apostle shows that this was implicit in the religious experience of Abraham (iv.). Only, it required the divine revelation in Christ to overcome the sin of man, which had weakened the race hitherto (v. 1f). From a philosophy of history he is now passing to the deeper experience of religion, and the magnificent sweep of the next passage (vi.–viii.) shows how this faith embodies the power of receiving and realising the gift of God, since it invests man with the divine Spirit, which is the sole guarantee of a sound life in the present and of a secure life in the future.

Reverting to history, he now (ix.–xi.) faces the problem of the Jewish nation's antipathy to the gospel, seeking to reconcile this with the justice and promises of God in the Old Testament. God is not to blame for such unbelief, he argues. And, with patriotic pathos, he hopes it will not be final; the rejection of Christ by the Jews, he contends, is merely partial and temporary. But part of his interest is to prevent Gentile Christians from depreciating their relation to God's earlier revelation in Israel and from disparaging the historical link between themselves and the saving purpose of God in the world. All men are equally under the sweep of God's marvellous mercy, he concludes, in an impassioned outburst (xi. 25–36).

Such an experience of the divine mercy brings obligations in its train, however, and these are now outlined (xii.–xiii.) as they bear upon the conduct of Christians as members of the Church, of society, and of the State; love is the supreme law, and as the Day of the Lord is near, there is no time for indulgence in vice. "It is high time to wake up." But, instead of dwelling on this motive, he proceeds to apply the law of Christian love to one special problem of contemporary ethic, viz., the strain set up between the narrower and the more liberal parties over total abstinence and vegetarianism (xiv.–xv. 13), pleading for consideration on the part of the liberal majority, and finally calling on all alike to glorify God for His mercy to them in Jesus Christ.

Such is the outline of the epistle as a whole. It is not unfair to suggest that faith dominates the first part (i.–v.), hope the second (vi.–viii., ix.–xi.), and love the third (xii.–xv.), though none of the three is ever isolated entirely from the others. The epilogue (xv. 14–33) reverts to the situation noted in the opening paragraph; the apostle tells them of his plans and asks for their prayers.

The sixteenth chapter seems to contain a note intended for a different audience. It is possible that the apostle may have known a number of Christians who had found their way to Rome, but the probability is that the first part of this chapter (1–16, 1–20, or 1–23), represents a letter of commendation for Phoebe, addressed to the church at Ephesus. The number of personal references and the unusual wealth of detail point to some community with which St. Paul was more familiar than he could be with the Roman church. Ephesus answers this requirement better than almost any other sphere; besides, the sharp warning against errorists in verses 17–20 applies to Ephesus at this period (1 Cor. xvi. 8–9, Acts xx. 29f) better than to what we know of the Roman church, for it is improbable that the apostle meant the words to be a vague warning against something that might happen in the future. For these reasons many editors and critics detach xvi.

from the original Roman epistle.

The tone and style of xvi. 25–27 suggest also that it is an editorial addition, later than St. Paul. Indeed in some early copies of the epistle during the second century it is found after xiv. 23, perhaps in editions drawn up for reading in worship. This is merely one of a number of textual phenomena, which are discussed fully in Lake's *The Earlier Epistles of St. Paul* (pp. 335f), in Lightfoot's *Biblical Essays*, in Zahn's *Einleitung in das Neue Testament* (section 22), in Westcott and Hort's *Greek New Testament* (appendix), and in the present writer's *Introduction to the Literature of the New Testament* (pp. 134f), as well as by the critical editors. Some early editions of Romans seem to have omitted the words "in Rome" at i. 7 and 15. Unless this was due to a desire to make the epistle a catholic document, or to Marcion's revision, it may point to the fact that there were more than one edition of the epistle. Lake, for example, argues on textual grounds that Paul himself wrote an edition, without "in Rome," consisting of i. i.–xiv. 23, xvi. 25–27, as a companion letter to Galatians, and that later he edited the epistle as we have it for the special purpose of instructing the Roman church. Others, like Renan (*St. Paul*, pp. 461f), think of two editions, the first (i.–xiv., xvi. 1–20) intended for Asia or Ephesus, the second for Rome—a hypothesis which assumes a variety of forms. But it is not easy to suppose that the apostle ever left xiv. 23 with xvi. 25–27 as a self-contained letter, even if the doxology be accepted as Pauline. It is fairly clear that the canonical epistle represents an edited form of the original, and one natural hypothesis is that the original ended with xv., whilst xvi. 1f contains an addition. As Deissmann points out, the papyri supply numerous analogies for a "letter of commendation plunging at once *in medias res* and beginning with 'I commend' " (*Light from the Ancient East*, p. 235); and if Tertius wrote both, the smaller letter might be put in the wake of the larger, as the canonical editors drew upon the copybook in which both were preserved. The mechanical conditions for such a practice are discussed in Gregory's *Canon and Text of the New Testament* (pp. 319f).

It is no longer necessary to discuss theories that the whole epistle is a later forgery: Schmiedel's examination of this aberration (in *Hibbert Journal* i. 532f) sufficiently indicates the impossibility of taking such views seriously. Nor is it needful to criticize the theories which attribute xv.–xvi. in whole or part to some later hand, much less the idea, voiced recently by H. Delafosse (*L'epitre aux Romains, traduction nouvelle, avec introduction, notes et commentaire*, Paris, 1926), that the canonical Romans represents an originally Pauline letter which was first edited by Marcion and then catholicized. The epistle as it stands was known early to writers of the second century like Justin and Polycarp, possibly even to Ignatius; indeed traces of it are to be found in the epistle of Clemens Romanus, which lies within the last decade of the first century, at the very latest (*see* for an even earlier date, G. Edmundson's *The Church of Rome in the first Century*, 1913, pp. 14f, etc).

Bibliography.—The ablest editions of modern days are those by B. Weiss in Meyer's *Commentary* (9th edition, 1899), R. A. Lipsius in the *Handcommentar* (1892), Sanday and Headlam (*International Critical Commentary*, 5th ed. 1905), Denney (*Expositor's Greek Testament*, 1901), Lietzmann in his own *Handbuch* (1906), Parry (*Cambridge Greek Testament*, 1912), E. Kühl (1913), P. Lagrange (Paris, 1916), and Hauck in Zahn's *Commentar* (1925), although the older work of men like Godet (1879, Eng. Tr. 1888) and E. H. Gifford (in the *Speaker's Commentary*, 1881) deserves attention still for its delicate exegesis. Lightfoot's posthumously published notes do not go beyond vii. 25 (*Notes on Epistles of St. Paul*, 1895), but we have Hort's invaluable *Romans and Ephesians* (1895) for a study of the general data of the epistle, as well as the chapters in Kirsopp Lake's *The Earlier Epistles of St. Paul*, Liddon's *Explanatory Analysis* (1893), Pfleiderer's *Primitive Christianity* (vol. i. pp. 211f), G. Semeria's *Il pensiero di S. Paolo nella lettera ai Romani* (Rome, 1903), and J. Drummond's article in the *Hibbert Journal* (1913, pp. 787f). The critical movements are chronicled by C. Clemen in his *Paulus* (i. pp. 85f, ii. 238f), and by A. Robertson (Hastings' *Dictionary of the Bible*, iv. 295f) and C. W. Emmett (*Dictionary of the Apostolic Age*, ii. 408f). The first chapter of Matthew Arnold's *St. Paul and Protestantism* discusses Romans, and Sievers has just published an edition in rhythmical form, in the first volume of his *Paulinische Briefe, klanglich untersucht und herausgegeben* (Leipzig, 1926). (J. Mof.)

ROMANSHORN, an important commercial town in the Swiss canton of Thurgau, on the west shore of the lake of Constance. By rail it is 51½ m. N.E. of Zürich. In 1920 its population was 6,474, mostly German-speaking, while there were 4,535 Protestants and 1,898 Roman Catholics. Originally a small fishing village, it belonged to the abbot of St. Gall from 1432 to 1798, when it became part of the canton of Thurgau. In 1856 the railway from Romanshorn to Zürich was opened, and this vastly increased the commercial importance of Romanshorn. Its position on the lake helps to make it the centre of a great transit trade, chiefly in corn and timber, and it has many industrial establishments.

ROMANS-SUR-ISÈRE, a town of south-eastern France, in the department of Drôme, 12½ m. N.E. of Valence on the railway to Grenoble. Pop. (1926) 15,041. Romans stands on a height on the right bank of the Isère, a bridge uniting it with Bourg-de-Péage (pop. 5,510) on the other side of the river. The present parish church belonged to an abbey founded in 837 by St. Bernard, bishop of Vienne.

Romans has a tribunal of commerce. Its industries include tanning, leather-dressing and shoe-making, distilling and oil-refining.

ROMANUS, the name of four East Roman emperors.

Romanus I. (Lecapenus), who shared the imperial throne with Constantine VII. (*q.v.*) and exercised all the real power from 919 to 944, was admiral of the Byzantine fleet on the Danube when, hearing of the defeat of the army at Achelous (917), he resolved to sail for Constantinople. Soon after the marriage of his daughter Helena to Constantine he was crowned colleague of his son-in-law. His reign, which was uneventful, except for an attempt to check the accumulation of landed property, was terminated by his own sons, Stephen and Constantine, who in 944 compelled him to become a monk. He died in 948.

Romanus II. succeeded his father Constantine VII. in 959 at the age of twenty-one, and died—poisoned, it was believed, by his wife, Theophano—in 963. He was a pleasure-loving sovereign, but showed judgment in the selection of his ministers. The great event of his reign was the conquest of Crete by Nicephorus Phocas.

Romanus III. (Argyrus), emperor 1028–1034, was an undistinguished Byzantine patrician, who was compelled by the dying emperor, Constantine IX. to marry his daughter Zoe and to become his successor. He showed great eagerness to make his mark as a ruler, but was mostly unfortunate in his enterprises, and in his endeavour to relieve the pressure of taxation disorganized the finances of the state. In 1030 he resolved to retaliate upon the incursions of the Moslems on the eastern frontier by leading a large army in person against Aleppo, but sustained a serious defeat at Azaz near Antioch, after which he never recovered popularity. His early death was supposed to have been due to poison administered by his wife.

See J. B. Bury in the *English Historical Review* (1889), pp. 53–57; G. Schlumberger, *L'Épopée byzantine* (Paris, 1905), iii. pp. 56–158.

Romanus IV. (Diogenes), emperor 1068–1071, had risen to distinction in the army, when he was convicted of treason against the sons of Constantine X. He was pardoned, however, by the empress Eudocia, whom he subsequently married. After his coronation he carried on three successful campaigns against the Saracens and Seljuk Turks; in a fourth he was disastrously defeated by Alp Arslan on the banks of the Araxes and taken prisoner. After releasing himself by the promise of a large ransom and the conclusion of a peace, he turned his arms against the pretender Michael VII., but was compelled after a defeat to resign the empire and retire to the island of Prote, where he soon died in great misery. It was during this reign that, by the surrender of Bari (1071), the Byzantine empire lost its last hold upon Italy.

See J. J. C. Anderson in the *Journal of Hellenic Studies* (1897), pp. 36–39. On all the above *see* also J. B. Bury's edition of Gibbons, *Decline and Fall of the Roman Empire*.

ROMANY LANGUAGE. The strongest proof that the gypsies came originally from India is found in their language.

For all its dialects are clearly Indo-Aryan, that is to say, modifications of the language from which have sprung all the Aryan languages of modern India and Ceylon, and of which Sanskrit, with its oldest document the Ṛgveda, is the literary expression. Moreover, gypsy is not only derived from the same original source as the other Aryan languages of India, but must for many centuries after the Vedic age have shared their development within or near the borders of India. For in general it shows the phonetic and grammatical changes which the Indian languages as a whole did not reach long before the beginning of the Christian era.

Dialectical Position.—The question in which dialect-group of these languages gypsy had its origin has been much discussed. One school holds that it belongs to the north-western and especially to the Dardic, which comprises certain dialects of the Hindu Kush and includes also the more important Kashmiri. These languages, in some respects more conservative than those further in India, have kept certain features of the old Sanskrit sound-system unchanged, *e.g.*, the preservation of two or more sibilants (*ś, ṣ, s*) or of an *r* preceded by a consonant. The gypsy dialects also show some of these peculiarities. But the preservation by descendants of characteristics that existed in the parent language is not proof that they have any specially close relationship (other than common origin). The existence of the same early innovations in both is proffered by those who hold that gypsy belonged originally to a more central group of dialects, of which a typical modern representative in India is Hindi. It is with these it shares its earliest sound-changes. Gypsy does not, however, share other later innovations of the central group which had set in or were setting in at the time of Aśoka (*c.* 250 B.C.). They must, therefore, have severed their relations with this group before that date. The word *rom*, "Gypsy man," south-east European *rom*, Armenian Gy. *lom*, Palestinian Gy. *dōm*, is the same word as the Skt. *ḍomba-*, "a low caste of dancers and singers," from whom the *Ḍōms* of India also derive their name. It is probable that wandering tribes, perhaps of the same character as some of the criminal tribes of modern India, speaking a central dialect, made their way to the north-west (probably western Panjab or Peshawar district) before the middle of the 3rd century B.C. There, among speakers of the north-western dialect-group, they stayed until, at some time before the 9th century A.D., they left India behind them in a migration which spread them all over western Asia, Europe and even America.

Dialects.—It is not known whether the gypsies left India in one or several separate migrations or whether there were even at that time marked dialectical variations in the language they spoke. But at the present day there are at least three distinct groups of dialects, the Asiatic, the Armenian, and the European. One of the most noticeable differences lies in the treatment of the original voiced aspirates of Sanskrit. The Asiatic dialects have either preserved these or, losing the aspiration, have reduced them to simple voiced sounds; the European and Armenian dialects, on the other hand, have changed them to surd aspirates: Skt. *bh, dh, gh* become Asiatic *b, d, g*, but Armenian and European *ph, th, kh* (*p', t', k'*). Thus we find Skt. *bhrātā* "brother," *dhūmáḥ* "smoke," *ghṛtám* "melted butter" in Eur. Gy. *p'ral, t'uv, k'il*, in Pal. Gy. *bar, dif, gir*.

To-day there is considerable dialectical variation even within a single group such as the European, dating probably from the time of separation within Europe itself. These dialects differ according to locality and to the degree in which they have been influenced by surrounding languages. In this respect they may vary from the comparatively pure Indian idiom of, for example, some of the Balkan gypsies or even of the gypsies of Wales, to mere jargons consisting of a framework of the local language, for example, English, in which a certain portion of the vocabulary is replaced by gypsy words.

Sounds.—The vowel-system rests on that of Sanskrit. As in all Middle Indian dialects Skt. *ai* and *au* have become *ē* and *ō* (*e.g.*, Arm. Gy. *tel*, "oil," from *tailám; mol*, "price," from *maulyam*). In the European dialect Skt. *a* in an open syllable appears as *e*, but in an originally closed syllable as *a*, which is also the representative of Skt. *ā: merel*, "dies," *rak'el*, "keeps," *manuś*, "man", from *máratē, rákṣati, mānuṣáḥ*.

In the consonant-system, the chief innovation is the change of the voiced aspirates already mentioned. Of the surd aspirates, *ph* appears to remain (*p'al*, "board" from Skt. *phālaḥ*); *ch* loses its aspiration in west European gypsy (W. Eur. *čin-*, "to cut," S. E. Eur. *č'in-* from Skt. *chinná-*); *kh* perhaps becomes a spirant χ (*χanro*, "sword" from Skt. *khaṇḍakaḥ*). Intervocalic consonants, as in all other descendants of Sanskrit, are weakened. The gutturals and palatals disappear altogether; the cerebrals remain as *r* (S. E. Eur. *ṛ*), the labials partly as *v*, the dentals as *l* in the European and Armenian dialects and as *r* in the Asiatic.

Sanskrit	Gypsy	Sanskrit	Gypsy
yūkā "louse"	*juv* id.	*āgataḥ* "came"	*alo* id.
sūcī "needle"	*suv* id.	*vijanati* "bears young"	*benel* id.
kīṭáḥ "insect"	*kiri* "ant"	*biḍālaḥ* "cat"	*blāri* (Syr.) id.
sthāpáyati "places"	*t'ovel* id.	*pībati* "drinks"	*piel* id.
yuvatíḥ "young woman"	*juvel* id.	*hṛdayam* "heart"	*yilo* id.
	jūār (Syr.)		*ǧri* (Syr.)

Assimilation of consonant-groups has occurred generally, with the exception of *r* preceded by a stop and of sibilants followed by dental or cerebral stops (except in the Armenian dialect). Thus

Sanskrit	Gypsy
dugdhám "milk"	*t'ud* (from *duddham*), Arm. *lut'*.
bhrātā "brother"	*p'ral* id., Arm. *p'al*, Syr. *bar*.
hástaḥ "hand"	*vast*, Syr. *ǧāst*, Arm. *at'*.

Grammar.—In grammar, too, the main structure of the better preserved dialects rests upon its Sanskrit original. The declension of the noun is based on two cases a direct (descended from the Sanskrit nominative and accusative) and an oblique (descended from the Sanskrit genitive) to which various postpositions can be added.

	Sanskrit	Prakrit	Gypsy
Sing. nom.	*cōráḥ* (*-ó*)	*cōrō*	*čor*
acc.	*cōrám*	*cōraṁ*	
gen.	*cōrásya*	*cōrassa* (*-asa*)	*čores*
Plur. nom.	*cōráḥ*	*cōrā*	*čor*
gen.	*cōrāṇām*	*cōrāṇaṁ*	*čoren*

The verb is built up of the old present stem, of which the indicative, the imperative and the participle still survive, and of the past participle, which alone or combined with auxiliaries forms past tenses.

		Sanskrit	Gypsy
Present indicative:	Sing.	*rākṣāmi*	*rak'av*
		rákṣasi	*rak'es*
		rákṣati	*rak'el*
	Plur.	*rákṣāmasi*	*rak'as*
		rákṣathana	*rak'en*
		rákṣanti	*rak'en*

The opposition between present stem and past participle, though in most cases the latter has been remodelled on the former, still survives in a few verbs:

Skt. *máratē* "dies" : *mṛtáḥ* "dead" = Gy. *merel* : *mulo*.
" *yáti* "goes" : *gatáḥ* "gone" = " *jal* : *gelo*.

Gypsy has preserved the Sanskrit numerals 1 to 6, 10, 20, 100. But 7, 8, 9 and higher numbers are borrowed—by Asiatic generally from Persian, by European from Greek—or are formed by various methods of addition or multiplication from existing numerals.

The borrowing of vocabulary has been extensive. The first examples can be dated back to the time when, leaving the central group of dialects in India, the gypsies sojourned among the speakers of the north-western group. Indeed, the borrowed words of a gypsy dialect disclose the itinerary of its migrations. When in the dialect of the gypsies of Wales we find borrowed words from Persian, Armenian, Greek, Rumanian, Bulgarian, Serbian, Czech, German, French and English, we may assume that at some time or other the ancestors of this particular group passed through the countries where these languages were spoken. The form in which the words appear may give some clue as to the date when they were borrowed. The most numerous source

for the European dialects is Greek, a fact which accords with the long stay the gypsies appear to have made in the Eastern empire.

Black, *New York Pub. Lib. Bull.*, vol. xix., pp. 727–738 (1915). (R. L. T.)

ROMBLON, a municipality (with administration centre and 27 *barrios* or districts), capital and port of the province and island of Romblon, Philippine Islands, about 187 m. from Manila. It has a deep well sheltered harbour which makes it one of the best ports south of Luzon. Pop. (1918), 10,467. It is a port of call from Manila. Much copra is exported. Romblon is famous for its beautiful *buri* mats. The language spoken is a dialect of Bisayan.

ROME, a province of modern Italy, forming a part of the district of Latium (Lazio) (*q.v.*).

ROME, the capital of the kingdom of Italy, lies on the Tiber river, 17m. north-east from its mouth on the Mediterranean. It was the capital of the ancient Roman republic and of the Roman empire and became very early the headquarters of the Christian Church. With a longer record of continuous political and religious importance than any other city it is unique for its antiquarian interest. In the following account the general subject of Rome is treated broadly under two aspects, themselves subdivided. These are: (1) the topography and growth of the city of Rome, the evolution of which is traced from the earliest times to the present, and (2) Roman history, *i.e.*, the political and social history of the Roman republic, empire, the mediaeval commune, and briefly the modern Rome.

THE ANCIENT CITY

The primitive city of Rome stood not in the Tiber valley, but on the ridges—so-called hills—of the Latin plain that jut unevenly into the valley. During the empire the city encroached more and more on the lower level till it covered the whole of the Campus Martius that lay in the wide bend of the river opposite the Vatican hill. These ridges, like the whole Latin plain, consisted of volcanic ash, partly cemented into hard tuff, which had, during a long series of eruptions in the Alban hills, filled an inland lake and built up an uneven plateau. In drilling wells outside of Rome's gates the following strata, enumerated from top to bottom, are usually pierced: several layers of brownish ash or tuff, a stratum of cappellaccio or friable grey tufa mixed with alluvial sediment, sand and gravel of the former lake bottom, and finally pliocene clay. Where erosion has not been very active the volcanic deposit near Rome rises to about 100 feet. Nearer the Alban hills it is far deeper. Here and there drilling also encounters hardened streams of lava that flowed from the craters from time to time. The Appian way lies partly upon a tongue of hard lava that flowed northwards during one of the last eruptions, not long before historic times.

The First Settlements.—On the part of Latium covered by the ash deposits we have as yet no convincing proofs of human settlements prior to the early iron age (about 1000 B.C.), whereas on the calcareous areas of Latium—on the Sabine and Volscian hills—which this ash did not reach, numerous remains even of Neolithic settlements have been found. It would seem that the site of Rome (and its neighbourhood on the south and east) was not an attractive place for settlement until about 1,000 years before our era, and the cause may well have been the activity of the Alban volcanoes. The first settlers coming from north of the Tiber seem to have taken possession first of the Alban hills and then of the Roman "hills." They were apparently shepherd and agricultural peoples of the "Italic" branch of the Indo-European race, related to the Villanovans (*q.v.*) who were settling in southern Etruria at the end of the second millennium B.C. The highest and safest points (the Palatine hill, probably the Capitoline and the outjutting spurs of the Esquiline) seem to have been chosen for the first communities. The graves of these early people that have been found in the Sepulcretum at the edge of the Forum show that they were a cremating folk that possessed the same kind of utensils and pottery that have been found in the Alban cemeteries. About the 8th century a related people, which however buried their dead, came in from the older settlements of the Sabine hills and built their straw huts on the Esquiline and Quirinal ridges. In the 6th century Etruscan princes seem to have conquered the whole of Latium. They soon organized these communities (which had apparently coalesced to some extent) into a city, and, bringing it into connection with the rapidly growing Etruscan cities north of the river, laid the foundations of a flourishing principality. Before they were driven out, about 500 B.C., a large temple had been built to Jupiter, Juno and Minerva on the Capitoline, a stone wall had been raised enclosing all the hill communities, and the forum valley had been drained so that the area could be used as a common market place.

In early Rome ordinary dwellings were straw huts or straw-thatched adobe huts, while temples and public buildings were erected in the Etruscan manner to suit the materials of the vicinity. The Capitoline temple, for instance, had walls of volcanic tuff well coated with stucco to hide the ugliness of the material. The ceiling beams which supported a tile roof were probably held up by a cantilever brace. The roof of the portico rested on four tuscan columns of wood or stuccoed tufa. The wooden architraves were covered with figured terra-cotta slabs that provided some adornment and protection for the beams. The pediment figures were also of terra-cotta. Because of the absence of good building stone the Etruscans early developed for architectural adornment a dignified plastic art in terra-cotta, and its artistic qualities can now be appreciated in the splendid Apollo-figure recently discovered in Veii, a few miles north of Rome. This Etruscan method of building sufficed for the city till Greek artists were brought to Rome in the second century B.C. The building of stone bridges and aqueducts during the 2nd century popularized the use of the stone arch. The concrete dome which became so striking an element in later Roman construction was not used to good effect till the latter part of the 1st century of the empire when the art of making reliable concrete had been fully developed.

Materials.—Since public buildings were frequently rebuilt and enlarged it is difficult to assign the present remains to their proper epoch, and the accounts of early Roman architecture do not by any means agree as to dates. It is only by careful observation of the materials[1] used that we can assign the remains of the republican period to their approximate periods. Before the Gallic fire in 387 B.C. practically the only stone used was the soft grey volcanic tufa called cappellaccio, the principal source of which was the quarry at the foot of the Capitoline where the Mamertine prison now stands. This is a very poor weathering stone so that it was regularly protected by a coat of stucco when used above ground. After the Gallic fire, when Rome had gained possession of the Veientian quarries of Grotta Oscura near the Tiber some 10m. north of the city, the yellowish grey tufa of that region came into popular use. This stone was as easily worked as the native one, and being more uniform in texture was cut into larger blocks of 2x2 feet. The massive fortification walls of Rome were largely rebuilt of this material during the 4th century, as were many of the public structures that had been destroyed by the Gauls. For rough work some very ugly volcanic stone, full of inclusions of black scoria, was also used for a while. This was also found in southern Etruria, and the blocks that were used at Rome and Ostia may have come from the abandoned walls of Fidenae, north of Rome. The grey tufa of Grotta Oscura was the favourite building stone of the city for over 200 years, while the scoria-filled stone was soon abandoned.

These materials also weathered poorly and proved too weak for

[1]Middleton, *The Remains of Ancient Rome* (1892); Lanciani, *Ruins and Excavations* (1897); Delbrück, *Hellenistische Bauten* (1907); Van Deman, *The Date of Concrete Monuments* (1912); Frank, *Roman Buildings of the Republic* (1924).

heavy loads. Hence in the 3rd century architects went to the Alban hills for the stronger dark grey tufa (*Lapis Albanus, peperino*) when in search for architrave beams and heavy column drums. The Tullianum, Rome's first prison, which required a very hard stone, seems to be the first structure built of this material. It probably was constructed about 250 B.C., certainly not in the regal period as has been supposed. All the large temples built during the 2nd century B.C. used peperino for points of great stress and weight. At the Gabine lake, an old volcanic crater which was nearer Rome, a tufa somewhat rougher than peperino, but equally strong, was then brought into use. This Gabine stone (*Lapis Gabinus, sperone*) was freely employed in massive walls for a century or more, but its use was limited by the fact that it would not yield to ornamental cutting. Both of these stones were costly because of the heavy transportation charges. Hence during the 2nd century experiments were made with the brown tufas nearer Rome. As can still be seen, the hills of Rome had an abundant supply of this brown tufa lying above the cappellaccio, but these hills were now so well covered with buildings that quarrying inside the city was impracticable. South of the Janiculum, on Mt. Verde, a quarry was opened and used for several buildings of the second century and of the early decades of the first. The Mt. Verde stone is hard, close-grained, but too brittle for heavy burdens, and was seldom used after Sulla's day. The brown tufa from the Anio river just above Rome proved to be very strong and uniform, in fact an excellent material except for its ugly appearance. After the fine arches of the Aqua Marcia were built of it in 144 B.C., it remained because of its durability and cheapness the favourite stone for ordinary ashlar masonry for two centuries. This Anio tufa is now to be found in the ruins of more than half of the buildings of the forum. During the 2nd century B.C. two very important discoveries of materials were made. The travertine deposits at Bagni on the road to Tivoli were found. This is a limestone of recent formation caused by the deposit of the carbonate of lime from the hot springs that arise at that point. Since the ground was level and covered with vegetation the splendid deposit had for centuries lain unobserved. The stone being rather soft when at first exposed is easily sawed and worked. It soon hardens under exposure. The Romans used it at first with some hesitation, but by Caesar's day they had learned to appreciate its good qualities. During the early empire it was freely used, as may be seen in the massive walls of the Colosseum. Recently this stone has been exported in large quantities to America.

Unfortunately for the aesthetic qualities of Roman architecture the process of making a cheap and durable, though ugly, concrete was discovered at about the same time. Since good sand is difficult to find near Rome, volcanic ash (*pozzolana*), which lies in abundance everywhere in Latium, was substituted. This ash is of course a crushed dehydrated slag, and it was eventually found that if the ash was taken from deep pits where rain-water had not destroyed its qualities it would mix with lime into a very firm hydraulic cement. By adding a filler of tufa fragments a very cheap and durable concrete could thus be made. Concrete was first used freely in the foundations and podia of the temple of Concord in 120 B.C. and the temple of Castor in 117 B.C., but it is found even earlier in a part of the platform that was constructed in front of Castor several years before. This platform probably belongs to the Gracchan period. Concrete however came into free use in superstructures only in the age of Caesar, when marble was imported in such abundance that it could be used as a veneer for ugly concrete walls. The great importance of concrete for Roman architecture lay in the fact that during the empire, when Rome required very extensive structures, domes and vaults of immense span could be built of this material. During the empire most of the heavy walls were constructed of concrete because of its cheapness and durability. They were usually faced with brick or with marble slabs. The bricks when used were generally triangular with one angle stuck into the concrete; the marble slab veneering was usually held in place by iron clamps.

Though the art of making good terra-cotta ware was known in primitive Rome, and roof-tiles of terra-cotta of excellent quality had freely been used for six centuries before Augustus' day, bricks were not burned at Rome for use in wall-construction during the republic. Immense heaps of fragments of broken roof-tiles had however accumulated, and the Augustan architects began to use these fragments in facing concrete walls. When this supply gave out, triangular bricks were made for the same purpose—during the reign of Claudius—and when, after the great fire of Nero's day, a vast programme of rebuilding followed, brick yards turned out an immense quantity of material for the facing of concrete walls. This material continued to be used freely through imperial times.

Marble was very expensive and relatively few buildings were made of solid marble; but for veneering, for columns, entablatures and decorative members large quantities of marble were imported. A few wealthy nobles had imported marble columns for their porticoes before Caesar's day. While Caesar was governor of Cisalpine Gaul his architects and engineers began to import to Rome Carrara marble, found in that province. The architects of Augustus developed the Numidian quarries of Simitthu, which yielded a variety of yellow and cream coloured marbles of great beauty (giallo antico). The transportation costs were very heavy since it had to be brought 100m. over land before it was loaded on ships. Its use was largely confined to decorative purposes. The pavonazzetto of Synnada, 200m. inland from Smyrna in Asia Minor, also came into use, as well as the greenish cipollino of Euboea, the marbles of Pentelicon, Hymettus and Paros, and the red granites of Aswan in Egypt. During the empire architects vied with each other in attaining new colour effects with contrasting veneers, and the Christian basilicas and churches of Rome which are decorated with the marbles stripped from Roman buildings are rich with stones that the emperors had imported from all parts of the world. Besides those mentioned we may name the products of quarries of Chios (called *Africano*), Thasos (*porta santa*), Laconia (*rosso antico* and *nero antico*), Thessaly (*verde antico*), and the alabasters and porphyries of Egypt.

Early Town Walls.—Tradition speaks of very early fortifications around the Palatine and Capitoline hills. These may have been earthen mounds bearing a fence of stakes. There is no doubt that a stone wall was constructed of cappellaccio blocks around the whole city at the time of the Etruscan kings. This wall was almost wholly rebuilt after the Gallic fire (387 B.C.) with the stronger Grotta Oscura stone, and later strengthened and improved from time to time with better materials. This so-called Servian wall (at first not including the Aventine) was nearly 6km. long. It began at the Tiber near the present Ponte Rotto, had two gates between the Tiber and the Capitoline hill, skirted the Capitoline on its west side (where a few blocks of the 4th-century wall are visible), then proceeded across the valley to the edge of the Quirinal hill. A small gate (perhaps an embrasure for artillery) is still visible inside the Palazzo Antonielli, but this consists of Anio tufa and must date from about the time of the first civil war. The fragment of wall seen in the via Nazionale just above is of Grotta Oscura stone belonging to the 4th century. From this point the wall followed the edge of the Quirinal hill north-eastwards for over a mile to the porta Collina. At the via Finanze may be seen a well preserved portion in cappellaccio. Because of the material this part has usually been assigned to the 6th century, but the fine workmanship and battering would rather indicate a 4th century reconstruction. From the Porta Collina the wall turned southwards across the level plateau to the porta Esquilina, a distance of about a mile. Here the city was especially exposed to attack and the wall was not only made with special care in the 4th century but was later frequently strengthened and repaired. In constructing this portion a moat 30ft. deep and 100ft. wide was dug and the earth of this excavation was used for an agger about 40ft. thick. The stone wall itself that stood behind the moat and supported the mound was about 10ft. thick and more than 30ft. high and was made of Grotta Oscura stone. The inner side of the agger was supported by a lower cappellaccio wall. The numerous quarry marks found in the section near the railway station are probably those of the Etruscan workmen of the 4th century, while those found at Piazza Fanti seem to belong to the repairs of the second Punic War. The Gabine and Monte Verde stones of the reconstructed

Viminal gate may belong to the time of the Social War, while the concrete work and Anio stone at Piazza Macao seem to be a part of the repairs made during the Catilinarian Rebellion or the civil war.

The original wall skirted the Palatine hill on the south side and ran directly to the river. Here several portions of the 4th-century wall, built in Grotta Oscura tufa and the scoriated Fidenae stone, have been found, but at the south-west corner of the hill a fragment of the original 6th-century wall in cappellaccio blocks may still be seen. During the 4th century the Aventine was also included in the fortifications. The large wall on the Via di porta S. Paulo, however, was repaired with Anio stone and a concrete backing during the Sullan period, and near the gateway arched openings for the placement of defensive artillery were neatly constructed.

Streets.—It is doubtful whether Rome had paved streets before the 2nd century B.C. The earliest pavement that has been found is that of the street which ascends the Capitoline hill from the forum. It was laid in 174 B.C. The few remains of it still visible at the side of the temple of Saturn are hard rough lava blocks full of leucitic crystals. This lava was brought from beyond Civita Castellana and was preferred to the native lava of the Appian Way because the crystals furnish a rough surface which is essential on a steep roadway. During the 1st century B.C. most of the streets were paved with large polygonal lava blocks neatly fitted and (at times) set in a concrete bedding and curbed with travertine. Outside of the city some of these pavements are still in use after 2,000 years of wear.

Bridges and Drains.—The first bridges of Rome were laid on wooden piles. In 179, stone piers were built for the Aemilian bridge (the *ponte rotto*). In the period between Gracchus and Sulla, architects had learned to make strong arches and then the Aemilian and the Mulvian bridges were constructed of splendid stone arches. The Fabrician bridge, contracted for apparently during Cicero's consulship, with two vast arches, is still in use. The first large sewer which drained the forum and cattle market seems to have been an open channel lined with cappellaccio masonry. It was covered over early in the republic. The magnificent Cloaca Maxima which opens out near the Palatine bridge and was in use till some 30 years ago was, to judge from its free use of Gabine stone, not constructed till the latter part of the 2nd century B.C. During the empire the whole city was as thoroughly drained with well-built sewers as any modern city.

Aqueducts.—Before 312 B.C. the city depended upon wells and springs for its water supply. In that year Appius Claudius, the censor, constructed an underground aqueduct 7m. in length to supply water to the poor of the crowded sections of the city. Forty years later the Anio Vetus was added. In 144 the Aqua Marcia was laid bringing an abundant supply of excellent water from high in the Sabine hills 44m. away. Where it crossed the lower plain outside of Rome the conduit was raised on splendid arches so as to bring the water to the top of the Capitoline hill. Some of these arches are still standing near Porta Furba; and the city of Rome is still using the springs that supplied the Aqua Marcia. Augustus, Claudius and later emperors enlarged the water supply, laid an extensive system of leaden pipes in the streets and built numerous fountains, till in Trajan's day the city was generously supplied with pure water.

THE FORUM[1]

In the early days the valley between the Palatine hill and the Capitoline was marshy ground with an open pool, the Lacus Curtius, near the centre, another near the west end, the Lacus Servilius, which caught the spring waters of the Capitoline hill, and another, the Lacus Juturnae at the base of the Palatine. On the lower slope of the Capitoline hill, on a protruding ledge of rock, were altars to Saturn and to Vulcan, and between them a speaker's platform. On the corresponding lower slope of the Palatine was the shrine of Vesta with the house of the vestals near by and the office of the pontifex maximus. Below the Esquiline was an extensive burial ground. When the marsh was drained and the three springs walled in the central part became an open market place—*forum*—which was soon lined with two rows of shops (*tabernae*), while the north-west corner was laid off for open-air town-meetings (the *comitium*), and a speaker's platform was early constructed between the *comitium* and the forum. Without regard for chronology we shall briefly mention the more important buildings of the forum of which there are remains, beginning at the Tullianum on the north-west corner.

The *Tullianum*[2] ("Mamertine prison") took the place, as death-chamber, of the older quarry caverns that here ran deep into the Capitoline hill. It was apparently built in the 3rd century B.C. Alban stone—the hardest material available—was used. The chamber was a truncated cone, about 12ft. high. It originally had a ceiling of oak beams, and could be entered only from a trap-door above. In the 2nd century an arc of the circle was cut away to make room for the road in front, and a straight wall of Grotta Oscura stone was built in its place. About 100 B.C. an upper vaulted chamber of Mt. Verde and Anio stone was constructed above the Tullianum, and later the lower chamber was given a horizontal stone vault. Finally, in the reign of Tiberius, a massive façade of travertine was built on the forum front. This is the chamber where noted prisoners like Jugurtha, the Catilinarian conspirators and Vercingetorix were kept before execution. It could never have been a well-house, as has been supposed, since the floor is actually above the republican level of the *comitium*. The present floor is about 6ft. above the original, if Sallust's measure of its depth is correct.

On the south of the Tullianum are the remains of the *Temple of Concordia*.[3] The original temple was erected to the deified abstraction of Concord in 366 to mark the temporary peace in the class conflict between the patricians and plebeians. The temple was rebuilt, partly with the earlier materials, and enlarged by the aristocratic consul Opimius in 120 B.C., to mark the end of the Gracchan class contests. The rededication to Concord was however considered an insult by the defeated Gracchans. Here Cicero delivered two of his Catilinarian speeches, using the temple for his addresses not only because he wished to remind the people of his programme of *concordia ordinum* but also because of the suggestive proximity of the place to the death-chamber. Tiberius rebuilt the temple in marble to commemorate the Concord of the Augustan régime. This new temple had a large portico and entrance on the forum side and the concrete base of this comes forward nearly to the Vulcanal. Portions of the elaborately carved cornice and of some of the capitals and bases are still to be seen in the corridor of the Tabularium. The temple was one of the most richly decorated at Rome and became a veritable museum of precious works of art. The corner of the podium nearest the prison originally belonged to the *senaculum*—a gathering place of senators—but was incorporated in the enlarged portico of this later temple.

Below the steps of the temple of Concord may be seen the remains of a very old *Altar of Vulcan* cut in the native cappellaccio, and near by several cuttings in the rock which give evidence of an early cemetery here. Passing the *Arch of Septimius Severus*, a work of pleasing proportions though covered with confused reliefs of a decadent and boastful art, we reach the remains of the old *Rostra*, the scene of Rome's legislative struggles from the time of the *Twelve Tables* till Caesar. It is the birthplace of modern democracy. In the centre of the mass may be seen a few of the old steps that may belong to the platform of the decemviral times. The name rostra derived from the iron rams taken as trophies from the warships of Antium (338 B.C.) and fastened on the back of the platform (on the forum side). The outer steps of Mt. Verde stone on the side of the Comitium and the circular rear wall of concrete lined with reticulate blocks belong to a rebuilding of the Sullan period.

Between the rostra and the Arch lies a *black stone* pavement that marks a sacred area uncovered in the excavations of 1899.

[3] Rebert and Marceau, in *Memoirs of Amer. Acad. in Rome,* v. 53.

The layer of gravel which covered this area as well as the pre-Sullan rostra shows that the sacred area was abandoned and covered up when the Sullan rostra were built. The objects found beneath the black stone are a 6th-century inscription of very great importance, though so much damaged that no line is complete, a truncated cone which probably supported a statue, a double base which, according to Varro, supported two figures of lions, presumably such as Etruscans placed in front of important tombs, and a great many votive objects of different periods—now to be seen in the forum museum. Some of these objects were found in their original setting, others had been removed here and buried as being too sacred to destroy at the time when the rostra were rebuilt.

The inscription is cut on stone imported from Etruscan territory, and since the lettering is too archaic for the 4th century, when Rome captured the region from which it came, we must assume that it was brought here during the Etruscan period, *i.e.*, before 509 B.C. The "black stone" was supposed by the Romans to mark the tomb of Romulus, of Faustulus or of Hostilius. The riddle has not yet been solved.

The *Curia* or senate chamber, which stands in the comitium, is the debased structure of Diocletian's day, much altered and converted into a church. The first senate house (attributed to the king Hostilius) stood farther back, leaving room for a large comitium between the Curia and the rostra. The original bronze doors of Diocletian's Curia may now be seen at the end of the nave of the Lateran basilica.

Crossing the narrow street, the *Argiletum*, which led into the Forum from the north, we come to the extensive remains of the *Basilica Aemilia*. This was a covered hall in which court could be held when the weather was too inclement for sessions in the open forum. When building it in 179 B.C. Aemilius Lepidus and Fulvius Nobilior also rebuilt the row of public shops (*tabernae novae*) and included these under the same roof with a covered arcade in front. There was a hasty reconstruction by Aemilius Lepidus in 79. About the year 54 when Caesar planned his basilica along the opposite side of the forum at a higher level he lent large sums to Aemilius Paullus to reconstruct the Aemilian basilica at a corresponding level and in an appropriate style. This rebuilding, frequently interrupted, was not completed for 20 years. The foundations now visible are chiefly of this period, though the shop walls reveal materials of all three periods. Augustus later provided money for lavish repairs and decorations after the structure had been damaged by fire. Most of the splendid marble decorations now to be seen date from the Augustan period, deriving partly from the Doric façade, partly from the interior porticoes decorated with Ionic and Corinthian columns.

East of this basilica stands the temple which Antoninus Pius built in honor of his deified wife *Faustina*. After the emperor's death his name was added to the inscription. The columns are of the expensive and garish Carystian stone (*cipollino*) from Euboea, the walls are of peperino, a good fire-proof material, and were of course faced with marble slabs. The frieze has a charming design of griffins grouped in pairs around a candelabrum.

In front of this temple are the remains of the *Regia*, one of the oldest buildings of Rome. It may have been the office of the early kings, and certainly was of the pontifex maximus throughout the republic. The cappellaccio podium of the main quadrangle may well date from the fifth century. Professor Huelsen, who excavated the site, has drawings of a decorated terracotta slab from its frieze which belonged to the 5th-century structure. The rear wall, however, contains materials of a reconstruction, probably made in 148 B.C., when the place was damaged by fire. In this building were kept the important pontifical records and lists of magistrates which provided the skeleton of facts that historians eventually used in writing the story of the early republic. And because of this historical association, Domitius Calvinus, when rebuilding the house in 36 B.C. in marble, had a complete list of magistrates and of triumphs inscribed on its walls. Some remains of these inscriptions, called Capitoline Fasti, are now preserved in the Capitoline museum. The few architectural remains that lie near by reveal the fact that even as late as 36 B.C. marble cutting was still very crude.[1] The pontifex himself had his home in the *domus publica*, the foundations of which, as it was when Caesar lived there, may still be seen a few yards to the south-east of the regia.

The extensive *House of the Vestals*,[2] as it appeared in the late empire, has many of its walls intact. They date from several rebuildings and additions made at various times during the empire. A few of the Vestal statues and honorary inscriptions remain, but not on their original locations, since all were found in a confused heap ready for the limekiln. Of the small republican structure there are few remains except the simple mosaic floor visible at a low level near the entrance. The foundation of the round shrine of Vesta is visible between this Atrium and the Regia, and near by are remains of the marble entablature cut in the decadent workmanship of Septimius' day.

Between the Regia and the open space of the forum stands the podium of the *Temple of Divus Iulius* which Augustus erected to the deified Caesar (dedicated 29 B.C.). This site was chosen because Caesar's body was burned upon a speaker's platform at this place (probably the *tribunal Aurelianum*). The spot had first been marked by an altar, the foundations of which may still be seen.

Augustus in building the temple respected the altar, indenting the portico so that the steps of the temple rose at the sides of the altar. Hence the strange ground-plan. This temple was the first striking proof at Rome of the acceptance of the theory of "Divine rights" of Rome's princes. Foundation walls of heavy masonry built outside of the concrete mass now visible supported the walls of the temple. The temple itself was an Ionic hexastyle building of marble, the columns being about ten and a half metres high. The interior was very richly decorated with imported works of art, but the architectural decoration of the entablature, fragments of which are still to be seen on the south side, was rather crude, as was all such work at Rome during the period. A few feet south of this temple there still exist the foundations of the *Arch of Augustus* erected only ten years later. Fragments of the marble decoration of this arch may be seen lying at the nearby corner of the Regia. Though somewhat too graceful and delicate for the purpose of a triumphal arch those carvings are done with a care which shows a remarkable advance in such work during the ten years after the construction of the temple of Divus Iulius.

The famous *temple of Castor and Pollux*,[3] which still has three Pentelic columns erect with a part of the entablature, is the most prominent ruin of the Forum. The first temple on the site was built in the Tuscan style early in the republic (484 B.C.) to the divinities of the Greek cavalry who aided the Romans at the battle of Lake Regillus. Since these gods were adopted as the patron-deities of the Roman knights, the temple became the official meeting place of the knights and wealthy business men of Rome, and these took some interest in maintaining it. They used its coffers for safety deposits, and its basement offices for the protection of standard weights and measures and for an assay-laboratory for the testing of coins and metals. It thus came to be Rome's "Bureau of Standards." The cappellaccio blocks which may be seen in the podium remain from the first structure, while those found in a small room under the front stairway belonged to an early speaker's platform not directly connected with the first temple. Much of the inner core of concrete belongs to a reconstruction made by Caecilius Metellus in 117 B.C., while the rest of the concrete, as well as the heavy masonry, are a part of the reconstructed temple built by Tiberius in A.D. 6. The splendid Pentelic columns seem, however, to belong to a reconstruction of Hadrian's day, though of this we are not yet certain. This last temple was Corinthian, octostyle and peripteral, with 11 columns on each side, the whole measuring about 30x50 metres. No temple at Rome reveals finer decorative workmanship.

Along the west side of this temple runs the vicus Tuscus which leads to a very large brick structure behind Castor. This has long been called the *temple of Augustus*, though the brick-work belongs chiefly to the Flavian period and no traces of an earlier temple

[3] *Memoirs Amer. Acad. in Rome*, v. p. 79.

have been found. The suggestion has also been made that it was intended as an audience chamber by Domitian.[1] There are serious objections to both hypotheses. East of this massive structure one enters the remains of the mediaeval church, *S. Maria Antica,* directly from the area of the Lacus Iuturnae. It contains frescoes—interesting to students of early Christian art, from the 7th, 8th and 9th centuries.[2] What the building was before Christian times is still a matter of dispute: older authorities assumed that it was a library, though it has not the usual form of a Roman library. A more recent suggestion is that it was the *Atrium Minervae* where the records of honourable dismissal of legionaries were kept. The impluvium, part of which is visible, belonged to the palace which Caligula had built here as an extension of his Palatine residence.

West of the vicus Tuscus, in the forum, are the confused remains of the *Basilica Iulia.* Caesar first built this on the site of the small basilica Sempronia, dedicating it in 46 B.C. To gain the necessary space he removed the shops which lined the Via Sacra of the Forum, and built in their place a row of shops all along the rear colonnade of his basilica. The whole was a vast structure designed to serve as a set for the four lower civil courts as well as for a market place. After a fire Augustus rebuilt it with lavish adornments of Oriental marbles, but later rebuildings after fires in the 3rd and 4th centuries left little of these structures to be seen. The modern excavators attempted to outline the ground plan by erecting bases of brick and marble fragments, but succeeded only in confusing the evidence of the structure found. An accurate reconstruction is no longer possible. The old *praetor's tribunal,* which stood in the forum in front of the Basilica Iulia, has now quite disappeared, but the remains of an inscription in honour of Naevius Surdinus, praetor, cut into the pavement blocks of the forum reveals the location. It was merely a low platform large enough to seat judges and jury, and was unprotected except for a canopy over the praetor's seat. The place was seldom used after the larger basilicas were built to house the courts, but it was here that the principles of Roman law were first formulated.

West of the Basilica Iulia, beyond the narrow street that was called the *vicus Iugarius,* stands a large part of the old *temple of Saturn.* The ugly granite columns with a portion of the entablature belong in part to a hasty reconstruction of the 4th century A.D.[3] (a part of one column is even inverted). The inscription recording the final restoration avoids mention of the pagan god, and the building was then in secular use. Some fragments of the cornice are remains of the republican temple of 42 B.C.—from the period of crude stone-carving—while others are later work done on the same design. On the interior facing of the frieze may be seen some good decorative slabs that were actually filched from Trajan's forum for this hasty patchwork. The podium has not a little of the splendid travertine masonry of Plancus' temple of 42 B.C. The only remains of the original temple of the early republic (497 B.C.) are the few cappellaccio blocks visible in the podium (at the very base of the east side), and in the crude wall in front of the temple—remains apparently of the original altar. The low drain-vault that appears near the latter—also early work—carries a shelf on which was found a shallow trough, apparently the runnel constructed to carry away the blood of the victims sacrificed on the altar. Saturn was an early agrarian divinity, but since his temple stood not far from the senate house, the senators—who knew that temples alone might escape looting in times of war—began to store State moneys in this temple. It thus became the official Aerarium or State treasury at Rome.

West of the temple of Saturn stands the colonnade of the *Dei Consentes,* the 12 chief gods whose images were represented at public festivals, according to an imported Greek rite. The older parts of the structure belong to the 3rd century B.C., when the rite was introduced at Rome. The cult never received much attention. Between this and the temple of Concord is seen the podium of the *Vespasian Temple,* on which three fine Corinthian columns still stand. Titus began to build this temple to his deified father and after his death it was completed by Domitian. The well carved frieze and cornice are good examples of Flavian workmanship.

Finally at the very head of the market place are the remains of the *Rostra* built by Caesar and Augustus. What we see is a semicircular approach in travertine steps from the area of Concord to the platform, and, on the forum side, the front foundation in tufa blocks (partly restored). The timber platform extending from the one to the other was at first supported by travertine posts standing upright, a few of which are still visible. When these proved too weak brick piers were added. The fragment of a fine wall of tile seen on the inside seems to be Augustan, and is one of the earliest instances of brick (broken-tile) masonry of Rome. It was removed in large part during the empire and the foundation which it lined was cut back into a semicircle to make room for a small chamber. The tufa wall on the forum side was originally faced with marble and to this wall were attached the beaks of ships (rostra) brought from the old platform of the comitium. The platform held numerous statues, and in the older concrete mass of Caesar's period we may discern separate concrete bases which probably supported such statues. The interesting marble balustrades that now stand near the centre of the forum, decorated with excellent representations of political and sacrificial scenes, were probably made for this platform in Trajan's day.

East of the forum along the *Via Sacra* in its course over the *Velia* the excavations have left many problems unsolved. Between the street and the Palatine there are remains of many residences of the republican period. The foundations of old shops along the street—it was the jeweller's street—are probably of the Gracchan era. After Nero's fire the emperor covered the whole area with one vast commercial hall with an imposing portico of travertine arches along the street.[4] Owing to faulty construction this building had to be strengthened later with brick-lined concrete piers which are now seen everywhere throughout the building. North of the Via Sacra, beyond Faustina's temple, stands the church of Cosmas and Damianus, which seems to have been the *temple of the Penates.*[5] In front of this, later used as entrance to it, is an ugly round temple not yet identified with certainty.

Beyond the narrow street is the massive *Basilica of Constantine* (almost completed by Maxentius) which Michelangelo and Bramante studied for their plans of Saint Peter's, and which has influenced the architects of more than one structure in England and America. This basilica first had its entrance at the east end with its apse at the west. Constantine's architect built a portico at the centre of the south wall on the street, and made a tribunal against the north wall opposite this new entrance. Of the immense marble monolith columns (brought from the sea of Marmora) one is still standing in the piazza in front of S. Maria Maggiore. The plan is that which had been developed for the central halls of Roman baths rather than for the earlier basilicas. The four enormous piers, for instance, bear the weight on the interior, whereas in the Basilica Iulia, which is only a third as large, 74 pillars are used. The material of this immense basilica was sumptuous to a degree, but the decorative carving reveals the tasteless exaggerations and lack of practised artistry of Constantine's day.

At the top of the Velia stands the tasteful *arch of Titus,* as restored by Valadier more than a century ago. It commemorates the capture of Jerusalem, A.D. 70, and is decorated with two of the best reliefs that Roman art produced; the triumphal quadriga with the Dea Roma entering the city, and the floats that bore the chief objects of booty.

PALATINE HILL

The Palatine hill,[6] according to tradition, was the site of the earliest settlement at Rome. Since the "hut of Romulus" stood

on the southern brow of the hill above the *Scalae Caci*, farthest removed from the forum, that side was presumably the aristocratic quarter in the early day. Fragments of good terra-cotta revetments of temples and palaces of the 5th and 6th centuries B.C. have been found in this area, two large cisterns of early workmanship, and cappellaccio blocks of an early town wall. After the second Punic War many of the nobles are incidentally mentioned as living on the Palatine, especially on the northern brow of the hill, which overlooks the forum. In Cicero's day the Clivus Victoriae, the street which ran near the crest of the hill above the house of the vestals, was lined with palaces of important men, *e.g.*, Cicero, Catullus, Crassus, Metellus Celer, Scaurus and several members of the Claudian family. During the empire a large part of the hill was gradually covered by the expanding imperial palace. Augustus' first palace arose south of the centre on property confiscated from republican nobles. The Claudian emperors, especially Tiberius and Caligula, built extensively on the old properties of the family at the north-west corner. Nero enlarged the Augustan palace, connecting it with the Tiberian structure. Vespasian abandoned the Palatine palace for more modest quarters, but Domitian moved into the Augustan structure, enlarging it with magnificent State apartments and public halls. Septimius Severus finally threw out on massive substructures a vast complex of wings toward the south-east corner of the hills with a lofty façade on the Appian Way. As early as Augustus' day the word *palatium* began to be used to designate the imperial palace.

We begin the topographical survey at the very south-west corner of the hill, where there may be seen a portion of the regal fortifications in grey tufa, as well as a large section of the 4th century town wall built in Grotta Oscura and Fidenae stone. Turning eastwards we pass apartments of the Antonine period, perhaps those of the imperial guard. Ascending the hill by the old *Scalae Caci* we reach the confusion of walls that mark one of Rome's most venerated sites. From the area of Cybele's temple a few steps, made of brown tufa (2nd century B.C.), lead down to the stone platform on which the rethatched *hut of Romulus* apparently stood in Cicero's day. The stone water-trough around the platform indicates that the building above was incapable of bearing its own water-gutter. South of this, and at a lower level, the native rock of the hill has borings that seem to mark the position of poles that supported an early straw hut. Then are found a few stones of the 4th-century fortification, and immediately beyond an early inhumation grave. This is probably a grave of the very early period, since its position proves that it was there before the wall was built. The 4th-century urn found in it may have been placed there for expiation when the grave was disturbed by the builders of the wall. Here then we have actual remnants of the primitive settlement though much confused by later builders. The two cisterns near by probably belong to the same community. The one near the house of Livia has an interesting corbelled vault.

The concrete foundation overgrown with ilexes near by is a part of the *temple of Cybele* or *Magna Mater*, first built soon after the second Punic War. Here the first oriental cult gained entrance to Rome, and the orgiastic rites practised here probably inspired Catullus' remarkable poem, the *Attis*. The concrete podium and the peperino fragments from its stuccoed entablature date from a rebuilding in 111 B.C. Augustus' architects who reconstructed it in A.D. 3 seem to have used much of the old material, which they restuccoed in a new design. This temple became very important in the empire, being considered the "mother church" of a widely extended cult.

East of this temple area is the *house of Livia*, the wife of Augustus. Its very low level is due to the desire of later emperors to preserve this house intact when the other palaces about it were being raised on lofty substructures. It was built about 50 B.C., and contains excellent wall paintings (now badly faded) which correspond to the "second style" of decoration at Pompeii. The house is the best preserved of Roman houses of its period. South of this house is a level platform laid over the ruins of republican houses not yet excavated. On this platform, according to a plausible conjecture,[1] may have stood Augustus' first palace. The house at any rate was connected with Livia's.

The temple foundation that projects into this platform at the southern corner has recently been identified with plausible arguments as that of the great *temple of Apollo* erected by Augustus in 28 B.C.[2] (*cf.* Horace *Odes I.* 28 and Propertius' description in Bk. II. 31). The final proofs have not yet appeared. The temple, octostyle and peripteral, was of Luna marble, with Numidian columns. The acroterion represented the sun-god in his chariot, the pediment group Apollo with Artemis and Leto; the doors were covered with ivory reliefs of the defeat of the Gauls at Delphi and the death of the Niobids—two themes reminding of Apollo's power. This too became a museum of splendid works of art. Adjoining the temple area—in the space on the south-east of the temple, if the identification is correct, was the extensive portico of the Danaids into which Augustus built the first great public library of Rome.

The centre of the Palatine is occupied by the ruins of *Domitian's palace* (usually called the *domus Augustiana*) which faces northwards. At the front are the audience and public chambers: (1) a "basilica" with an apse in the rear for the emperor's tribunal, used when he acted as judge in political cases; (2) on the east of this room, the *aula* or large audience room where foreign legations were heard and meetings of the senate were held; (3) farther to the right a smaller room which is incorrectly called the *lararium*. The centre of the palace was occupied by an extensive peristyle containing a garden with an elaborate fountain. In the rear was the large dining room flanked on both sides with curious fountain-chambers. The emperor's table apparently stood on a dais at the end. All of these rooms were decorated with coloured marbles and floor mosaics, and the architectural carving reveals the exquisite designing of the Flavian architects. The large central audience chamber was roofed with concrete vaulting, the earliest example of such a vault employed on a large scale.

Under this vast palace there are buried many houses of earlier periods which have recently been excavated in part but not yet described.[3] Under the basilica one enters the segments of a large room that has not only wall paintings of the second style but also stuccoed reliefs of bold design. The masonry is not unlike that of the house of Livia. If this is not a part of Octavian's first palace it must have belonged to one of his powerful friends. The room was later abandoned for the construction of a large reservoir and finally cut through by a solid curved wall which must be a part of the foundations of Nero's palace. Deep under the lararium are five rooms of an even earlier period; the oldest frescoes and mosaics of this house point to a period of about 75 B.C. Some important family of Cicero's time lived here. Under the dining room there are remains of two previous periods of the palace, the lower rooms pertaining apparently to the reign of Claudius. The delicate decorations of a fountain-house and the very charming wall-decorations in coloured stucco plaques that resemble those of the "golden house" of Nero are as successful as anything in their kind at Rome.

Of the *Domus Tiberiana* which occupied a large part of the north-west corner of the Palatine and which is now covered with pleasing gardens very little remains but the substructures with their dark rooms. Many of these rooms have not even been excavated, and since they must have been used for servant quarters it is not likely that things of importance would be found here. Tiberius' palace did not extend to the Clivus Victoriae on the brow of the hill because this street still retained several of its republican mansions when the palace was built. Caligula seems to have connected this corner of the palace with a new wing on the forum level behind the temple of Castor. The magnificent ramp that zigzags down to the forum seems to belong to the Flavian period. The splendid arches thrown over the Clivus Victoriae to carry the palace grounds forward to the very edge of the hill above the forum are attributed to the architects of Trajan and Hadrian. These lend much to the picturesqueness of the Palatine as seen from the forum and to the long vistas over Rome when viewed

from the platform laid over these piers.

The north-east quarter of the Palatine is still occupied by S. Sebastian and S. Bonaventura. What buildings stood there in antiquity we do not know. The south-east quarter is occupied chiefly by the so-called "hippodrome" and the substructures of Septimius' additions to the palace. The "hippodrome" (the word was sometimes used for gardens of the long oval type) seems to have been a large garden which was surrounded by high retaining walls to keep the higher portions of ground from caving in. It certainly contained fountains, trees and walks, with a portico circling the whole within the wall. Perhaps the portico roof had hanging gardens. The masonry is of the Flavian period with additions and changes of a century later. The substructures of Septimius' palace spread in several directions. The central portion contained very luxurious baths. The lofty ruins that extend along the brow of the hill were apparently substructures that supported apartments from which the emperor could view the games of the circus below, while farther south-east stood the Septizonium with its lavishly decorated façade which was to remind the African friends of Septimius on approaching Rome that one of their countrymen occupied the imperial palace. A large part of the Septizonium stood till the 16th century, when it fell a prey to the greed of Sixtus V. (1588).

THE CAPITOLINE HILL

The Capitoline hill,[1] which in ancient times could be approached only from the forum, had in the regal period a fort (*arx*) on the northern height, an area sacred to Jupiter on the southern height and a wooded asylum on the depression that lay between these two. In the area sacred to Jupiter the last of the kings built a magnificent Etruscan temple with three cellas to the triad Jupiter, Juno and Minerva, and this, officially called the temple of Jupiter Optimus Maximus, was ready for dedication the first year of the republic, 509 B.C. The foundations of this temple have long been known, and when in 1919 the German embassy, which stood upon it, was torn down to make place for an enlargement of the Capitoline museum the old walls were excavated and measured. (*Notizie degli Scavi*, 1919.) These foundations, built of the native cappellaccio, are now visible at two corners, and prove that though masonry was still fairly crude in technique, the original temple was built on the magnificent scale that it had in imperial restorations, about 60x50 metres. Since it was the largest temple in existence in Italy in that day we may conclude that the tradition was not far from correct which held that Rome was a large and wealthy city under the Etruscan princes. The first temple was probably, like the foundations, built of native tufa and covered with a white stucco. The porch was probably supported in four wooden columns set wide apart, and the wooden architraves were in Tuscan fashion covered with painted terra-cotta slabs. A few fragments which may possibly belong to the early temple have been found and placed in the museum near by. On the roof was placed a quadriga of Jupiter in terra-cotta made by the artists of Veii, probably by the same school of artists which created the splendid Apollo now to be seen in the Villa Giulia museum. This old temple, with its decorations renewed from time to time, stood until it was burned in 83 B.C. After various rebuildings it was reconstructed in marble with Pentelic columns by Domitian, and the surviving marble fragments of the entablatures that are in the museum give some idea of the magnificence of this Flavian temple. This marble structure was hexastyle with three rows of columns across the front and a row on each side.

Of the Arx and the temple of Juno Moneta later built thereon all traces have been hidden by the church of Ara Coeli and the recent monument to Victor Emmanuel II. The *Tabularium*, the gaunt walls of which command the view of the forum, has so frequently been altered in rebuilding the rooms of the modern council chamber of Rome that little but the rear remains intact. It was erected after the Sullan fire, which destroyed the Capitoline temple, to serve as a fireproof hall of records for the State. Gabine stone was employed for the exterior walls because it was known not to suffer from fire. The ceilings of the rooms were domed with concrete and an arcade of round and flat arches was developed far beyond the usual architectural customs of the day to avoid the use of inflammable material. It is probably the first attempt at a hall of records that was to be absolutely impervious to the accidents of the elements, and the attempt was successful as the present condition of the store-chambers proves.

[1]Rodocanachi, *Le Capitole romain*, 1904; Platner, *Ancient Rome*, p. 291.

THE IMPERIAL FORA[2]

The Julian Forum.—Julius Caesar set aside a large part of the moneys which he derived from Gallic booty for the relief of the overcrowded forum. Thus he moved the comitium to the new *saepta* farther north, and built in the forum the large basilica mentioned above. His most extensive building, however, was a new forum enclosure with high walls and numerous shops lining the walls north of the old forum. In the via delle Marmorelle there are remains of the portico and walls ingeniously constructed of the three varieties of stone best adapted to the requirements. This wall was veneered with marble. Beneath, not now visible, are the remains of several of the shops built of tufa and vaulted with concrete. In the centre of the forum Caesar erected a marble temple to Venus Genetrix, the "ancestress" of the Gens Iulia. This temple he vowed at the battle of Pharsalus, doubtless intending that it should be a visible reminder of his own exalted claims. The forum itself was planned in 54 B.C. but not yet fully completed at Caesar's death in 44.

Forum Augusti.—Augustus completed the forum of his predecessor and built a larger one on adjacent ground chiefly for the purpose of enclosing a *temple to Mars Ultor* which he vowed at Philippi, 42 B.C. To protect the temple from fire he raised a massive wall of Gabine and Alban stone about the area. This wall, one of the most imposing now at Rome, rises 100ft. high. On the outside the great blocks were left rustic, while on the inside, where it was faced with marble, two rows of niches were cut to hold statues and honorary tablets to the noted heroes of Roman history. The statues have disappeared but many fragments of the tablets have been found. The area in front of the temple and on its north side was excavated in 1925–27 and revealed fragments enough of the entablature to ensure complete drawings of the whole structure. The marble decoration was of the best that the Augustan age could produce. The temple proves to be octostyle with a row of columns on each side while the rear of the cella stands solidly against the massive enclosure wall.

Forum Vespasiani.—The next imperial forum to be built was that of Vespasian, through the area of which the Via Cavour now runs. In its centre he constructed a magnificent temple to Peace, which is frequently mentioned for its library and its large collection of works of art—among them statues of Phidias and Lysippus. No part of this structure is now visible. Between the forum of Augustus and that of Vespasian lay the long and narrow area of the lower Argiletum about forty metres wide in which Domitian began to build a forum to contain a small *temple of Minerva*. Since Nerva completed and dedicated it, the structure bore his name, but the decorative work is all of the luxurious style of the Flavian period. Two of the columns of the handsome colonnade still remain with a part of the entablature. Its frieze is in bold relief representing the story of Arachne and other themes suitable for the adornment of a precinct sacred to the goddess of arts and crafts. No portion of the temple of Minerva is now visible but the whole area will probably soon be excavated.

Forum Traiani.—The *forum of Trajan*, north-west of the Augustan group, was a large complex of open areas and buildings, including the spacious forum proper enclosed with a portico, the basilica Ulpia, the two library buildings, the column of Trajan, and, an addition of Hadrian, the massive temple of Trajan. Since the valley was too narrow for all these structures the opposing slopes of the Capitoline and Quirinal hills were cut back, and when necessary heavy retaining walls of concrete and brick erected, a part of which still remain. The forum proper had its stately entrance in the form of a triumphal arch near the forum

[2]Platner, *Ancient Rome*, p. 274 (1911), with earlier bibliography.

of Augustus. Its area is rectangular, 116 metres wide and 95 metres long. The large hemicycle against the Quirinal which is now being excavated served as a retaining wall of the Forum. The corresponding one on the opposite side has disappeared. The forum was of course open to the sky, but was surrounded by a very beautiful marble portico backed by a masonry wall. Many fragments of this portico may be seen lying about in the area. Next to the forum proper stood the basilica, which far surpassed the earlier ones in magnificence. A double row of 96 Corinthian columns supported the upper arcade that bore the roof. The nave was 25 metres wide; the apses at the end have been destroyed. North of this judgment hall were the two wings of the library, a rendezvous of literary men and students. In the area between these was built the column of Trajan[1] which is still standing. This column is 100ft. high and is covered with reliefs arranged in a spiral band representing the events of Trajan's two campaigns in Dacia. This is apparently the first column which was decorated in this manner, and the reliefs are made with such fidelity to fact as to be our best document for the history of the wars. Since the porticoes of the library rose on both sides, the reliefs could then be seen from near at hand. Nothing now remains of the great temple of Trajan which Hadrian erected north of the column.

FORUM BOARIUM AND CAMPUS MARTIUS

Between the Capitoline and the well known church of S. Maria in Cosmedin is an area which in early Rome was used as a cattle market, though during the empire it was as thickly populated as it is now. In this area, near the river, are found two republican temples for which the original names have not yet been discovered. The rectangular temple, usually called the *Temple of Fortuna*, was freed from mediaeval additions in 1923 and conservatively restored. It is exceedingly interesting as showing the type of building used at Rome in the late republic before Caesar and Augustus began to reconstruct Rome's temples in marble. It is an Ionic tetrastyle pseudo-peripteral temple of pleasing proportions, though small, measuring only 20x12 metres. The walls are of Anio tufa as are also the imbedded columns except those at the corners. These latter, as well as the free columns of the portico, all the capitals, the entablature of the porch and the facing of the podium are of travertine. The whole was covered with white stucco and the stucco of the frieze was neatly moulded into low reliefs of ox-skulls and garlands. The careful distribution of these materials points to the period of about 70–50 B.C. The round temple near by stands on a foundation of the 3rd or 4th century B.C., but the marble temple itself seems to belong to the Augustan period. It would be a graceful temple if the entablature and roof could be restored as well as several of the capitals which have apparently been replaced by alien material. It is of course not a temple of Vesta, but its true name is not known. Huelsen has suggested "Portunus."

The double-arched *Ianus quadrifrons* which stands over the Cloaca Maxima, is of late date and of ugly proportions. The extensive remains that are found in and under S. Maria in Cosmedin apparently belong to the public granary as it was in Cicero's day. Under the church of *S. Nicola in Carcere* near the Piazza Montanara are seen the foundations of three temples that stood beside the vegetable market outside the ancient Porta Carmentalis. These seem to be—from north to south—the temples of Janus, Juno Sospita, and Spes, originally built respectively in 260, 194 and 258 B.C. Most of the materials now visible belong to the rebuildings of *c.* 90 B.C. (Janus), 90 B.C. (Juno Sospita) and 31 B.C. (Spes). For the architectural history of the republic they are very important. Farther north on the site of S. Maria in Campitelli stood the famous old *temple of Apollo* where the sibylline books were kept and near which, on the slope of the Capitoline, Rome's early plays were given at the games of Apollo. The temple was first built in the early republic (431 B.C.) but the extensive remains now to be seen under the church seem to belong to the reconstruction of 179 B.C.[2] Because of the association of this district with early dramatic performances Augustus constructed a very large theatre near by (first used, when still incomplete, in 17 B.C.) which he named in honour of his nephew Marcellus. A large part of the semicircular façade is still standing and when it has been cleared of its ugly shops and superstructure —excavations are in progress—it will be one of the most imposing ruins of ancient Rome. The exterior consisted of three series of open arcades, the lower one being decorated with engaged columns of the Doric order, the middle with Ionic ones, the third with Corinthian pilasters. The theatre seated about 10,000 spectators and had a stage of the enormous proportion of 80x20 metres.

North of this theatre may be seen the portal of the extensive Porticus of Octavia (originally the Porticus of Metellus) which enclosed large temples of Juno and Jupiter. The whole was originally built in the 2nd century B.C., but all the remains now visible belong to the debased art of the Septimian period. Within may be seen, rising above shabby walls, a column and capital of one of the great temples. North-east of this lay the extensive *Circus Flaminius* built before the second Punic war as a place to hold the plebeian games. Fragments of the supporting walls may be seen in the basements of several houses on the Via d. Bottege Oscure, but these all belong to a rebuilding of about 50–30 B.C. A few hundred feet to the north-west of this circus, Pompey built his massive theatre in 55 B.C., the first permanent theatre of Rome. This was about the same size as the Marcellus theatre and its stage was even longer. Considerable remains of it are to be found under the shops east of the Campo dei Fiori.

Farther north, in the old Campus Martius is the Pantheon,[3] a structure which Hadrian built to replace the earlier temple of Agrippa and Domitian. This round temple was one of the boldest of old Roman structures, having a brick and concrete dome with a diameter of 43½ metres without support except on the walls of the temple. The dome itself was built of narrowing circles of brick on which were laid several layers of concrete which hardened into one firm mass so that there is no lateral thrust on the walls. The walls of the rotunda are also of brick-faced concrete with solid brick arches running through the mass to aid in carrying the weight over the niches while the mass was solidifying. The portico is a rectangular structure, most of whose columns belong to Hadrian's time. Some of the repairs of its entablature seem to be of a later period. The large inscription on its front generously credits the building to Agrippa while the smaller one mentions the repairs of Septimius. Nothing is said of the actual builder, but the brick stamps and the style of work prove that Hadrian should have the chief credit. The exterior was of course faced with marble slabs, and the sumptuous decoration of the interior—originally even more elaborate—will give some idea of how lavish the whole building must have been. The temple was dedicated by Agrippa to the divinities of the Julian house, and the name was intended to convey the idea of "all-holy." Of other notable buildings in this region we may mention the *temple of Hadrian*, the walls of which have been incorporated in the Borsa, or stock exchange; the *Mausoleum of Augustus* which has till recently served as a concert hall, called the Augusteo, and the *tomb of Hadrian*, on the right bank of the Tiber, rebuilt during the middle ages into a fort called the Castel Sant' Angelo.[4]

The *Colosseum*,[5] or more correctly, the *Amphitheatrum Flavium*, was begun by Vespasian on the low ground that Nero had used for a lake in the centre of his imperial villa. It was used for hunts, sham battles, gladiatorial shows and races, and the arena could be flooded for sham naval battles. The façade consists of three series of 80 arches decorated in the three orders as were the theatres of Pompey and Marcellus, and rises 48½ metres. Stone masonry in travertine lined with tufa supports the heavier outer portion, while the vaulting of the arcades and the inner bowl consist of concrete. The seats were of marble and could hold about 50,000 spectators. The building which is elliptical measures

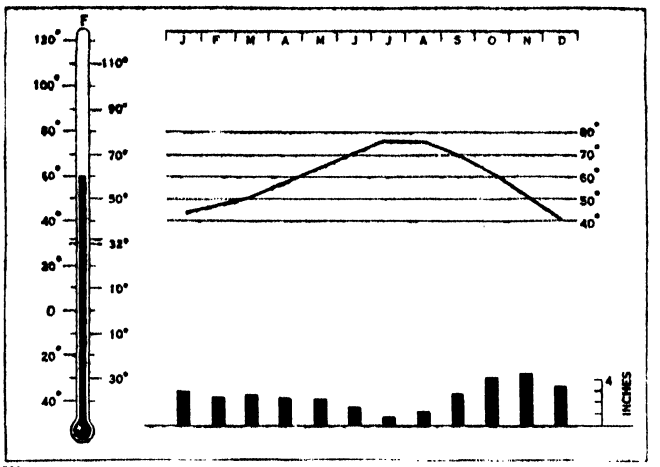
188 metres in length and 156 metres in width, while the arena measures 86x54 metres. It was apparently the largest amphitheatre in the Roman world.

Near by stands the well proportioned *Arch of Constantine* which however is largely constructed of materials taken from previous arches. The only sculpture upon it that belongs to Constantine's day is the very narrow frieze rudely carved in a band about its centre. The other reliefs were taken from structures of the second century and in the use of these the imperial portraits were rechiselled to represent Constantine. North-east of the Colosseum one may enter several rooms of the *golden house* of Nero,[1] or rather the private apartments of that emperor. The rooms have been to some extent preserved because the walls were later used as substructions for a part of Trajan's baths built at a higher level. Many of the rooms of the palace have recently been excavated and reveal much damaged frescoes and stucco reliefs which represent the best work of its kind at Rome for the period of Nero. It was here, as graffiti on the walls indicate, that several of the Renaissance painters borrowed themes and designs for the arabesque and "grotesque" decoration so popular when the loggia of the Vatican was decorated.



Several of the massive *Thermae* (Baths) of ancient Rome are still among the most conspicuous ruins of the city. The first large structure of this type was the one built by Agrippa in 20 B.C. south of the Pantheon. Little now remains of this. More may be seen of the ruins of those constructed by Titus and Trajan (on the grounds of Nero's *Domus Aurea*), by Caracalla on the edge of the Aventine and by Diocletian (part of which is now used for the national museum). Since these buildings contained, besides the baths, playgrounds, gymnasia, clubrooms and auditoria for immense crowds, the architects who constructed them had to employ all the arts and sciences at their disposal. The central building of Caracalla's baths covers an area of 270,000sq.ft.; and the central hall has a clear space of 183x79ft. It is roofed with a solid concrete intersecting barrel vault that rests chiefly on four massive piers and rises 108ft. from the pavement. It was while solving the problems of such construction that the Roman architects made those contributions to their art which have been most frequently studied by recent architects. The baths of Diocletian have suffered more from time, but the church of S. Maria degli Angeli has preserved two of its great halls. Here may be seen in their most advanced use at Rome good examples of flying and rectangular buttresses, a careful system of thrusts and counter thrusts and of ribbed quadripartite vaulting. A large number of the smaller rooms are used by the Museo delle Terme.

Finally the *Subterranean Basilica*[2] discovered near Porta Maggiore in 1917 has proved to be not only one of the best preserved of ancient buildings but one of the most important for the interpretation of Roman life. Though it seems to have been built before the middle of the 1st century A.D. it has the regular basilican form with nave, apse and two aisles. It was built wholly underground apparently for the purposes of a secret religious sect. The ceilings of the nave, the apse and the aisles are richly adorned with excellent stucco reliefs, the interpretation of which has proved as difficult as would be the explanation of the biblical illustrations of a mediaeval cathedral if we had no copies of the Bible. The most generally accepted view is the one proposed by Cumont, that this basilica was the temple of a Neo-Pythagorean congregation which practised mystic rites of initiation that were not approved of by the imperial authorities, and that the reliefs in question pertain to myths and rites which had been given a symbolic interpretation in the Neo-Pythagorean ritual. But quite apart from their meaning, they now give us the best conception possible of the beauty of Roman interior decoration for the 1st century of the empire. (*See* Rivoira, *Roman Architecture*, p. 204.)

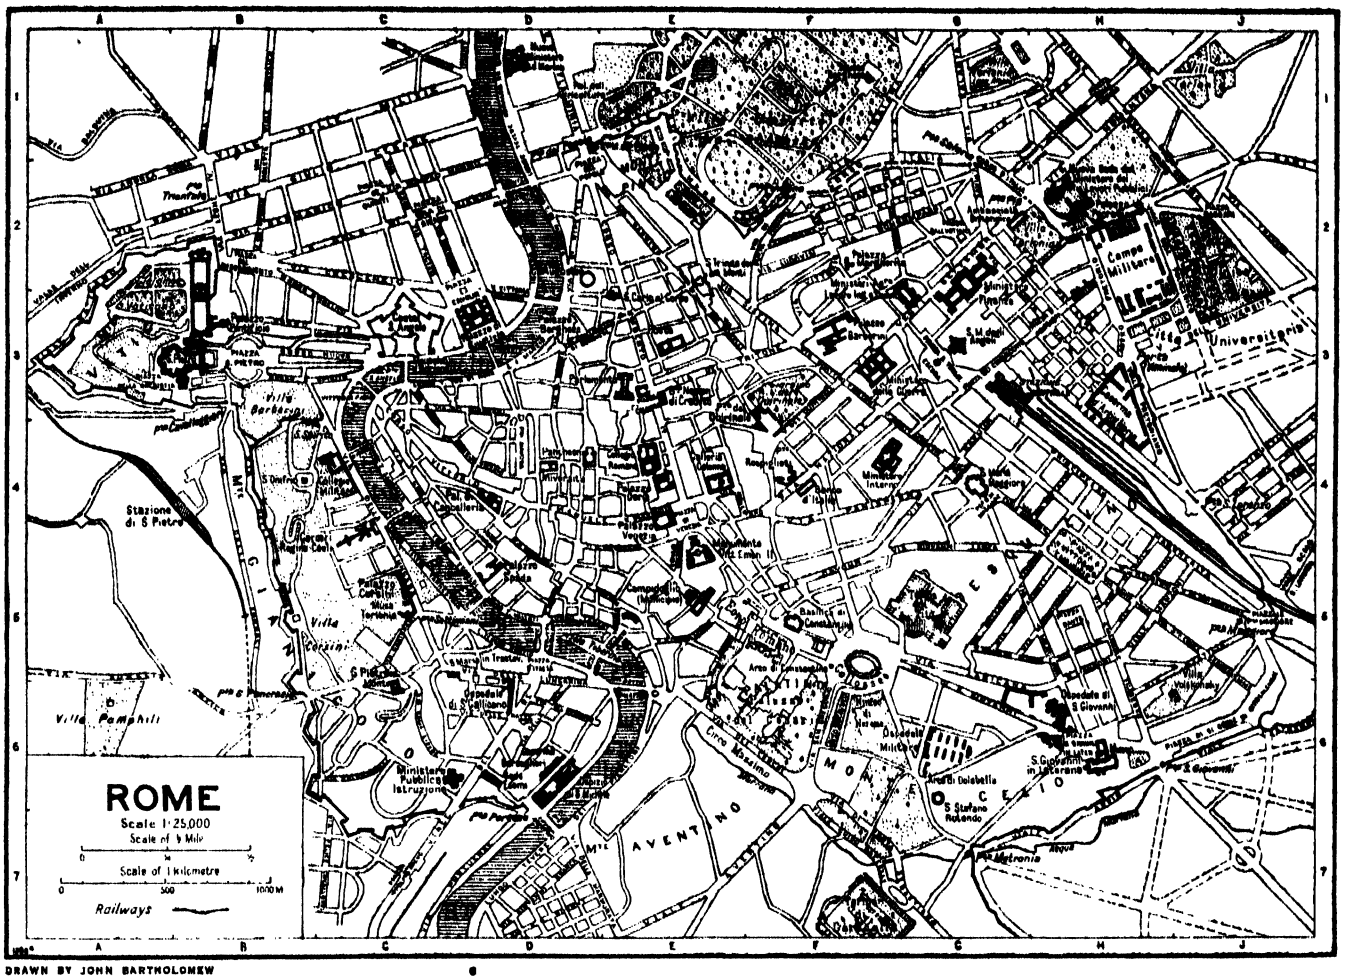
(T. F.)

THE MODERN CITY

In the middle ages the population of Rome had dwindled to twenty or thirty thousand inhabitants, who lived huddled together about the strongholds of the barons, and the modern city grew slowly upon the exiguous foundation of a mediaeval town. The first plan for modernizing and improving Rome was that of Pope Julius II., who aimed at the enlargement of the lower city on both sides of the Tiber. Following him, Sixtus V. did his best to develop the upper part of the city by laying out the Via Sistina, from the Trinità dei Monti to S. Maria Maggiore and Porta S.

WEATHER GRAPH OF ROME. THE THERMOMETER INDICATES THE ANNUAL MEAN TEMPERATURE. THE CURVE SHOWS THE MONTHLY MEAN TEMPERATURE AND THE COLUMNS, THE MONTHLY PRECIPITATION

Giovanni. A plan of improvements was made, under the direction of Mgr. de Merode, during the reign of Pius IX.; and, although only very partially executed, has served as a basis for later efforts.



Great changes in the municipal and social conditions followed the occupation of the city by the Italians (Sept. 20, 1870), and the rapid increase of population due to immigration from other parts of Italy. In a rush of land-speculation, trees and fine villas were unfortunately destroyed. As soon as political circumstances admitted, the municipality set to work.

Two principal problems presented themselves. The more important was the confinement of the Tiber in such a manner as to render impossible the serious floods which had from time to time inundated the city, often causing great damage to property and rendering the lower streets more or less impassable. There were floods which almost reached the level of the first storey near San Carlo in the Corso, and it was common to see the great Piazza Navona and the neighbourhood of the Pantheon full of water for days together during the winter. The interruption of traffic can be imagined, and the damage to property was serious. The other urgent matter was one of which the government of Pius IX. had been partially aware, namely, the necessity for opening better thoroughfares between different parts of the city.

It is necessary to distinguish between the work carried out by the municipality, and that which was done in the way of private speculation. The first was on the whole good, and has proved enduring; the second was in many cases bad, and resulted in great loss. As soon as the opening of such streets as the Via Nazionale and the Via Cavour, the widening and straightening of the Via dell' Angelo Custode, now the Via del Tritone Nuovo, and similar improvements, such as the construction of new bridges over the Tiber, had demonstrated that the value of property could be doubled and quadrupled in a short time, and as soon as the increase of population had caused a general rise in rents, owners of property awoke to the situation of affairs, and became as anxious as they had at first been disinclined to improve their estates by wholesale building.

The most important work executed by the government with the assistance of the municipality was the construction of the embankments along the Tiber. Though damaged by the great flood of December 1900, their truly Roman solidity saved the city from the disastrous consequences of a wide inundation. It is impossible not to admire them, and not to feel respect for a people able to carry out such a plan in such a manner and in so short a time, in

DRAWN BY JOHN BARTHOLOMEW

the face of such great difficulties. But so far as the life of the city was concerned, the cutting of new streets and the widening of old ones produced a more apparent immediate result. The opening of such a thoroughfare as the Via Nazionale now named in part Via Cesare Battisti, and in part Via Quattro Novembre could not but prove to be of the greatest value. It begins at the Piazza delle Terme, in which the principal railway station is situated, and connects the upper part of the city by a broad straight road, and then, by easy gradients, with the Forum of Trajan, the Piazza dei Santi Apostoli and the Piazza di Venezia, whence, as the Corso Vittorio Emanuele, it runs through the heart of the old city, being designed to reach St. Peter's by a new bridge of the same name opened in 1911 near the bridge of S. Angelo. It is true that, in order to accomplish this, the Villa Aldobrandini had to be partially destroyed but this is almost the only point which lovers of beauty can regret, and in compensation it opened to full view the famous palace of the Massimo family, the imposing church of S. Andrea della Valle, and the noble pile of the Cancelleria, one of the best pieces of architecture in Rome. Another great artery is the Via Cavour, which was intended to connect the railway station with the south-western part of Rome, descending to the Forum, and thence turning northwards to reach the Piazza di Venezia on the east side of the monument to Victor Emanuel II. It was proposed again (1928) to extend the Via Cavour to the Piazza. Rome is now divided clearly into two parts, the old and the new, of which the old is incomparably the more artistic and the more beautiful, as it will always remain the more interesting. A tunnel under the Quirinal Hill connects the north end of the old city, the Corso, Babuino, etc., and the upper part of modern Rome, including the former Via Nazionale and the Esquiline. A causeway and bridge unites the Pincio with the Villa Borghese, or, as it is now called, the Villa Umberto Primo. In 1911 zoological gardens were arranged in the grounds of the Villa and a fine collection of modern Italian art was opened in the Palazzo delle Belle Arti, to the west of the Villa.

The Policlinico, on the Macas, is one of the finest hospitals in Europe. It is on part of the large site, east and south of the Castro Pretorio, requisitioned by the Government for building a new University, and bringing together various institutions scattered about the city. Of this scheme the hospital forms part. The military hospital is on the Coelian. In 1910 in honour of the jubilee of the unity of Italy, the formation of an archaeological park, extending from the Via Appia to the foot of the Aventine and almost to the Aurelian Wall, was approved by the Parliament. It contains the Baths of Caracalla. Among the important modern buildings are the Cassa del Risparmio, in the Corso; the Palazzo Negroni, near the Piazza Nicotia, the Chamber of Deputies, with its principal front on the new Piazza del Parlamento and the Palace of Justice, near the castle of St. Angelo. It was proposed in 1922 to make the barracks and storerooms of the Castle of St. Angelo into a topographical museum. In the same year a museum of antiquities from the Forum was arranged in a building adjoining the church of Santa Francesca Romana; and the Museo Petriano, containing objects connected with the foundation and development of St. Peter's was opened in 1925.

Municipal Administration.—After 1870, those who remained loyal to Pius IX. took no part whatever in public affairs, and the municipal administration was entirely in the hands of the monarchists. The expression "nè eletti nè elettori," meaning that Catholics are to be neither voters nor candidates, which came to be regarded as a sort of rule of the party, was invented at that time by an epigrammatic journalist, and it seems at first to have been applied also to municipal matters, whereas it was later understood to refer only to parliamentary elections. Leo XIII. encouraged the formation of a Catholic party in the municipal administration, and the municipal government then drifted largely into the hands of Catholics. In the year preceding the present régime the three democratic parties, known as the monarchist,

socialist and republican, united to form a popular coalition, and succeeded in completely excluding the conservative, aristocratic and Catholic elements. Prior to 1926 there was a municipal or Communal Council chosen by the electors and a Syndic (Mayor) drawn by the Municipal Council from its members. In all Italian communes except Rome and Naples there has been substituted for these a *Podestà*, but Rome itself has a governor.

Population.—The population in 1870 was 226,022, by 1901 it had reached 462,743 (communal population). It therefore more than doubled in thirty years. The increase, however, did not take place at a regular rate, owing to the changes in the rates of immigration and emigration. In 1925 the population had reached 767,983 an almost as rapid increase as during the earlier period 1870–1901. There are in the city population many military and ecclesiastical officials.

Climate and Hygiene.—Rome is mild and sunny, but the variation in temperature between day and night is very great. December and February appear to be the coldest months, the thermometer then averaging 47°; the greatest heat, which averages 75°, is felt in July and August. The surrounding Campagna is still not all habitable during the summer, though the dangerous malaria has been much checked by the planting of numerous eucalyptus trees. A remarkable instance of the effect produced upon the marshy soil by these plantations may be studied at the Trappist monastery of the Tre Fontane, situated on the Via Ardeatina, about 4 m. from Rome. Whereas in former times it was almost always fatal to spend the whole summer there, the monks have so far dried the soil by means of the eucalyptus that they reside in the monastery throughout the year. The municipality has made strenuous efforts, attended with marked success, to reduce the mortality due to malaria. The hygienic conditions of Rome itself have greatly improved, largely through the ceaseless efforts of Commondatore Baccolli, a distinguished man of science, who repeatedly held office in the Italian Ministry. Ninety per 1,000 deaths occurred in 1871 from typhoid (the so-called "Roman fever"), but the average has now fallen to a low constant. Since the introduction of compulsory vaccination deaths from smallpox may be said not to occur at all. The death rate in (1928) averaged about 19 per 1,000.

Charities and Education.—A great number of small charitable institutions for children and old people have been founded, which are organized on the most modern principles, and in many of these charitable persons of the upper classes give their individual assistance to the poor. There are also private hospitals for diseases of the eye, in which poor patients are lodged and treated without payment. There are two hospitals entirely maintained by private resources, where infants are treated whose mothers fear to send them to a public hospital, or in cases refused by the latter as not being serious enough for admission. Of course, the numbers of the poor greatly increased with the growth of population, especially after the failure of building speculations between 1888 and 1890, though great efforts were made by the municipality to send all persons then thrown out of employment back to their homes. One of the difficulties under which Rome labours is that while it attracts the population of the country, as other capitals do, it possesses no great mechanical industries in which the newcomers can be employed. Efforts to create small industries in the populous quarters of the poor met with little success. Before 1870 a society was formed, which has since greatly developed as an intelligent private enterprise, to provide the poor with sanitary tenements; but its success is much hampered by the absence of employment, which again is partly due to the heavy taxation of small industries. A number of trade schools are also maintained by private funds, such as the Instituto degli Artigianelli, managed by the Fratelli della Dottrina Cristiana, and the Ricovero pei Fanciulli Abbandonati (home for friendless children), which is under lay management and has flourishing work shops. The character of official charities has certainly improved in principle, so far as their educational and moral scope are concerned, for whereas in former times the limited number of the poor made individual and almost paternal relief possible, that form of charity had a pauperizing influence. If anything, the present tendency is to go too far in the opposite direction, and to require too many formalities before any relief is granted; and while the union of the principal charities under a central management on advanced theories improved the methods of administration, it destroyed numerous small sources of immediate relief on which the poor had a traditional right to count, and was in that way productive of hardship. At the same time, however, mutual benefit societies (*società di mutuo soccorso*) have been organized in great numbers by the different crafts and professions, and are chiefly distinguishable by the political parties to which they belong. It is characteristic of the modern Roman people that the most widely different elements subsist without showing any signs of amalgamating, yet without attacking each other. Some of these societies have an exclusively clerical character, others are merely conservative, some consist of monarchists, and some of avowed republicans.

Popular education is principally in the hands of the municipality, but besides the public schools there are numerous religious institutions attended by the children of the lower classes; they follow the curriculum prescribed by the government, and are under the constant supervision of municipal inspectors, both as regards their teaching and their hygiene. The pope also expends large sums in the maintenance of the people's schools, managed entirely by laymen, and also under government inspection. For education of the higher grade, besides the regular lyceums and gymnasiums, there are many private schools similarly designated from which pupils can present themselves for the regular government examinations. The University of Rome was established in 1265 and in the session 1924–25 there were 4,500 students. There is also a Higher Institute of Economic and Commercial Education founded in 1906 with some 2,000 students. Rome has also an Engineering college, a Women's Training college and a School of Architecture. The State regulates public education and maintains either entirely or in conjunction with the municipality public schools of every grade. (X.)

ANCIENT HISTORY

I. THE BEGINNINGS OF ROME

The limestone ridges that border Latium contain numerous remains of stone age settlements, and one has even been found on Monte Mario within 3m. of the Vatican in the old volcanic stratum that borders the right bank of the Tiber. On the left bank, however, within the area that was in prehistoric times subject to rains of volcanic ash from the Alban craters there are very few traces of human habitation before the iron age.[1] Perhaps the activity of the volcanoes kept migrants from settling there during the bronze age. The oldest settlements so far discovered within this peculiar region seem to be those of the Alban hills, between Grotta Ferrata and Albano. Here several groups of cremating people belonging apparently to the so-called Villanova[2] (*q.v.*) branch of the Indo-Europeans came down from Tuscany and settled, about the end of the 2nd millennium B.C. In the early part of the 1st millennium they spread here and there over the Latin plain as far at least as Antium on the sea and the Palatine hill on the Tiber. In the primitive cemetery of the Forum 40 graves have so far been excavated. The deepest and earliest were cremation burials containing the same kind of pottery and personal ornaments as those of the Alban hills. Later, possibly in the 8th century, the rite of inhumation began to take the place of cremation here as on the Alban hills, at Antium, at Veii and at Falerii north of the Tiber. It is generally assumed that Sabine people from the central mountains were at this time pressing into Latium in large enough groups to become in several towns the dominating element. Whether further excavations will prove that this rite replaced cremation in all the primitive burial places at Rome is very doubtful. The fact that cremation again became the orthodox rite during the Roman republic would incline us to assume that cremation survived in some cemeteries that have not yet been discovered.

Early Institutions.—By the 7th century we may assume that

[1] Von Duhn, *Italische Gräberkunde*, 392 (1924); Antonielli, in *Bull. Palet. Ital.*, 161 (1924).

[2] Randall-MacIver, *Villanovans and Early Etruscans* (1925); *Iron Age in Italy* (1927).

the Palatine, the Capitoline, the Esquiline and the Quirinal hills had compact settlements of "Villanovan" and Sabine farmers and shepherds. These two groups were closely related in culture, language and religion. Philology proves that the bearers of the Latin language (probably the cremating group) and those who spoke the Sabellic dialects had not been separated very many centuries, and that they had been one people before entering Italy over the Alps. Several of their deities—Jupiter, Mars, Juno, Minerva and others—were also a common inheritance, and were worshipped by both peoples with rites that knew nothing of anthropomorphism. That it was a religion peculiarly adapted to an agricultural people we learn from the oldest calendar of festivals, which was drawn up before the Etruscans came to Rome. (W. Warde-Fowler, *The Religious Experience of the Roman People* [1911], 92.) Their political and social organizations were also of the same kind. The property-owning males constituted the "town-meeting" and the army. They elected the annual leaders (usually two "praetors" or "consuls") who summoned and conducted the meetings, held the elections and directed the army. The consuls must consult a smaller group of elders (senators), heads of important families, in all matters of public interest. Without the approval of the elders no proposal was put before the commons. For purposes of transacting business the commons of a town were usually divided into ten wards called *curiae*. That Rome had 30 instead of ten seems therefore to indicate that Rome was a union of three settlements already organized into regular polities before the city government was formed. In taking possession of the country, these people had settled in village groups, usually upon some hill which could be defended, and which gave access to a good spring of water or a stream. Most of the land near each village was apparently divided into private holdings, though it also seems probable that some land was left undivided for community grazing. Sacred land, used for the support of the cult, was also set apart at a very early period. These villages were independent and autonomous within the tribe. A tribal organization, however, existed, which supported a tribal cult on the Alban mount. This tribal organization was kept alive by an annual religious festival, and it had a presiding officer whose duty it was in time of danger to summon the forces of the different communities to common action. Since both the Villanovan and the Sabine communities shared in these democratic customs they coalesced readily in such a large tribal organization.

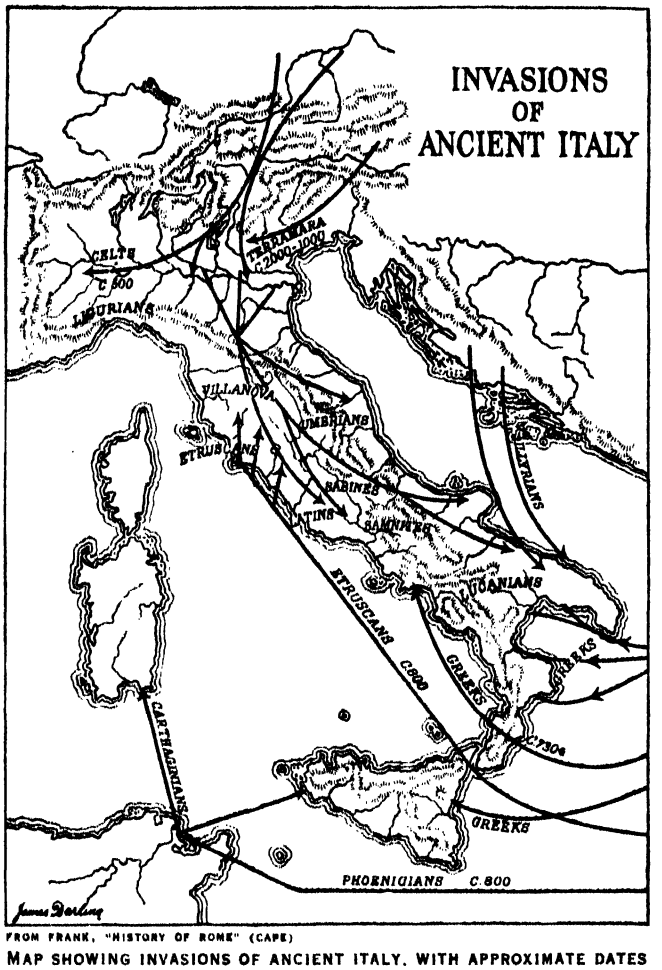
Finally both peoples long retained the institutions of a very strong patriarchal organization. Women, children and slaves were subject to the *potestas* of the family patriarch. He gave the members of his household in marriage, assigned the properties—there are but shadowy traces of clan-ownership, and testamentary rights are highly developed—and he, with his family council, meted out punishment for crimes committed within the family, and in the earlier day at least, directed the vendetta of the family against those who had committed a wrong against him or his. While the villages were still small, there were few opportunities for community action, whether judicial or legislative, so long as the patriarchal customs were respected.

City States.—At an early day these numerous communities belonging to a wide-spread tribe began to aggregate to a few favoured centres where cities grew up. Such cities soon overshadowed the villages and endangered the existence of the Latin tribal organizations. It is likely that raids from across the Tiber and from the Sabine and Volscian hills emptied the more exposed villages that could not well be fortified, drove the populace to more defensible villages, and in the case of places like Praeneste, strongly situated near the natural road between Etruria and Campania, trade of a lucrative kind also attracted settlers. It was in this way that some six city-states gradually grew up in Latium to take the place in each case of several villages. The growth of such cities in these circumstances naturally required stronger and more efficient governments, a better army organization, the building of walls or at least defensible earthen mounds with protecting pickets.

Kings.—At Rome the coalescing of three villages with their 30 curiae may date from the 8th century B.C. And here, since the threats of Etruscan raiders from Veii and Caere added much to the difficulty of governing communities that are not wholly homogeneous, elective princes holding office for life seem for a while to have displaced the customary annual magistrates. Tradition held that of these early princes Romulus (*q.v.*), Hostilius and Ancus Marcius were Latins, but that Titus Tatius (the prince of a Sabine group) and Numa Pompilius (*q.v.*) were Sabine in origin, while Tarquinius Priscus was said to be the son of a Corinthian adventurer who had first settled in Tarquinium and married an Etruscan woman, and Servius Tullius was an Etruscan chief by the name of Mastarna.

There is nothing unreasonable in this tradition, and since the art of writing was already known, the names may well have survived from early times on inscriptions of public buildings, treaties and tombs. The tradition regarding Servius Tullius was at least derived from Etruscan documents of an early date. (*See* the speech of the Emperor Claudius, Dessau, *Ins. Lat. Sel.*, 212.) History, however, need not take seriously the numerous legends preserved by Livy regarding the wars and deeds of these kings. Villages near Rome which naturally dwindled to insignificance under the attractive power of a neighbouring city left traces of themselves in abandoned walls; and picturesque legends grew up to account for their annihilation, but most of them had decayed several centuries before history was written.

Etruscan Kings.—The Etruscan (*see* ETRURIA) house of the Tarquins seems to be more tangible. Tradition places their rule in the latter half of the 6th century B.C., at a time in fact when we know that Etruscan princes were making conquests southward as far as Capua, when Etruscan art and Greek objects of art carried by Etruscans came into Rome as they did into Praeneste, Velitrae, Ardea, Satricum[1] and other Latin towns, when Rome received a stone ring-wall enclosing a remarkably large area and ceased to use the Forum cemetery for burial—since that now was included within the ring—and when Rome's rulers began to reach out for the control of the larger part of Latium.



The Etruscan adventurers, employing methods like those of the Normans who ruled the Sicilian cities in the 12th century, had come by sea to govern and exploit the unorganized communities of the Villanovans some two centuries before. Different families had secured control of most of the districts of Tuscany, had fortified their various cities, trained their subjects into effective armies as well as into obedient tenants and serfs, had developed farming by improved methods of planting, draining and irrigation, had exploited the copper and iron mines of Etruria and organized a flourishing industry in metal work with which they attracted Phoenician and Greek traders and had even entered actively into maritime commerce.[2]

Whether the Tarquins actually seized Rome by force or migrated to Rome and secured control by political devices we do not know. Under them Rome and Latium underwent very remarkable changes. An extensive wall[3] of almost 6m. was built to enclose an area that would readily house 200,000 inhabitants living in low small houses. There could hardly have been so many inhabitants when the enclosure was made; and indeed the walls, in order to make use of natural escarpments and to include outlying shrines, probably took in many undeveloped tracts. We cannot be sure that the regal wall extended as far out as the so-called Servian wall, despite the existence of very old remains in the gardens of the "Villa Spithoever." Tombs of the 4th century within the area seem to prove at least that the sacred *pomerium* did not extend so far, even if the fortifications did. Nevertheless the regal city was remarkably large when compared with other Italian cities, and its size points to a builder who was intent upon extensive projects of development. The Tarquins certainly opened the city to the currents of Mediterranean commerce now being attracted westward by Etruscan prosperity. Tradition plausibly holds that a port was used at the mouth of the Tiber as early as the 6th century; Greek and Etruscan articles came

[1] Della Seta, *Museo di Villa Giulia*, i., 235 (1918).
[2] D. Randall-MacIver, *The Etruscans* (1927).
[3] *Papers of the American Academy in Rome*, iii., 112 (1924).

to the city. Greek and Etruscan artisans were at work on the public buildings, and it is not unlikely that some of the industries that prospered in Etruria were enticed to Rome.

A strong army was also organized. Tradition attributes the regal army of nearly 20,000 men to Servius, who came from Etruria and doubtless employed the same methods as other Etruscan princes. Of these, 9,800 belonged to the "first class" of property holders, the rest to the other four classes; that is to say, all of the "first class" men were liable to army service, but

FROM FRANK, "HISTORY OF ROME" (CAPE)

MAP SHOWING INVASIONS OF ANCIENT ITALY, WITH APPROXIMATE DATES

only a diminishing proportion of the lower classes. In any modern industrial city where 10,000 males of military age constitute the highest 20% of taxpayers one would have to assume a population of at least 500,000 souls, or 100,000 male citizens; and that would be a very large population for a city with a rural territory of only about 500sq.m. (320,000ac.). It must, however, be remembered that in early Latium the proportion of property owners was large, that the Latin communities had consisted chiefly of famers practising hoe-culture to whom 5–10ac. would not only suffice for a family but would require all its energies for cultivation. In the rural area, at least, property was more evenly divided than would be the case in an industrial community to-day, so that the 9,800 soldiers of the first class need not imply as large a population as it might to-day. Considering the extent of the city walls and the intensive cultivation of the Latin soil, we may accept for the last years of the regal period the tradition of the army of 193 centuries (19,300 men), and conjecture an urban population of about 200,000 and a rural population of about the same size. That the Latin country was at that time intensively cultivated we may well believe, when we recall the long underground drainage channels which were driven through the tufa on the Alban slopes to carry off torrential rain waters in order to save the surface soil from erosion. Such expensive work of salvage would not have been undertaken unless land had been very much in demand and the population much more dense than in historical times.

The Etruscan princes were also vigorous conquerors, bent on extending their power throughout Latium. Tradition, reported by Livy and Dionysius, dwells long on their wars of conquest with Veii, Latin towns like Gabii, Aricia, Ardea and the Volscians as far as Tarracina. That this tradition happens to be fairly correct we may conclude from the facts that the region below Velitrae was particularly submitted to agricultural development (Frank, *Economic History of Rome,* 8 and 35, 2nd ed. 1927), that the colony of Cora existed at the founding of the first Latin league, and that the terms of the first treaty between Carthage and Rome, signed in 509, prove that the principality developed by Tarquin extended as far as Tarracina. This famous treaty recorded by Polybius (III. 22–3) is our oldest genuine document of Roman history. It was signed with the new republic of Rome immediately after the Etruscans had been banished and doubtless to a large extent reiterated the provisions of the previous treaty which the Tarquins had signed when in control of Rome. In the first sections it assumes that the free Romans would continue commerce on the seas to the extent that the Tarquins had, and it therefore makes an effort to safeguard the Punic trade monopoly at Punic ports. That proved to be a needless precaution, for the Romans abandoned the seas soon after they fell out of touch with Etruscan enterprise. A paragraph of the second part of the treaty reveals how far the ambitions of Etruscan Rome had advanced. It reads, "The Carthaginians shall do no injury to the people of Ardea, Antium, Laurentum, Circeii, Tarracina, nor any other people of the Latins that are subject to Rome. From those townships of Latium which are not subject to Rome they shall hold their hands; and if they shall take one they shall deliver it unharmed to the Romans." If, as seems to be the case, these clauses remain standing from Tarquin's last treaty with Carthage, they indicate that Tarquin had conquered at least the towns named, and that such towns as Pometia and Satricum, which are not mentioned, are considered within the sphere of Rome's natural interests, so that even if Carthage in some dispute should attack them she must deliver them to Rome. Needless to say the Roman republic which signed this treaty could not long entertain such ambitions, inherited for the time from Tarquin. Rome discovered within a few years that she had to release the Latins from subjection in order to win their support in her struggle with the returning Etruscans.

The terms of this treaty reveal how powerful Rome had become under the Tarquins and explain to us the resources that could pay for the building of a wall of 6m. and the power that could muster and employ an army of 20,000 men. They also help us to picture the resources that were expended in a very aggressive building programme. The temple to Jupiter which Tarquin nearly completed on the Capitoline hill stood on a lofty stylobate more than 20ft. high and measured about 200ft. x 185ft. None of the flourishing Etruscan cities with all their commercial prosperity had any temple comparable to this. Tarquin also moved the Diana cult from Aricia to Rome so as to make Rome the religious centre of the Latin communities of the Alban hills, and to Diana he built a famous temple on the Aventine. To the Etruscan period are also attributed several Fortuna temples—since soothsaying was particularly in favour with the Etruscans. Then in the first years of the republic there were built several temples begun by the Tarquins or vowed in the vigorous spirit of enterprise that the Tarquins had instilled; the large temple of Saturn below the Capitoline, the temple of Mercury—the god of commerce—behind the Palatine, the temple of Ceres nearby, and the splendid temple of Castor in the Forum. Not till two centuries later did the republic spend so much energy and money in public buildings, for with the expulsion of the Etruscans Rome became again a rural market place.

The effects of the Etruscan régime were widespread, though it apparently did not last more than about a century—if we are right in dating the last of the Forum burials about 600 B.C. In the Etruscan Government the senate had been retained, though virtually stripped of power, and the assembly was probably never

summoned by the last Tarquin. A large industrial class must have come into existence in the city in the regal period, for even though the walls were raised by forced citizen-labour as tradition held, the increase in trade at the Roman market, the manufacture of the elaborate decorations for the new buildings, the service of a luxurious court, the provisioning and equipping of a large army would require much skilled labour. In some of the regions of Latium taken by force it is probable that the natives were reduced to serfdom as had been the custom in various parts of Etruria. The long and expensive drainage canals that are found between the Alban hills and the sea are not explicable in a system of small free farmers. In that region at least there must have been one or more strong lords who commanded much labour and capital. Whether the prince retained the land as a royal domain or assigned it as fiefs to favourites we have no means of knowing, and we must also admit that no conclusive evidence survived in Roman custom of the servile system which is frequently posited for this period.

This foreign régime also accounts for certain changes in rites, customs and institutions that were more or less lasting. The Etruscans had usually accepted the Italic deities from their subjects, but having come from the East and imbued with anthropomorphic conceptions they made representations of these deities in bronze or terra-cotta and built temples for them. Since such representations were usually derived from figures of Greek gods this process not only localized and gave human form to the Italic deities, but syncretized them with definite Greek gods regarding whom there existed a mythology. In this respect therefore the intervention of the Etruscans completely revolutionized the ideas of the younger generation of Romans. The Etruscans also lent their influence to the growing custom of inhuming the dead, and, for a while at least, to the interment of costly adornments with the body. Since the Etruscan burial rites—brought from Asia—were definitely connected with beliefs of the survival of the *genius* in a state of happiness or suffering, the Italic ideas of future existence were thus permanently altered, even though the Republican Government when restored tried to abolish funeral adornments and encourage a return to the Italic burial customs. That the Latin language was not displaced at Rome even in official regal inscriptions is proved by the survival of the famous "stele" of the forum, which is written in Latin though on an Etruscan stone and containing a reference to the king.

Expulsion of the King.—Near the end of the 6th century the Etruscan usurpers were ejected and a republican government formed with a restoration of annual elective magistrates, an advisory senate of nobles and a timocratic popular assembly. The traditional date is 509 B.C., but since the chronology adopted by later writers is a reconstruction from consular lists and from the marks made every year on the doorposts of the Capitoline temple, and since a discrepancy of a few years existed between these two records, we must not insist upon exact dates. Livy attributes the revolt against the Tarquins to a general objection to forced labour on public buildings and in the last instance to the wrong done to Lucretia by a son of the king. That tradition should have kept an accurate and adequate explanation of causes for several hundred years is not plausible, but in view of the evidence of archaeology and of institutional survivals we cannot doubt that Etruscan princes held Rome for a while and that they were ejected with a restoration of native rule.

II. THE REPUBLIC

Period A: 509–265 B.C.—(*a*) **The Struggle Between the Orders.**—The Tarquins apparently did not at once acquiesce in the results of the revolution. Securing the aid of friends in Etruscan cities and also in some Latin towns like Tusculum, still held by friendly princes, they attacked Rome again and again. An Etruscan tradition mentions a temporary victory by Lars Porsenna of Clusium by which he was able to disarm Rome for a while; and as late as 499 there was a famous battle at Lake Regillus in which the Romans won a decisive victory over Etruscan and some Latin forces, and the general on that occasion vowed the temple to Castor in recognition of aid received from Greek cavalry. Rome also had trouble with the Latin cities, for the new Government attempted to take over the hegemony of the Latin towns that had been subjected by the Tarquins, while these Latin towns also wished a restoration of independence. Rome's wars with the Etruscans made it impossible to enforce her claims over the Latins, and consequently she had to come to terms with them. The independent league of Latin towns[1] consisting of Tibur, Tusculum, Aricia, Lanuvium, Ardea, Pometia and Cora, formed in order to resist Rome's pretensions, soon (*c.* 493) entered into a defensive alliance with her (the *foedus Cassianum*), and this new league made enough progress at once so that Signia and Norba were settled as common Latin colonies. But the Volscian towns of Antium, Satricum, Velitrae and Tarracina fell away from Latin connections.

The Government.—The new Government of Rome was more nearly an aristocracy than the old native Italic Governments. During the regal period with its great prosperity, its immigration of labourers, its partial imposition of serfdom, and grants of fiefs and privileges, class distinctions had come into existence. The favoured elders, selected by position, influence and favour for seats in the senate, were now considered a caste apart from the rest and they and their descendants were called patricians (*q.v.*). Since this group seems to have led the revolution and formed the new Government it is not strange that they imposed the requirements that patricians alone could hold the magistracies and priesthoods and interpret the laws, and that no resolution of the popular assembly should be binding unless ratified by the patrician senators. And when the more influential of the plebeians were enrolled as senators these *conscripti* apparently were not allowed to participate in the ratification of laws. Economic changes added to the disagreement between the classes. With the departure of the king and his court Rome fell out of the current of sea-going commerce, if we may judge from the evidence of excavations. For a while also trade relations with Etruria were cut off. Building construction which had flourished also soon came to an end. Furthermore when Rome had to surrender her hegemony not only over the Volscians of southern Latium but also over all the towns of central Latium, the profits that had flowed into the city from those regions ceased. There must have been much poverty and a large number of unemployed. And since the laws still permitted imprisonment and under certain conditions enslavement for debts, there arose among the poorer plebeians a demand for political rights with which to win some relief from economic distress. There were still in the vicinity several primitive Latin villages with their old town meetings which reminded the Romans of the old democratic government that had existed before the Etruscan invasion.

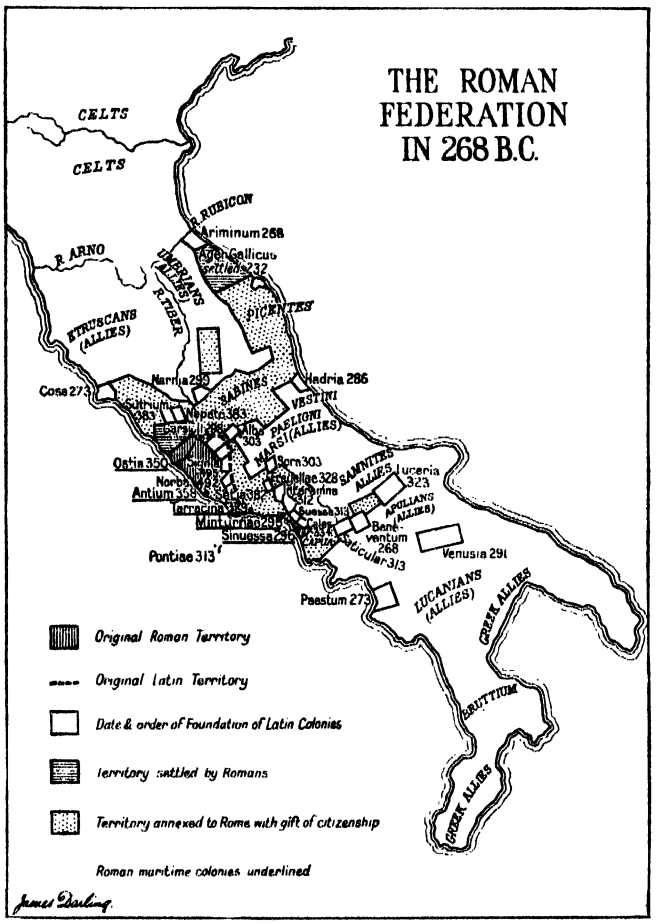
In the domain of external politics the 5th century was largely devoted to a reconquest by the league of the parts of Latium which were lost to the Volsci and Aequi during the distressing years of warfare with the Etruscans. In internal politics the plebeians made some progress during the century in their battle for recognition. What the plebeians first asked for was the right to elect advocates (tribunes of the people) who should have the right to prevent arbitrary arrest, and to speak for them in court when arrested. This seems to have been an attempt to find a remedy against harsh debtor-laws, and a substitute for the king who had listened to such appeals. The historians say that the plebeians were not granted this request until they had seceded to Mons Sacer when called upon for service against the Volsci. The fact that the privilege was granted by a sacred agreement which also invoked a curse upon any who impeded a tribune in the performance of his duty gives evidence that the measure rested upon a solemnly sworn compact between the orders. The story of the political strike is therefore plausible. There may at first have been four tribunes, one for each city tribe; but before the time of the decemvirs there were ten, and this remained henceforth the standing number.

It would be difficult to find a parallel to the tribunate anywhere. The tribune never became, strictly speaking, a magistrate of the Roman people. His one prerogative in the early day was

[1] Rosenberg, in *Hermes*, 159 (1919).

to protect individual plebeians against summary arrest by patrician officials and he must exercise this function in person and within the city. That he was sacrosanct and absolutely protected in the performance of his duty clearly points to the intention that in this one function he was to be as efficient a protector of the oppressed individual as the absolute monarch had been. Such powers could hardly be kept from abuse, and in time the tribunes became powerful individuals who could intervene in almost any department of state.

Since the tribunes were elected annually by the plebeians it was only natural that the plebeian assembly—which met by local groups or tribes—might remain to discuss policies and instruct the tribunes by resolution. In 471, if Livy is correct, a law was passed (the lex Publilia) which recognized the plebeian tribal assemblies as lawful, and authorized the tribunes to propose and carry resolutions in such assemblies. These resolutions (plebiscites) had of course only such force as plebeian influence gave them, but the time was to come when the plebeians were the most powerful element of the state, and when the law-making body dared not long resist the demands of plebiscites.



The Twelve Tables.—The plebeians now had advocates in court, but the tribunes were hampered by the fact that court judgments were rendered according to unwritten custom preserved from father to son within a narrow group of learned patricians. It therefore became apparent that the customary law must be codified and posted. After many years of discussion a law was passed substituting for the while a board of ten patricians in place of the two consuls and authorizing this board of ten to frame and publish a code of laws to be binding upon all. The *decemviri* worked on this code in 451 and 450, when it was inscribed and posted in the Forum. These "XII. tables" were in no sense a reform or a liberalizing of old custom. They recognized the prerogatives of the patrician caste and of the patriarchal family, the validity of enslavement for unpaid debt and the interference of religious custom in civil cases. That they reveal a remarkable liberality for their time in respect to testamentary rights and to contracts is probably not due to any alteration brought in by the *decemviri*, but rather to the progress that had been made in commercial customs in the Roman Forum in the days of prosperity and vigorous trade. The gist of this code has survived in quotations and is now the historian's safest index of the state of Rome's culture in the 5th century. (T. F.)

Constitutional Changes.—The *decemviri*, who had incurred much opposition because of their autocratic administration of Rome, were deposed at the demand of the plebeians who seceded to the Janiculan Hill and made a formal demand that the former Government be restored. The assemblies accordingly met and elected consuls and tribunes again. But the plebeian assembly went farther and demanded certain reforms in the constitution. These demands were embodied in the very important Valerio-Horatian laws passed by the popular (centuriate) assembly in 449. These laws granted or reaffirmed the inviolability of the tribunes, the right of every citizen to carry his appeal to the assembly in cases of death sentences, and finally enacted that plebiscites passed by the plebeian assembly should be placed before the senate and if ratified by the *patres* should be recognized as law. Only a few years after the Valerio-Horatian legislation came the *lex Canuleia*, itself a *plebiscitum* (445 B.C.), by which mixed marriages between patricians and plebeians were declared lawful, and the social exclusiveness of the patriciate broken down. In the same year with this measure, and like it in the interests primarily of the wealthier plebeians, a vigorous attack commenced on the patrician monopoly of the consulate, and round this stronghold of patrician ascendancy the conflict raged until the passing of the Licinian laws in 367. The original proposal of the tribune Gaius Canuleius, in 445, that the people should be allowed to elect a plebeian consul was evaded by a compromise. The senate resolved that for the next year, in the stead of consuls, six military tribunes with consular powers should be elected, and that the new office should be open to patricians and plebeians alike. The consulship was thus for the time saved from pollution, as the patricians phrased it, but the growing strength of the *plebs* is shown by the fact that in 50 years out of the 78 between 444 and 366 they succeeded in obtaining the election of consular tribunes rather than of consuls. Despite, however, these discouragements, the patricians fought on. Each year they strove to secure the creation of consuls rather than consular tribunes, and failing this strained every nerve to secure for their own order at least a majority among the latter. Even the institution of the censorship (435), though rendered desirable by the increasing importance and complexity of the census, was, it is probable, due in part to their desire to discount beforehand the threatened loss of the consulship by diminishing its powers. Other causes, too, helped to protract the struggle. Between the wealthier plebeians, who were ambitious of high office and the poorer, whose minds were set rather on allotments of land recently taken from Veii, there was a division of interest of which the patricians were not slow to take advantage, and to this must be added the pressure of war. The death struggle with Veii and the sack of Rome by the Gauls absorbed for the time all the energies of the community. In 377, however, two of the tribunes, G. Licinius Stolo (*see* LICINIUS STOLO, GAIUS) and L. Sextius, came forward with proposals which united all sections of the *plebs* in their support. Their proposals were as follows: (1) that consuls and not consular tribunes be elected; (2) that one consul at least should be a plebeian; (3) that the priestly college, which had the charge of the Sibylline books, should consist of ten members instead of two, and that of these half should be plebeians; (4) that no single citizen should hold in occupation more than 500ac. of the common lands, or pasture upon them more than 100 head of cattle and 500 sheep; (5) that interest already paid on debts should be deducted from the principal, and the remainder paid off in three years. The last two proposals were obviously intended to meet the demands of the poorer plebeians, and to secure their support for the first half of the scheme. Ten years of bitter conflict followed, but at last, in 367 B.C., the Licinian rogations became law, and one of their authors, L. Sextius, was created the first plebeian consul. For the moment it was some consolation to the patricians that they not only succeeded in detaching from the consulship the administration of civil law, which was entrusted to a separate officer, *praetor urbanus*, to be elected by the *comitia* of the centuries, with an understanding apparently that he should be a patrician, but also obtained the institution of two additional aediles (*aediles curules*), who were in like manner to be members of their own order. With the opening of the consulship, however, the issue of the long contest was virtually decided, and the next 80 years witnessed a rapid succession of plebeian victories. Now that a plebeian consul might preside at the elections, the main difficulty in the way of the nomination and election of plebeian candidates was removed. The proposed patrician monopoly of the new curule aedileship was almost instantly abandoned. In 356 the first plebeian was made dictator; in 350 the censorship, and in 337 the praetorship was filled for the first time by plebeians; and lastly, in 300, by the *lex Ogulnia*, even the sacred colleges of the pontiffs and augurs, the old strongholds of patrician supremacy, were thrown open to the *plebs*. The patricians lost also the control they had exercised so long over the action of the people in assembly. The *patrum auctoritas*, the sanction given or refused by the patrician senators to laws and to elections, had hitherto been a powerful weapon in their hands. But in 339 a law of Q. Publilius Philo, a plebeian dictator, enacted that this sanction should be given beforehand to laws enacted in the *comitia centuriata*, and a *lex Maenia* of uncertain date extended the rule to elections in the same assembly. Henceforward the *patrum auctoritas* sank into a meaningless form, though as such it still survived in the time of Livy. From 287 onwards it is certain that measures passed by the *plebs*, voting by their tribes, had the full force of laws without any further conditions whatsoever. The legislative independence of the plebeian assembly was secured, and with this crowning victory ended the long struggle between the orders.

(*b*) **Conquest of Italy.**—Twelve years after the passing of the *lex Hortensia*, King Pyrrhus, beaten at Beneventum, withdrew from Italy, and Rome was left mistress of the peninsula.

The steps by which this supremacy had been won have now to be traced.

The expulsion of the Tarquins from Rome, followed as it seems to have been by the emancipation from Etruscan supremacy of all the country between the Tiber and the Liris, entirely altered the aspect of affairs. North of the Tiber the powerful Etruscan city of Veii, after a vain attempt to restore the Tarquins, relapsed into an attitude of sullen hostility towards Rome, which, down to the outbreak of the final struggle in 407, found vent in constant and harassing border forays. The Sabines recommenced their raids across the Anio; from their hills to the south-east the Aequi pressed forward as far as the eastern spurs of the Alban range, and ravaged the low country between that range and the Sabine mountains; the Volsci overran the coast-lands as far as Antium, established themselves at Velitrae and even wasted the fields within a few miles of Rome. But the good fortune of Rome did not leave her to face these foes single-handed, and it is a significant fact that the history of the Roman advance begins, not with a brilliant victory, but with a timely alliance. According to Livy, it was in 493, only a few years after the defeat of the prince of Tusculum at Lake Regillus, that a treaty was concluded between Rome and the Latin communities of the Campagna. The alliance was in every respect natural. The Latins were the near neighbours

FROM FRANK, "HISTORY OF ROME" (CAPE)

MAP SHOWING GROWTH OF THE ROMAN FEDERATION UP TO 268 B.C.

and kinsmen of the Romans, and both Romans and Latins were just freed from Etruscan rule to find themselves as lowlanders and dwellers in towns face to face with a common foe in the ruder hill tribes on their borders. The exact terms of the treaty cannot, any more than the precise circumstances under which it was concluded, be stated with certainty (*see* LATIUM), but two points seem clear. There was at first a genuine equality in the relations between the allies; Romans and Latins, though combining for defence and offence, did so without sacrificing their separate freedom of action, even in the matter of waging wars independently of each other. But, secondly, Rome enjoyed from the first one inestimable advantage. The Latins lay between her and the most active of her foes, the Aequi and Volsci, and served to protect her territories at the expense of their own. Behind this barrier Rome grew strong, and the close of the Aequian and Volscian wars left the Latins her dependents rather than her allies. Beyond the limits of the Campagna Rome found a second ally, hardly less useful than the Latins, in the tribe of the Hernici, in the valley of the Trerus, who had equal reason with the Romans and Latins to dread the Volsci and Aequi, while their position midway between the two latter peoples made them valuable auxiliaries to the lowlanders of the Campagna.

Capture of Veii.—During the period 449–390 there is an unmistakable development of Roman power on all sides. In southern Etruria the capture of Veii (396) virtually gave Rome the mastery as far as the Ciminian forest. Sutrium and Nepete, "the gates of Etruria," became her allies and guarded her interests against any attack from the Etruscan communities to the north, while along the Tiber valley her suzerainty was acknowledged as far as Capena and Falerii. On the Anio frontier we hear of no disturbances from 449 until some ten years after the sack of Rome by the Gauls. In 446 the Aequi appear for the last time before the gates of Rome. After 418 they disappear from Mt. Algidus, and in the same year the communications of Rome and Latium with the Hernici in the Trerus valley were secured by the capture and colonization of Labicum. Successive invasions, too, broke the strength of the Volsci, and in 393 a Latin colony was founded as far south as Circeii. In part, no doubt, these Roman successes were due to the improved condition of affairs in Rome itself, consequent upon the great reforms carried between 450 and 442; but it is equally certain that now, as often afterwards, fortune befriended Rome by weakening, or by diverting the attention of, her opponents. In particular, her rapid advance in southern Etruria was facilitated by the heavy blows inflicted upon the Etruscans during the 5th century B.C. by Celts, Greeks and Samnites. By the close of this century the Celts had expelled them from the rich plains of what was afterwards known as Cisalpine Gaul, and were even threatening to advance across the Apennines into Etruria proper. The Sicilian Greeks, headed by the tyrants of Syracuse, wrested from them their mastery of the seas, and finally, on the capture of Capua by the Samnites in 423, they lost their possessions in the fertile Campanian plain. These conquests of the Samnites were part of a great southward movement of the highland Sabellian peoples.

Sack of Rome by the Gauls.—But in 390, or more probably 389, the Roman advance was for a moment checked by a disaster which threatened to alter the course of history in Italy, and which left a lasting impress on the Roman mind. In 391 a Celtic horde left their newly won lands on the Adriatic, and, crossing the Apennines into Etruria, laid siege to the Etruscan city of Clusium (Chiusi). Thence, provoked, it is said, by the conduct of the Roman ambassadors, who, forgetting their sacred character, had fought in the ranks of Clusium and slain a Celtic chief, the barbarians marched upon Rome. On July 18, 390 B.C., only a few miles from Rome, was fought the disastrous battle of the Allia. The defeat of the Romans was complete, and Rome lay at the mercy of her foe. But in characteristic fashion the Celts halted three days to enjoy the fruits of victory, and time was thus given to put the Capitol at least in a state of defence. The arrival of the barbarians was followed by the sack of the city, but the Capitol remained impregnable. For seven months they besieged it, and then in as sudden a fashion as they had come they disappeared. The Roman chroniclers explain their retreat in their own way, by the fortunate appearance of M. Furius Camillus with the troops which he had collected, at the very moment when famine had forced the garrison on the Capitol to accept terms. More probably the news that their lands across the Apennines were threatened by the Veneti, coupled with the unaccustomed tedium of a long siege and the difficulty of obtaining supplies, inclined the Celts to accept readily a heavy ransom as the price of their withdrawal. But, whatever the reason, it is certain that they retreated, and, though during the next 50 years marauding

bands appeared at intervals in the neighbourhood of Rome, and even once penetrated as far south as Campania (361–360), the Celts never obtained any footing in Italy outside the plains in the north which they had made their own.

Annexation of Southern Etruria.—Nor, in spite of the defeat on the Allia and the sack of the city, was Rome weakened except for the moment by the Celtic attack. The storm passed away as rapidly as it had come on. The city was hastily rebuilt, and Rome dismayed the enemies who hastened to take advantage of her misfortunes by her undiminished vigour. Her conquests in southern Etruria were successfully defended against repeated attacks from the Etruscans to the north. The creation in 387 of four new tribes (Stellatina, Sabatina, Tromentina and Arnensis) marked the final annexation of the territory of Veii and of the lands lying along the Tiber valley. The addition of these tribes, containing Roman settlers as well as Veientines, increased the number and influence of the plebeian group. A few years later Latin colonies were established at Sutrium and Nepete for the more effectual defence of the frontier, and finally, in 353, Caere (*q.v.*) signed a treaty of peace for 100 years[1].

Next to the settlement of southern Etruria, the most important of the successes gained by Rome between 390 B.C. and 343 B.C. were those won against her old foes the Aequi and Volsci, and her old allies the Latins and Hernicans. The Aequi indeed, already weakened by their long feud with Rome, and hard pressed by the Sabellian tribes in their rear, were easily dealt with, and after the campaign of 389 we have no further mention of an Aequian war until the last Aequian rising in 304. The Volsci, who in 389 had advanced to Lanuvium, were met and utterly defeated by Camillus, the conqueror of Veii, and this victory was followed up by the gradual subjugation to Rome of all the lowland country lying between the hills and the sea as far south as Tarracina. Latin colonies were established at Satricum (385), at Setia (379), and at Antium and Tarracina some time before 348. In 358 two fresh Roman tribes (Pomptina and Publilia) were formed in the same district.

Reorganization of the Latin League.—Rome had now nothing more to fear from the foes who a century ago had threatened her very existence. The lowland country, of which she was the natural centre, from the Ciminian forest to Tarracina, was quiet, and within its limits Rome was by far the strongest power. But she had now to reckon with the old and faithful allies to whose loyal aid her present position was largely due. The Latini and Hernici had suffered severely in the Aequian and Volscian wars; it is probable that not a few of the smaller communities included in the league had either been destroyed or been absorbed by larger states, and the independence of all alike was threatened by the growing power of Rome. The sack of Rome by the Celts gave them an opportunity of reasserting their independence, and we are consequently told that this disaster was immediately followed by the temporary dissolution of the confederacy, and this again a few years later by a series of actual conflicts between Rome and her former allies. Between 383 and 358 we hear of wars with Tibur, Praeneste, Tusculum, Lanuvium, Circeii and the Hernici. But in all Rome was successful. In 382 Tusculum was fully incorporated with the Roman state by the bestowal of the full franchise; in 358, according to Livy and Polybius, the old alliance was formally renewed with the Latini and the Hernici. We cannot, however, be wrong in assuming that the position of the allies under the new league was far inferior to that accorded them by the treaty of Spurius Cassius. Henceforth they were the subjects rather than the equals of Rome, a position which it is evident that they accepted much against their will, and from which they were yet to make one last effort to escape.

First Samnite War.—Rome had won her supremacy from the Ciminian forest to the Liris as the champion of the comparatively civilized communities of the lowlands against the rude highland tribes which threatened to overrun them, and so, when her legions first crossed the Liris, it was in answer to an appeal from a lowland city against invaders from the hills. While she was engaged in clearing Latium of Volsci and Aequi, the Sabellian tribes of the central Apennines had rapidly spread over the southern half of the peninsula. Foremost among these tribes were the Samnites, a portion of whom had captured the Etruscan city of Capua in 423, the Greek Cumae in 420, and had since then ruled as masters over the fertile Campanian territory. But in their new homes the conquerors soon lost all sense of relationship and sympathy with their highland brethren. They dwelt in cities, amassed wealth, and inherited the civilization of the Greeks and Etruscans whom they had dispossessed; above all, they had before long to defend themselves in their turn against the attacks of their ruder kinsmen from the hills, and it was for aid against these that the Samnites of Campania appealed to the rising state which had already made herself known as the bulwark of the lowlands north of the Liris, and which with her Latin and Hernican allies had scarcely less interest than the Campanian cities themselves in checking the raids of the highland Samnite tribes.

The Campanian appeal was listened to. Rome with her confederates entered into alliance with Capua and the neighbouring Campanian towns, and war was formally declared (343) against the Samnites. While to the Latins and Hernicans was entrusted apparently the defence of Latium and the Hernican valley against the northerly members of the Samnite confederacy; the Romans themselves undertook the task of driving the invaders out of Campania. After two campaigns the war was ended in 341 by a treaty, and the Samnites withdrew from the lowlands, leaving Rome the recognized suzerain of the Campanian cities which had sought her aid.

The Latin War.—There is no doubt that the check thus given by Rome to the advance of the hitherto invincible Sabellian highlanders not only made her the natural head and champion of the low countries, south as well as north of the Liris, but also considerably added to her prestige. Carthage sent her congratulations, and the Etruscan city of Falerii voluntarily enrolled herself among the allies of Rome. Of even greater service, however, was the fact that for 15 years the Samnites remained quiet, for this inactivity, whatever its cause, enabled Rome triumphantly to surmount a danger which theatened for the moment to wreck her whole position. This danger was nothing less than a desperate effort on the part of nearly all her allies and dependents south of the Tiber to throw off the yoke of her supremacy. The way was led by her ancient confederates the Latini, whose smouldering discontent brok into open flame directly the fear of a Samnite attack was removed. From the Latin Campagna and the Sabine hills the revolt spread westwards and southwards to Antium and Tarracina, and even to the towns of the Campanian plain, where the mass of the inhabitants at once repudiated the alliance formed with Rome by the ruling class. The struggle was sharp but short. In two pitched battles the strength of the insurrection was broken, and two more campaigns sufficed for the complete reduction of such of the insurgent communities as still held out. The revolt crushed, Rome set herself deliberately to the task of re-establishing on a new and firmer basis her supremacy over the lowlands, and in doing so laid the foundations of that marvellous organization which was destined to spread rapidly over Italy, and to withstand the attacks even of Hannibal. The old historic Latin league ceased to exist, though its memory was still preserved by the yearly Latin festival on the Alban Mount. Most if not all of the common land of the league became Roman territory; five at least of the old Latin cities were compelled to accept the Roman franchise (Livy viii. 14; Lanuvium, Aricia, Nomentum, Pedum and Tusculum) and enter the pale of the Roman State. The rest, with the Latin colonies, were ranked as Latin allies of Rome, but on terms which secured their complete dependence upon the sovereign city. The policy of isolation, which became so cardinal a principle of Roman rule, was now first systematically applied. No rights of *conubium* or *commercium* were any longer to exist between these communities. Their federal councils were prohibited, and all federal action independent of Rome forbidden.

In Campania and the coast-lands connecting Campania with Rome, a policy of annexation was considered safer than that of alliance. Of the two frontier posts of the Volsci, Antium and

[1] For the status of Caere, see *Klio* xi., 377.

Velitrae, the former was constituted a Roman colony, its long galleys burnt and their prows set up in the Forum at Rome, while the walls of Velitrae were razed to the ground, its leading men banished beyond the Tiber, and their lands given to Roman settlers. Farther south on the route to Campania, Fundi and Formiae were, after the precedent set in the case of Caere, declared Roman and granted the civil rights of Roman citizenship, while lastly in Campania itself the same status was given to Capua, Cumae and the smaller communities dependent upon them[1]. During the ten years from 338 to 328 the work of settlement was steadily continued. Tarracina, like Antium, was made a Roman colony. Privernum, the last Volscian town to offer resistance to Rome, was subdued in 330, part of its territory allotted to Roman citizens, and the state itself forced to accept the Roman franchise. Lastly, to strengthen the lines of defence against the Sabellian tribes, two colonies with the rights of Latin allies were established at Cales (334) and at Fregellae (328). The settlement of the lowlands was accomplished. As a single powerful and compact state with an outer circle of closely dependent allies, Rome now stood in sharp contrast with the disunited and degenerate cities of northern Etruria, the loosely organized tribes of the Apennines, and the decaying and disorderly Greek towns of the south.

Second Samnite War.—The strength of this system was now to be tried by a struggle with the one Italian people who were still ready and able to contest with Rome the supremacy of the peninsula. The passive attitude of the Samnites between 342 and 327 was no doubt largely due to the dangers which had suddenly threatened them in South Italy. But the death of Alexander of Epirus, in 332, removed their only formidable opponent there, and left them free to turn their attention to the necessity of checking the steady advance of Rome. In 327, the year after the ominous foundation of a Roman colony at Fregellae, a pretext for renewing the struggle was offered them. The Cumaean colony of Palaepolis had incurred the wrath of Rome by its raids into her territory in Campania. The Samnites sent a force to defend it, and Rome replied by a declaration of war. The two opponents were not at first sight unequally matched, and had the Sabellian tribes held firmly together the issue of the struggle might have been different. As it was, however, the Lucanians to the south actually joined Rome from the first, while the northern clans, Marsi, Vestini, Paeligni and Frentani, after a feeble and lukewarm resistance, subsided into a neutrality which was exchanged in 304 for a formal alliance with Rome. An even greater advantage to Rome from the outset was the enmity existing between the Samnites and the Apulians, the latter of whom from the first joined Rome and thus gave her a position in the rear of her enemy and in a country eminently well fitted for maintaining a large military force. These weaknesses on the Samnite side were amply illustrated by the events of the war.

After several years of partial success, the Romans were thoroughly defeated at Caudine Forks (321) and, in order to save their captured army, were compelled to sign a dishonourable treaty of peace. Rome, however, continued to strengthen her connections with the Lucanians and Apulians, settling a Latin colony at Luceria (320), and to draw the net of alliances more closely by winning over the Vestini and Frentani, north and east of Samnium. The Samnites accordingly, finding that peace was more dangerous than war, renewed hostilities in 316, by making a series of desperate efforts to break through the lines of defence which protected Latium and Campania. Sora and Fregellae on the upper Liris were captured by a sudden attack; the Ausones in the low country near the mouth of the same river were encouraged to revolt by the appearance of the Samnite army; and in Campania another army, attracted by rumours of disturbance, all but defeated the Roman consuls under the very walls of Capua. But these efforts were unavailing. Sora and Fregellae were recovered as quickly as they had been lost, and the frontier there was strengthened by the establishment of a colony at Interamna. The Ausones were punished by the confiscation of their territory, and Roman supremacy further secured by the two colonies of Suessa and Pontia (312). The construction of the famous Via Appia, the work of the censor Appius Claudius Caecus, opened a safe and direct route to Campania, while the capture of Nola deprived the Samnites of their last important stronghold in the Campanian lowlands. The failure of these attempts broke the courage even of the Samnites. Their hopes were indeed raised for a moment by the news that Etruria had risen against Rome (310), but their daring scheme of effecting a union with the Etruscans was frustrated by the energy of the Roman generals. Five years later (305) the Romans revenged a Samnite raid into Campania by an invasion of Samnium itself. Arpinum on the frontier was taken, and at last, after a 22 years' struggle, the second Samnite War was closed by a renewal of the ancient treaty with Rome (304).

The six years of peace which followed (304–298) were employed by Rome in still further strengthening her position. Already, two years before the peace, a rash revolt of the Hernici had given Rome a pretext for finally annexing the territory of her ancient allies. The tribal confederacy was broken up, and all the Hernican communities, with the exception of three which had not joined the revolt, were incorporated with the Roman State as municipia, with the civil rights of the Roman franchise. Between the Hernican valley and the frontiers of the nearest Sabellian tribes lay what remained of the once formidable people of the Aequi. In their case, too, a revolt (304) was followed by the annexation of their territory, which was marked in this case by the formation there (301) of two Roman tribes (Aniensis and Teretina). Not content with thus carrying the borders of their own territory up to the very frontiers of the Sabellian country, Rome succeeded (304) in finally detaching from the Sabellian confederacy all the tribes lying between the north-east frontier of Latium and the Adriatic sea. Henceforward the Marsi, Paeligni, Vestini, Marrucini and Frentani were enrolled among the allies of Rome, and not only swelled her forces in the field but interposed a useful barrier between her enemies to the north in Etruria and Umbria and those to the south in Samnium, while they connected her directly with the friendly Apulians. Lastly, as a security for the fidelity at least of the nearest of these allies, colonies were planted in the Marsian territories at Alba Fucentia (303) and at Carsioli (298). A significant indication of the widening range of Rome's influence in Italy, and of the new responsibilities rapidly pressing upon her, is the fact that when in 302 the Spartan Cleonymus landed in the territory of the Sallentini, far away in the south-east, he was met and repulsed by an Italic and Roman force.

Third Samnite War.—Six years after the conclusion of the treaty which ended the second Samnite War, news arrived that the Samnites were harassing the Lucanians. Rome at once interfered to protect her allies. Samnium was invaded in force, the country ravaged and one stronghold after another captured. Unable any longer to hold their own in a position where they were hedged round by enemies, the Samnite leaders turned as a last hope to the communities of northern Etruria, to the free tribes of Umbria and to the once dreaded Celts. With a splendid daring they formed the scheme of uniting all these people with themselves in a last desperate effort to break the power of Rome.

For some 40 years after the final annexation of southern Etruria (351 B.C.) matters had remained unchanged in that quarter. Sutrium and Nepete still guarded the Roman frontier; the natural boundary of the Ciminian forest was still intact; and up the valley of the Tiber, Rome had not advanced beyond Falerii, a few miles short of the most southerly Umbrian town Ocriculum. But in 311, on the expiry, apparently, of the long truce with Rome, concluded in 351, the northern Etruscans, alarmed no doubt by the rapid advances which Rome was making farther south, rose in arms and attacked Sutrium. The attack, however, recoiled disastrously upon the heads of the assailants. A Roman force promptly relieved Sutrium, and its leader, Q. Fabius Rullianus, without awaiting orders from home, boldly plunged

[1] For the controversy as to the precise status of Capua and the "equites Campani" (Livy viii. 14), *see* Beloch, *Ital. Bund*, 122 seq.; *idem*, *Campanien*, 317; Mommsen, *Staatsr.* iii. 574; Frank, *Roman Imperialism*, 41.

into the wilds of the Ciminian forest, and crossing them safely swept with fire and sword over the rich lands to the north. Then turning southwards he met and utterly defeated the forces which the Etruscans had hastily raised in the hopes of intercepting him at the Vadimonian lake. This decisive victory ended the war. The Etruscan cities, disunited among themselves, and enervated by long years of peace, abandoned the struggle for the time, paid a heavy indemnity and concluded a truce with Rome (309–08). In the same year the promptitude of Fabius easily averted a threatened attack by the Umbrians, but Rome proceeded nevertheless to fortify herself in her invariable fashion against future dangers on this side, by an alliance with Ocriculum, which was followed ten years later (299) by a colony at Narnia, and an alliance with the Picentes, whose position in the rear of Umbria rendered them as valuable to Rome as the Apulians had proved farther south.

Fourteen years had passed since the battle on the Vadimonian lake, when the Samnites appeared on the borders of Etruria and called on the peoples of northern Italy to rise against the common enemy. Their appeal, backed by the presence of their troops, was successful. The Etruscans found courage to face the Roman legions once more; a few of the Umbrians joined them; but the most valuable allies to the Samnites were the Celts, who had for some time threatened a raid across the Apennines, and who now marched eagerly into Umbria and joined the coalition. The news that the Celts were in motion produced a startling effect at Rome, and every nerve was strained to meet this new danger. While two armies were left in southern Etruria as reserves, the two consuls, Q. Fabius Maximus Rullianus and P. Decius Mus the younger, both tried soldiers, marched northwards up the valley of the Tiber and into Umbria at the head of four Roman legions and a still larger force of Italian allies. At Sentinum, on the farther side of the Apennines, they encountered the united forces of the Celts and Samnites, the Etruscans and Umbrians having, it is said, been withdrawn for the defence of their own homes. The battle that followed was desperate, and the Romans lost one of their consuls, Decius, and more than 8,000 men. But the Roman victory was decisive. The Celts were annihilated, and the fear of a second Celtic attack on Rome removed. All danger from the coalition was over. The Etruscan communities gladly purchased peace by the payment of indemnities. The rising in Umbria, never formidable, died away, and the Samnites were left single-handed to bear the whole weight of the wrath of Rome. During four years more, however, they desperately defended their highland homes, and twice at least, in 293 and 292, they managed to place in the field a force sufficient to meet the Roman legions on equal terms. At last, in 290, the consul M. Curius Dentatus finally exhausted their power of resistance. Peace was concluded, and it is significant of the respect inspired at Rome by their indomitable courage that they were allowed to become the allies of Rome, on equal terms and without any sacrifice of independence.

Between the close of the third Samnite War and the landing of Pyrrhus in 281 B.C. we find Rome engaged, as was her wont, in quietly extending and consolidating her power. In southern Italy she strengthened her hold on Apulia by planting on the borders of Apulia and Lucania the strong colony of Venusia. In central Italy the annexation of the Sabine country (290) carried her frontiers eastwards to the borders of her Picentine allies on the Adriatic. Farther east, in the territory of the Picentes themselves, she established colonies on the Adriatic coast at Hadria and Castrum (285–283). North of the Picentes lay the territories of the Celtic Senones stretching inland to the north-east borders of Etruria, and these too now fell into her hands. Ten years after their defeat at Sentinum (285–284) a Celtic force descended into Etruria, besieged Arretium and defeated the relieving force despatched by Rome. In 283 the consul L. Cornelius Dolabella was sent to avenge the insult. He completely routed the Senones. Their lands were annexed by Rome, and a colony established at Sena on the coast. This success, followed as it was by the decisive defeat of the neighbouring tribe of the Boii, who had invaded Etruria and penetrated as far south as the Vadimonian lake, awed the Celts into quiet, and for more than 40 years there was comparative tranquillity in northern Italy.

Pyrrhus.—In the south, however, the claims of Rome to supremacy were now to be disputed by a new and formidable foe. At the close of the third Samnite War the Greek cities on the southern coast of Italy found themselves once more harassed by the Sabellian tribes on their borders, whose energies, no longer absorbed by the long struggles in central Italy, now found an attractive opening southwards.

The city of Thurii appealed to Rome for protection, and the plebeian assembly at Rome—recently given full legislative powers by the Hortensian law—voted to send the consul Fabricius to aid the Greeks. The consul easily routed the barbarians and established a garrison in the city. Thurii thus accepted Rome's suzerainty. The Tarentines, who claimed to be the protectors of the Greeks in Italy, were offended at the course taken by Thurii, and rightly feared that Rome's advance to the sea would soon compel all the cities of Magna Graecia to acknowledge the dominance of Rome's influence. While the Tarentines were debating whether to protest, several Roman ships (presumably of the *socii navales*), bound for the Adriatic colonies of Rome, appeared off the harbour of Tarentum. Since the Romans had long before signed a treaty that no Roman ships of war should sail east of the Lacinian cape, the Tarentines regarded the appearance of this squadron as a hostile act, attacked it, killed the admiral and sank most of the ships. Rome, desiring peace, asked for reparations without making a hostile demonstration, but the democratic party in Tarentum, bent upon asserting the independence and power of their city, engaged King Pyrrhus of Epirus to come to their aid and, in reliance upon his forces, declared war upon Rome (281).

King Pyrrhus (*see* PYRRHUS), whose timely appearance seemed for the moment to have saved the independence of Tarentum, was the most brilliant of the military adventurers whom the disturbed times following the death of Alexander the Great had brought into prominence. High-spirited, generous and ambitious, he had formed the scheme of rivalling Alexander's achievements in the East, by winning for himself an empire in the West. He aspired not only to unite under his rule the Greek communities of Italy and Sicily, but to overthrow the great Phoenician state of Carthage—the natural enemy of Greeks in the West, as Persia had been in the East. Of Rome it is clear that he knew little or nothing; the task of ridding the Greek seaports of their barbarian foes he no doubt regarded as an easy one; and the splendid force he brought with him was intended rather for the conquest of the West than for the preliminary work of chastising a few Italian tribes, or securing the submission of the unwarlike Italian Greeks. He defeated the Roman consul, M. Valerius Laevinus, on the banks of the Liris (280), and gained the support of the Greek cities as well as that of numerous bands of Samnites, Lucanians and Bruttians. But, to the disappointment of his new allies, Pyrrhus showed no anxiety to follow up his advantage. His heart was set on Sicily and Africa, and his immediate object was to come to terms with Rome. But though he advanced as near Rome as Anagnia (279), nothing could shake the resolution of the senate, and in the next year (278) he again routed the legions at Asculum (Ascoli), but only to find that the indomitable resolution of the enemy was strengthened by defeat. He now crossed into Sicily, where, though at first successful, he was unable to achieve any lasting result. Soured and disappointed, Pyrrhus returned to Italy (276) to find the Roman legions steadily moving southwards, and his Italian allies disgusted by his desertion of their cause. In 275 the decisive battle of the war was fought at Beneventum. The consul M. Curius Dentatus, the conqueror of Samnium, gained a complete victory and Pyrrhus, unable any longer to face his opponents in the field, and disappointed of all assistance from his allies, retreated in disgust to Tarentum and thence crossed into Greece.

A few years later (272) Tarentum was surrendered to Rome by its Epirot garrison; it was granted a treaty of alliance, but its walls were razed and its fleet handed over to Rome. In 270 Rhegium also entered the ranks of Roman allies, and finally in 269 a single campaign crushed the last efforts at resistance in Sam-

nium. Rome was now at leisure to consolidate the position she had won. Between 273 and 263 three new colonies were founded in Samnium and Lucania—Paestum in 273, Beneventum in 268, Aesernia in 263. In central Italy the area of Roman territory was increased by the full enfranchisement (268) of the Sabines, and of their neighbours to the east, the people of Picenum. To guard the Adriatic coast, colonies were established at Ariminum (268), at Firmum and at Castrum Novum (264), while to the already numerous maritime colonies was added that of Cosa in Etruria.

Rome the Mistress of Italy.—Rome was now the undisputed mistress of Italy. The limits of her supremacy to the north were represented roughly by a line drawn across the peninsula from the mouth of the Arnus on the west to that of the Aesis on the east. Beyond this line lay the Ligurians and the Celts; all south of it was now united as "Italy" under the rule of Rome.

But the rule of Rome over Italy, like her wider rule over the Mediterranean coasts, was not an absolute dominion over conquered subjects. It was in form at least a confederacy under Roman protection and guidance; and the Italians, like the provincials, were not the subjects, but the "allies and friends" of the Roman people. In the treatment of these allies Rome consistently followed the maxim, *divide et impera*. In every possible way she strove to isolate them from each other, while binding them closely to herself. The old federal groups were in most cases broken up, and each of the members united with Rome by a special treaty of alliance. In Etruria, Latium, Campania and Magna Graecia the city was taken as the unit; in central Italy where urban life was non-existent, the unit was the tribe. The northern Sabellian peoples, for instance—the Marsi, Paeligni, Vestini, Marrucini and Frentani—were now constituted as separate communities in alliance with Rome. In many cases, too, no freedom of trade or intermarriage was allowed between the allies themselves. Nor were all these numerous allied communities placed on the same footing as regarded their relations with Rome herself. To begin with, a sharp distinction was drawn between the "Latini" and the general mass of Italian allies. The "Latins" of this period had little more than the name in common with the old 30 Latin peoples of the days of Spurius Cassius. With a few exceptions, such as Tibur and Praeneste, the latter had either disappeared or had been incorporated with the Roman State, and the Latins of 268 B.C. were almost exclusively the "Latin colonies," that is to say, communities founded by Rome, composed partly of allies but chiefly of men of Roman blood, and whose only claim to the title "Latin" lay in the fact that Rome granted to them some portion of the rights and privileges formerly enjoyed by the old Latin cities under the Cassian treaty. Though nominally allies, they were in fact offshoots of Rome herself, bound to her by community of race, language and interest, and planted as Roman garrisons among alien and conquered peoples. The Roman citizen who joined a Latin colony lost his citizenship—to have allowed him to retain it would no doubt have been regarded as enlarging too rapidly the limits of the citizen body; but he received in exchange the status of a favoured ally. The member of a Latin colony had the right of *commercium* and down to 268 of *conubium* also with Roman citizens. Provided they left sons and property to represent them at home, they were free to migrate to Rome and acquire the Roman franchise. In war-time they not only shared in the booty, but claimed a portion of any land confiscated by Rome and declared "public." These privileges, coupled with their close natural affinities with Rome, successfully secured the fidelity of the Latin colonies, which became not only the most efficient props of Roman supremacy, but powerful agents in the work of Romanizing Italy. Below the privileged Latins stood the Italian allies; and here again we know generally that there were considerable differences of status, determined in each case by the terms of their respective treaties with Rome. We are told that the Greek cities of Neapolis and Heraclea were among the most favoured; the Bruttii, on the other hand, seem, even before the Hannibalic War, to have been less generously treated. But beyond this we have no detailed information.

Rome, however, did not rely only on this policy. Her allies were attached as closely to herself as they were clearly separated from each other, and from the first she took every security for the maintenance of her own paramount authority. Within its own borders, each ally was left to manage its own affairs as an independent State. The badges which marked subjection to Rome in the provinces—the resident magistrate and the tribute—were unknown in Italy. But in all points affecting the relations of one ally with another, in all questions of the general interests of Italy and of foreign policy, the decision rested solely with Rome. The place of a federal constitution, of a federal council, of federal officers, was filled by the Roman senate, assembly and magistrates. The maintenance of peace and order in Italy, the defence of the coasts and frontiers, the making of war or peace with foreign Powers, were matters the settlement of which Rome kept entirely in her own hands. Each allied State, in time of war, was called upon for a certain contingent of men, but, though its contingent usually formed a distinct corps under officers of its own, its numerical strength was fixed by Rome, it was brigaded with the Roman legions, and was under the orders of the Roman consul.

The Roman State.—This paramount authority of Rome throughout the peninsula was confirmed and justified by the fact that Rome herself was now infinitely more powerful than any one of her numerous allies. Her territory, as distinct from that of the allied States, covered something like one-third of the peninsula south of the Aesis. Along the west coast it stretched from Caere to the southern borders of Campania. Inland, it included the former territories of the Aequi and Hernici, the Sabine country, and even extended eastwards into Picenum, while beyond these limits were outlying districts, such as the lands of the Senonian Celts, with the Roman colony of Sena, and others elsewhere in Italy, which had been confiscated by Rome and given over to Roman settlers. Since the first important annexation of territory after the capture of Veii (396), 12 new tribes had been formed, and the number of male citizens registered at the census had risen from 152,000 to 290,000. Within this enlarged Roman State were now included numerous communities with local institutions and government. At their head stood the Roman colonies (*coloniae civium Romanorum*), founded to guard especially the coasts of Latium and Campania. Next to these eldest children of Rome came those communities which had been invested with the full Roman franchise, such, for instance, as the old Latin towns of Aricia, Lanuvium, Tusculum, Nomentum and Pedum. Lowest in the scale were those which had not been considered ripe for the full franchise, but had, like Caere, received instead the *civitas sine suffragio*, the civil without the political rights. Their members, though Roman citizens, were not enrolled in the tribes, and in time of war served not in the ranks of the Roman legions but in separate contingents. In addition to these organized town communities, there were also the groups of Roman settlers on the public lands, and the dwellers in the village communities of the enfranchised highland districts in central Italy.

The administrative needs of this enlarged Rome were obviously such as could not be adequately satisfied by the system which had done well enough for a small city State with a few square miles of territory. The old centralization of all government in Rome itself had become an impossibility, and the Roman statesmen did their best to meet the altered requirements of the time. The urban communities within the Roman pale, colonies and *municipia*, were allowed a large measure of local self-government. In all we find local assemblies, senates and magistrates, to whose hands the ordinary routine of local administration was confided, and, in spite of differences in detail, *e.g.*, in the titles and numbers of the magistrates, the same type of constitution prevailed throughout. But these local authorities were carefully subordinated to the higher powers in Rome. The local constitution could be modified or revoked by the Roman senate and assembly, and the local magistrates, no less than the ordinary members of the community, were subject to the paramount authority of the Roman consuls, praetors and censors. In particular, care was taken to keep the administration of justice well under central control. The Roman citizen in a colony or *municipium* enjoyed, of course, the right of appeal of the Roman people in a capital

case. We may also assume that from the first some limit was placed to the jurisdiction of the local magistrate, and that cases falling outside it came before the central authorities. But an additional safeguard for the equitable and uniform administration of Roman law, in communities to many of which the Roman code was new and unfamiliar, was provided by the institution of prefects (*praefecti iuri dicundo*), who were sent out annually, as representatives of the Roman praetor, to administer justice in the colonies and *municipia*. To prefects, moreover, were assigned the charge of those districts within the Roman pale where no urban communities, and consequently no organized local government, existed. In these two institutions, that of municipal government and that of prefectures, we have already two of the cardinal points of the later imperial system of government.

Lastly, the changes which the altered position and increased responsibilities of Rome had effected in her military system tended to weaken the intimate connection between the Roman army in the field and the Roman people at home, and thus prepared the way for that complete breach between the two which in the end proved fatal to the republic. It is true that service in the legion was still the first duty and the highest privilege of the fully qualified citizen. But this service was gradually altering in character. Though new legions were still raised each year for the summer campaigns, this was by no means always accompanied, as formerly, by the disbandment of those already on foot, and this increase in the length of time during which the citizen was kept with the standards had, as early as the siege of Veii, necessitated a further deviation from the old theory of military service—the introduction of pay. Moreover, while in the early days of the republic the same divisions served for the soldier in the legion and the citizen in the assembly, in the new manipular system, with its three lines, no regard was paid to civic distinctions, but only to length of service and military efficiency, while at the same time the more open order of fighting which it involved demanded of each soldier greater skill, and therefore a more thorough training in arms than the old phalanx. One other change resulted from the new military necessities of the time, which was as fruitful of results as the incipient separation between the citizen and the soldier. Under the early republic, the chief command of the legions rested with the consuls of the year. But, as Rome's military operations increased in area and in distance from Rome, a larger staff became necessary, and the inconvenience of summoning home a consul in the field from an unfinished campaign became intolerable. The remedy found, that of prolonging for a further period the imperium of the consul, was first applied in 327 B.C. in the case of Q. Publilius Philo, and between 327 and 264 instances of this *prorogatio imperii* became increasingly common. This proconsular authority, originally an occasional and subordinate one, was destined to become first of all the strongest force in the Republic, and ultimately the chief prop of the power of the Caesars.

Period B: Rome and the Mediterranean States, 265–146 B.C.—(*a*) *Conquest of the West.*—Though marked out by her geographical position as the natural centre of the Mediterranean, Italy had hitherto played no active part in the Mediterranean politics, but, now that she was for the first time united, it was felt throughout the Mediterranean world that a new Power had arisen, and Rome, as the head and representative of Italy, found herself irresistibly drawn into the vortex of Mediterranean affairs. Egypt sought her alliance, and Greek scholars began to interest themselves keenly in the history, constitution and character of the Latin republic which had so suddenly become famous. But Rome looked naturally westwards rather than eastwards. The western coasts of the peninsula were the most fertile and populous and wealthy; and it was in this direction that the natural openings for Italian commerce were to be found. It was, however, precisely on this side that Rome had serious ground for anxiety. Carthage was now at the height of her power. Her outposts were threateningly near to Italy in Sardinia and in Sicily, while her fleets swept the seas and jealously guarded for the benefit of Carthage alone the hidden treasures of the West. In the east of Sicily, Syracuse still upheld the cause of Greek independence against the hereditary foe of the Greek race; but Syracuse stood alone, and her resources were comparatively small. What Rome had to fear was the establishment, and that at no distant date, of an absolute Carthaginian domination over the western seas—a domination which would not only be fatal to Italian commerce, but would be a standing menace to the safety of the Italian coasts.

First Punic War, 265–241.—It was above all things essential for Rome that the Carthaginians should advance no farther eastwards. But in 265 Rome was threatened with the establishment of Carthaginian rule at Messana, within sight of the Italian coast. The intervention of both powers in a quarrel between the Mamertines, a body of Campanian mercenaries who had occupied Messana, and Hieron II. of Syracuse, led to the outbreak of war between Rome and Carthage in 264 B.C. The military history of the struggle which followed is treated in the article PUNIC WARS; it will suffice to note here that the war lasted until 241 B.C., when the Carthaginians were compelled to cede Sicily and the Lipari islands to Rome, and to pay an indemnity of 3,200 talents (about £800,000).

The struggle was one in which both Rome and Carthage were serving an apprenticeship in a warfare the conditions of which were unfamiliar to both. The Roman legions were foes very unlike any against which the Carthaginian leaders had ever led their motley array of mercenaries, while Rome was called upon for the first time to fight a war across the sea, and to fight with ships against the greatest naval power of the age. The chief dangers for Carthage lay obviously in the jealousy exhibited at home of her officers abroad, in the difficulty of controlling her mercenary troops, and in the ever-present possibility of disaffection among her subjects in Libya—dangers which even the genius of Hannibal failed finally to surmount. Rome, on the other hand, was strong in the public spirit of her citizens, the fidelity of her allies, the valour and discipline of her legions. What she needed was a system which would make a better use of her splendid materials than one under which her plans were shaped from day to day by a divided senate, and executed by officers who were changed every year, and by soldiers most of whom returned home at the close of each summer's campaign.

The interval between the first and second Punic Wars was employed by both Rome and Carthage in strengthening their respective positions. The eastern end of Sicily was still left under the rule of Hieron as the ally of Rome, but the larger western portion of the island became directly subject to Rome, and a temporary arrangement seems to have been made for its government, either by one of the two praetors, or possibly by a quaestor. Sardinia and Corsica had not been surrendered to Rome by the treaty of 241, but three years later (239), on the invitation of the Carthaginian mercenaries stationed in the islands, a Roman force occupied them; Carthage protested, but, on the Romans threatening war, she gave way, and Sardinia and Corsica were formally ceded to Rome, though it was some seven or eight years before all resistance on the part of the natives themselves was crushed. In 227, however, the senate considered matters ripe for the establishment of a separate administration in her oversea possessions. In that year two additional praetors were elected; to one was assigned the charge of western Sicily, to the other that of Sardinia and Corsica, and thus the first stones of the Roman provincial system were laid. Of at least equal importance for the security of the peninsula was the subjugation of the Celtic tribes in the valley of the Po. These, headed by the Boii and Insubres and assisted by levies from the Celts to the westward, had in 225 alarmed the whole of Italy by invading Etruria and penetrating to Clusium, only three days' journey from Rome. Here, however, their courage seems to have failed them. They retreated northwards along the Etruscan coast, until at Telamon their way was barred by the Roman legions returning from Sardinia to the defence of Rome, while a second consular army hung upon their rear. Thus hemmed in, the Celts fought desperately, but were completely defeated and the flower of their tribesmen slain. The Romans followed up their success by invading the Celtic territory. The Boii were easily reduced to submission. The Insubres, north of the Po, resisted more obstinately, but by 222 the war was over,

and all the tribes in the rich Po valley acknowledged the supremacy of Rome. The conquered Celts were not enrolled among the Italian allies of Rome, but were treated as subjects beyond the frontier. Two colonies were founded to hold them in check—Placentia (218) and Cremona in the territory of the Insubres—and the great northern road (Via Flaminia) was completed as far as the Celtic border at Ariminum.

On the Adriatic coast the immediate interests of Rome were limited to rendering the sea safe for Italian trade. It was with this object that, in 229, the first Roman expedition crossed the Adriatic, and inflicted severe chastisement on the Illyrian pirates of the opposite coast. This expedition was the means of establishing for the first time direct political relations between Rome and the states of Greece proper, to many of which the suppression of piracy in the Adriatic was of as much importance as to Italy. Alliances were concluded with Corcyra, Epidamnus and Apollonia; and embassies explaining the reasons which had brought Roman troops into Greece were sent to the Aetolians, the Achaeans and even to Athens and Corinth. Everywhere they were well received, and the admission of the Romans to the Isthmian games (228) formally acknowledged them as the natural allies of the free Greek states against both barbarian tribes and foreign despots. Meanwhile Carthage had acquired a possession which promised to compensate her for the loss of Sicily, Sardinia and Corsica. The genius of her greatest citizen and soldier, Hamilcar Barca, had appreciated the enormous value of the Spanish peninsula, and conceived the scheme of founding there a Carthaginian dominion which should not only add to the wealth of Carthage, but supply her with a base of operations for a war of revenge with Rome. The conquest of southern and eastern Spain, begun by Hamilcar (236–228) and carried on by his kinsman Hasdrubal (228–221), was completed by his son Hannibal, who, with all his father's genius, inherited also his father's hatred of Rome, and by 219 the authority of Carthage had been extended as far as the Ebro (*see* SPAIN, *History*). Rome's ancient ally Massilia (mod. Marseilles) was especially disturbed by these advances, for she had trading posts on the coast of Spain which would become unprofitable if Carthage conquered the whole of the interior and drew the commerce of the peninsula southwards to the Punic ports. Furthermore, since Carthage forbade Massiliot traders to make use of the straits of Gibraltar, Massiliot trade in British tin would be endangered if Carthage succeeded in reaching southern Gaul. From the fact that Marseilles lent her whole navy to Rome when the war broke out we may assume that her envoys were active in reporting the advance of Carthage in Spain and in interpreting that advance as aimed at Rome. Rome finally was induced to act. A defensive alliance was signed with Saguntum, a seaport of Spain which was still independent, and Hasdrubal was asked to promise that Carthage should not carry her arms beyond the Ebro river (226).

Second Punic War, 218–211.—But these precautions were of no avail against the resolute determination of Hannibal, with whom the conquest of Spain was only preliminary to an attack upon Italy, and who could not afford to leave behind him in Spain a state allied to Rome. In 219, therefore, disregarding the protests of a Roman embassy, he attacked and took Saguntum, an act which, as he had foreseen, rendered a rupture with Rome inevitable, while it set his own hands free for a further advance.

For the details of the war which followed, the reader may be referred to the articles PUNIC WARS; HANNIBAL; and SCIPIO. From the outbreak of hostilities until the crowning victory of Cannae in 216 Hannibal's career of success was unchecked; and the annihilation of the Roman army in that battle was followed by the defection of almost the whole of southern Italy, with the exception of the Latin colonies and the Greek coast towns. In 215, moreover, Philip V. of Macedon formed an alliance with Hannibal and threatened to invade Italy; in 214 Syracuse revolted, and in 212 the Greek cities in northern Italy went over to Hannibal. But the indomitable spirit of the Romans asserted itself in the face of these crushing misfortunes. In 212 Syracuse was recovered; in 211 Capua fell after a long siege which Hannibal failed to raise, even by his famous march up to the gates of Rome, and in the same year a coalition was formed in Greece against Philip V. of Macedon, which effectually paralysed his offensive action. Hannibal was now confined to Lucania and Bruttium; and his brother Hasdrubal, marching from Spain to join him, was defeated and slain on the river Metaurus (207). The war in Italy was now virtually ended, for, though during four years more Hannibal stood at bay in a corner of Bruttium, he was powerless to prevent the restoration of Roman authority throughout the peninsula. Sicily was once more secure; and finally in 206, the year after the victory on the Metaurus, the successes of the young P. Scipio in Spain (211–206) were crowned by the complete expulsion of the Carthaginians from the peninsula. On his return from Spain Scipio eagerly urged an immediate invasion of Africa. The senate hesitated; but Scipio gained the day. He was elected consul for 205, and given the province of Sicily, with permission to cross into Africa if he thought fit. Voluntary contributions of men, money and supplies poured in to the support of the popular hero; and by the end of 205 Scipio had collected in Sicily a sufficient force for his purpose. In 204 he crossed to Africa, where he was welcomed by the Numidian prince Massinissa, whose friendship he had made in Spain. In 203 he twice defeated the Carthaginian forces, and a large party at Carthage were anxious to accept his offer of negotiations. But the advocates of resistance triumphed.

Hannibal was recalled from Italy, and returned to fight his last battle against Rome at Zama, where Scipio, who had been continued in command as proconsul for 202 by a special vote of the people, won a complete victory. The war was over. The Roman assembly voted that the Carthaginian request for peace should be granted, and entrusted the settlement of the terms to Scipio and a commission of ten senators. Carthage was allowed to retain her territory in Africa; but she undertook to wage no wars outside Africa, and none inside without the consent of Rome. She surrendered all her ships but ten triremes, her elephants, and all prisoners of war, and agreed to pay an indemnity of 10,000 talents in 50 years. The Numidian Massinissa (*q.v.*) was rewarded by an increase of territory, and was enrolled among the "allies and friends" of the Roman people.

The West Under Roman Rule.—The battle of Zama decided the fate of the West. The power of Carthage was broken and her supremacy passed to Rome. Henceforth Rome had no rival to fear westward of Italy, and it rested with herself to settle within what limits her supremacy should be confined and what form it should take. In Sicily the former dominions of Hieron were at once united with the western half of the island as a single province, and in Spain, after nine years of a provisional Government (206–197), two provinces were in 197 definitely established, and each, like Sicily, assigned to one of the praetors for the year, two additional praetors being elected for the purpose. But here the resemblance between the two cases ends. From 201 down to the outbreak of the Slave War in 136 there was unbroken peace in Sicily, and its part in the history is limited to its important functions in supplying Rome with corn and in provisioning and clothing the Roman legions. The governors of the two Spains had very different work to do from that which fell to the lot of the Sicilian praetors. The condition of Spain required that year after year the praetors should be armed with the consular authority, and backed by a standing force of four legions, while more than once the presence of the consuls themselves was found necessary. Still, in spite of all difficulties, the work of pacification proceeded. To M. Porcius Cato (consul, 195) and to Tiberius Sempronius Gracchus (praetor and pro-praetor, 180–179), father of the two tribunes, is mainly due the credit of quieting the Celtiberian tribes of central Spain, and the government of Gracchus was followed by 30 years of comparative tranquillity. The insurrection headed by Viriathus in 149 was largely caused by exactions of the Roman magistrates themselves, while its obstinate continuance down to the capture of Numantia, in 133, was almost as much the result of the incapacity of the Roman commanders. But the re-settlement of the country by Scipio Africanus the younger in that year left all Spain, with the exception of the highland Astures and Cantabri in the north-west, finally and tranquilly subject to

Rome.

Third Punic War, 153–146.—In Africa there was no question at first of the introduction of Roman government by the formation of a province (*see* AFRICA, ROMAN). Carthage, bound hand and foot by the treaty of 201, was placed under the jealous watch of the loyal prince of Numidia, who himself willingly acknowledged the suzerainty of Rome. But it was impossible for this arrangement to be permanent. Every symptom of reviving prosperity at Carthage was regarded at Rome with feverish anxiety, and neither the expulsion of Hannibal in 195 nor his death in 183 did much to check the growing conviction that Rome would never be secure while her rival existed. It was therefore with grim satisfaction that many in the Roman senate watched the increasing irritation of the Carthaginians under the harassing raids and encroachments of their favoured neighbor Massinissa, and waited for the moment when Carthage should, by some breach of the conditions imposed upon her, supply Rome with a pretext for interference. At last in 151 came the news that Carthage, in defiance of treaty obligations, was actually at war with Massinissa. The anti-Carthaginian party in the senate, headed by M. Porcius Cato, eagerly seized the opportunity, and war was declared, and nothing short of the destruction of their city itself was demanded from the despairing Carthaginians. The demand was refused and in 149 the siege of Carthage begun. During the next two years little progress was made, but in 147 P. Cornelius Scipio Aemilianus, grandson by adoption of the conqueror of Hannibal, was, at the age of 37, and though only a candidate for the aedileship, elected consul and given the command in Africa. In the next year (146) Carthage was taken and razed to the ground. Its territory became the Roman province of Africa, while Numidia, now ruled by the three sons of Massinissa, remained as an allied state under Roman suzerainty, and served to protect the new province against the raids of the desert tribes (*see* CARTHAGE).

In Italy itself the Hannibalic War had been followed by important changes. In the north the Celtic tribes paid for their sympathy with Hannibal by the final loss of all separate political existence. Cispadane Gaul, studded with colonies and flooded with Roman settlers, was rapidly Romanized. Beyond the Padus (Po) in Polybius's time Roman civilization was already widely spread. In the extreme north-east the Latin colony of Aquileia, the last of its kind, was founded in 181, to control the Alpine tribes, while in the north-west the Ligurians were held in check by the colony of Luna (180), and by the extensive settlements of Roman citizens and Latins made on Ligurian territory in 173. In southern Italy the depression of the Greek cities on the coast, begun by the raids of the Sabellian tribes, was completed by the repeated blows inflicted upon them during the Hannibalic struggle. Some of them lost territory[1]; all suffered from a decline of population and loss of trade; and their place was taken by such new Roman settlements as Brundusium (Brindisi) and Puteoli (Pozzuoli). In the interior the southern Sabellian tribes suffered scarcely less severely. The Bruttii were struck off the list of Roman allies, and nearly all their territory was confiscated. To the Apulians and Lucanians no such hard measure was meted out; but their strength had been broken by the war, and their numbers dwindled; large tracts of land in their territories were seized by Rome, and allotted to Roman settlers, or occupied by Roman speculators. That Etruria also suffered from declining energy, a dwindling population, and the spread of large estates is clear from the state of things existing there in 133. It was indeed in central Italy, the home of the Latins and their nearest kinsmen, and in the new Latin and Roman settlements throughout the peninsula, that progress and activity were henceforth concentrated.

(*b*) **Rome in the East, 200–133.**—Ever since the repulse of Pyrrhus from Italy, Rome had been slowly drifting into closer contact with the eastern states. With one of the three great powers which had divided between them the empire of Alexander, with Egypt, she had friendly relations since 273, and the friendship had been cemented by the growth of commercial intercourse between the two countries. In 228 her chastisement of the Illyrian pirates had led naturally enough to the establishment of friendly relations with some of the states of Greece proper. In 214 the alliance between Philip V. and Hannibal, and the former's threatened attack on Italy, forced her into war with Macedon, at the head of a coalition of the Greek states against him, which effectually frustrated his designs against herself; at the first opportunity, however (205), she ended the war by a peace which left the position unchanged. The results of the war were not only to draw closer the ties which bound Rome to the Greek states, but to inspire the senate with a genuine dread of Philip's restless ambition, and with a bitter resentment against him for his union with Hannibal. The events of the next four years served to deepen both these feelings. In 205 Philip entered into a compact with Antiochus III. of Syria for the partition between them of the dominions of Egypt, now left by the death of Ptolemy Philopator to the rule of a boy-king. Antiochus was to take Coele-Syria and Phoenicia, while Philip claimed for his share the districts subject to Egypt on the coasts of the Aegean and the Greek islands. Philip no doubt hoped to be able to secure these unlawful acquisitions before the close of the second Punic War should set Rome free to interfere with his plans. But the obstinate resistance offered by Attalus of Pergamum and the Rhodians upset his calculations. In 201 Rome made peace with Carthage, and the senate had leisure to listen to the urgent appeal for assistance which reached her from her Eastern allies. With Antiochus indeed the senate was not yet prepared to quarrel; but with Philip the senate was ready to have a serious discussion despite the depletion of all resources. Philip had compelled Rome to give way to him in Illyricum, and he had proved by his attack on Egypt that he would prove to be a dangerous neighbour in time of peril. Furthermore philhellenism had grown very strong at Rome since Livius, Naevius and Ennius had translated scores of Greek plays for production at the Roman festivals. To the nobles who were now eagerly reading Homer, Plato and Euripides, the appeal of the old Greek cities for protection of independence, democracy and culture in Greece came to open ears. The people, to be sure, remembering all too well what they had suffered in the last war, at first rejected the senate's proposal to aid the Greeks, but the nobles, insisting that postponement would only result in a Macedonian invasion of Italy, finally secured a declaration of war (200).

Second Macedonian War, 200–197.—The war began in the summer of 200 B.C., and, though the landing of the Roman legions in Epirus was not followed, as had been hoped, by any general rising against Philip, yet the latter made no progress south of Boeotia. The fleets of Pergamum and Rhodes, now the zealous allies of Rome, protected Attica and watched the eastern coasts. The Achaeans and Nabis of Sparta were obstinately neutral, while nearer home in the north the Epirots and Aetolians threatened Thessaly and Macedonia. His own resources both in men and in money had been severely strained by his constant wars, and the only ally who could have given him effective assistance, Antiochus, was fully occupied with the conquest of Coele-Syria. It is no wonder then that, in spite of his dashing generalship and high courage, he made but a brief stand. T. Quinctius Flamininus (consul, 198), in his first year of command, defeated him on the Aous, drove him back to the pass of Tempe, and in the next year utterly routed him at Cynoscephalae. Almost at the same moment the Achaeans, who had now joined Rome, took Corinth, and the Rhodians defeated his troops in Caria. Further resistance was impossible; Philip submitted, and early the next year a Roman commission reached Greece with instructions to arrange terms of peace. These were such as effectually secured Rome's main object in the war, the removal of all danger to herself and her allies from Macedonian aggression. Philip was left in possession of his kingdom, but was degraded to the rank of a second-rate Power, deprived of all possessions in Greece, Thrace and Asia Minor, and forbidden, as Carthage had been in 201, to wage war without the consent of Rome, whose ally and friend he now became.

The second point in the settlement now effected by Rome was the liberation of the Greeks. The "freedom of Greece" was

[1] *E.g.*, Tarentum, Livy, xliv. 16. A Roman colony was established at Croton in 194, and a Latin colony (Copia) at Thurii in 193 (Livy, xxxiv. 45, 53).

proclaimed at the Isthmian games amid a scene of wild enthusiasm, which reached its height when two years later (194) Flamininus withdrew his troops even from the "three fetters of Greece"—Chalcis, Demetrias and Corinth. There is no reason to doubt that, in acting thus, not only Flamininus himself, but the senate and people at home were influenced, partly at any rate, by feelings of genuine sympathy with the Greeks and reverence for their past. It is equally clear than no other course was open to them. For Rome to have annexed Greece, as she had annexed Sicily and Spain, would have been a flagrant violation of the pledges she had repeatedly given both before and during the war; the attempt would have excited the fiercest opposition, and would probably have thrown the Asiatic as well as the European Greeks into the arms of Antiochus. But a friendly and independent Greece would be at once a check on Macedon and a barrier against aggression from the East. Nor while liberating the Greeks did Rome abstain from such arrangements as seemed necessary to secure the predominance of her own influence. In the Peloponnese, for instance, the Achaeans were rewarded by considerable accessions of territory; and it is possible that the Greek states, as allies of Rome, were expected to refrain from war upon each other without her consent.

War with Antiochus, 192–189.—Antiochus III. of Syria, Philip's accomplice in the proposed partition of the dominions of their common rival, Egypt, returned from the conquest of Coele-Syria (198) to learn first of all that Philip was hard pressed by the Romans, and shortly afterwards that he had been decisively beaten at Cynoscephalae. It was already too late to assist his former ally, but Antiochus resolved at any rate to lose no time in securing for himself the possessions of the Ptolemies in Asia Minor and in eastern Thrace, which Philip had claimed, and which Rome now pronounced free and independent. In 197–196 he overran Asia Minor and crossed into Thrace. But Antiochus was pleasure-loving, irresolute, and no general, and it was not until 192 that the urgent entreaties of the Aetolians, and the withdrawal of the Roman troops from Greece, nerved him to the decisive step of crossing the Aegean; even then the force he took with him was so small as to show that he completely failed to appreciate the nature of the task before him. At Rome the prospect of a conflict with Antiochus excited great anxiety, and it was not until every resource of diplomacy had been exhausted that war was declared, and the real weakness which lay behind the once magnificent pretensions of the "king of kings" was revealed.

Had Antiochus acted with energy when in 192 he landed in Greece, he might have won the day before the Roman legions appeared. As it was, in spite of the warnings of Hannibal, who was now in his camp, and of the Aetolians, he frittered away valuable time between his pleasures at Chalcis and useless attacks on petty Thessalian towns. In 191 Acilius Glabrio landed at the head of an imposing force; and a single battle at Thermopylae broke the courage of Antiochus, who hastily recrossed the sea to Ephesus, leaving his Aetolian allies to their fate. But Rome could not pause here. The safety of her faithful allies, the Pergamenes and Rhodians, and of the Greek cities in Asia Minor, as well as the necessity of chastising Antiochus, demanded an invasion of Asia. A Roman fleet had already (191) crossed the Aegean, and in concert with the fleets of Pergamum and Rhodes worsted the navy of Antiochus. In 190 the new consul L. Scipio, accompanied by his famous brother, the conqueror of Africa, led the Roman legion for the first time into Asia. At Magnesia ad Sipylum, in Lydia, he met and defeated the motley and ill-disciplined hosts of the great king. For the first time the West, under Roman leadership, successfully encountered the forces of the East, and the struggle began which lasted far on into the days of the emperors. The terms of the peace which followed the victory at Magnesia tell their own story clearly enough. There is no question, any more than in Greece, of annexation; the main object in view is that of securing the predominance of Roman interests and influence throughout the peninsula of Asia Minor, and removing to a safe distance the only eastern Power which could be considered dangerous. The line of the Halys and the Taurus range, the natural boundary of the peninsula eastwards, was established as the boundary between Antiochus and the kingdoms, cities and peoples now enrolled as the allies and friends of Rome. This line Antiochus was forbidden to cross; nor was he to send ships of war farther west than Cape Sarpedon in Cilicia. Immediately to the west of this frontier lay Bithynia, Paphlagonia and the immigrant Celtic Galatae, and these frontier states, now the allies of Rome, served as a second line of defence against attacks from the east. The area lying between these "buffer states" and the Aegean was organized by Rome in such a way as should at once reward the fidelity of her allies and secure both her own paramount authority and safety from foreign attack. Pergamum and Rhodes were so strengthened—the former by the gift of the Chersonese, Lycaonia, Phrygia, Mysia and Lydia, the latter by that of Lycia and Caria—as not only amply to reward their loyalty, but to constitute them effective props of Roman interests and effective barriers alike against Thracian and Celtic raids in the north and Syrian aggression in the south. Lastly, the Greek cities on the coast, except those already tributary to Pergamum, were declared free, and established as independent allies of Rome.

In a space of little over 11 years (200–189) Rome had broken the power of Alexander's successors and established throughout the eastern Mediterranean a Roman protectorate.

Third Macedonian War, 171–168.—It was in the western half of this protectorate that the first steps in the direction of annexation were taken. The enthusiasm provoked by the liberation of the Greeks had died away, and its place had been taken by feelings of dissatisfied ambition or sullen resentment. Internecine feuds and economic distress had brought many parts of Greece to the verge of anarchy, and, above all, the very foundations of the settlement effected in 197 were threatened by the reviving power and aspirations of Macedon. Loyally as Philip had aided Rome in the war with Antiochus, the peace of Magnesia brought him nothing but fresh humiliation. He was forced to abandon all hopes of recovering Thessaly, and he had the mortification to see the hated king of Pergamum installed almost on his borders as master of the Thracian Chersonese. Resistance at the time was unavailing, but from 189 until his death (179) he laboured patiently and quietly to increase the internal resources of his own kingdom, and to foment, by dexterous intrigue, feelings of hostility to Rome among his Greek and barbarian neighbours. His successor, Perseus, his son by a left-handed alliance, continued his father's work. He made friends among the Illyrian and Thracian princes, connected himself by marriage with Antiochus IV. of Syria and with Prusias of Bithynia, and, among the Greek peoples, strove, not without success, to revive the memories of the past glories of Greece under the Macedonian leadership of the Great Alexander. The senate could no longer hesitate. They were well aware of the restlessness and discontent in Greece; and after hearing from Eumenes of Pergamum and from their own officers, all details of Perseus's intrigues and preparations, they declared war. The struggle, in spite of Perseus's courage and the incapacity at the outset of the Roman commanders, was short and decisive. The sympathy of the Greeks with Perseus, which had been encouraged by the hitherto passive attitude assumed by Rome, instantly evaporated on the news that the Roman legions were on their way to Greece. No assistance came from Prusias or Antiochus, and Perseus's only allies were the Thracian king Cotys and the Illyrian Genthius. The victory gained by L. Aemilius Paulus at Pydna (168) ended the war. Perseus became the prisoner of Rome, and as such died in Italy a few years later. Rome had begun the war with the fixed resolution no longer of crippling but of destroying the Macedonian State. Perseus's repeated proposals for peace during the war had been rejected; and his defeat was followed by the final extinction of the kingdom of Philip and Alexander. Macedonia, though it ceased to exist as a single State, was not, however, definitely constituted a Roman province. On the contrary, the mistake was made of introducing some of the main principles of the provincial system—taxation, disarmament and the isolation of the separate communities—without the addition of the element most essential for the maintenance of order—that of a resident Roman governor. The four petty republics now created were each

autonomous, and each separated from the rest by the prohibition of *commercium* and *conubium*, but no central controlling authority was substituted for that of the Macedonian king. The inevitable result was confusion and disorder, resulting finally (149–48) in the attempt of a pretender, Andriscus, who claimed to be a son of Perseus, to resuscitate the ancient monarchy. On his defeat in 148 the senate declared Macedonia a Roman province, and placed a Roman magistrate at its head.

From 189 to the defeat of Perseus in 168 no formal change of importance in the status of the Greek states had been made by Rome. The senate, though forced year after year to listen to the mutual recriminations and complaints of rival communities and factions, contented itself as a rule with intervening just enough to remind the Greeks that their freedom was limited by its own paramount authority, and to prevent any single state or confederacy from raising itself too far above the level of general weakness which it was the interest of Rome to maintain. After the victory at Pydna, however, the sympathy shown for Perseus, exaggerated as it seems to have been by the interested representations of the romanizing factions in the various states, was made the pretext for a more emphatic assertion of Roman ascendancy. All those suspected of Macedonian leanings were removed to Italy, as hostages for the loyalty of their several communities, and the real motive for the step was made clear by the exceptionally severe treatment of the Achaeans, whose loyalty was not really doubtful, but whose growing power in the Peloponnese and independence of language had awakened alarm at Rome. A thousand of their leading men, among them the historian Polybius, were carried off to Italy (*see* POLYBIUS). In Aetolia the Romans connived at the massacre by their so-called friends of 500 of the opposite party. Acarnania was weakened by the loss of Leucas, while Athens was rewarded for her unambitious loyalty by the gift of Delos and Samos.

But this somewhat violent experiment only answered for a time. In 148 the Achaeans rashly persisted, in spite of warnings, in attempting to compel Sparta by force of arms to submit to the league. When threatened by Rome with the loss of all that they had gained since Cynoscephalae, they madly rushed into war. They were easily defeated, and a "commission of ten," under the presidency of L. Mummius, was appointed by the senate thoroughly to resettle the affairs of Greece. Corinth, by orders of the senate, was burnt to the ground and its territory confiscated. Thebes and Chalcis were destroyed, and the walls of all towns which had shared in the last desperate outbreak were razed to the ground. All the existing confederacies were dissolved; no *commercium* was allowed between one community and another. Everywhere an aristocratic type of constitution was established, and the payment of a tribute was apparently imposed. Into Greece, as into Macedonia in 167, the now familiar features of the provincial system were introduced—disarmament, isolation and taxation. The Greeks were still nominally free, and no separate province with a governor of its own was established, but the needed central control was provided by assigning to the neighbouring governor of Macedonia a general supervision over the affairs of Greece. From the Adriatic to the Aegean, and as far north as the river Drilo and Mt. Scardus, the whole peninsula was now under direct Roman rule.

The Roman Protectorate in Asia.—Beyond the Aegean the Roman protectorate worked no better than in Macedonia and Greece, and the quarrels and disorders which flourished under its shadow were aggravated by its longer duration and by the still more selfish view taken by Rome of her responsibilities. At one period indeed, after the battle of Pydna, it seemed as if the more vigorous, if harsh, system then initiated in Macedon and Greece was to be adopted farther east also. The levelling policy pursued towards Macedon and the Achaeans was applied with less justice to Rome's two faithful and favoured allies, Rhodes and Pergamum. The former had rendered themselves obnoxious to Rome by their independent tone. On a charge of complicity with Perseus they were threatened with war, and though this danger was averted they were forced to exchange their equal alliance with Rome for one which placed them in close dependence upon her, and to resign the lucrative possessions in Lycia and Caria given them in 189. Finally, their commercial prosperity was ruined by the establishment of a free port at Delos. With Eumenes of Pergamum no other fault could be found than that he was strong and successful; but this was enough. His brother Attalus was invited, but in vain, to become his rival. His turbulent neighbours, the Galatae, were allowed to harass him by raids. Pamphylia was declared independent, and favours were heaped upon Prusias of Bithynia. These and other annoyances and humiliations had the desired effect. Eumenes and his two successors—his brother and son, Attalus II. and Attalus III.—contrived indeed by studious humility and dexterous flattery to retain their thrones, but Pergamum (*q.v.*) ceased to be a powerful State, and its weakness, added to that of Rhodes, increased the prevalent disorder in Asia Minor. During the same period we have other indications of a temporary activity on the part of Rome. The frontier of the protectorate was pushed forward to the confines of Armenia by alliances with the kings of Pontus and Cappadocia beyond the Halys. In Syria, on the death of Antiochus Epiphanes (164), Rome intervened to place a minor, Antiochus Eupator, on the throne, under Roman guardianship. In 168 Egypt formally acknowledged the suzerainty of Rome, and in 163 the senate, in the exercise of this new authority, restored Ptolemy Philometor to his throne, but at the same time weakened his position by handing over Cyrene and Cyprus to his brother Euergetes.

But this display of energy was short-lived. From the death of Eumenes in 159 down to 133 Rome, secure in the absence of any formidable power in the East, and busy with affairs in Macedonia, Africa and Spain, relapsed into an inactivity the disastrous results of which revealed themselves in the next period, in the rise of Mithridates of Pontus, the spread of Cretan and Cilician piracy, and the advance of Parthia.

Both the western and eastern Mediterranean now acknowledged the suzerainty of Rome, but her relations with the two were from the first different. The West fell to her as the prize of victory over Carthage, and, the Carthaginian power broken, there was no hindrance to the immediate establishment in Sicily, Sardinia, Spain, and finally in Africa, of direct Roman rule. To the majority, moreover, of her western subjects she brought a civilization as well as a government of a higher type than any before known to them. And so in the West she not only formed provinces but created a new and wider Roman world. To the East, on the contrary, she came as the liberator of the Greeks; and it was only slowly that in this part of the empire her provincial system made way. In the East, moreover, the older civilization she found there obstinately held its ground. Her proconsuls governed and her legions protected the Greek communities, but to the last the East remained in language, manners and thought Greek and not Roman.

(*c*) **The Period of the Revolution (146–49 B.C.).**—In the course of little more than a century, Rome had become the supreme power in the civilized world. Although in its outward form her old constitution had undergone little change during the age of war and conquest from 265 to 146, the causes, both internal and external, which brought about its fall had been silently at work throughout. Its form was in strictness that of a moderate democracy. The patriciate had ceased to exist as a privileged caste, and there was no longer any order of nobility recognized by the constitution. The senate and the offices of state were in law open to all, and the will of the people in assembly had been in the most explicit and unqualified manner declared to be supreme alike in the election of magistrates, in the passing of laws, and in all matters touching the *caput* of a Roman citizen. But in practice the constitution had become an oligarchy. The senate, not the assembly, ruled Rome, and both the senate and the magistracies were in the hands of a class which, in defiance of the law, arrogated to itself the title and the privileges of a nobility. The ascendancy of the senate is too obvious and familiar a fact to need much illustration here. It was but rarely that the assembly was called upon to decide questions of policy, and then the proposal was usually made by the magistrate in obedience to the

express directions of the senate. In the enormous majority of cases the matter was settled by a *senatus consultum*, without any reference to the people at all. The assembly decides for war or peace, but the conduct of the war and the conditions of peace are matters left to the senate (*q.v.*). Now and then the assembly confers a command upon the man of its choice, or prolongs the *imperium* of a magistrate, but, as a rule, these and all questions connected with foreign affairs are settled within the walls of the senate-house. It is the senate which year after year assigns the commands and fixes the number and disposition of the military forces, directs the organization of a new province, conducts negotiations and forms alliances. Within Italy, though its control of affairs was less exclusive, we find that, besides supervising the ordinary current business of administration, the senate decides questions connected with the Italian allies, sends out colonies, allots lands, and directs the suppression of disorders. Lastly, both in Italy and abroad it managed the finances. Inseparably connected with this monopoly of affairs to the exclusion of the assembly was the control which in practice, if not in theory, the senate exercised over the magistrates. The latter had become what Cicero wrongly declares they were always meant to be, merely the subordinate ministers of the supreme council, which assigned them their departments, provided them with the necessary equipment, claimed to direct their conduct, prolonged their commands, and rewarded them with triumphs. It was now at once the duty and the interest of a magistrate to be *in auctoritate senatus*, "subject to the authority of the senate," and even the once formidable *tribuni plebis* are found during this period actively and loyally supporting the senate, and acting as its spokesmen in the assembly.

The Senatorial Government.—Behind both senate and magistrates, lay the whole power and influence of the new nobility. These *nobiles* were essentially distinct from the older and more legitimate patrician aristocracy. Every patrician was of course noble, but the majority of the "noble families" in 146 were not patrician but plebeian. The title had been gradually appropriated, since the opening of the magistracies, by those families whose members had held the consulship. It was thus in theory within the reach of any citizen who could win this office, and, moreover, it carried with it no legal privileges whatsoever. Gradually, however, the ennobled plebeian families drew together, and combined with the older patrician *gentes* to form a distinct order. Office brought wealth and prestige, and both wealth and prestige were liberally employed in securing for this select circle a monopoly of political power, and excluding new men. Already by the close of the period it was rare for anyone but a noble to find his way into high office or into the senate. The senate and magistrates were the mouthpieces of this order, and identified with it in policy and interest. Lastly, it must be allowed that both the senate and the nobility had to some extent justified their power by the use they made of it. It was their tenacity of purpose and devoted patriotism which had carried Rome through the dark days of the Hannibalic War. The heroes of the struggle with Carthage belonged to the leading families; the disasters at the Trasimene lake and at Cannae were associated with the blunders of popular favourites.

From the first, however, there was an inherent weakness in this senatorial government. It had no sound constitutional basis, and with the removal of its accidental supports it fell to the ground. Legally the senate had no positive authority. It could merely advise the magistrate when asked to do so, and its decrees were strictly only suggestions to the magistrate, which he was at liberty to accept or reject as he chose. It had, it is true, become customary for the magistrate not only to ask the senate's advice on all important points, but to follow it when given. But it was obvious that if this custom were weakened, and the magistrates chose to act independently, the senate was powerless. It might indeed anathematize the refractory official, or hamper him if it could by setting in motion against him a colleague or the tribunes, but it could do no more, and these measures failed just where the senate's control was most needed and most difficult to maintain—in its relations with the generals and governors of provinces abroad. The virtual independence of the proconsul was before 146 already exciting the jealousy of the senate and endangering its supremacy. Nor again had the senate any legal hold over the assembly. Except in certain specified cases, it rested with the magistrate to decide whether any question should be settled by a decree of the senate or a vote of the assembly. If he decided to make a proposal to the assembly, he was not bound except by custom to obtain the previous approval of the senate, and the constitution set no limits to the power of the assembly to decide any question whatsoever that was laid before it.

From 150, at least, onwards, there were increasing indications that both the acquiescence of the people in senatorial government and the loyalty of the magistrates to the senate were failing. The rich landowners were not only taking possession of the public lands but were buying out the small farmers. And since the Government took little interest in commerce and industry, the poor were drifting idly to the cities or migrating to the Po valley. Slaves were being brought in to do the work of citizens, and the levies for the wars, which never ceased, fell more and more upon a decreasing citizenry. Between 165 and 135 the number of citizens, which should have increased by at least 100,000, actually dropped 20,000. The populace began to object to the constant levies and to criticize the régime which seemed only to be interested in foreign policies.

It is possible that these constitutional and administrative difficulties would not have proved so rapidly fatal to the republic had not its very foundations been sapped by the changes which followed more or less directly on the conquests of the 3rd and 2nd centuries B.C. For the opening of the world to Rome, and of Rome to the world, produced a radical change in the structure of Roman society. The subjugation of the Mediterranean countries, by placing at the disposal of Rome the vast natural resources of the West and the accumulated treasures of the East, caused a rapid rise in the standard of wealth and a marked change in its distribution. The Roman State was enabled to dispense with the direct taxation of its citizens, since it derived all the revenue which it needed from the subject countries. But this wealth enticed the Romans away from a beneficial development of their own resources into a dangerous parasitism. In time generals and soldiers learned to depend upon the profits of wars, governors to provide for their estates out of illegitimate perquisites of office far away from the vigilant eyes of magistrates at home. Speculators learned to place mortgages in the provinces where interest rates were high, to profit by the protection of Rome's armies, and secure the high return of their investments from lenient governors. Roman nobles, engaged all their lives in the expensive civil and military service, unable to devote any attention to developing their own properties for a livelihood, excused their own and their fellows' exploitation of the subjects. Compelled to find leisure from financial concerns, they disregarded the needs of industry and commerce that might have employed citizens and developed the resources of Italy. Instead they acquiesced in the slave-driven culture of large estates which yielded meagre returns and begot out of war captives a body of citizens bred in servility, ignorance and hatred. Surely the great successes of the 2nd century had come too speedily.

The New Learning.—It was not only the structure and composition of Roman society that underwent a transformation. The victory of Rome in her struggle for supremacy in the Mediterranean basin had been largely due to the powerful conservative forces by which her institutions were preserved from decay. Respect for the *mos maiorum*, or ancestral custom, imposed an effective check on the desire for innovation. Though personal religion, in the deeper sense, was foreign to the Roman temperament, there was a genuine belief in the gods whose favour had made Rome great in the past and would uphold her in the future so long as she trod in the old paths of loyalty and devotion. Above all, the healthy moral traditions of early Rome were maintained by the discipline of the family, resting on the supreme authority of the father—the *patria potestas*—and the powerful influence of the mother, to whom the early training of the child was entrusted. Finally, the institution of the censorship, backed as it was by the mighty force of public opinion, provided a deterrent

which prevented any flagrant deviation from the accepted standard of morals. All this was changed by the influence of Greek civilization, with which Rome was first brought face to face in the 3rd century B.C. owing to her relations with Magna Graecia. At first the results of contact with the older and more brilliant culture of Hellas were on the whole good. In the 2nd century B.C., when constant intercourse was established with the communities of Greece proper and of Asia Minor, "philhellenism" became a passion, which was strongest in the best minds of the day and resulted in a quickened intellectual activity, wider sympathies and a more humane life. But at the same time the "new learning" was a disturbing and unsettling force. The Roman citizen was confronted with new doctrines in politics and religion, and initiated into the speculations of critical philosophy. Under the influence of this powerful solvent the fabric of tradition embodied in the *mos maiorum* fell to pieces; a revolt set in against Roman discipline and Roman traditions of self-effacement, and the craving for individual distinction asserted itself with irresistible vehemence. As it had been in the days of the "sophistic" movement at Athens, so it was now with Rome; a higher education, which, owing to its expense, was necessarily confined to the wealthier classes, interposed between the upper and lower ranks of society a barrier even more effectual than that set up by differences of material condition, and by releasing the individual from the trammels of traditional morality, gave his ambition free course. The effect on private morals may be gauged by the vehemence with which the reactionary opposition, headed by M. Porcius Cato (consul, 195 B.C.; censor, 184 B.C.), inveighed against the new fashions, and by the list of measures passed to check the growth of luxury and licence, and to exclude the foreign teachers of the new learning. It was all in vain. The art of rhetoric, which was studied through the medium of Greek treatises and Greek models, furnished the Roman noble with weapons of attack and defence of which he was not slow to avail himself in the forum and the senate-house. In the science of money-making which had been elaborated under the Hellenistic monarchies, the Roman capitalists proved apt pupils of their Greek teachers. Among the lower classes, contact with foreign slaves and freedmen, with foreign worships and foreign vices, produced a love of novelty which no legislation could check. Even amongst women there were symptoms of revolt against the old order, which showed itself in a growing freedom of manners and impatience of control, the marriage tie was relaxed, and the respect for mother and wife which had been so powerful a factor in the maintenance of the Roman standard of morals, was grievously diminished. Thus Rome was at length brought face to face with a moral and economic crisis which a modern historian has described in the words: "Italy was living through the fever of moral disintegration and incoherence which assails all civilized societies that are rich in the manifold resources of culture and enjoyment, but tolerate few or no restraints on the feverish struggle of contending appetites." In this struggle the Roman republic perished, and personal government took its place. The world had outgrown the city-state and its political machinery, and as representative government, tried in Thessaly and Macedonia, was out of the question in a heterogeneous empire, no solution of the problem was possible save that of absolutism. But a far stronger resistance would have been opposed to political revolution by the republican system had not public morals been sapped by the influences above described. Political corruption was reduced to a science for the benefit of individuals who were often faced with the alternatives of ruin or revolution; there was no longer any body of sound public opinion to which, in the last resort, appeal could be made; and, long before the final catastrophe took place, Roman society itself had become, in structure and temper, thoroughly unrepublican.

The Gracchi, 133–121.—The first systematic attack upon the senatorial government is connected with the names of Tiberius and Gaius Gracchus (*qq.v.*) and its immediate occasion was an attempt to deal with no less a danger than the threatened disappearance of the class to which of all others Rome owed most in the past. The small landholders throughout the greater part of Italy were sinking deeper into ruin under the pressure of accumulated difficulties. The Hannibalic war had laid waste their fields and thinned their numbers, nor when peace returned to Italy did it bring with it any revival of prosperity. The heavy burden of military service still pressed ruinously upon them, and in addition they were called upon to compete with the foreign corn imported from beyond the sea, and with the foreign slave-labour purchased by the capital of wealthier men. Farming became unprofitable, and the hard laborious life with its scanty returns was thrown into still darker relief when compared with the stirring life of the camps with its opportunities of booty, or with the cheap provisions, frequent largesses and gay spectacles to be had in the large towns. The small-holders went off to follow the eagles to try fortune in some province, or swell the proletariat of the cities, and their holdings were left to run waste or merged in the vineyards, olive-yards and above all in the great cattle farms of the rich, and their own place was taken by slaves. The evil was worst in Etruria and in southern Italy; but everywhere it was serious enough to demand the earnest attention of Roman statesmen. Of its existence the Government had received plenty of warning in the declining numbers of able-bodied males returned at the census, in the increasing difficulties of recruiting for the legions, in servile outbreaks in Etruria and Apulia, and between 200 and 160 a good deal was attempted by way of remedy. In addition to the foundation of 20 colonies, there were frequent allotments of land to veteran soldiers, especially in Apulia and Samnium. In 180, 40,000 Ligurians were removed from their homes and settled on vacant lands once the property of a Samnite tribe, and in 160 the Pomptine marshes were drained for the purpose of cultivation. But these efforts were only partially successful. The colonies planted in Cisalpine Gaul and in Picenum flourished, but of the others the majority slowly dwindled away, and two required recolonizing only eight years after their foundation. The veterans who received land were unfitted to make good farmers; and large numbers, on the first opportunity, gladly returned as volunteers to a soldier's life. Moreover, after 160 even these efforts ceased, and with the single exception of the colony of Auximum in Picenum (157) nothing was done to check the spread of the evil, until in 133 Tiberius Gracchus, on his election to the tribunate, set his hand to the work.

The remedy proposed by Gracchus amounted in effect to the resumption by the State of as much of the "common land" as was not held in occupation by authorized persons and conformably to the provisions of the Licinian law, and the distribution in allotments of the land thus rescued for the community from the monopoly of a few. It was a scheme which could quote in its favour ancient precedent as well as urgent necessity. Of the causes which led to its ultimate failure something will be said later on; for the present we must turn to the constitutional conflict which it provoked. The senate from the first identified itself with the interests of the wealthy occupiers, and Tiberius found himself forced into a struggle with that body, which had been no part of his original plan. He fell back on the legislative sovereignty of the assembly; he resuscitated the half-forgotten powers of interference vested in the tribunate in order to paralyse the action of the senatorial magistrates, and finally lost his life in an attempt to make good one of the weak points in the tribune's position by securing his own re-election for a second year. But the conflict did not end with his death. It was renewed on a wider scale and with a more deliberate aim by his brother Gaius, who on his election to the tribunate (123) at once came forward with a vast programme of legislation. He shrewdly began by weakening the influence of the senate. Since his followers had every reason to dread the *senatus consultum ultimum*, the senate's chief weapon of attack against opponents, his first plebiscite reasserted the "right of appeal." He then destroyed the senate's prerogative to assign the provinces to its partisans, took away the jury panels from the senators, and also claimed for the assembly the right to assign public contracts and to control the budget so far as it desired. Thus the senate lost control of the gifts by which it cajoled and the lashes by which it compelled obedience. Very early also he gave doles of grain to the poor. This later led to great evils, but it must have been instituted as a temporary

measure since he intended soon to distribute the needy in colonies. The evils of the dole must be accredited to the senate which stopped the colonization and did not have the courage to stop the dole. The jury panels he now made up of knights instead of senators. Gracchus wished, it seems, to give official recognition through civil service to men of business, in whom he had great faith. He would thus widen the group interested in public concerns and build up an influential order as a balance to the old nobility. Later it proved a disadvantage that publicans could sit in judgment over provincial governors who had to hold the publicans in check, but this difficulty could hardly have been foreseen since publicans did not yet have provincial contracts. In order to secure larger returns from the Asiatic province, recently inherited by Rome, Gracchus permitted the knights to form corporations of limited liability (such corporations were otherwise prohibited) with the privilege of taking contracts to gather and dispose of the Asiatic tithe. The advantages would be that the State would receive in advance the sums bid, would not have to build up a large taxing bureau in order to get all that was due, and the taxpayers could pay the tithe in kind according to the yield of each year. Since this system had not been tried before by Rome, its inherent evils were probably not yet known. In time it led not only to harsh exactions because of collusion between governors and publicans, but also to costly exploitation, because the publicans lent money to delinquents at high rates and engaged generally in unseemly speculation. Gracchus used the money in such public works as the assembly at his bidding authorized. The colonies which Gracchus founded—it was only the beginning of a large project—were well selected. Two were planted in southern Italy where many allotments had recently been made to small farmers—at Tarentum and Scylacium. For these, men specially selected for their capacity were chosen. Then 6,000 hardy farmers were sent to the province of Africa which had been lying desolate for a generation, and which had had to depend upon the Punic city of Utica for its harbour and its praetorian residence. Not even then did the senate comprehend its duty to its provincials, but cancelled the colonial charter, though it dared not cancel the allotments. And now though Gracchus lost his re-election to the tribunate he attempted his last great reform of giving the franchise to the Latins in order that the democracy might rest on a wider and sounder basis. Since Caesar, who took many suggestions from Gracchus, later proposed to extend balloting through Italy by local polls, it is not unlikely that Gracchus had that in view. That would finally have removed democratic legislation from the control of the urban crowd. Be that as it may, the attempt to broaden the franchise failed, not this time because of senatorial opposition but because of the selfishness of the voters who did not wish to diminish their own prerogatives. Gracchus lost his influence, and soon after when a riot arose the senate declared martial law and summoned Gracchus to the bar of the senate. He refused to recognize a procedure which the assembly had outlawed the year before. The senate insisting on the legality of its course ordered his arrest and in the riot which ensued he was slain.

The agrarian reforms of the two Gracchi had little permanent effect. Even in the lifetime of Gaius the clause in his brother's law rendering the new holdings inalienable was repealed, and the process of absorption recommenced. In 118 a stop was put to further allotment of occupied lands, and finally, in 111, the whole position of the agrarian question was altered by a law which converted all land still held in occupation into private land. The old controversy as to the proper use of the lands of the community was closed by this act of alienation. The controversy in future turns, not on the right of the poor citizens to the State lands, but on the expediency of purchasing other lands for distribution at the cost of the treasury.

But, though the agrarian reform failed, the political conflict it had provoked continued, and the lines on which it was waged were in the main those laid down by Gaius Gracchus. The sovereignty of the assembly continued to be the watchword of the popular party, and a free use of the tribunician powers of interference and of legislation remained the most effective means of accomplishing their aims.

Marius, 118–100.—Ten years after the death of Gaius the *populares* once more summoned up courage to challenge the supremacy of the senate; but it was on a question of foreign administration that the conflict was renewed. The course of affairs in the client state of Numidia since Micipsa's death in 118 had been such as to discredit a stronger government than that of the senate. In defiance of Roman authority, and relying on the influence of his own well-spent gold, Jugurtha had murdered both his legitimate rivals, Hiempsal and Adherbal, and made himself master of Numidia. The declaration of war wrung from the senate (112) by popular indignation had been followed by the corruption of a consul (111) and the crushing defeat of the proconsul Albinus. On the news of this crowning disgrace the storm burst, and on the proposal of the tribunes a commission of enquiry into the conduct of the war was appointed. But the popular leaders did not stop here. Q. Caecilius Metellus, who as consul (109) had succeeded to the command in Numidia, was an able soldier but a rigid aristocrat; and they now resolved to improve their success by entrusting the command instead to a genuine son of the people. Their choice fell on Gaius Marius (*see* MARIUS), an experienced officer and administrator, but a man of humble birth, wholly illiterate, and one who, though no politician, was by temperament and training a hater of the polished and effeminate nobles who filled the senate. He was triumphantly elected, and, in spite of a decree of the senate continuing Metellus as proconsul, he was entrusted by a vote of the assembly with the charge of the war against Jugurtha (*q.v.*).

Jugurtha was vanquished; and Marius, who had been a second time elected consul in his absence, arrived at Rome in Jan. 104, bringing the captive prince with him in chains. But further triumphs awaited the popular hero. The Cimbri and Teutones were at the gates of Italy; they had four times defeated the senatorial generals, and Marius was called upon to save Rome from a second invasion of the barbarians. After two years of suspense the victory at Aquae Sextiae (102), followed by that on the Raudine plain (101), put an end to the danger by the annihilation of the invading hordes; and Marius, now consul for the fifth time, returned to Rome in triumph. There the popular party welcomed him as a leader with all the prestige of a successful general. Once more, however, they were destined to a brief success followed by disastrous defeat. Marius became for the sixth time consul; of the two popular leaders Glaucia became praetor and Saturninus tribune. But Marius and his allies were not statesmen of the stamp of the Gracchi; and the laws proposed by Saturninus had evidently no serious aim in view other than that of harassing the senate. His corn law merely reduced the price fixed in 123 for the monthly dole of corn, and the main point of his agrarian law lay in the clause appended to it requiring all senators to swear to observe its provisions[1]. The laws were carried, but the triumph of the popular leaders was short-lived. Their period of office was drawing to a close. At the elections fresh rioting took place, and Marius as consul was called upon by the senate to protect the State against his own partisans. Saturninus and Glaucia surrendered, but while the senate was discussing their fate they were surrounded and murdered by their opponents.

The popular party had been worsted once more in their struggle with the senate, but none the less their alliance with Marius, and the position in which their votes placed him, marked an epoch in the history of the revolution. The transference of the political leadership to a consul who was nothing if not a soldier was at once a confession of the insufficiency of the purely civil authority of the tribunate and a dangerous encouragement of military interference in political controversies. The consequences were already foreshadowed by the special provisions made by Saturninus for Marius's veterans, and in the active part taken by them in the passing of his laws. Indirectly, too, Marius, though no politician, played an important part in this new departure. His military reforms at once democratized the army and attached it more closely to its leader for the time being. He swept away

[1]For the *leges Appuleiae*, *see* SATURNINUS, L. APPULEIUS, and authorities there quoted.

the last traces of civil distinctions of rank or wealth within the legion, admitted to its ranks all classes, and substituted voluntary enlistment under a popular general for the old-fashioned compulsory levy. The efficiency of the legion was increased at the cost of a complete severance of the ties which bound it to the civil community and to the civil authorities.

The Social War.—The next important crisis was due partly to the rivalry which had been growing more bitter each year between the senate and the commercial class, and partly to the long-impending question of the enfranchisement of the Italian allies. The *publicani, negotiatores* and others, who constituted what was now becoming known as the equestrian order (*see* EQUITES), had made unscrupulous use of their control of the courts and especially of the *quaestio de repetundis* against their natural rivals, the official class in the provinces. The threat of prosecution before a hostile jury was held over the head of every governor, legate and quaestor who ventured to interfere with their operations in the provinces. The average official preferred to connive at their exactions; the bolder ones paid with fines and even exile for their courage. In 92 the necessity for a reform was proved beyond a doubt by the scandalous condemnation of P. Rutilius Rufus, ostensibly on a charge of extortion, in reality as the reward of his efforts to check the extortions of the Roman equites in Asia. The difficulties of the Italian question were more serious. That the Italian allies were discontented was notorious. After nearly two centuries of close alliance, of common dangers and victories, they now eagerly coveted as a boon that complete amalgamation with Rome which they had at first resented as a dishonour. But, unfortunately, Rome had grown more exclusive in proportion as the value set upon Roman citizenship increased. During the last 40 years feelings of hope and disappointment had rapidly succeeded each other; Marcus Fulvius Flaccus, Gaius Gracchus, Saturninus, had all held out promises of relief—and nothing had yet been done. On each occasion they had crowded to Rome, full of eager expectation, only to be harshly ejected from the city by the consul's orders. The justice of their claims could hardly be denied, the danger of continuing to ignore them was obvious—yet the difficulties in the way of granting them were formidable in the extreme, and from a higher than a merely selfish point of view there was much to be said against the revolution involved in so sudden and enormous an enlargement of the citizen body.

Marcus Livius Drusus (*q.v.*), who as tribune gallantly took up the task of reform, is claimed by Cicero as a member of that party of the centre to which he belonged himself. Noble, wealthy and popular, he seems to have hoped to be able by the weight of his position and character to rescue the burning questions of the day from the grasp of extreme partisans and to settle them peacefully and equitably. But he, like Cicero after him, had to find to his cost that there was no room in the fierce strife of Roman politics for moderate counsels. His proposal to reform the law courts excited the equestrian order and their friends in the senate to fury. The agrarian and corn laws which he coupled with it alienated many more in the senate, and roused the old anti-popular party feeling; finally, his known negotiations with the Italians were eagerly misrepresented to the jealous and excited people as evidence of complicity with a widespread conspiracy against Rome. His laws were carried, but the senate pronounced them null and void. Drusus was denounced in the senate house as a traitor, and on his way home was struck down by the hand of an unknown assassin. His assassination was the signal for an outbreak which had been secretly prepared for some time before. Throughout the highlands of central and southern Italy the flower of the Italian peoples rose as one man. Etruria and Umbria held aloof; the isolated Latin colonies stood firm; but the Sabellian clans, north and south, the Latinized Marsi and Paeligni, as well as the Oscan-speaking Samnites and Lucanians, rushed to arms. No time was lost in proclaiming their plans for the future. A new Italian State was to be formed. The Paelignian town of Corfinium was selected as its capital and re-christened with the proud name of Italica. All Italians were to be citizens of this new metropolis, and here were to be the place of assembly and the senate house. A senate of 500 members and a magistracy resembling that of Rome completed a constitution which adhered closely to the very political traditions which its authors had most reason to abjure.

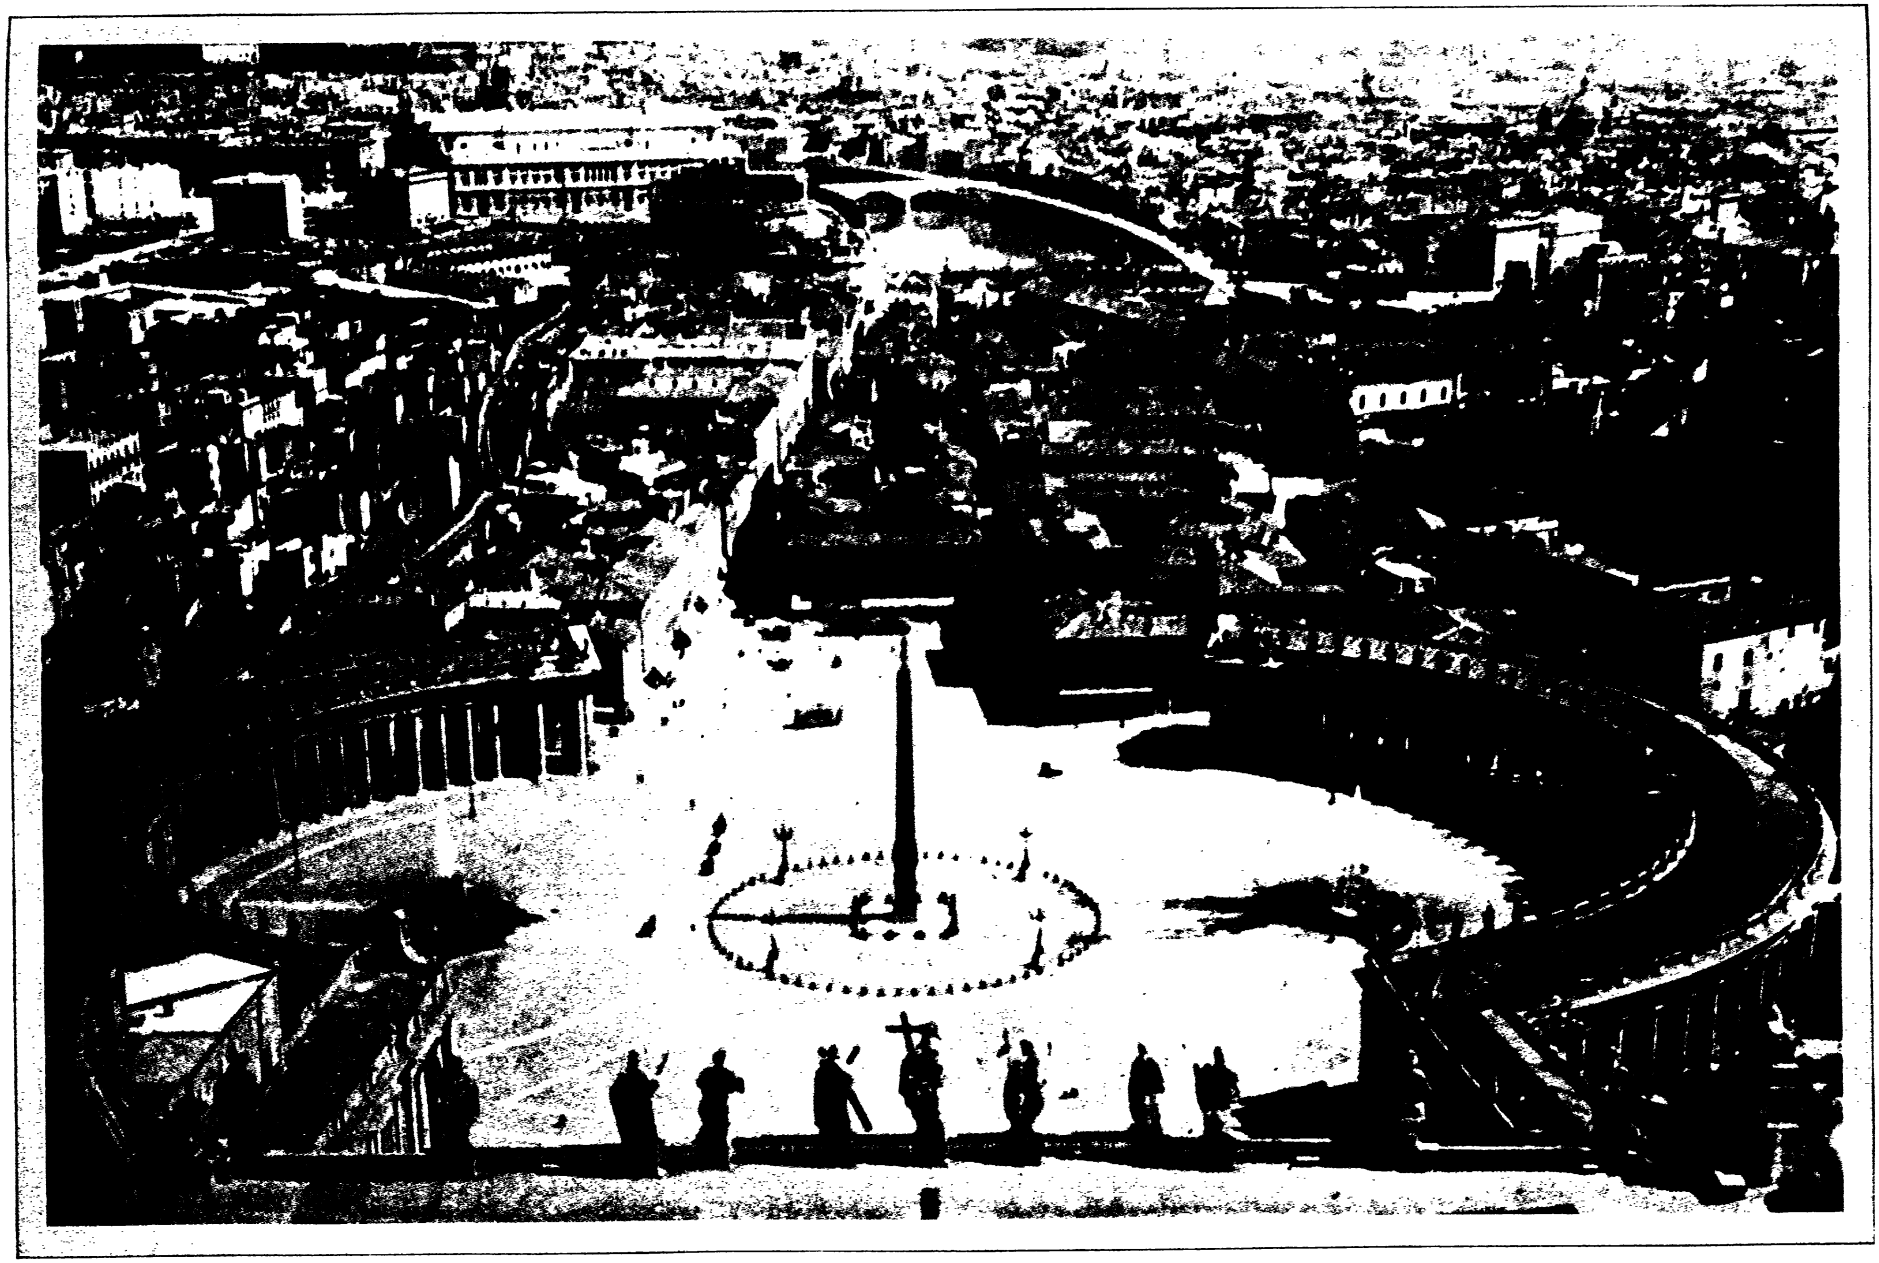
Now, as always in the face of serious danger, the action of Rome was prompt and resolute. Both consuls took the field; with each were five legates, among them the veteran Marius and his destined rival L. Cornelius Sulla, and even freedmen were pressed into service with the legions. But the first year's campaign opened disastrously. In central Italy the northern Sabellians, and in the south the Samnites, defeated the forces opposed to them. And though before the end of the year Marius and Sulla in the north, and the consul Caesar himself in Campania, succeeded in inflicting severe blows on the enemy, and on the Marsi especially, it is not surprising that, with an empty treasury, with the insurgents' strength still unbroken, and with rumours of disaffection in the loyal districts, opinion in Rome should have turned in the direction of the more liberal policy which had been so often scornfully rejected and in favour of some compromise which should check the spread of the revolt, and possibly sow discord among their enemies. Towards the close of the year 90 the consul L. Julius Caesar (killed by Fimbria in 87) carried the *lex Iulia*, by which the Roman franchise was offered to all communities which had not as yet revolted; early in the next year (89) the Julian law was supplemented by the *lex Plautia Papiria*, introduced by two of the tribunes, M. Plautius Silvanus and C. Papirius Carbo Arvina, which enacted that any citizen of an allied community then domiciled in Italy might obtain the franchise by giving in his name to a praetor in Rome with 60 days. A third law (*lex Calpurnia*), apparently passed at the same time, empowered Roman magistrates in the field to bestow the franchise there and then upon all who were willing to receive it. This sudden opening of the closed gates of Roman citizenship was completely successful, and its effects were at once visible in the diminished vigour of the insurgents. By the end of 89 the Samnites and Lucanians were left alone in their obstinate hostility to Rome, and neither, thanks to Sulla's brilliant campaign in Samnium, had for the moment any strength left for active aggression.

The termination of the Social War brought with it no peace in Rome. The old quarrels were renewed with increased bitterness, and the newly enfranchised Italians themselves complained as bitterly of the restriction which robbed them of their due share of political influence by allowing them to vote only in a specified number of tribes. The senate itself was distracted by violent personal rivalries—and all these feuds, animosities and grievances were aggravated by the widespread economic distress and ruin which affected all classes. Lastly, war with Mithridates VI. had been declared; it was notorious that the privilege of commanding the force to be sent against him would be keenly contested, and that the contest would lie between the veteran Marius and L. Cornelius Sulla.

Sulla.—It was in an atmosphere thus charged with the elements of disturbance that P. Sulpicius Rufus (*q.v.*) as tribune brought forward his laws. He proposed: (1) that the command of the Mithridatic War should be given to Marius, though it had legally been assigned to the consul Sulla; (2) that the new citizens should be distributed through all the tribes; (3) that the freedmen should no longer be confined to the four city tribes; (4) that any senator owing more than 2,000 denarii should lose his seat; (5) that those exiled on suspicion of complicity with the Italian revolt should be recalled. These proposals inevitably provoked a storm, and both sides were ominously ready for violent measures. The consuls, in order to prevent legislation, proclaimed a public holiday. Sulpicius replied by arming his followers and driving the consuls from the forum. The proclamation was withdrawn and the laws carried, but Sulpicius's triumph was short-lived. From Nola in Campania, where lay the legions commanded by him in the Social War, Sulla advanced on Rome, and for the first time a Roman consul entered the city at the head of the legions of the republic. Resistance was hopeless. Marius and Sulpicius fled, and Sulla, summoning the assembly of the centuries, proposed the measures he considered necessary for the

public security, the most important being a provision that the sanction of the senate should be necessary before any proposal was introduced to the assembly. Then, after waiting in Rome long enough to hold the consular elections, he left for Asia early in 87.

Sulla had conquered, but his victory cost the republic dear. He had first taught political partisans to look for final success, not to a majority of votes in the forum or campus, but to the swords of the soldiery. The lesson was well learnt. Shortly after his departure L. Cornelius Cinna as consul revived the proposals of Sulpicius; his colleague, Gnaeus Octavius, at the head of an armed force, fell upon the new citizens who had collected in crowds to vote, and the forum was heaped high with the bodies of the slain. Cinna fled, but fled, like Sulla, to the legions. When the senate declared him deposed from his consulship, he replied by invoking the aid of the soldiers in Campania in behalf of the violated rights of the people and the injured dignity of the consulship, and, like Sulla, found them ready to follow where he led. The neighbouring Italian communities, who had lost many citizens in the recent massacre, sent their new champion men and money; while from Africa, whither he had escaped after Sulla's entry into Rome, came Marius with 1,000 Numidian horsemen. The senate had prepared for a desperate defence, but fortune was adverse, and after a brief resistance they gave way. Cinna was acknowledged as consul, the sentence of outlawry passed on Marius was revoked and Cinna and Marius entered Rome with their troops. Marius's thirst for revenge was gratified by a frightful massacre, and he lived long enough to be nominated consul for the seventh time. But he held his consulship only a few weeks. Early in 86 he died, and for the next three years Cinna ruled Rome. Constitutional government was virtually suspended. For 85 and 84 Cinna nominated himself and a trusted colleague as consuls. The state was, as Cicero says, without lawful authority. A partial registration of the newly enfranchised Italians was made, but beyond this little was done. The attention of Cinna and his friends was in truth engrossed by the ever-present dread of Sulla's return from Asia. The consul of 86, L. Valerius Flaccus (who had been consul with Marius in 100 B.C.), sent out to supersede him, was murdered by his own soldiers at Nicomedia. In 85 Sulla, though disowned by his Government, concluded a peace with Mithridates. In 84, after settling affairs in Asia and crushing Flaccus's successor, C. Flavius Fimbria, he crossed into Greece, and in the spring of 83 landed at Brundusium with 40,000 soldiers and a large following of *émigré* nobles. Cinna was dead, murdered like Flaccus by his mutinous soldiers; his most trusted colleague, Cn. Papirius Carbo, was commanding as proconsul in Cisalpine Gaul; and the resistance offered to Sulla's advance was slight. At Capua, Sulla routed the forces of one consul, Gaius Norbanus; at Teanum the troops of the other went over in a body to the side of the outlawed proconsul. After a winter spent in Campania he pressed forward to Rome, defeated the younger Marius (consul, 82) near Praeneste, and entered the city without further opposition. In north Italy the success of his lieutenants, Q. Caecilius Metellus Pius (son of Metellus Numidicus), Cn. Pompeius and Marcus Crassus, had been fully as decisive. Cisalpine Gaul, Umbria and Etruria had all been won for Sulla, and the two principal leaders on the other side, Carbo and Norbanus, had each fled, one to Rhodes, the other to Africa. Only one foe remained to be conquered. The Samnites and Lucanians whom Cinna had conciliated, and who saw in Sulla their bitterest foe, were for the last time in arms, and had already joined forces with the remains of the Marian army close to Rome. The decisive battle was fought under the walls of the city, and ended in the complete defeat of the Marians and Italians (battle of the Colline gate).



For a period of nearly ten years Rome and Italy had been distracted by civil war. Sulla (*q.v.*) was now called upon to heal the divisions which rent the State asunder, to set in working again the machinery of civil government, and above all so to modify it as to meet the altered conditions, and to fortify it against the dangers which visibly threatened it in the future. The real charge against Sulla is not that he failed to accomplish all this, for to do so was beyond the powers even of a man so able, resolute and self-confident as Sulla, armed though he was with absolute authority and backed by overwhelming military strength and the prestige of unbroken success. He stands convicted rather of deliberately aggravating some and culpably ignoring others of the evils he should have tried to cure, and of contenting himself with a party triumph when he should have aimed at the regeneration and confirmation of the whole State. His victory was instantly followed, not by any measures of conciliation, but by a series of massacres, proscriptions and confiscations, of which almost the least serious consequence was the immediate loss of life which they entailed. From this time forward the fear of proscription and confiscation recurred as a possible consequence of every political crisis, and it was with difficulty that Caesar himself dissipated the belief that his victory would be followed by a Sullan reign of terror. The legacy of hatred and discontent which Sulla left behind him was a constant source of disquiet and danger. In the children of the proscribed, whom he excluded from holding office, and the dispossessed owners of the confiscated lands, every agitator found ready and willing allies. The moneyed men of the equestrian order were more than ever hostile to the senatorial government, which they now identified with the man who cherished towards them a peculiar hatred, and whose creatures had hunted them down like dogs. The attachment which the new Italian citizens might in time have learnt to feel for the old republican constitution was nipped in the bud by the massacres at Praeneste and Norba, by the harsh treatment of the ancient towns of Etruria, and by the ruthless desolation of Samnium and Lucania. Quite as fatal were the results to the economic prosperity of the peninsula. Sulla's confiscations, following on the civil and social wars, opened the doors wide for a long train of evils. The veterans whom he planted on the lands he had seized did nothing for agriculture, and swelled the growing numbers of the turbulent and discontented. The "Sullan men" became as great an object of fear and dislike as the "Sullan reign." The *latifundia* increased with startling rapidity—whole territories passing into the hands of greedy partisans. Wide tracts of land, confiscated but never allotted, ran to waste. In many districts of Italy the free population finally and completely disappeared from the open country; and life and property were rendered insecure by the brigandage which now developed unchecked, and in which the herdsmen slaves played a prominent part. The outbreaks of Spartacus in 73, and of Catiline ten years later, were significant commentaries on this part of Sulla's work. His constitutional legislation, while it included many useful administrative reforms, is marked by as violent a spirit of partisanship, and as apparently wilful a blindness to the future. The re-establishment on a legal basis of the ascendancy which custom had so long accorded the senate was his main object. With this purpose he had already, when consul in 88, made the *senatus auctoritas* legally necessary for proposals to the assembly. He now as dictator followed this up by crippling the power of the magistracy, which had been the most effective weapon in the hands of the senate's opponents. The legislative freedom of the tribunes was already hampered by the necessity of obtaining the senate's sanction; in addition, Sulla restricted their wide powers of interference (*intercessio*) to their original purpose of protecting individual plebeians, and discredited the office by prohibiting a tribune from holding any subsequent office in the State. The control of the courts (*quaestiones perpetuae*) was taken from the equestrian order and restored to the senate. To prevent the people from suddenly installing and keeping in high office a second Marius, he re-enacted the old law against re-election, and made legally binding the custom which required a man to mount up gradually to the consulship through the lower offices. His increase of the number of praetors from six to eight, and of quaestors to 20, though required by administrative necessities, tended, by enlarging the numbers and further dividing the authority of the magistrates, to render them still more dependent upon the central direction of the senate. Lastly, he replaced the pontifical and augural colleges in the hands of the senatorial nobles, by enacting that vacancies in them should, as before the *lex Domitia* (104), be filled up by co-optation. It cannot be said that Sulla was success-

ful in fortifying the republican system against the dangers which menaced it from without. He accepted as an accomplished fact the enfranchisement of the Italians, but he made no provision to guard against the consequent reduction of the *comitia* to an absurdity, and with them of the civic government which rested upon them, or to organize an effective administrative system for the Italian communities. In fact he prevented the further registration of the new citizens by abolishing the censorship. Of all men, too, Sulla had the best reason to appreciate the dangers to be feared from the growing independence of governors and generals in the provinces and from the transformation of the old civic militia into a group of professional armies, devoted only to a successful leader, and with the weakest possible sense of allegiance to the State. He had himself, as proconsul of Asia, contemptuously and successfully defied the home Government, and he, more than any other Roman general, had taught his soldiers to look only to their leader, and to think only of booty. Yet, beyond a few inadequate regulations, there is no evidence that Sulla dealt with these burning questions, the settlement of which was among the greatest of the achievements of Augustus. One administrative reform of real importance must, lastly, be set down to his credit. The judicial procedure first established in 149 for the trial of cases of magisterial extortion in the provinces, and applied between 149 and 81 to cases of treason and bribery. Sulla extended so as to bring under it the chief criminal offences, and thus laid the foundation of the Roman criminal law.

Overthrow of the Sullan Constitution.—The Sullan system stood for nine years, and was then overthrown—as it had been established—by a successful soldier. It was the fortune of Cn. Pompey, a favourite officer of Sulla, first of all to violate in his own person the fundamental principles of the constitution re-established by his old chief, and then to overturn it. In Spain the Marian governor Q. Sertorius (*see* SERTORIUS) had defeated one after another of the proconsuls sent out by the senate, and was already in 77 master of all Hither Spain. To meet the crisis, Pompey (*q.v.*), who was not yet 30, and had never held even the quaestorship, was sent out to Spain with proconsular authority. Still Sertorius held out, until in 73 he was foully murdered by his own officers. The native tribes who had loyally stood by him submitted, and Pompey early in 71 returned with his troops to Italy, where, during his absence in Spain, an event had occurred which had shown Roman society with startling plainness how near it stood to revolution. In 73 Spartacus (*q.v.*), a Thracian slave, escaped with 70 others from a gladiators' training school at Capua. In a startlingly short time he found himself at the head of 70,000 runaway slaves, outlaws, brigands and impoverished peasants, and for two years terrorized Italy, routed the legions sent against him, and even threatened Rome. He was at length defeated and slain by the praetor, M. Licinius Crassus, in Apulia. In Rome itself the various classes and parties hostile to the Sullan system had, ever since Sulla's death in 78, been incessantly agitating for the repeal of his most obnoxious laws, and needed only a leader in order successfully to attack a Government discredited by failure at home and abroad. With the return of Pompey from Spain their opportunity came. Pompey, who understood politics as little as Marius, was anxious to obtain a triumph, the consulship for the next year (70), and as the natural consequence of this an important command in the East. The opposition wanted his name and support, and a bargain was soon struck. Pompey and with him Marcus Licinius Crassus, the real conqueror of Spartacus, were elected consuls, almost in the presence of their troops, which lay encamped outside the gates in readiness to assist at the triumph and ovation granted to their respective leaders. Pompey lost no time in performing his part of the agreement. The tribunes regained their prerogatives. The "perpetual courts" (*quaestiones perpetuae*) were taken out of the hands of the senatorial *iudices*, who had outdone the equestrian order in scandalous corruption, and finally the censors, the first since 86 B.C., purged the senate of the more worthless and disreputable of Sulla's partisans. The victory was complete; but for the future its chief significance lay in the clearness with which it showed that the final decision in matters political lay with neither of the two great parties in Rome, but with the holder of the military authority. The tribunes ceased to be political leaders and became lieutenants of the military commanders, and the change was fatal to the dignity of politics in the city. Men became conscious of the unreality of the old constitutional controversies, indifferent to the questions which agitated the forum and the curia, and contemptuously ready to alter or disregard the constitution itself when it stood in the way of interests nearer to their hearts.

Pompey, Caesar and Cicero.—When his consulship ended, Pompey impatiently awaited at the hands of the politicians he had befriended the further gift of a foreign command. He declined an ordinary province, and from the end of 70 to 67 he remained at Rome in a somewhat affectedly dignified seclusion. But in 67 and 66 the laws of Gabinius and Manilius gave him all and more than all that he expected (*see* POMPEY). By the former he obtained the sole command for three years against the Mediterranean pirates. He was to have supreme authority over all Roman magistrates in the provinces throughout the Mediterranean and over the coasts for 50m. inland. Fifteen *legati*, all of praetorian rank, were assigned to him, with 200 ships, and as many troops as he thought desirable. The Manilian law transferred from Lucullus and Glabrio to Pompey the conduct of the Mithridatic War in Asia, and with it the entire control of Roman policy and interests in the East. The unrepublican character of the position thus granted to Pompey, and the dangers of the precedent established, were clearly enough pointed out by such moderate men as Q. Lutatius Catulus, the "father of the senate," and by the orator Hortensius—but in vain. Both laws were supported, not only by the tribunes and the populace, but by the whole influence of the *publicani* and *negotiatores*, whose interests in the East were at stake.

Pompey left Rome in 67. In a marvellously short space of time he freed the Mediterranean from the Cilician pirates and established Roman authority in Cilicia itself. He then crushed Mithridates (*q.v.*), added Syria to the list of Roman provinces, and led the Roman legions to the Euphrates and the Caspian, leaving no power capable of disputing with Rome the sovereignty of western Asia. He did not return to Italy till towards the end of 62. The interval was marked in Rome by the rise to political importance of Caesar (*q.v.*) and Cicero, and by Catiline's attempt at revolution. As the nephew of Marius and the son-in-law of Cinna, Caesar possessed a strong hereditary claim to the leadership of the popular and Marian party. He had already taken part in the agitation for the restoration of the tribunate; he had supported the Manilian law; and, when Pompey's withdrawal left the field clear for other competitors, he stepped at once into the front rank on the popular side. He took upon himself, as their nearest representative, the task of clearing the memory and avenging the wrongs of the great popular leaders, Marius, Cinna and Saturninus. He publicly reminded the people of Marius's services, and set up again upon the Capitol the trophies of the Cimbric War. He endeavoured to bring to justice, not only the ringleaders in Sulla's bloody work of proscription, but even the murderers of Saturninus, and vehemently pleaded the cause of the children of the proscribed. While thus carrying on in genuine Roman fashion the feud of his family, he attracted the sympathies of the Italians by his efforts to procure the Roman franchise for the Latin communities beyond the Po, and won the affections of the populace in Rome and its immediate neighbourhood by the splendour of the games which he gave as curule aedile (65), and by his lavish expenditure upon the improvement of the Appian Way. But these measures were with him only means to the further end of creating for himself a position such as that which Pompey had already won; and this ulterior aim he pursued with an audacious indifference to constitutional forms and usages. His coalition with Crassus, soon after Pompey's departure, secured him an ally whose colossal wealth and wide financial connections were of inestimable value, and whose vanity and inferiority of intellect rendered him a willing tool. The story of his attempted *coup d'état* in Jan. 65 is probably false, but it is evident that by the beginning of 63 he was bent on reaping the reward of his exertions by obtaining from the people an extraordinary command

MONUMENTS AND BUILDINGS OF ANCIENT AND MODERN ROME

1. Monument of Victor Emmanuel II. begun in 1885, dedicated in 1911, in commemoration of the achievement of Italian unity. Designed by Giuseppe Sacconi. 2. Part of the Vatican and the Pope's private gardens as seen from the terrace. 3. Bridge and Castle of S. Angelo on the right bank of the Tiber (*See* also Plate I.). 4. The Appian Way, showing part of the ruins of the Claudian Aqueduct, originally 46½ miles long, begun by Caligula in A.D. 38 and finished by Claudius, A.D. 52. 5. The Pantheon, built by Hadrian, and consecrated as a Christian church in 609. 6. St. Peter's church and piazza. 7. A small circular Corinthian temple erroneously called the "Temple of Vesta," situated on the left bank of the Tiber, near the foot of the Aventine hill. It is now thought to have been the temple of Portunus, god of harbours. 8. Ruins of the Roman Forum, looking southeast. In the background, beyond the Forum, is the Colosseum

abroad, which should secure his position before Pompey's return; and the agrarian law proposed early that year by the tribune P. Servilius Rullus had for its object the creation, in favour of Caesar and Crassus, of a commission with powers so wide as to place its members almost on a level with Pompey himself. It was at this moment when all seemed going well, that Caesar's hopes were dashed to the ground by Catiline's desperate outbreak, which not only discredited every one connected with the popular party, but directed the suspicions of the well-to-do classes against Caesar himself, as a possible accomplice in Catiline's revolutionary schemes.

The same wave of indignation and suspicion which for the moment checked Caesar's rise carried Marcus Tullius Cicero to the height of his fortunes. Cicero (*q.v.*), as a politician, has been equally misjudged by friends and foes. That he was deficient in courage, that he was vain, and that he attempted the impossible, may be admitted at once. But he was neither a brilliant and unscrupulous adventurer nor an aimless trimmer, nor yet a devoted champion merely of senatorial ascendancy[1]. He was a representative man, with a numerous following, and a policy which was naturally suggested to him by the circumstances of his birth, connections and profession, and which, impracticable as it proved to be, was yet consistent, intelligible and high-minded. Born at Arpinum, he cherished like all Arpinates the memory of his great fellow-townsman Marius, the friend of the Italians, the saviour of Italy and the irreconcilable foe of Sulla and the nobles. A "municipal" himself, his chosen friends and his warmest supporters were found among the well-to-do classes in the Italian towns. Unpopular with the Roman aristocracy, who despised him as a *peregrinus*, and with the Roman populace, he was the trusted leader of the Italian middle class, "the true Roman people," as he proudly styles them. It was they who carried his election for the consulship (63), who in 58 insisted on his recall from exile, and it was his influence with them which made Caesar so anxious to win him over in 49. He represented their antipathy alike to socialistic schemes and to aristocratic exclusiveness, and their old-fashioned simplicity of life in contrast with the cosmopolitan luxury of the capital. By birth, too, he belonged to the equestrian order, the foremost representatives of which were indeed still the *publicani* and *negotiatores*, but which since the enfranchisement of Italy included also the substantial burgesses of the Italian towns and the smaller "squires" of the country districts. With them, too, Cicero was at one in their dread of democratic excesses and their social and political jealousy of the *nobiles*. Lastly, as a lawyer and a scholar, he was passionately attached to the ancient constitution. His political ideal was the natural outcome of these circumstances. He advocated the maintenance of the old constitution, but not as it was understood by the extreme politicians of the right and left. The senate was to be the supreme directing council, but the senate of Cicero's dreams was not an oligarchic assemblage of nobles, but a body freely open to all citizens, and representing the worth of the community. The magistrates, while deferring to the senate's authority, were to be at once vigorous and public-spirited; and the assembly itself which elected the magistrates and passed the laws was to consist, not of the "mob of the forum," but of the true Roman people throughout Italy. For the realization of this ideal he looked, above all things, to the establishment of cordial relations between the senate and nobles in Rome and the great middle-class of Italy represented by the equestrian order, between the capital and the country towns and districts. This was the *concordia ordinum*, the *consensus Italiae*, for which he laboured.

Cicero's election to the consulship for 63 over the heads of Caesar's nominees, Antonius and Catiline, was mainly the work of the Italian middle-class, already rendered uneasy both by the rumours which were rife of revolutionary schemes and of Caesar's boundless ambition, and by the numerous disquieting signs of disturbance noticeable in Italy. The new consul vigorously set himself to discharge the trust placed in him. He defeated the insidious proposals of Rullus for Caesar's aggrandizement and assisted in quashing the prosecution of Gaius Rabirius (*q.v.*). But with the consular elections in the autumn of 63 a fresh danger arose from a different quarter. The "conspiracy of Catiline" (*see* CATILINE) was not the work of the popular party, and still less was it an unselfish attempt at reform; Catiline himself was a patrician, who had held high office, and possessed considerable ability and courage; but he was bankrupt in character and in purse, and two successive defeats in the consular elections had rendered him desperate. To retrieve his broken fortunes by violence was a course which was only too readily suggested by the history of the last 40 years, and materials for a conflagration abounded on all sides. The danger to be feared from his intrigues lay in the state of Italy, which made a revolt against society and the established Government only too likely if once a leader presented himself, and it was such a revolt that Catiline endeavoured to organize. Bankrupt nobles like himself, Sullan veterans and the starving peasants whom they had dispossessed of their holdings, outlaws of every description, the slave population of Rome, and the wilder herdsmen-slaves of the Apulian pastures, were all enlisted under his banner, and attempts were even made to excite disaffection among the newly conquered people of southern Gaul and the warlike tribes who still cherished the memory of Sertorius in Spain. In Etruria, the seat and centre of agrarian distress and discontent, a rising actually took place headed by a Sullan centurion, but the spread of the revolt was checked by Cicero's vigorous measures. Catiline fled from Rome, and died fighting with desperate courage at the head of his motley force of old soldiers, peasants and slaves. His accomplices in Rome were arrested, and, after an unavailing protest from Caesar, the senate authorized the consuls summarily to put them to death.

Coalition of Pompey, Caesar and Crassus.—The Catilinarian outbreak had been a blow to Caesar, whose schemes it interrupted, but to Cicero it brought not only popularity and honour, but, as he believed, the realization of his political ideal. But Pompey was now on his way home[2], and again as in 70 the political future seemed to depend on the attitude which the successful general would assume; Pompey himself looked simply to the attainment by the help of one political party or another of his immediate aims, which at present were the ratification of his arrangements in Asia and a grant of land for his troops. It was the impracticable jealousy of his personal rivals in the senate, aided by the versatility of Caesar who presented himself not as his rival but as his ally, which drove Pompey once more, in spite of Cicero's efforts, into the camp of what was still nominally the popular party. In 60, on Caesar's return from his propraetorship in Spain, the coalition was formed which is known by the somewhat misleading title of the First Triumvirate. Pompey was ostensibly the head of this new alliance, and in return for the satisfaction of his own demands he undertook to support Caesar's candidature for the consulship. The wealth and influence of Crassus were enlisted in the same cause, and the *publicani* were secured by a promise of release from their bargain for collecting the taxes of Asia. Cicero was under no illusions as to the significance of this coalition. It scattered to the winds his dreams of a stable and conservative republic. The year 59 saw the republic powerless in the hands of three citizens. Caesar as consul procured the ratification of Pompey's acts in Asia, granted to the *publicani* the relief refused by the senate, and carried an agrarian law of the new type, which provided for the purchase of lands for allotment at the cost of the treasury and for the assignment of the rich *ager Campanus*. But Caesar aimed at more than the carrying of laws in the teeth of the senate or any party victory in the forum. An important military command was essential to him. An obedient tribune, P. Vatinius, was found, and by the *lex Vatinia* he was given for five years the command of Cisalpine Gaul and Illyricum, to which was added by a decree of the senate Transalpine Gaul also. This command not only opened to him a great military career, but enabled him, as the master of the valley of the Po, to keep an effective watch on the course of affairs in Italy.

[1] Mommsen is throughout unfair to Cicero. The best estimates of Cicero are those given by Strachan-Davidson in his *Cicero* (1894), by Prof. Tyrrell in his Introductions to his edition of Cicero's *Letters*, and by Petersson, *Cicero, a Biography* (1920).

[2] For the history of the next 18 years, the most important ancient authority is Cicero in his letters and speeches.

Early the next year the attack upon himself which Cicero had foreseen was made. P. Clodius (*q.v.*) as tribune brought forward a law enacting that anyone who had put a Roman citizen to death without trial by the people should be interdicted from fire and water. Cicero, finding himself deserted even by Pompey, left Rome in a panic, and by a second Clodian law he was declared to be outlawed. With Caesar away in his province and Cicero banished, Clodius was for the time master in Rome. But, absolute as he was in the streets, and recklessly as he parodied the policy of the Gracchi by violent attacks on the senate, his tribunate merely illustrated the anarchy which now inevitably followed the withdrawal of a strong controlling hand. A reaction speedily followed. Pompey, bewildered and alarmed by Clodius's violence, at last bestirred himself. Cicero's recall was decreed by the senate, and early in Aug. 57 in the *comitia centuriata*, to which his Italian supporters flocked in crowds, a law was passed revoking the sentence of outlawry passed upon him.

Break-up of the Coalition.—Intoxicated by the acclamations which greeted him, and encouraged by Pompey's support, and by the salutary effects of Clodius's excesses, Cicero's hopes rose high. With indefatigable energy he strove to reconstruct a solid constitutional party, but only to fail once more. Pompey was irritated by the hostility of a powerful section in the senate, who thwarted his desires for a fresh command and even encouraged Clodius in insulting the conqueror of the East. Caesar became alarmed at the reports which reached him that the repeal of his agrarian law was threatened and that the feeling against the coalition was growing in strength; above all, he was anxious for a renewal of his five years' command. He acted at once, and in the celebrated conference at Luca (56) the alliance of the three self-constituted rulers of Rome was renewed. Cicero succumbed to the inevitable and withdrew in despair from public life. Pompey and Crassus became consuls for 55. Caesar's command was renewed for another five years, and to each of his two allies important provinces were assigned for a similar period—Pompey receiving the two Spains and Africa, and Crassus Syria. The coalition now divided between them the control of the empire. For the future the question was, how long the coalition itself would last. Its duration proved to be short. In 53 Crassus was defeated and slain by the Parthians at Carrhae, and in Rome the course of events slowly forced Pompey into an attitude of hostility to Caesar. The year 54 brought with it a renewal of the riotous anarchy which had disgraced Rome in 58–57. Conscious of its own helplessness, the senate, with the eager assent of all respectable citizens, dissuaded Pompey from leaving Italy; and he accordingly left his provinces to be governed by his legates. But the anarchy and confusion only grew worse, and even strict constitutionalists like Cicero talked of the necessity of investing Pompey with some extraordinary powers for the preservation of order[1]. At last in 52 he was elected sole consul, and not only so, but his provincial command was prolonged for five years more, and fresh troops were assigned him. The rôle of "saviour of society" thus thrust upon Pompey was one which flattered his vanity, but it entailed consequences which it is probable he did not foresee, for it brought him into close alliance with the senate. In the senate there was a powerful party which was resolved to force him into heading the attack upon Caesar that otherwise they could not successfully make. It was known that Caesar, whose command expired in March 49, but who in the ordinary course of things would not have been replaced by his successor until Jan. 48, was anxious to be allowed to stand for his second consulship in the autumn of 49 without coming in person to Rome. His opponents in the senate were equally bent on bringing his command to an end at the legal time, and so obliging him to disband his troops and stand for the consulship as a private person, or, if he kept his command, on preventing his standing for the consulship. Through 51 and 50 the discussions in the senate and the negotiations with Caesar continued, but with no result. On Jan. 1, 49, Caesar made a last offer of compromise. The senate replied by requiring him on pain of outlawry to disband his legions. Two tribunes who supported him were ejected from the senate house, and the magistrates with Pompey were authorised to take measures to protect the republic. Caesar hesitated no longer; he crossed the Rubicon and invaded Italy. The rapidity of his advance astounded and bewildered his foes. Pompey, followed by the consuls, by the majority of the senate and a long train of nobles, abandoned Italy as untenable, and crossed into Greece. At the end of March Caesar entered Rome as the master of Italy. Four years later, after the final victory of Munda (45), he became the undisputed master of the Roman world[2].

Dictatorship of Caesar, 48–44.—From the very first moment when Pompey's ignominious retreat left him master of Italy, Caesar made it clear that he was neither a second Sulla nor even the reckless anarchist which many believed him to be. The Roman and Italian public were first startled by the masterly rapidity and energy of his movements, and then agreeably surprised by his lenity and moderation. No proscriptions or confiscations followed his victories, and all his acts evinced an unmistakable desire to effect a sober and reasonable settlement of the pressing questions of the hour; of this, and of his almost superhuman energy, the long list of measures he carried out or planned is sufficient proof. The "children of the proscribed" were at length restored to their rights, and with them many of the refugees who had found shelter in Caesar's camp during the two or three years immediately preceding the war; but the extreme men among his supporters soon realized that their hopes of *novae tabulae* and grants of land were illusory. In allotting lands to his veterans, Caesar carefully avoided any disturbance of existing owners and occupiers, and the mode in which he dealt with the economic crisis produced by the war seems to have satisfied all reasonable men. It had been a common charge against Caesar in former days that he paid excessive court to the populace of Rome, and now that he was master he still dazzled and delighted them by the splendour of the spectacles he provided, and by the liberality of his largesses. But he was no indiscriminate flatterer of the mob. The popular clubs and gilds which had helped to organize the anarchy of the last few years were dissolved. A strict enquiry was made into the distribution of the monthly doles of corn, and the number of recipients was reduced by one-half; finally, the position of the courts of justice was raised by the abolition of the popular element among the indices. Nor did Caesar shrink from the attempt, in which so many had failed before him, to mitigate the twin evils which were ruining the prosperity of Italy—the concentration of a pauper population in the towns and the denudation and desolation of the country districts. His strong hand carried out the scheme so often proposed by the popular leaders since the days of Gaius Gracchus, the colonization of Carthage and Corinth. Allotments of land on a large scale were made in Italy; decaying towns were reinforced by fresh drafts of settlers; on the large estates and cattle farms the owners were required to find employment for a certain amount of free labour; and a slight and temporary stimulus was given to Italian industry by the reimposition of harbour dues upon foreign goods.

The reform of the calendar (*q.v.*) completes a record of administrative reform which entitles Caesar to the praise of having governed well, whatever may be thought of the validity of his title to govern at all. But how did Caesar deal with what was after all the greatest problem which he was called upon to solve, the establishment of a satisfactory government for the empire? One point indeed was already settled. Some centralization of the executive authority was indispensable, and this part of his work Caesar thoroughly performed. From the moment when he seized the moneys in the treasury on his first entry into Rome down to the day of his death, he recognized no other authority but his throughout the empire. He alone directed the policy of Rome in foreign affairs; the legions were led, and the provinces governed, not by independent magistrates, but by his legates; and the title *imperator* which he adopted was intended to express the absolute and unlimited nature of the *imperium* he claimed, as distinct

[1] Cicero himself anticipated Augustus in his picture of a *princeps civitatis* sketched in a lost book of the *De republica*, written about this time, which was based upon his hopes of what Pompey might prove to be; *Ad Att.*, viii. 11; August *De civ. Dei*, v. 13.

[2] For the Civil Wars, *see* CAESAR; CICERO; and POMPEY.

from the limited spheres of authority possessed by republican magistrates. In so centralizing the executive authority over the empire at large, Caesar was but developing the policy implied in the Gabinian and Manilian laws, and the precedent he established was closely followed by his successors. It was otherwise with the more difficult question of the form under which this new executive authority should be exercised and the relation it should hold to the republican constitution.

Caesar did not explain to the public what shape he intended ultimately to give to the new system. It could hardly have been the "perpetual dictatorship," which was decreed him by the senate after his victory at Munda (45). The dictatorship was associated with those very Sullan traditions from which Caesar was most anxious to sever himself, and the name had no value in the empire at large. It was rumoured that he intended to follow Alexander's example and at least in the eastern provinces adopt the title of king with the theocratic associations which the title bore in the East. Roman proconsuls who had served in Asia and had seen the ease with which kings ruled when not hampered by constitutions and privileged to utter decrees that were considered sacred, would well have comprehended the advantages of such divine absolutism. Caesar might readily remain in the East for some years after his Parthian campaign, and while busy reorganizing the provinces there he would inure his court and the senators in his train to accept the new *rex*. When the time was ripe he might proclaim the title at Rome, and then, being recognized as more than human and above legal restrictions, he could carry whatever reforms he desired by decree. That these rumours deserve some credit we may believe, not only because Caesar before his death accepted several "divine" honours from the senate, but also because Mark Antony, who knew Caesar's plans, pursued such a course after Caesar's death. It is not unlikely that Caesar intended some day to accept for himself the position of an absolute monarch like Alexander or Ptolemy Philadelphus[1]. But he was well aware that it would require many years of training to prepare the senate for the announcement.

The old constitution was not formally abrogated. The senate met and deliberated; the assembly passed laws and elected magistrates; there were still consuls, praetors, aediles, quaestors and tribunes; and Caesar himself, like his successors, professed to hold his authority by the will of the people. But senate, assembly and magistrates were all alike subordinated to the paramount authority of the dictator; and this subordination was, in appearance at least, more direct and complete under the rule of Caesar than under that of Augustus. For months together Rome was left without any regular magistrates, and was governed like a subject town by Caesar's prefects. At another time a tribune was seen exercising authority outside the city bounds and invested with the *imperium* of a praetor. At the elections, candidates appeared before the people backed by a written recommendation from the dictator, which was equivalent to a command. Finally, the senate itself was transformed out of all likeness to its former self by the raising of its numbers to 900, and by the admission of old soldiers, sons of freedmen and even "semi-barbarous Gauls." But, though Caesar's high-handed conduct in this respect was not imitated by his immediate successors, yet the main lines of their policy were laid down by him. These were: (1) the municipalization of the old republican constitution, and (2) its subordination to the paramount authority of the master of the legions and the provinces. In the first case he only carried farther a change already in progress. Of late years the senate had been rapidly losing its hold over the empire at large. Even the ordinary proconsuls were virtually independent potentates, ruling their provinces as they chose, and disposing absolutely of legions which recognized no authority but theirs. The consuls and praetors of each year had since 81 been stationed in Rome, and immersed in purely municipal business; and, lastly, since the enfranchisement of Italy, the *comitia*, though still recognized as the ultimate source of all authority, had become little more than assemblies of the city populace, and their claim to represent the true Roman people was indignantly questioned, even by republicans like Cicero. The concentration in Caesar's hands of all authority outside Rome completely and finally severed all real connection between the old institutions of the republic of Rome and the Government of the Roman empire. But the institutions of the republic not merely became, what they had originally been, the local institutions of the city of Rome; they were also subordinated even within these narrow limits to the paramount authority of the man who held in his hands the army and the provinces. Autocratic abroad, at home he was the chief magistrate of the commonwealth; and this position was marked, in his case as in that of those who followed him, by a combination in his person of various powers, and by a general right of precedence which left no limits to his authority but such as he chose to impose upon himself. During the greater part of his reign he was consul as well as dictator. In 48, after his victory at Pharsalia, he was given the *tribunicia potestas* for life, and after his second success at Thapsus the *praefectura morum* for three years. As chief magistrate he convenes and presides in the senate, nominates candidates, conducts elections, carries laws in the assembly and administers justice in court. Finally, as a reminder that the chief magistrate of Rome was also the autocratic ruler of the empire, he wore even in Rome the laurel wreath and triumphal dress, and carried the sceptre of the victorious imperator.

Nor are we without some clue as to the policy which Caesar had sketched out for himself in the administration of the empire, the government of which he had centralized in his own hands. The much needed work of rectifying the frontiers he was forced, by his premature death, to leave to other hands, but within the frontiers he anticipated Augustus in lightening the financial burdens of the provincials, and in establishing a stricter control over the provincial governors, while he went beyond him in his desire to consolidate the empire by extending the Roman franchise and admitting provincials to a share in the Government. He completed the Romanization of Italy by his enfranchisement of the Transpadane Gauls, and by establishing throughout the peninsula a uniform system of municipal government, which under his successors was gradually extended to the provinces.

The Second Triumvirate, 43–28.—On the eve of his departure for the East, to avenge the death of Crassus and humble the power of Parthia, Caesar fell a victim to the republican nobles; and between the day of his death (March 15, 44) and that on which Octavian defeated Antony at Actium (Sept. 2, 31) lies a dreary period of anarchy and bloodshed.

For a moment, in spite of the menacing attitude of Caesar's self-constituted representative Marcus Antonius (Mark Antony), it seemed to one man at least as if the restoration of republican government was possible. With indefatigable energy Cicero strove to enlist the senate, the people, and above all the provincial governors in support of the old constitution. But, though his eloquence now and again carried all before it in senate house and forum, it was powerless to alter the course of events. By the beginning of 43 civil war had recommenced; in the autumn Antony was already threatening an invasion of Italy at the head of 17 legions. Towards the end of October Antony and his ally M. Aemilius Lepidus coalesced with the young Octavian, who had been recently elected consul at the age of 20, in spite of senatorial opposition; and the coalition was legalized by the creation of the extraordinary commission for the "reorganization of the commonwealth" known as the Second Triumvirate. It was appointed for a period of five years, and was continued in 37 for five years more. The rule of the triumvirs was inaugurated in the Sullan fashion by a proscription, foremost among the victims of which was Cicero himself. In the next year the defeat of M. Iunius Brutus and C. Cassius Longinus at Philippi, by the combined forces of Octavian and Antony, destroyed the last hopes of the republican party. In 40 a threatened rupture between the two victors was avoided by the treaty concluded at Brundisium. Antony married Octavian's sister Octavia, and took command of the eastern half of the empire; Octavian appropriated Italy and the West; while Lepidus was forced to content himself with Africa. For the next 12 years, while Antony was indulging in

[1] E. Meyer, *Kleine Schriften* (2nd ed. i. 449).

dreams of founding for himself and Cleopatra an empire in the East, and shocking Roman feeling by his wild excesses and his affectation of Oriental magnificence, Octavian was patiently consolidating his power. Lepidus, his fellow-triumvir, was in 36 ejected from Africa and banished to Circeii, while Sextus Pompeius, who had since his defeat at Munda maintained a semi-piratical ascendancy in the western Mediterranean, was decisively defeated in the same year, and his death in 35 left Octavian sole master of the West. The inevitable trial of strength between himself and Antony was not long delayed. In 32 Antony openly challenged the hostility of Octavian by divorcing Octavia in favour of the beautiful and daring Egyptian princess, with whom, as the heiress of the Ptolemies, he aspired to share the empire of the eastern world. By a decree of the senate Antony was declared deposed from his command, and war was declared against Queen Cleopatra. On Sept. 2, 31, was fought the battle of Actium. Octavian's victory was complete. Antony and Cleopatra committed suicide (30), and the eastern provinces submitted in 29. Octavian returned to Rome to celebrate his triumph and mark the end of the long-continued anarchy by closing the temple of Janus; at the end of the next year he formally laid down the extraordinary powers which he had held since 43, and a regular Government was established.

III. THE EMPIRE

Period I.: The Principate, 27 B.C.–A.D. 284—The Constitution of the Principate.—The conqueror of Antonius at Actium, the great-nephew and heir of the dictator Caesar, was now summoned, by the general consent of a world wearied out with 20 years of war and anarchy, to the task of establishing a Government which should as far as possible respect the forms and traditions of the republic, without sacrificing that centralization of authority which experience had shown to be necessary for the integrity and stability of the empire.

The new system which was formally inaugurated by Octavian in 28–27 B.C. assumed the shape of a restoration of the republic under the leadership of a *princeps*. Octavian voluntarily resigned the extraordinary powers which he had held since 43, and, to quote his own words, "handed over the republic to the control of the senate and people of Rome." The old constitutional machinery was once more set in motion; the senate, assembly and magistrates resumed their functions; and Octavian himself was hailed as the "restorer of the commonwealth and the champion of freedom." But his abdication, in any real sense of the word, would have simply thrown everything back into confusion. Any revival of the kingly title was out of the question, and Octavian himself expressly refused the dictatorship. Nor was any new office created or any new official title invented for his benefit. But by senate and people he was invested according to the old constitutional forms with certain powers, as many citizens had been before him, and so took his place by the side of the lawfully appointed magistrates of the republic—only, to mark his pre-eminent dignity, as the first of them all, the senate decreed that he should take as an additional cognomen that of "Augustus," while in common parlance he was henceforth styled *princeps*, a simple title of courtesy, familiar to republican usage, and conveying no other idea than that of a recognized primacy and precedence over his fellow-citizens. The ideal sketched by Cicero in his *De Republica*, of a constitutional president of a free republic, was apparently realized; but it was only in appearance. For in fact the special prerogatives conferred upon Octavian gave him back in substance the autocratic authority he had resigned, and as between the restored republic and its new *princeps* the balance of power was overwhelmingly on the side of the latter.

Octavian had held the *imperium* since 43; in 33, it is true, the powers of the triumvirate had legally expired, but he had continued to wield his authority, as he himself puts it, "by universal consent." In 27 he received a formal grant of the *imperium* from the senate and people for the term of ten years, and his *provincia* was defined as including all the provinces in which military authority was required and legions were stationed. He was declared commander-in-chief of the Roman army, and granted the exclusive right of levying troops, of making war and peace, and of concluding treaties. As consul, moreover, he not only continued to be the chief magistrate of the State at home, but took precedence in virtue of his *maius imperium*, over the governors of the "unarmed provinces," which were still nominally under the control of the senate. Thus the so-called "restoration of the republic" was in essence the recognition by law of the personal supremacy of Octavian, or Augustus, as he must henceforth be called.

In 23 an important change was made in the formal basis of Augustus's authority. In that year he laid down the consulship which he had held each year since 31, and could therefore only exert his *imperium pro consule*, like the ordinary governor of a province. He lost his authority as chief magistrate in Rome and his precedence over the governors of senatorial provinces. To remedy these defects a series of extraordinary offices were pressed upon his acceptance; but he refused them all, and caused a number of enactments to be passed which determined the character of the principate for the next three centuries. First, he was exempted from the disability attaching to the tenure of the *imperium* by one who was not an actual magistrate, and permitted to retain and exercise it in Rome. Secondly, his *imperium* was declared to be equal with that of the consuls, and therefore superior to that of all other holders of that power. Thirdly, he was granted equal rights with the consuls of convening the senate and introducing business, of nominating candidates at elections, and of issuing edicts. Lastly, he was placed on a level with the consuls in outward rank. Twelve lictors were assigned to him and an official seat between those of the consuls themselves.

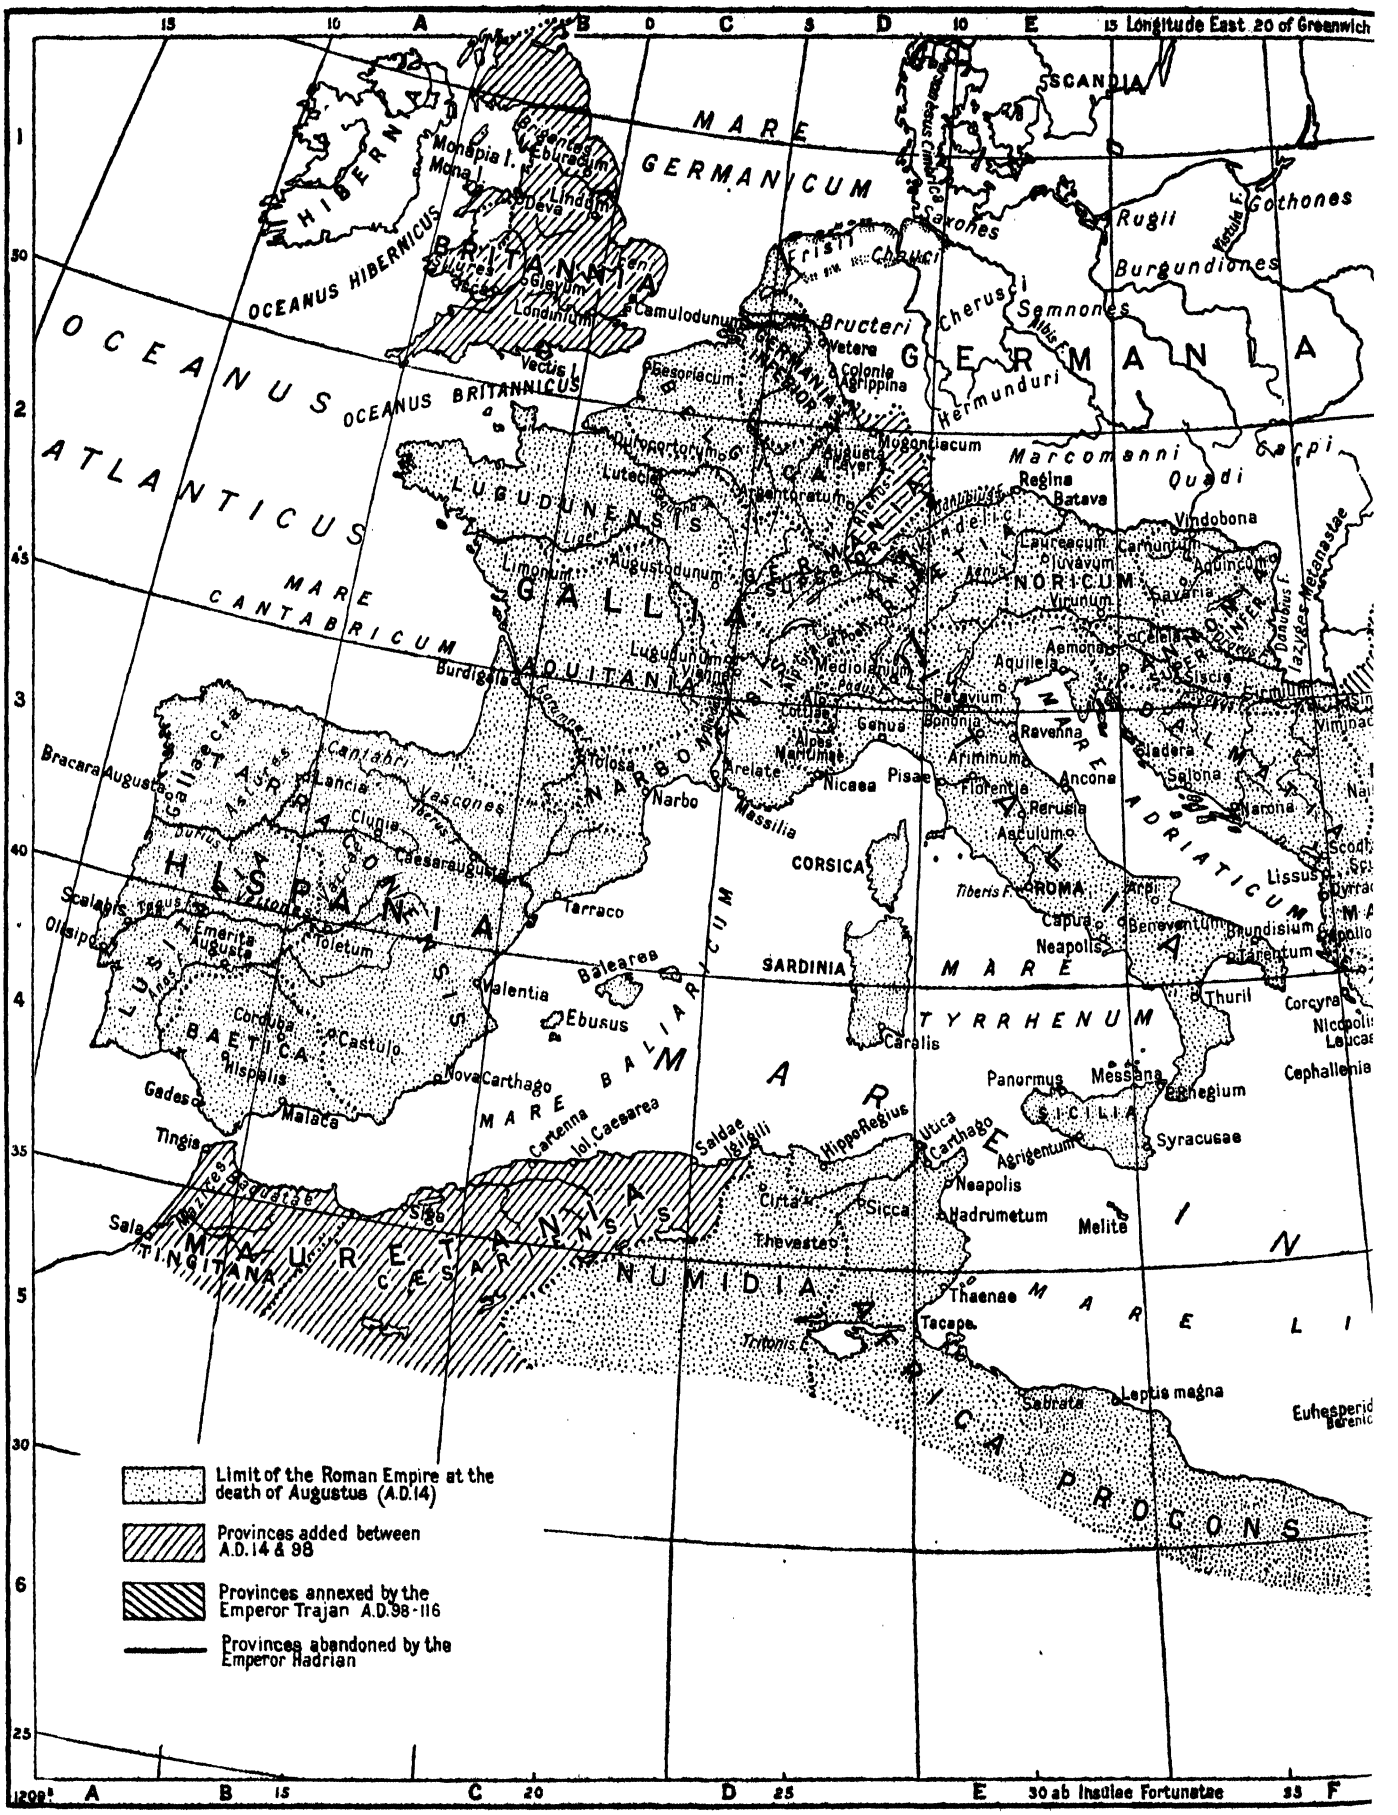
Tribunicia Potestas.—Thus the proconsular authority was for the time admitted within the walls of Rome; but Augustus was too cautious a statesman to proclaim openly the fact that the power which he wielded in the city was the same as that exercised in camps and provinces by a Roman military commander. Hence he sought for a title which should disguise the nature of his authority, and found it in the "tribunician power," which had been conferred upon him for life in 36, and was well suited, from its urban and democratic traditions, to serve in Rome as "a term to express his supreme position." From 23 onwards the *tribunicia potestas* appears after his name in official inscriptions, together with the number indicating the period during which it had been held (also reckoned from 23); it was in virtue of this power that Augustus introduced the social reforms which the times demanded; and, though far inferior to the *imperium* in actual importance, it ranked with or even above it as a distinctive prerogative of the emperor or his chosen colleague.

The *imperium* and the *tribunicia potestas* were the two pillars upon which the authority of Augustus rested, and the other offices and privileges conferred upon him were of secondary importance. After 23 he never held the consulship save in 5 and 2 B.C., when he became the colleague of his grandsons on their introduction to public life. He permitted the triumvir Lepidus to retain the chief pontificate until his death, when Augustus naturally became *pontifex maximus* (12 B.C.). He proceeded with the like caution in reorganizing the chief departments of the public service in Rome and Italy. The *cura annonae, i.e.*, the supervision of the corn supply of Rome, was entrusted to him in 22 B.C., and this important branch of administration thus came under his personal control; but the other boards (*curae*), created during his reign to take charge of the roads, the water-supply, the regulation of the Tiber and the public buildings, were composed of senators of high rank, and regarded in theory as deriving their authority from the senate.

Such was the ingenious compromise by which room was found for the master of the legions within the narrow limits of the old Roman constitution. Augustus could say with truth that he had accepted no office which was "contrary to the usage of our ancestors," and that it was only in *auctoritas*[1] that he took precedence of his colleagues. Nevertheless, as every thinking man must have realized, the compromise was unreal, and its signif-

[1] *See* Ramsay and Primerstein, *Mon. Antioch*, iv. 3 (1927).

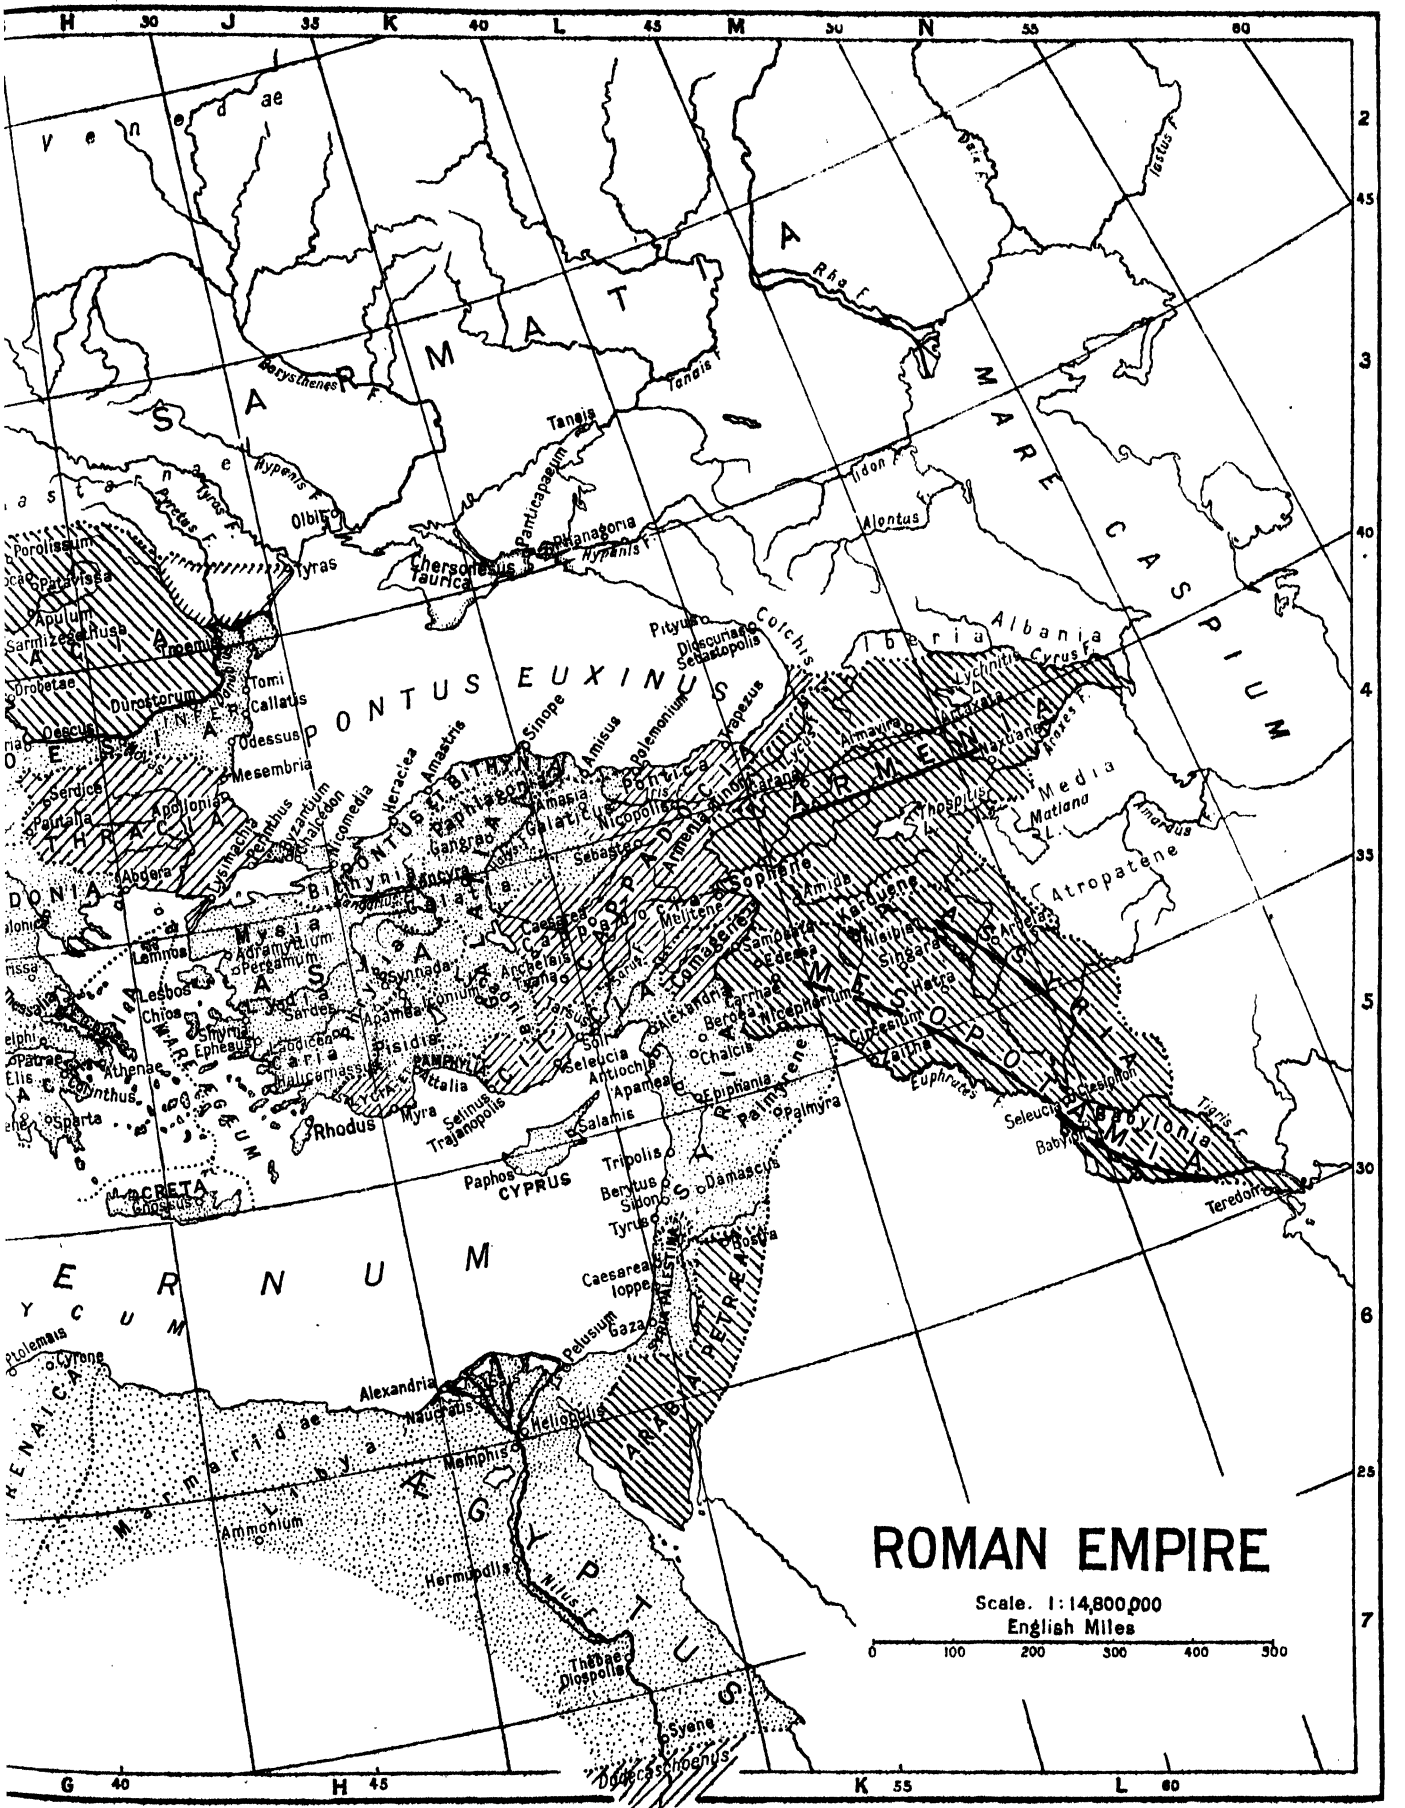
icance was ambiguous. It was an arrangement avowedly of an exceptional and temporary character, yet no one could suppose that it would in effect be otherwise than permanent. The powers voted to Augustus were (like those conferred upon Pompey in 67 B.C.) voted only to him, and (save the *tribunicia potestas*) voted only for a limited time; in 27 he received the *imperium* for ten years, and it was afterwards renewed for successive periods of five, five, ten and ten years. In this way the powers of the principate were made coextensive in time with the life of Augustus, but there was absolutely no provision for hereditary or any other form of succession, and various expedients were devised in order to indicate the destined successor of the *princeps* and to bridge the gap created by his death. Ultimately Augustus associated his stepson Tiberius with himself as co-regent. The *imperium* and the *tribunicia potestas* were conferred upon him, and he was thus marked out as the person upon whom the remaining powers of the principate would naturally be bestowed after the death of his stepfather. But succeeding emperors did not always indicate their successors so clearly, and, in direct contrast to the maxim that "the king never dies," it has been well said that the Roman principate died with the death of the *princeps*.



Changes in the Constitution of the Principate.—In theory, at least, the Roman world was governed according to the "maxims of Augustus" (Suet. *Ner.* 10), down to the time of Diocletian. Even in the 3rd century there is still in name at least a republic, of which the emperor is in strictness only the chief magistrate, deriving his authority from the senate and people, and with prerogatives limited and defined by law. The case is quite different when we turn from theory to practice. The division of authority between the republic and its chief magistrate became increasingly unequal. Over the provinces the *princeps* from the first ruled autocratically; and this autocracy reacted upon his position in Rome, so that it became every year more difficult for a ruler so absolute abroad to maintain even the fiction of republican government at home. The republican institutions, with the partial exception of the senate, lose all semblance of authority outside Rome, and even as the municipal institutions of the chief city of the empire they retain but little actual power. The real government even of Rome passes gradually into the hands of imperial prefects and commissioners, and the old magistracies become merely decorations which the emperor bestows at his pleasure. At the same time the rule of the *princeps* assumes an increasingly personal character, and the whole work of government is silently concentrated in his hands and in those of his own subordinates. Closely connected with this change is the different aspect presented by the history of the empire in Rome and Italy on the one hand and in the provinces on the other. Rome and Italy share in the decline of the republic. Political independence and activity die out; their old pre-eminence and exclusive privileges gradually disappear; and at the same time the weight of the overwhelming power of the *princeps*, and the abuses of their power by individual *principes*, press most heavily upon them. On the other hand, in the provinces and on the frontiers, where the imperial system was most needed, and where from the first it had full play, it is seen at its best as developing or protecting an orderly civilization and maintaining the peace of the world.

The decay of the republican institutions had commenced before the revolutionary crisis of 49. It was accelerated by the virtual suspension of regular government between 49 and 28; and not even the diplomatic deference towards ancient forms which Augustus displayed availed to conceal the unreality of his work of restoration. The *comitia* received back from him "their ancient rights" (Suet. *Aug.* 40), and during his lifetime they continued to pass laws and to elect magistrates. But after the end of the reign of Tiberius we have only two instances of legislation by the assembly in the ordinary way[1], and the law-making of the empire is performed either by decrees of the senate or by imperial edicts and constitutions. Their prerogative of electing magistrates was, even under Augustus, robbed of most of its importance by the control which the *princeps* exercised over their choice by means of his rights of nomination and commendation, which effectually secured the election of his own nominees. By Tiberius this restricted prerogative was still further curtailed. The candidates for all magistracies except the consulship were thenceforward nominated and voted for in the senate house and by the senators, and only the formal return of the result (*renuntiatio*) took place in the assembly (Dio lviii. 20). The *princeps* himself as long as the principate lasted, continued to receive the *tribunicia potestas* by a vote of the assembly, and was thus held to derive his authority from the people.

This almost complete effacement of the *comitia* was largely due to the fact that they had ceased to represent anything but the populace of Rome, and the comparatively greater vitality shown by the old magistracies is mainly attributable to the value they continued to possess in the eyes of the Roman upper class. But, though they were eagerly sought (Plin. *Epp.* ii. 9, vi. 6), and conferred on their holders considerable social distinction, the magistrates ceased, except in name, to be the popularly chosen executive officers of the Roman State. In the administration of the empire at large they had no share, if we except the subordinate duties still assigned to the quaestor in a province. In Rome, to which their sphere of work was limited, they were overshadowed by the dominant authority of the *princeps*, while their range of duties was increasingly circumscribed by the gradual transference of administrative authority, even within the city, to the emperor and his subordinate officials.



The senate alone among republican institutions retained some importance and influence, and it thus came to be regarded as sharing the government of the empire with the *princeps* himself. It nominally controlled the administration of Italy and of the "public provinces," whose governors it appointed. It is to the senate, in theory, that the supreme power reverts in the absence of a *princeps*. It is by decree of the senate that the new *princeps* immediately receives his powers and privileges, though he is still supposed to derive them ultimately from the people. After the cessation of all legislation by the *comitia*, the only law-making authority, other than that of the *princeps* by his edicts, was that of the senate by its decrees. Its judicial authority was co-ordinate with that of the emperor, and at the close of the 1st century we find the senators claiming, as the emperor's "peers," to be exempt from his jurisdiction. But in spite of the outward dignity of its position, and of the deference with which it was frequently treated, the senate became gradually almost as powerless in reality as the *comitia* and the magistracies. The senators continued indeed to be taken as a rule from the ranks of the wealthy, and a high property qualification was established by Augustus as a condition of membership; but this merely enabled the emperors to secure their own ascendancy by subsidizing those whose property fell short of the required standard, and who thus became simply the paid creatures of their imperial patrons. Admission to the senate was possible only by favour of the emperor, both as controlling the elections to the magistracies, which still gave entrance to the curia, and as invested with the power of directly creating senators by *adlectio*, a power which from the time of Vespasian onwards was freely used. As the result, the composition of the senate rapidly altered. Under Augustus and Tiberius it still contained many representatives of the old republican families, whose prestige and ancestral traditions were some guarantee for their independence. But this element soon disappeared. The ranks of the old nobility were thinned by natural decay and by the jealous fears of the last three Claudian emperors. Vespasian flooded the senate with new men from the municipal towns of Italy and the Latinized provinces of the West. Trajan and Hadrian, both provincials themselves, carried on the same policy, and by the close of the 2nd century even the Greek provinces of the East had their representatives in the senate. Some, no doubt, of these provincials, who constituted the great majority of the senate in the 3rd century, were men of wealth and mark, but many more were of low birth; on some rested the stain of a servile descent, and all owed alike their present position and their chances of further promotion to the emperor. The procedure of the senate was as completely

at the mercy of the *princeps* as its composition. He was himself a senator and the first of senators; he possessed the magisterial prerogatives of convening the senate, of laying business before it, and of carrying *senatus consulta;* above all, his tribunician power enabled him to interfere at any stage, and to modify or reverse its decisions. The share of the senate in the government was in fact determined by the amount of administrative activity which each *princeps* saw fit to allow it to exercise, and this share became steadily smaller. The jurisdiction assigned it by Augustus and Tiberius was in the 3rd century limited to the hearing of such cases as the emperor thought fit to send for trial, and these became steadily fewer in number. Its control of the State treasury, as distinct from the imperial *fiscus,* was in fact little more than nominal, and became increasingly unimportant as the great bulk of the revenue passed into the hands of the emperor.

The process by which all authority became centralized in the hands of the *princeps* and in practice exercised by an organized bureaucracy was of necessity gradual; but it had its beginnings under Augustus, who formed the equestrian order (admission to which was henceforth granted only by him) into an imperial service, partly civil and partly military, whose members, being immediately dependent on the emperor, could be employed on tasks which it would have been impossible to assign to senators (*see* EQUITES). From this order were drawn the armies of "procurators"—the term was derived from the practice of the great business houses of Rome—who administered the imperial revenues and properties in all parts of the empire. Merit was rewarded by independent governorships such as those of Raetia and Noricum, or the command of the naval squadrons at Misenum and Ravenna; and the prizes of the knight's career were the prefectures of the praetorian guard, the corn-supply and the city police, and the governorship of Egypt. The household offices and imperial secretaryships were held by freedmen, almost always of Greek origin, whose influence became all-powerful under such emperors as Claudius. The financial secretary (*a rationibus*) and those who dealt with the emperor's correspondence (*ab epistulis*) and with petitions (*a libellis*) were the most important of these.

Caesar Worship.—This increase of power was accompanied by a corresponding elevation of the *princeps* himself above the level of all other citizens. The comparatively modest household and simple life of Augustus were replaced by a more than regal splendour, and under Nero we find all the outward accessories of monarchy present, the palace, the palace guards, the crowds of courtiers and a court ceremonial. In direct opposition to the republican theory of the principate, members of the family of the *princeps* share the dignities of his position. The males bear the cognomen of Caesar, and are invested, as youths, with high office; their names and even those of the females are included in the yearly prayers for the safety of the *princeps;* their birthdays are kept as festivals; the praetorian guards take the oath to them as well as to the *princeps* himself.

These honours culminate in the "imperial cult" which most definitely marks the vast distance between republican and imperial Rome. Julius Caesar, for policy's sake, had been enticed by Alexander's example to attempt the introduction of autocracy in the only form known in the ancient world. The East was accustomed to accepting commands from the semi-divine king and made no objection, and since half the population of Rome now consisted of the stock of slaves and captives the plan met with noisy applause by the lowest classes at Rome. But Brutus's dagger was the senate's answer to the proposal. Octavian, who rested his hopes of succession on the favour of Caesar's devout soldiers and on the sacred character of Caesar's last will and testament, did all in his power to canonize Julius, and built a temple to *Divus Iulius* in the Forum. This sufficed for his immediate purpose, and when he consolidated his position after Antony's defeat he wisely forbade the bestowal of divine honours upon himself within Italy while welcoming deification in Asia and Egypt where the populace could not understand why the successor of Ptolemies and Seleucid kings should not be a god. However, even in Italy the Oriental ex-slave population, very numerous everywhere, would revert to non-Roman mysticism. Here and there in Italy shrines arose and were permitted, not to Augustus, but to the "genius" of Augustus[1], and in 12 B.C. the court devised an organization of ex-slaves in the towns of Italy for devotions to the Augustan *lares.* Thus the Oriental cult crept in gradually. And as the worship of Augustus by the eastern provincial communes seemed to the court to be a pleasing token of loyalty, attempts were also made officially to introduce the worship at the meetings of the provincial gatherings in Gaul, Spain and Africa. But it must be said that, except so far as Orientals took part in the worship, in the West it was and remained to the end merely lip service. As the cult was worked out for Italy after Augustus's death the emperors were deified only after death and the worship was directed to the *Divi.* But in the provinces the worship of the living ruler continued. The image of the living emperor was on the army standards and was made the object of devotion, and refusal to perform libations to it became the ugly test of treason and of heterodoxy. A few emperors, like Caligula and Domitian, attempted to invite, while living, the honours of *Divi* even in Rome, but with little success. Diocletian was the first emperor who actually brought into the very senate the worship of the emperor as it was practised all through the empire in Asiatic cities, and he had his capital in Asia.

The Frontiers.—To secure peace it was necessary to establish on all sides of the empire really defensible frontiers; and this became possible now that for the first time the direction of the foreign policy of the state and of its military forces was concentrated in the hands of a single magistrate. To the south and west the generals of the republic, and Caesar himself, had extended the authority of Rome to the natural boundaries formed by the African deserts and the Atlantic ocean, and in these two directions Augustus's task was in the main confined to the organization of a settled Roman government within these limits. In Africa the client state of Egypt was ruled by Augustus as the successor of the Ptolemies, and administered by his deputies (*praefecti*), and the kingdom of Numidia (25 B.C.) was incorporated with the old province of Africa. In Spain the hill-tribes of the north-west were finally subdued and a third province, Lusitania, established. In Gaul Augustus (27 B.C.) established in addition to the "old province" the three new ones of Aquitania, Lugdunensis and Belgica, which included the territories conquered by Julius Caesar. Towards the north the republic had left the civilized countries bordering on the Mediterranean with only a very imperfect defence against the threatening mass of barbarian tribes beyond them. The result of Augustus's policy was to establish a protecting line of provinces running from the Euxine to the North sea, and covering the peaceful districts to the south —Moesia (A.D. 6), Pannonia (A.D. 9), Noricum (15 B.C.), Raetia (15 B.C.) and Gallia Belgica. Roman rule was thus carried up to the natural frontier lines of the Rhine and the Danube. It was originally intended to make the Elbe the frontier of the empire; but after the defeat of P. Quintilius Varus (A.D. 9) the forward policy was abandoned. Tiberius recalled Germanicus as soon as Varus had been avenged; and after the peace with Maroboduus, the chief of the Marcomanni on the upper Danube, in the next year (A.D. 17), the defensive policy recommended by Augustus was adopted along the whole of the northern frontier. The line of the great rivers was held by an imposing mass of troops. Along the Rhine lay the armies of Upper and Lower Germany, consisting of four legions each; eight more guarded the Danube and the frontiers of Pannonia and Moesia. At frequent intervals along the frontier were the military colonies, the permanent camps and the smaller intervening *castella.* Flotillas of galleys cruised up and down the rivers, and Roman roads opened communication both along the frontiers and with the seat of government in Italy.

In the East, Rome was confronted with a well organized and powerful State whose claims to empire were second only to her own. The victory of Carrhae (53 B.C.) had encouraged among the Parthians the idea of an invasion of Syria and Asia Minor, while it had awakened in Rome a genuine fear of the formidable power which had so suddenly arisen in the East. Caesar was at the moment of his death preparing to avenge the death of Crassus by

[1] L. R. Taylor, in *Trans. Amer. Phil. Assn. 1920,* 116.

an invasion of Parthia, and Antony's schemes of founding an Eastern empire which should rival that of Alexander included the conquest of the kingdom beyond the Euphrates. Augustus, however, adhered to the policy which he recommended to his successors of "keeping the empire within its bounds"; and the Parthians, weakened by internal feuds and dynastic quarrels, were in no mood for vigorous action. Roman pride was satisfied by the restoration of the standards taken at Carrhae. Four legions guarded the line of the Euphrates, and, beyond the frontiers of Pontus and Cappadocia, Armenia was established as a "friendly and independent ally."

The Provinces.—Next in importance to the rectification and defence of the frontiers was the reformation of the administration, and the restoration of prosperity to the distracted and exhausted provinces. The most serious defect of the republican system had been the absence of any effective control over the Roman officials outside Italy. This was now supplied by the general proconsular authority vested in the emperor. The provinces were for the first time treated as departments of a single State, while their governors, from being independent and virtually irresponsible rulers, became the subordinate officials of a higher authority. Over the *legati* of the imperial provinces the control of the emperor was as complete as that of the republican proconsul over his staff in his own province. They were appointed by him, held office at his good pleasure, and were directly responsible to him for their conduct. The proconsuls of the senatorial provinces were in law magistrates equally with the *princeps*, though inferior to him in rank; it was to the senate that they were, as of old, responsible; they were still selected by lot from among the senators of consular and praetorian rank. But the distinction did not seriously interfere with the paramount authority of the emperor. The provinces left nominally to the senate were the more peaceful and settled districts in the heart of the empire, where only the routine work of civil administration was needed, and where the local municipal governments were as yet comparatively vigorous. The senatorial proconsuls themselves were indirectly nominated by the emperor through his control of the praetorship and consulship. They wielded no military and only a strictly subordinate financial authority, and, though Augustus and Tiberius, at any rate, encouraged the fiction of the responsibility of the senatorial governors to the senate, it was in reality to the emperor that they looked for direction and advice, and to him that they were held accountable. Moreover, in the case of all governors this accountability became under the empire a reality. Prosecutions for extortion (*de pecuniis repetundis*), which were now transferred to the hearing of the senate, were tolerably frequent during the first century of the empire; but a more effective check on maladministration lay in the appeal to Caesar from the decisions of any governor, which was open to every provincial, and in the right of petition. Finally, the authority both of the legate and the proconsul was weakened by the presence of the imperial procurator, to whom was entrusted the administration of the fiscal revenues; while both legate and proconsul were deprived of that right of requisitioning supplies which, in spite of a long series of restrictive laws, had been the most powerful instrument of oppression in the hands of republican governors. The financial reforms of Augustus are marked by the same desire to establish an equitable, orderly and economical system, and by the same centralization of authority in the emperor's hands. The institution of an imperial census or valuation of all land throughout the empire, and the assessment upon this basis of a uniform land tax, in place of the heterogeneous and irregular payments made under the republic, were the work of Augustus, though the system was developed and perfected by the emperors of the 2nd century and by Diocletian. The land tax itself was directly collected, either by imperial officials or by local authorities responsible to them, and the old wasteful plan of selling the privilege of collection to *publicani* was henceforward applied only to such indirect taxes as the customs duties. The rate of the land tax was fixed by the emperor, and with him rested the power of remission even in senatorial provinces. The effect of these reforms is clearly visible in the improved financial condition of the empire. Under the republic the treasury had been nearly always in difficulties, and the provinces exhausted and impoverished. Under the emperors, at least throughout the 1st century, in spite of a largely increased expenditure on the army, on public works, on shows and largesses, and on the machinery of government itself, the better emperors, such as Tiberius and Vespasian, were able to accumulate large sums, while the provinces showed but few signs of distress. Moreover, while the republic had almost entirely neglected to develop the internal resources of the provinces, Augustus set the example of a liberal expenditure on public works, in the construction of harbours, roads and bridges, the reclamation of waste lands and the erection of public buildings.

The Julio-Claudian Line.—Augustus founded a dynasty which occupied the throne for more than half a century after his death. The first and by far the ablest of its members was Tiberius (A.D. 14–37). He was undoubtedly a capable and vigorous ruler, who enforced justice in the government of the provinces, maintained the integrity of the frontiers and husbanded the finances of the empire, but he became intensely unpopular in Roman society, and was painted as a cruel and odious tyrant. His successor, Gaius (A.D. 37–41), generally known as Caligula, was the slave of his wild caprices and uncontrolled passions, which issued in manifest insanity. He was followed by his uncle, Claudius (A.D. 41–54), whose personal uncouthness made him an object of derision to his contemporaries, but who was by no means devoid of statesmanlike faculties. His reign left an abiding mark on the history of the empire, for he carried forward its development on the lines intended by Augustus. Client-states were absorbed, southern Britain was conquered, the romanization of the West received a powerful impulse, public works were executed in Rome and Italy, and the organization of the imperial bureaucracy made rapid strides. Nero (A.D. 54–68), the last of the Julio-Claudian line, has been handed down to posterity as the incarnation of monstrous vice and fantastic luxury. But his wild excesses scarcely affected the prosperity of the empire at large; the provinces were well governed, and the war with Parthia led to a compromise in the matter of Armenia which secured peace for half a century.

The Antonine Empire.—The fall of Nero and the extinction of the "progeny of the Caesars" was followed by a war of succession which revealed the military basis of the principate and the weakness of the tie connecting the emperor with Rome. Galba, Otho, Vitellius and Vespasian represented in turn the legions of Spain, the household troops, the army of the Rhine, and a coalition of the armies of the Danube and the Euphrates; and all except Otho were already *de facto* emperors when they entered Rome. The final survivor in the struggle, Vespasian (A.D. 69–79), was a man of comparatively humble origin, and as the principate ceased to possess the prestige of high descent it became imperatively necessary to remove, as far as possible, the anomalies of the office and to give it a legitimate and permanent form. Thus we find an elaborate and formal system of titles substituted for the personal names of the Julio-Claudian emperors, an increasing tendency to insist on the inherent prerogatives of the principate (such as the censorial power), and an attempt to invest Caesarism with an hereditary character, either by natural descent or by adoption, while the worship of the *Divi*, or deified Caesars, was made the symbol of its continuity and legitimacy. The dynasty of Vespasian and his sons (Titus, A.D. 79–81, Domitian, A.D. 81–96) became extinct on the murder of the last named, whose high-handed treatment of the senate earned him the name of a tyrant; his successor, Nerva (A.D. 96–98), opened the series of "adoptive" emperors (Trajan, A.D. 98–117, Hadrian, 117–138, Antoninus Pius, 138–161, Marcus Aurelius 161–180) under whose rule the empire enjoyed a period of internal tranquillity and good government. Its boundaries were extended by the subjugation of northern Britain by Agricola, A.D. 78–84 (*see* BRITAIN: *Roman*), by the annexation of the districts included in the angle of the Rhine and Danube under the Flavian emperors, and by the conquest of Dacia (the modern Transylvania) under Trajan (completed in A.D. 106). Trajan also annexed Arabia

Petraea and in his closing years invaded Parthia and formed provinces of Armenia, Mesopotamia and Assyria; but these conquests were surrendered by his successor, Hadrian, who set himself to the task of consolidating the empire and perfecting its defences. To him is due the system of permanent *limites* or frontier fortifications, such as the wall which protected northern Britain and the palisade which replaced the chain of forts established by the Flavian emperors from the Rhine to the Danube. The construction of these defences showed that the limit of expansion had been reached, and under M. Aurelius the tide began to turn. A great part of his reign was occupied with wars against the Marcomanni, Quadi, Sarmatians, etc., whose irruptions seriously threatened the security of Italy. Henceforth Rome never ceased to be on the defensive.

Within the frontiers the levelling and unifying process commenced by Augustus had steadily proceeded. A tolerably uniform provincial system covered the whole area of the empire. The client-states had one by one been reconstituted as provinces, and even the government of Italy had been in many respects assimilated to the provincial type. The municipal system had spread widely; the period from Vespasian to Aurelius witnessed the elevation to municipal rank of an immense number of communities, not only in the old provinces of the West, in Africa, Spain and Gaul, but in the newer provinces of the North, and along the line of the northern frontier; and everywhere under the influence of the central imperial authority there was an increasing uniformity in the form of the local constitutions, framed and granted as they all were by imperial edict. Throughout the empire again the extension of the Roman franchise was preparing the way for the final act by which Caracalla assimilated the legal status of all free-born inhabitants of the empire, and in the west and north this was preceded and accompanied by the complete romanizing of the people in language and civilization. Yet, in spite of the internal tranquillity and the good government which have made the age of the Antonines famous, we can detect signs of weakness. It was in this period that the centralization of authority in the hands of the *princeps* was completed; the "dual control" established by Augustus, which had been unreal enough in the 1st century, was now, though not formally abolished, systematically ignored in practice. The senate ceased to be an instrument of government, and became an imperial peerage, largely composed of men not qualified by election to the quaestorship but directly ennobled by the emperor. The restricted sphere of administration left by Augustus to the old magistracies was still further narrowed; their jurisdiction, for example, tended to pass into the hands of the Greek officers appointed by Caesar—the prefect of the city and the prefect of the guards. The complete organization of Caesar's own administrative service, and its recognition as a state bureaucracy, was chiefly the work of Hadrian, who took the secretaryships out of the hands of freedmen and entrusted them to procurators of equestrian rank. All these changes, inevitable, and in some degree beneficial, as they were, brought with them the attendant evils of excessive centralization. Though these were hardly felt while the central authority was wielded by vigorous rulers, yet even under Trajan, Hadrian and the Antonines we notice a failure of strength in the empire as a whole, and a corresponding increase of pressure on the imperial Government itself. The reforms of Augustus had given free play to powers still fresh and vigorous. The ceaseless labours of Hadrian were directed mainly to the careful husbanding of such strength as still remained, or to attempts at reviving it by the sheer force of imperial authority. Among the symptoms of incipient decline were the growing depopulation, especially of the central districts of the empire, the constant financial difficulties, the deterioration in character of the local governments in the provincial communities, and the increasing reluctance exhibited by all classes to undertake the now onerous burden of municipal office.

It is to such facts as these that we must look in passing a final judgment on the imperial Government, which is admittedly seen in its best and most perfect form in the Antonine period. In our review of the conditions which brought about the fall of the Roman republic, we saw that the collapse of the city-state made Caesarism inevitable, since the extension of federal and representative institutions to a heterogeneous world-empire was out of the question. The benefits which Caesarism conferred upon mankind are plain. In the first place, the Roman world, which had hitherto not been governed in the true sense of the word, but exploited in the interests of a dominant clique, now received an orderly and efficient government, under which the frightful ravages of misrule and civil strife were repaired. The financial resources of the empire were husbanded by skilled and, above all *trained* administrators, to whom the imperial service offered a *carrière ouverte aux talents;* many of these were Greeks, or half-Greek Orientals, whose business capacity formed an invaluable asset hitherto neglected. Augustus caused an official survey of the empire to be made, and a scientific census of its resources was gradually carried out and from time to time revised; thus the balance of revenue and expenditure could be accurately estimated and adjusted, and financial stability was established. The system of tax-farming was gradually abolished and direct collection substituted; commerce was freed from vexatious restrictions, and large customs-districts were formed, on whose borders duties were levied for revenue only. The Government took even more direct measures for the encouragement of industry and especially of agriculture. The most remarkable of these were the "alimentary" institutions, originally due to Nerva and developed by succeeding emperors. Capital was advanced at moderate rates of interest to Italian landowners on the security of their estates, and the profits of this system of land banks were devoted to the maintenance and education of poor children. The foundation of colonies for time-expired soldiers, who received grants of land on their discharge, contributed something to the formation of a well-to-do agricultural class; and although the system was not successful in lower Italy, where economic decline could not be arrested, there can be no doubt that central and northern Italy, where the vine and olive were largely cultivated, and manufacturing industries sprang up, enjoyed a considerable measure of prosperity. The extension of the Roman municipal system to the provinces, and the watchful care exercised by the imperial Government over the communities, together with the profuse liberality of the emperors, which was imitated by the wealthier citizens of the towns, led to the creation of a flourishing municipal life still evidenced by the remains which in districts such as Asia Minor or Tunis stand in significant contrast with the desolation which was brought about by centuries of barbaric rule. Mommsen[1] has, indeed, expressed the opinion that "if an angel of the Lord were to strike the balance whether the domain ruled by Antoninus were governed with the greater intelligence and the greater humanity at that time or in the present day, whether civilization and national prosperity generally had since that time advanced or retrograded, it is very doubtful whether the decision would prove in favour of the present."

But there is another side to the picture. During the last two centuries of the republic Rome, by introducing slaves and captives to perform the hard labour of Italy while the free population spent itself in war or lost itself in the provinces, had thoroughly changed the Italian stock. Had the change come gradually and had Rome received the newcomers into schools that might have trained them into a consistent tradition this introduction of a varied stock might perhaps have enriched the spirit of Rome. But this was not to be. Such an amalgam requires time to eliminate the products of incongruous physical mixture,[2] to unify the peoples of a dozen languages until they can comprehend each other and effectually shape common ideals, to distil and throw off the hatred, servility and unsocial hostility to the community bred by years of suffering in slavery, and in a word to create a new people homogeneous enough to act together. The invasion was so rapid and the time so short that such a process of unification never completed itself at Rome. And when Rome, which was the heart of the empire, lost its rhythm and balance, when Rome no longer had a definite culture, a certain inspiration to impart to the provinces, when Rome's religion suc-

[1] *Provinces*, i. p. 5.
[2] M. P. Nilsson, in *Hereditas* (1921), 370.

cumbed to the several mystical cults brought in by her slaves, when her moral standards yielded before a dozen incongruous traditions, and her literature lost itself in blind gropings after a bygone tradition of a freer day, the provincials in despair abandoned her guidance.

Furthermore, the empire brought into being in the provinces a new nationality, due to the partial fusion of Roman ideas with Hellenic culture, beside which other elements, saving only, as we shall see, those contributed by the Oriental religions, were insignificant. This new nationality grew in definition through the gradual disappearance of distinctions of language and manners, the assimilating influence of commercial and social intercourse, and the extinction of national jealousies and aspirations. But the cosmopolitan society thus formed was compacted of so many disparate elements that a common patriotism was hard to foster, and doubly hard when the autocratic system of government prevented men from aspiring to that true political distinction which is attainable only in a self-governing community. It is true that there was much good work to be done, and that much good work was done, in the service of the emperors; true, also, that the *carrière ouverte aux talents* was in large measure realized. Distinctions of race were slowly but steadily effaced by the grant of citizen rights to provincials and by the manumission of slaves; and the career open to the romanized provincial or the liberated slave might culminate in the highest distinctions which the emperor could bestow. In the hierarchy of social orders—senate, *equites* and *plebs*—ascent was easy and regular from the lower grade to the higher; and the more enlightened of the emperors—especially Hadrian—made a genuine endeavour to give a due share in the work of government to the various subject races. But nothing could compensate for the lack of self-determination, and although during the first century and a half of imperial rule a flourishing local patriotism in some degree filled the place of the wider sentiment, this gradually sank into decay and became a pretext under cover of which the lower classes in the several communities took toll of their wealthier fellow-citizens in the shape of public works, largesses, amusements, etc., until the resources at the disposal of the rich ran dry, the communities themselves in many cases became insolvent, and the inexorable claims of the central Government were satisfied only by the surrender of financial control to an imperial commissioner. Then the organs of civic life became atrophied, political interest died out, and the whole burden of administration, as well as that of defence, fell upon the shoulders of the bureaucracy, which proved unequal to the task.

The Empire, 180–284.—Marcus Aurelius died in 180, and the reign of his worthless son, Commodus (A.D. 180–193), was followed by a century of war and disorder, during which nothing but the stern rule of soldier emperors saved the empire from dissolution. The first and ablest of these was Septimius Severus (193–211), whose claims were disputed by Clodius Albinus in the West, and by Pescennius Niger in the East; in these struggles rival Roman forces, for the first time since the accession of Vespasian, exhausted each other in civil war. Severus emphasized strongly the military character of the principate; he abstained from seeking confirmation for his authority from the senate, and deprived that body of most of the share in the government which it still retained; he assumed the title of proconsul in Rome itself, made the prefect of the guard the vicegerent of his authority, and heaped privileges upon the army, which, although they secured its entire devotion to his family, impaired its efficiency as a fighting force and thus weakened Rome in face of the barbarian invader. He succeeded in founding a short-lived dynasty, which ended with the attempt of the virtuous but weak Alexander (222–235) to restore the independence of the senate. This led to a military reaction, and the elevation of the brutal Maximinus, a Thracian peasant, to the throne. The disintegration of the empire was the natural result; for the various provincial armies put forward their commanders as claimants to the purple. These "tyrants," as they were called when unsuccessful, sprang up in ever-increasing numbers, and weakened Rome's power of resistance to the new enemies who were threatening her frontiers—the Alamanni and Franks, who broke through the German *limes* in 236; the Goths, who crossed the Danube in 247, raided the Balkan provinces, and defeated and slew the emperor, Decius, in 251, and the restored Persian kingdom of the Sassanidae (*see* PERSIA), whose rulers laid claim to all the Asiatic possessions of Rome and in 260 captured Antioch and made the emperor, Valerian, a prisoner. During the reign of Gallienus, the son of Valerian (260–268), the evil reached its height. The central authority was paralysed; the romanized districts beyond the Rhine were irrevocably lost; the Persians were threatening to overrun the eastern provinces; the Goths had formed a fleet of 500 sail which harried Asia Minor and even Greece itself, where Athens, Corinth, Sparta and Argos were sacked; and the legions on the frontiers were left to repel the enemies of Rome as best they could. A provincial empire was established by M. Cassianius Latinius Postumus in Gaul and maintained by his successors, M. Piavonius Victorinus and C. Pius Esuvius Tetricus. Their authority was acknowledged, not only in Gaul and by the troops on the Rhine, but by the legions of Britain and Spain; and under Postumus at any rate (259–269) the existence of the Gallic empire was justified by the repulse of the barbarians and by the restoration of peace and security to the provinces of Gaul. On the Danube, in Greece and in Asia Minor none of the "pretenders" enjoyed more than a passing success. In the Far East, the Syrian Odaenathus, prince of Palmyra (*q.v.*), though officially only the governor of the East (*dux Orientis*) under Gallienus, drove the Persians out of Asia Minor and Syria, recovered Mesopotamia, and ruled Syria, Arabia, Armenia, Cappadocia and Cilicia with all the independence of a sovereign. Odaenathus was murdered in 266. His young son Vaballathus (Wahab-allath) succeeded him in his titles, but the real power was vested in his widow Zenobia, under whom not only the greater part of Asia Minor but even the province of Egypt was forcibly added to the dominions governed by the Palmyrene prince, who ceased to acknowledge the supremacy of Rome.

Gallienus was murdered at Milan in 268, and after the brief reign of Claudius II. (A.D. 268–270), who checked the advance of the Goths, Aurelian (270–275) restored unity to the distracted empire. Palmyra was destroyed and Zenobia led a prisoner to Rome (273) and in the next year the Gallic empire came to an end by the surrender of Tetricus. Aurelian, it is true, abandoned the province of Dacia, but the defences of the Danube were strengthened, and in 276 Probus repulsed the Franks and Alamanni, who had been pressing on the Rhine frontier for some 40 years. Finally, Carus (282) recovered Armenia and Mesopotamia from the Persians and restored the frontier fixed by Septimius Severus.

The Empire at the Close of the 3rd Century.—Although any serious loss of territory had been avoided, the storms of the 3rd century had told with fatal effect upon the general condition of the empire. The "Roman peace" had vanished; not only the frontier territories, but the central districts of Greece, Asia Minor, and even Italy itself, had suffered from the ravages of war, and the fortification of Rome by Aurelian was a significant testimony to the altered condition of affairs. War, plague and famine had thinned the population and crippled the resources of the provinces. On all sides land was running waste, cities and towns were decaying and commerce was paralysed. Only with the greatest difficulty were sufficient funds squeezed from the exhausted taxpayers to meet the increasing cost of the defence of the frontiers. The old established culture and civilization of the Mediterranean world rapidly declined, and the mixture of barbaric rudeness with Oriental pomp and luxury which marked the court, even of the better emperors, such as Aurelian, was typical of the general deterioration, which was accelerated by the growing practice of settling barbarians on lands within the empire and of admitting them freely to service in the Roman army.

Period II.: The Dominate, A.D. 284–476. (a) From the Accession of Diocletian to the Death of Theodosius (A.D. 284–395).—The work of fortifying the empire alike against internal sedition and foreign invasion, begun by Aurelian and Probus, was completed by Diocletian and Constantine the Great,

whose system of government, novel as it appears at first sight, was in reality the natural and inevitable outcome of the history of the previous century. Its object was two-fold, to give increased stability to the imperial authority itself and to organize efficient administrative machinery throughout the empire. In the second year of his reign Diocletian associated Maximian with himself as colleague, and six years later (293) the hands of the two "Augusti" were further strengthened by the proclamation of Constantius and Galerius as "Caesares." Precedents for such an arrangement were to be found in the earlier history of the principate; and it divided the burdens and responsibilities of government without sacrificing the unity of the empire; for, although to each of the Augusti and Caesars a separate sphere was assigned, the Caesars were subordinate to the higher authority of the Augusti, and over all his three colleagues Diocletian claimed to exercise a paramount control. It also reduced the risk of a disputed succession by establishing in the two Caesars the natural successors to the Augusti, and it satisfied the jealous pride of the rival armies by giving them *imperatores* of their own. The distribution of power between Diocletian and his colleagues followed those lines of division which the feuds of the previous century had marked out. The armies of the Rhine, the Danube and of Syria fell to the lot respectively of Constantius, Galerius and Diocletian, the central districts of Italy and Africa to Maximian.

Diocletian's Reforms.—In the new system the imperial authority was finally emancipated from all constitutional limitation and control and the last traces of its republican origin disappeared. The emperors from Diocletian onwards were autocrats in theory as well as in practice. This avowed despotism Diocletian, following in the steps of Aurelian, hedged round with all the pomp and majesty of Oriental monarchy. The final adoption of the title *dominus*, the diadem on the head, the robes of silk and gold, the replacement of the republican salutation of a fellow-citizen by the adoring prostration even of the highest in rank before their lord and master, were all significant marks of the new régime. In the hands of this absolute ruler was placed the entire control of an elaborate administrative machinery. Most of the old local and national distinctions, privileges and liberties which had once flourished within the empire had already disappeared under the levelling influence of imperial rule, and the process was now completed. Roman citizenship had, since the edict of Caracalla, ceased to be the privilege of a minority. Diocletian finally reduced Italy and Rome to the level of the provinces: the provincial land-tax and provincial government were introduced into Italy, while Rome ceased to be even in name the seat of imperial authority.[1] Throughout the whole area of the empire a uniform system of administration was established, the control of which was centred in the imperial palace. Between the civil and military departments the separation was complete. At the head of the former were the praetorian prefects, next below them the *vicarii*, who had charge of the *dioceses;* below these again the governors of the separate provinces (*praesides, correctores, consulares*), under each of whom was a host of minor officials. Parallel with this civil hierarchy was the series of military officers, from the *magistri militum*, the *duces* and *comites* downwards. In both there is the utmost possible subordination and division of authority. The subdivision of provinces, begun by the emperors of the 2nd century, was systematically carried out by Diocletian, and each official, civil or military, was placed directly under the orders of a superior; thus a continuous chain of authority connected the emperor with the meanest official in his service. Finally, the various grades in these two imperial services were carefully marked by the appropriation to each of distinctive titles, the highest being that of *illustris*, which was confined to the prefects and to the military *magistri* and *comites*, and to the chief ministers.

There can be little doubt that on the whole these reforms prolonged the existence of the empire, by creating a machinery which enabled the stronger emperors to utilize effectively all its available resources, and which even to some extent made good the deficiencies of weaker rulers. But in many points they failed to attain their object. Diocletian's division of the imperial authority among colleagues, subject to the general control of the senior Augustus, was effectually discredited by the 20 years of almost constant conflict which followed his own abdication (305–323). Constantine's partition of the empire among his three sons was not more successful in ensuring tranquillity, and in the final division of the East and West between Valens and Valentinian (364) the essential principle of Diocletian's scheme, the maintenance of a single central authority, was abandoned. The "tyrants," the curse of the 3rd century, were far from unknown in the 4th. The system, moreover, while it failed altogether to remove some of the existing evils, aggravated others. The already overburdened financial resources of the empire were strained still further by the increased expenditure necessitated by the substitution of four imperial courts for one, and by the multiplication in every direction of paid officials. The gigantic bureaucracy of the 4th century proved, in spite of its undoubted services, an intolerable weight upon the energies of the empire.

[1] The seats of government for Diocletian and his three colleagues were Mediolanum, Augusta Trevirorum, Sirmium and Nicomedia.

The Division of the Empire.—Diocletian and Maximian formally abdicated their high office in 305. Nineteen years later Constantine I. the Great, the sole survivor of six rival emperors, united the whole empire under his own rule. His reign of 14 years was marked by two events of first-rate importance—the recognition of Christianity as the religion of the empire and the building of the new capital at Byzantium. The alliance which Constantine inaugurated between the Christian Church and the imperial Government, while it enlisted on the side of the State one of the most powerful of the new forces with which it had to reckon, imposed a check, which was in time to become a powerful one, on the imperial authority. The establishment of the new "City of Constantine" as a second Rome paved the way for the final separation of East and West by providing the former for the first time with a suitable seat of government on the Bosporus. The death of Constantine in 337 was followed, as the abdication of Diocletian had been, by the outbreak of quarrels among rival Caesars. Of the three sons of Constantine who in 337 divided the empire between them, Constantine the eldest fell in civil war against his brother Constans; Constans himself was, ten years afterwards, defeated and slain by Magnentius; and the latter in his turn was in 353 vanquished by Constantine's only surviving son Constantius. Thus for the second time the whole empire was united under the rule of a member of the house of Constantine. But in 355 Constantius granted the title of Caesar to his cousin Julian and placed him in charge of Gaul, where the momentary elevation of a tyrant, Silvanus, and still more the inroads of Franks and Alamanni, had excited alarm. But Julian's successes during the next five years were such as to arouse the jealous fears of Constantius. In order to weaken his suspected rival the legions under Julian in Gaul were suddenly ordered to march eastward against the Persians (360). They refused; and when the order was repeated, replied by proclaiming Julian himself emperor and Augustus. Julian, with probably sincere reluctance, accepted the position, but the death of Constantius in 361 saved the empire from the threatened civil war. Julian's attempted restoration of pagan and in especial of Hellenic worships had no more permanent effect than the war which he courageously waged against the multitudinous abuses which had grown up in the luxurious court of Constantius. But his vigorous administration in Gaul undoubtedly checked the barbarian advance across the Rhine, and postponed the loss of the western provinces; on the contrary, his campaign in Persia, brilliantly successful at first, ended in his own death (363), and his successor, Jovian, immediately surrendered the territories beyond the Tigris won by Diocletian 70 years before. Jovian died on Feb. 17, 364; and on Feb. 26, Valentinian was acknowledged as emperor of the army at Nicaea. In obedience to the wish of the soldiers that he should associate a colleague with himself, he conferred the title of Augustus upon his brother Valens, and the division of the empire was at last effected—Valentinian became emperor of the West, Valens of the East. Valentinian maintained the integrity of the empire until his death (in 375), which deprived the weaker Valens of a trusted

counsellor and ally, and was followed by a serious crisis on the Danube. In 376 the Goths, hard pressed by their new foes from the eastward, the Huns, sought and obtained the protection of the Roman empire. They were transported across the Danube and settled in Moesia, but, indignant at the treatment they received, they rose in arms against their protectors. In 378 at Adrianople Valens was defeated and killed, and the victorious Goths advanced eastwards to the very walls of Constantinople. Once more, however, the danger passed away. The skill and tact of Theodosius, who had been proclaimed emperor of the East by Gratian, conciliated the Goths; they were granted an allowance, and in large numbers entered the service of the Roman emperor. The remaining years of Theodosius's reign (382–395) were mainly engrossed by the duty of upholding the increasingly feeble authority of his western colleague against the attacks of pretenders. Maximus, the murderer of Gratian (383), was at first recognized by Theodosius as Caesar, and left in undisturbed command of Gaul, Spain and Britain; but, when in 386 he proceeded to oust Valentinian II. from Italy and Africa, Theodosius marched westwards, crushed him and installed Valentinian as emperor of the West. In the very next year, however, the murder of Valentinian (392) by Arbogast, a Frank, was followed by the appearance of a fresh tyrant in the person of Eugenius, a domestic officer and nominee of Arbogast himself. Once more Theodosius marched westwards, and near Aquileia decisively defeated his opponents. But his victory was quickly followed by his own illness and death (395), and the fortunes of East and West passed into the care of his two sons Arcadius and Honorius.

(b) From the Death of Theodosius to the Extinction of the Western Empire (395–476).—Through more than a century from the accession of Diocletian the Roman empire had succeeded in holding at bay the swarming hordes of barbarians. But, though no province had yet been lost, as Dacia had been lost in the century before, and though the frontier lines of the Rhine and the Danube were still guarded by Roman forts and troops, there were signs in plenty that a catastrophe was at hand.

From all the writers who deal with the 4th century we have one long series of laments over the depression and misery of the provinces.[1] To meet the increased expenditure necessary to maintain the legions, to pay the hosts of officials and to keep up the luxurious splendour of the imperial courts, not only were the taxes raised in amount but the most oppressive and inquisitorial methods were adopted in order to secure for the imperial treasury every penny that could be wrung from the wretched taxpayer. The results are seen in such pictures as that which the panegyrist Eumenius draws of the state of Gaul (306–312) under Constantine, in the accounts of the same province under Julian 50 years later, in those given by Zosimus early in the 5th century, and in the stringent regulations of the Theodosian code, dealing with the assessment and collection of the taxes. Among the graver symptoms of economic ruin were the decrease of population, which seriously diminished not only the number of taxpayers, but the supply of soldiers for the legions; the spread of infanticide; the increase of waste lands whose owners and cultivators had fled to escape the tax collector; the declining prosperity of the towns; and the constantly recurring riots and insurrections, both among starving peasants, as in Gaul, and in populous cities like Antioch. The distress was aggravated by the civil wars, by the rapacity of tyrants, such as Maxentius and Maximus, but above all by the raids of the barbarians, who seized every opportunity afforded by the dissensions or incapacity of the emperors to cross the frontiers and harry the lands of the provincials. Constantine (306–312), Julian (356–360) and Valentinian I. (364–375) had each to give a temporary breathing-space to Gaul by repelling the Franks and Alamanni. Britain was harassed by Picts and Scots from the north (367–370), while the Saxon pirates swept the northern seas and the coasts both of Britain and Gaul. On the Danube the Quadi, Sarmatae, and above all the Goths, poured at intervals into the provinces of Pannonia and Moesia, and penetrated to Macedon and Thrace. In the East, in addition to the constant border feud with Persia, we hear of ravages by the Isaurian mountaineers, and by a new enemy, the Saracens.

Even more ominous of coming danger was the extent to which the European half of the empire was becoming barbarized. The policy which had been inaugurated by Augustus himself of settling barbarians within the frontiers had been taken up on a larger scale and in a more systematic way by the Illyrian emperors of the 3rd century, and was continued by their successors in the 4th. In Gaul, in the provinces south of the Danube, even in Macedon and Italy, large barbarian settlements had been made—Theodosius in particular distinguishing himself by his liberality in this respect. Nor did the barbarians admitted during the 4th century merely swell the class of half-servile *coloni*. On the contrary, they not only constituted to an increasing extent the strength of the imperial forces, but won their way in ever-growing numbers to posts of dignity and importance in the imperial service. Under Constantine the palace was crowded with Franks. Julian led Gothic troops against Persia, and the army with which Theodosius defeated the tyrant Maximus (388) contained large numbers of Huns and Alans, as well as of Goths. The names of Arbogast, Stilicho and Rufinus are sufficient proof of the place held by barbarians near the emperor's person and in the control of the provinces and legions of Rome; and the relations of Arbogast to his nominee for the purple, Eugenius, were an anticipation of those which existed between Ricimer and the emperors of the latter half of the 5th century.

Barbaric Invasions.—It was by barbarians already settled within the empire that the first of the series of attacks which finally separated the western provinces from the empire and set up a barbaric ruler in Italy was made, and it was in men of barbarian birth that Rome found her ablest and most successful defenders. The Visigoths whom Alaric led into Italy had been settled south of the Danube as the allies of the empire since the accession of Theodosius. But, like the Germans of the days of Caesar, they wanted land for their own, and Alaric aspired to raise himself to the heights which had been reached before him by the Vandal Stilicho at Ravenna and the Goth Rufinus at Constantinople. The jealousy which existed between the rulers of the western and eastern empires furthered his plans. In the name of Arcadius, the emperor of the East, or at least with the connivance of Arcadius's minister Rufinus, he occupied the province of Illyricum, and from thence ravaged Greece, which, according to the existing division of provinces, belonged to the western empire. Thence in 396 he retreated before Stilicho to Illyricum, with the command of which he was now formally invested by Arcadius; he thus gained a base of operations against Italy. In 400 he led his people, with their wives and families, their wagons and treasure, to seek lands for themselves south of the Alps. But in this first invasion he penetrated no farther than the plains of Lombardy, and after the desperate battle of Pollentia (402 or 403) he slowly withdrew from Italy, his retreat being hastened by the promises of gold freely made to him by the imperial Government. Not until the autumn of 408 did Alaric again cross the Alps. Stilicho was dead; the barbarian troops in Honorius's service had been provoked into joining Alaric by the anti-Teutonic policy of Honorius and his ministers, and Alaric marched unopposed to Rome. The payment of a heavy ransom, however, saved the city. Negotiations followed between Alaric and the court of Ravenna. Alaric's demands were moderate, but Honorius would grant neither lands for his people nor the honourable post in the imperial service which he asked for himself. Once more Alaric sat down before Rome, and the citizens were forced to agree to his terms. Attalus, a Greek, the prefect of the city, was declared Augustus, and Alaric accepted the post of commander-in-chief. But after a few months Alaric formally deposed Attalus, on account of his incapacity, and renewed his offers to Honorius. Again they were declined, and Alaric marched to the siege and sack of Rome (410). His death followed hard on his capture of Rome. Two years later (412) his successor Ataulf led the Visigoths to find in Gaul the lands which Alaric had sought in Italy. It is characteristic of the anarchical condition of the West that Ataulf and his Goths should have fought for Honorius in Gaul

[1] Rostovtzeff, *Social and Economic History of Rome*, ch. 12.

against the tyrants and in Spain against the Vandals, Suebi and Alani; and it was with the consent of Honorius that in 419 Wallia, who had followed Ataulf as king of the Visigoths, finally settled with his people in south-western Gaul and founded the Visigothic monarchy.

It was about the same period that the accomplished fact of the division of Spain between the three barbarian tribes of Vandals, Suebi and Alani was in a similar manner recognized by the paramount authority of the emperor of the West. These peoples had crossed the Rhine at the time when Alaric was making his first attempt on Italy. A portion of the host led by Radagaisus actually invaded Italy, but was cut to pieces by Stilicho near Florence (405); the rest pressed on through Gaul, crossed the Pyrenees, and entered the as yet untouched province of Spain.

Honorius died in 423. With the single exception of Britain,[1] no province had yet formally broken loose from the empire. But over a great part of the West the authority of the emperors was now little more than nominal; throughout the major part of Gaul and in Spain the barbarians had settled, and barbarian states were growing up which recognized the supremacy of the emperor, but were in all essentials independent of his control.

The long reign of Valentinian III. (423–455) is marked by two events of first-rate importance—the conquest of Africa by the Vandals[2] and the invasion of Gaul and Italy by Attila. The Vandal settlement in Africa was closely akin in its origin and results to those of the Visigoths and of the Vandals themselves in Gaul and Spain. Here, as there, the occasion was given by the jealous quarrels of powerful imperial ministers. The feud between Boniface, count of Africa, and Aëtius, the "master-general" or "count of Italy," opened the way to Africa for the Vandal king Gaiseric (Genseric), as that between Stilicho and Rufinus had before set Alaric in motion westwards, and as the quarrel between the tyrant Constantine and the ministers of Honorius had paved the way for the Vandals, Suebi and Alani into Spain. In this case, too, land-hunger was the impelling motive with the barbarian invader, and in Africa, as in Gaul and Spain, the invaders' acquisitions were confirmed by the imperial authority which they still professed to recognize. In 429 Gaiseric, king of the Vandals, crossed with his warriors, their families and goods, to the province of Africa, hitherto almost untouched by the ravages of war. Thanks to the quarrels of Boniface and Aëtius, their task was an easy one. The province was quickly overrun. In 435 a formal treaty secured them in the possession of a large portion of the rich lands which were the granary of Rome, in exchange for a payment probably of corn and oil. Carthage was taken in 439, and in the following year the Vandal kingdom was firmly established over a wide area in the ancient Roman realm.

Eleven years later (451) Attila invaded Gaul, but this Hunnish movement was in a variety of ways different from those of the Visigoths and Vandals. Nearly a century had passed since the Huns first appeared in Europe and drove the Goths to seek shelter within the Roman lines. Attila was now the ruler of a great empire in central and northern Europe and, in addition to his own Huns, the German tribes along the Rhine and Danube and far away to the north owned him as king. He confronted the Roman power as an equal; and, unlike the Gothic and Vandal chieftains, he treated with the emperors of East and West as an independent sovereign. His advance on Gaul and Italy threatened, not the establishment of one more barbaric chieftain on Roman soil, but the subjugation of the civilized and Christian West to the rule of a heathen and semi-barbarous conqueror. But the Visigoths in Gaul, Christian and already half romanized, rallied to the aid of the empire against a common foe. Attila, defeated at Châlons by Aëtius, withdrew into Pannonia (451). In the next year he overran Lombardy, but penetrated no farther south, and in 453 he died. With the murder of Valentinian III. (455) the western branch of the house of Theodosius came to an end, and the next 20 years witnessed the accession and deposition of nine emperors.

The End.—Under the three months' rule of Maximus, the Vandals under Gaiseric invaded Italy and sacked Rome. From 456–472 the actual ruler of Italy was Ricimer, the Suebe. Of the four emperors whom he placed on the throne, Majorian (457–461) alone played any imperial part outside Italy. Ricimer died in 472, and two years later a Pannonian, Orestes, attempted to fill his place. He deposed Julius Nepos and proclaimed as Augustus his own son Romulus. But the barbarian mercenaries in Italy determined to secure for themselves a position there such as that which their kinsfolk had won in Gaul and Spain and Africa. Their demand for a third of the lands of Italy was refused by Orestes, and they instantly rose in revolt. On the defeat and death of Orestes they proclaimed their leader, Odoacer the Rugian, king of Italy. Romulus Augustulus laid down his imperial dignity, and the court at Constantinople was informed that there was no longer an emperor of the West.

The installation of a barbarian king in Italy was the natural climax of the changes which had been taking place in the West throughout the 5th century. In Spain, Gaul and Africa barbarian chieftains were already established as kings. In Italy, for the last 20 years, the real power had been wielded by a barbarian officer. Odoacer, when he decided to dispense with the nominal authority of an emperor of the West, placed Italy on the same level of independence with the neighbouring provinces. But the old ties with Rome were not severed. The new king of Italy formally recognized the supremacy of the one Roman emperor at Constantinople, and was invested in return with the rank of "patrician," which had been held before him by Aëtius and Ricimer. In Italy too, as in Spain and Gaul, the laws, the administrative system and the language remained Roman. But the emancipation of Italy and the western provinces from direct imperial control, which is signalized by Odoacer's accession, has rightly been regarded as marking the opening of a new epoch. It made possible in the West the development of a Romano-German civilization; it facilitated the growth of new and distinct states and nationalities; it gave a new impulse to the influence of the Christian Church and laid the foundations of the power of the bishops of Rome.

Chronological Table of the Roman Emperors

B.C.	
27.	Augustus.
A.D.	
14.	Tiberius.
37.	Gaius.
41.	Claudius.
54.	Nero.
68, 69.	Galba. Otho. Vitellius.
69.	Vespasian.
79.	Titus.
81.	Domitian.
96.	Nerva.
98.	Trajan.
117.	Hadrian.
138.	Antoninus Pius.
161.	Marcus Aurelius.
180.	Commodus.
193.	Pertinax. Didius Iulianus. Septimius Severus.
211.	Caracalla.
217.	Macrinus.
218.	Elagabalus.
222.	Alexander Severus.
235.	Maximinus.
238.	The two Gordiani. Pupienus and Balbinus. Gordian III.
244.	Philip.
249.	Decius.
251.	Gallus.
253.	Aemilianus.
260.	Valerian. Gallienus.
268.	Claudius.
270.	Quintillus. Aurelian.
275.	Tacitus.
276.	Probus.
282.	Carus.
283.	Carinus and Numerian.
284.	Diocletian (Maximian associated with him, 286).
305.	Constantius and Galerius.
311.	Licinius. Constantine I.
324.	Constantine I.
337.	Constantine II. Constantius II. Constans.
350.	Constantius II., sole emperor.
361.	Julian.
363.	Jovian.

473.	Glycerius.		
474.	Julius Nepos.	474.	Leo II.
475.	Romulus Augustulus.		

BIBLIOGRAPHY.—I. REPUBLICAN PERIOD: *Ancient Sources.* No history of Rome was written till Fabius Pictor issued his Annals about 200 B.C. His sources were inscribed laws, treaties and *senatus consulta*, a great many of which had been preserved, the annual priestly records of important events requiring thank-offerings and atonements—tablets that contained the lists of magistrates from the early republic—family records that did not go far back, some inscriptions on public buildings, some records of early colonies and oral tradition. Recent excavations indicate that the substructure of history which he gave from the early republic is fairly sound. But the traditional account of the regal period must be considered legendary, as indeed the Roman historians assumed that it was. The early historians, Fabius, Cincius, Acilius and Postumius, were all statesmen who seem to have written with a keen sense of responsibility. Those who followed, Cato the Elder, Calpurnius Piso, Cassius Hemina, Tuditanus and Fannius (who wrote of the Gracchan period), were also well informed, and wrote chiefly regarding contemporary events. At the same time the Greek statesman, Polybius, wrote an accurate history from the time of the first Punic War, valuable portions of which have survived. After the Gracchi, historians like Gnacus Gellius began to insert family legends into the dry annals of the early period and he was followed by diffuse and rhetorical writers like Claudius Quadrigarius and Valerius Antias who composed popular accounts with little regard for accuracy. During the same period numerous apologetic autobiographies, memoirs and political pamphlets appeared which unduly coloured later accounts of Rome. Of all that we have mentioned (except Polybius) only brief fragments are extant, but the substance of all these books went into later histories that have survived. We have two valuable pamphlets of the amateur historian Sallust, the excellent commentaries of Julius Caesar (*q.v.*), the exceedingly important correspondence of Cicero (*q.v.*) as well as many of his speeches. In the Ciceronian period much valuable antiquarian work was done by men like Varro, Pomponius Atticus, and others which aided later writers to correct the mistakes of their predecessors.

In the Augustan age the materials accumulated by previous generations were worked up by compilers whose works are in some cases preserved. The work of Livy (*q.v.*) covered the history of Rome from its foundation to 9 B.C. in 142 books; of these only 35 are preserved in their entirety, while the contents of the rest are known in outline from an epitome (*periochae*) and from the compendia of Florus and later authors. Diodorus Siculus (*q.v.*) of Agyrium in Sicily followed the earlier annalists in the sections of his *Universal History* (down to Caesar) which dealt with Roman affairs; Dionysius of Halicarnassus (*q.v.*), in his *Roman Archaeology* (published in 7 B.C.), treated early Roman history in a more ambitious and rhetorical style, with greater fullness than Livy, whose work he seems to have used. Universal histories were also written in the Augustan age by Trogus Pompeius, whose work is known to us from the epitome of Justin (2nd century A.D.), and Juba, the learned king of Mauretania. Strabo (*q.v.*), whose *Geography* is extant, was the author of a continuation of Polybius's history (to 27 B.C.). The learning of the time was enshrined in the encyclopaedia of Verrius Flaccus, of which we possess part of Festus's abridgement (2nd century A.D.), together with an epitome of Festus by Paulus Diaconus (*temp.* Charlemagne). An official list of the consuls and other chief magistrates of the republic was inscribed on the walls of the Regia (rebuilt 36 B.C.), followed somewhat later by a similar list of *triumphatores;* the former of these is known as the *Fasti Capitolini* (C.I.L.I.²,I. *sqq.*), since the fragments which have been recovered are preserved in the palace of the Conservatori on the Capitol.

Among writers of the imperial period who dealt with republican history the most important are Velleius Paterculus, whose compendium of Roman history was published in A.D. 30; Plutarch (*c.* A.D. 45–125), in whose biographies much contemporary material was worked up; Appian, who wrote under the Antonines and described the wars of the republic under geographical headings (partly preserved) and the civil wars in five books, and Dio Cassius (*v. infra*), of whose history only that portion which deals with events from 69 B.C. onwards is extant.

The evidence of inscriptions (*q.v.*) and coins (*q.v.*) begins to be of value during the last 150 years of the republic. A series of laws and *Senatus consulta* (beginning with the *Senatus consultum de Bacchanalibus*, 189 B.C.) throws light on constitutional questions, while the coins struck from about 150 B.C. onwards bear types illustrative of the traditions preserved by the families to which the masters of the mint (*triumviri monetales*) belonged.

MODERN AUTHORITIES.—The criticism of early Roman history begins with Giambattista Vico, 1725, and Louis de Beaufort, 1738, Niebuhr (1811–12) and Schwegler (1853–58) laid a sound foundation for the historical reconstruction of Theodore Mommsen, whose great history appeared in 1854–56. In Roman constitutional history Mommsen's *Staatsrecht* (1st ed. 1872–75) has not been superseded, though Lange's *Römische Alterthümer* (1856–71) is still serviceable. The soundest modern history of republican Rome (incomplete) is De Sanctis, *Storia dei Romani* (1907–). Heitland's *Roman Republic* (3 vols., 1909) is a fresh and independent work. Groebe's recent revision of Drumann is of value for its accumulation of references for the later period. Other briefer histories devoted to special topics are Greenidge, *History of Rome* vol. i. (for the Gracchan period); several volumes of Pais chiefly concerned with criticism; E. Meyer, *Caesars Monarchie und der Principat des Pompeius;* Homo, *L'Italie Primitive;* Holleaux, *Rome, la Grèce;* Beloch, *Römische Geschichte;* Holmes, *The Roman Republic* (chiefly military history of the late republic); Rostovtzeff, *Rome;* Frank, *Roman Imperialism* and *An Economic History of Rome;* and finally the chapters devoted to Rome in volumes vii.–ix. of the *Cambridge Ancient History.* (*See* VICO, GIOVANNI BATTISTA.)

II. IMPERIAL PERIOD: *Ancient Sources.*—The memoirs of Augustus as well as those of his contemporaries (Messalla, Agrippa, Maecenas, etc.) and successors (Tiberius, Agrippina the younger, etc.) have perished, but we possess the *Res gestae divi Augusti* inscribed on the walls of his temple at Ancyra (ed. Mommsen, 1883, Ramsay and Premerstein's *Mon. Antiochenum*, 1927, includes the fragments recently found at Antioch). Aufidius Bassus wrote the history of the civil wars and early empire, perhaps to A.D. 49, and this was continued by Pliny the Elder (*q.v.*) in 31 books, probably to the accession of Vespasian. These works and others were used by Tacitus (*q.v.*), whose *Annals* (properly called *ab excessu divi Augusti*) and *Histories*, when complete, carried the story of the empire down to A.D. 96. Pliny's correspondence with Trajan about the affairs of Bithynia, which he administered in A.D. 111–113, is of great historical value. Suetonius (*q.v.*), who was for some time secretary of state to Hadrian, wrote biographies of the emperors from Julius Caesar to Domitian. Arrian, a Bithynian Greek, wrote on Rome's policy and wars in the East. Appian (*v. supra*) dealt with the wars waged under the early empire in the closing books of his work, which have not been preserved. Dio Cassius, a Bithynian, wrote a history of Rome to the death of Elagabalus in 80 books. We possess only epitomes and excerpts of the portion dealing with events from A.D. 46 onwards, except for parts of the 78th and 79th books, in which Dio's narrative of contemporary events is especially valuable. Herodian, a Syrian, wrote a history of the emperors from Commodus to Gordian III., which as the work of a contemporary is not without value. The *Historia Augusta* (*see* AUGUSTAN HISTORIES), upon which we are obliged to rely for the history of the 3rd century A.D., consists in a series of lives of the emperors (including most of the pretenders to that title) from Hadrian to Carinus, professedly written by six authors, under Diocletian and Constantine. Modern criticism has shown that (at least in its present form) it is an unreliable compilation made in the latter half of the 4th century. The fragments of Dexippus, an Athenian who successfully defended his native town against Goths, throw much light on the barbaric invasions of the 3rd century. The most important historian of the 4th century was Ammianus Marcellinus, a native of Antioch and an officer in the imperial guard, who continued the work of Tacitus (in Latin) to the death of Valens. We possess the last 18 books of his history which cover the years A.D. 353–378. Two compendia of imperial history pass under the name of Aurelius Victor, the *Caesares*, or lives of the emperors from Augustus to Julian, and the *Epitome de Caesaribus* (not by the same author) which goes down to Theodosius I. Similar works are the *Breviarum* of Eutropius (secretary of state under Valens) and the still more brief epitome of Festus. The writings of the Emperor Julian and of the rhetoricians Libanius, Themistius and Eunapius—the last-named continued the history of Dexippus to A.D. 404—are of great value for the latter part of the 4th century A.D. They wrote as pagans, while the Christian version of events is given by the three orthodox historians Socrates, Sozomen and Theodoret, and the Arian Philostorgius, all of whom wrote in the 5th century. An imperial official, Zosimus, writing in the latter half of that century, gave a sketch of imperial history to A.D. 410; the latter part is valuable, being based on contemporary writings. The bishops Synesius and Palladius, who lived under Arcadius and Theodosius II., furnish valuable information as to their own times;

while the fragments of Priscus tell us much of Attila and the Hunnish invasions. Mention must also be made of the poets and letter-writers of the 4th and 5th centuries—Ausonius, Claudian, Symmachus, Paulinus of Nola, Sidonius Apollinaris, Prudentius, Merobaudes and others—from whose writings much historical information is derived. Cassiodorus, the minister of Theodoric, wrote a history of the Goths, transmitted to us in the *Historia Gothorum* of Jordanes (*c.* A.D. 550), which gives an account of the earlier barbaric invasions. Several chronological works were compiled in the 4th and 5th centuries. It will suffice to name the *Chronology of Eusebius* (to A.D. 324), translated by Jerome and carried down to A.D. 378, and the *Chronography of* A.D. *354*, an illustrated calendar containing miscellaneous information.

The codes of law, especially the *Codex Theodosianus* (A.D. 438) and the code of Justinian, as well as the army list of the early 5th century, known as the *Notitia Dignitatum*, possess great historical value. For the inscriptions of the empire, which are of incalculable importance as showing the working of the imperial system in its details, *see* INSCRIPTIONS; the coins (*q.v.*) also throw much light on the dark places of history in the lack of other authorities. Egyptian papyri are not only instructive as to legal, economic and administrative history, but also contribute to our general knowledge of events. (*See* especially Mitteis-Wilcken, *Chrestomatie*, 1912, and bibliography in Rostovtzeff, *Social and Economic History of Rome*, 1926.) The *Zeitschrift für Papyrusforschung*, ed. by U. Wilcken, gives an account of progress in this branch of study.

MODERN AUTHORITIES.—Tillemont's *Histoire des empereurs* (6 vols., 1690–1738), supplemented by his *Mémoires*, furnished Gibbon with material for his *Decline and Fall of the Roman Empire* (1776–78), which has never been superseded as a history of the entire imperial period, and has been rendered adequate for the purposes of the modern reader by Prof. J. B. Bury's edition (1897–1900). The history of the empire has yet to be written in the light of recent discoveries. Mommsen's fifth volume (Eng. trans., as *Provinces of the Roman Empire*, 1886) is not a narrative, but an account of Roman culture in the various provinces. H. Schiller's *Geschichte der römischen Kaiserzeit* (1883–88) is a useful handbook. Rostovtzeff's *Social and Economic History of Rome* (1926) is very valuable for its thorough sifting of inscriptions and papyri, while Dessau's *Gesch. der römischen Kaiserzeit* (1924), two volumes of which have appeared, promises to give a good survey of political history. H. S. Jones, *The Roman Empire* (1908) and Chapot, *Le Monde romain* (1927) are brief but sound and independent. For the later period we have Seeck, *Gesch. des Untergangs der antiken Welt* (6 vols., 1897–1920), Bury's *History of the Later Roman Empire* (1889), beginning from A.D. 395, and *Constitution of the Later Empire* (1910), and T. Hodgkin's *Italy and her Invaders* (8 vols., 1880–99), which tells the story of the barbaric invasions at great length. The imperial constitution is described by Mommsen in the second volume of his *Staatsrecht* (*v. supra*); divergent views will be found in Herzog's *Geschichte und System der römischen Staatsverfassung* (1884–91); the working of the imperial bureaucracy is treated by O. Hirschfeld, *Die römischen Verwaltungsbeamten* (1905). The *Prosopographia Imperii Romani*, compiled by Dessau and Klebs (1897–98), is a mine of information, as is the new edition of Pauly's *Realencyklopädie der classischen Alterthumswissenschaft* (in progress). Other useful books are: Greenidge, *Roman Public Life* (1901); Abbott and Johnson, *Municipal Administration in the Roman Empire* (1926); Dill, *Roman Society in the Last Century* (1906), Paribeni, *Traiano* (1927); Mattingly, *Roman Coins* (1928). (H. F. P.; H. S. J.; T. F.)

MEDIAEVAL HISTORY

The history of the city of Rome during the middle ages was overshadowed by the history of the papacy. The latter has left many documents; for the city there are very few, especially for the period before the 13th century. As the foundations were so ill-defined there was opportunity for historians to theorize on what the superstructure had been; and the theories were influenced by the ideas, patriotic or otherwise biased, held in the 19th century. One favourite theory was the existence of an aristocratic republic contending against the popes until overthrown by the popular revolution in 1143, when the commune arose. Of this aristocratic republic the consuls were thought to have been the heads, and the existence and functions of the senate were much discussed. This theory was held by some of the leading historians: Hegel, Gregorovius and Villari.

These views are no longer held. Some important documents have been discovered and made accessible by publication. Halphen and others whose works are cited in the bibliography have done much to elucidate the early history. Much still remains to be done, but it is probable that the analogies drawn in the past between the history of Rome and that of the other cities in Italy are misleading. The deserted Campagna surrounding the city checked any notable increase of trade or industry and prevented the establishment of gilds on the footing that elsewhere made them the basis and support of a commune. Moreover, the Campagna was unhealthy and ill-fitted for agriculture. The population of the city was very small. There was no strong middle class among its citizens, whose leaders were usually rude, illiterate nobles. Only slowly did the forces which were at work elsewhere in Italy penetrate into the city and cause the rise of a belated commune. What part was played by the memory of the traditions of republican Rome is a mooted question. The city was styled *respublica;* the titles senator, consul, prefect, occur repeatedly; but it is necessary to be on one's guard against drawing inferences from the long-continued or revived use of old terms.

Gothic and Byzantine Rule.—The removal of the seat of empire to Constantinople effected a radical change in the political situation of Rome, but the civil administration remained unaltered. The Gothic rule merely superimposed upon the Roman social order a Teutonic stratum that never penetrated beneath its surface. The senate, the principal magistrates, both provincial and municipal, the prefect of the city, and the Roman judges enforcing the enactments of the Roman law, were all preserved. Hence there was no visible change in the constitution of the city. The wars of Belisarius and Narses against the Goths (A.D. 535–555) caused terrible slaughter and devastation in Italy, and finally subjected her to Constantinople. In place of a Gothic king she was ruled at first by a pretorian prefect and later by an exarch (first mentioned in 584), who had his seat of government at Ravenna. The pragmatic sanction (554), promulgating the Justinian code, separated the civil from the military power, and, by conferring on the bishops the authority over the provincial and municipal government, soon led to the increase of the power of the Church.

Roman institutions were altered; but their original features were still to be traced, and no heterogeneous element had been introduced. The dawn of a new epoch can be dated from the invasion of the Lombards (568–572). Their conquest of a large portion of Italy reduced the inhabitants almost to slavery. But, in the unsubdued parts of the country—namely, in Ravenna, Rome and the maritime cities—a very different state of things prevailed. The necessity for self-defence and the distance of the empire, now too weak to render any assistance, compelled the inhabitants to depend solely on their own strength. In Rome we behold the rapid growth of the papal power and the continual increase of its political influence. Not only the superintendence but often the nomination of public functionaries and judges was in the hands of the popes. And the accession to St. Peter's chair of a man of real genius in the person of Gregory I., surnamed the Great, marked the beginning of a new era. By force of individual character this pope was the true representative of the city, the born defender of Church and State. His ecclesiastical authority, already great throughout Italy, was specially great in the Roman diocese and in southern Italy. The offerings of the faithful had endowed the Church with enormous possessions in the province of Rome, in Sicily, Sardinia, and other parts. The administration of this property assumed the shape of a small government council in Rome. The use made by the pope of his revenues greatly contributed to the increase of his moral and political authority. When the city was besieged by the Lombards and the emperor left his army unpaid, Gregory supplied the required funds and thus made resistance possible. And when the defence could be no longer maintained he alone, by the weight of his personal influence and the payment of large sums, induced the Lombards to raise the siege. He negotiated in person with Agilult and was recognized by him as the true representative of the city.

A prefect of Rome is not mentioned between 599 and 772, and then again there is silence until the time of the Ottos. It is impossible to say whether the office was discontinued. In the later days the prefect was an official of the pope, who had taken over the care of the aqueducts and the preservation of the city walls. There is also much doubt about the existence of a senate. We know that many senators had lost their lives in the long war. The pragmatic sanction of 554 did mention the senate, but this

was the last formal recognition of it as a governing body; and, if we may trust a despairing cry of Gregory the Great, it had disappeared, or at least was reduced to a shadow.

The popes now make common cause with the people against the Lombards on the one hand and the emperor on the other. This alliance was cemented by the religious disputes of the East and the West; for Pope Gregory II. (715–731) opposed the celebrated edict of the iconoclastic emperor Leo the Isaurian, and Venice, Ravenna, the Pentapolis and Rome took up arms against the emperor and elected dukes of their own.

Duchy of Rome.—In the midst of these warlike tumults a new constitution was being set up in Rome. In 711 the *Liber Pontificalis* makes the first mention of the duchy of Rome, and we find the people struggling to elect a duke of their own. In the early days of the Byzantine rule the territory appertaining to the city was no greater than under the Roman empire; but, partly through the weakness of the government of Constantinople, and above all through the decomposition of the provinces under the Lombards, this dukedom was widely extended; its limits were always changing in accordance with the course of events. At the beginning of the 8th century it had almost the same extent, except on the north, that the papal states had in 1860–70.

In the provinces, the administrators of church lands were important personages, and exercised both judicial and political functions. It was very natural that the heads of this vast administration resident in Rome should have a still higher standing and, in fact, from the 6th century, their power increased to such an extent that in the times of the Franks they already formed a species of papal cabinet with a share and sometimes a predominance in the affairs of the republic. The pope was thus at the head of a large administrative body and, in addition, was possessed of enormous revenues. He considered himself the real representative of the Roman republic. Gregory II. (715–731) accepted in the name of the republic the submission of other cities and protested against the conquest by the Lombards of those already belonging to Rome. The empire was now powerless in Italy, while the advance of the Lombards was becoming more and more threatening; they seized Ravenna in 751, thus putting an end to the exarchate, and next marched towards Rome, which had only its own forces and the aid of neighbouring cities to rely upon. To avoid being conquered Stephen II. (752–757) appealed to Pippin, king of the Franks, and concluded an alliance with him. The pope consecrated Pippin king of the Franks and named him *patricius Romanorum*. This title was given to Pippin as defender of the Church, for the pope styled him at the same time *defensor* or *protector ecclesiae*. And the king pledged himself not only to defend the Church but also to wrest the exarchate and the Pentapolis from the Lombards and give them to the pope. Pippin brought an army (754–755) and fulfilled his promise. The pope accepted the donation in the name of St. Peter and as the visible head of the Church. Thus in 755 central Italy broke its connection with the empire; thus was inaugurated the temporal power of the papacy.

Charles the Great.—In the years immediately succeeding the popes vacillated in their policy but it was soon apparent that their hopes must be placed on renewed aid from the Franks in order to check the constantly threatened danger from the Lombards, who were seeking to recover the territory which they had lost and also to seize Rome. Adrian I. (772–795) besought the assistance of Charlemagne, who made a descent into Italy in 773, destroyed the Lombard kingdom, and seized the iron crown. Entering Rome in 774, he confirmed the donation of Pippin. The pope was now regarded and regarded himself as master of Rome; he always spoke of Rome and the Romans as "our city," "our republic," "our people." It is true that Charlemagne held the supreme power, but this power was only occasionally exercised in Rome. The pope was most tenacious of his own authority, made vigorous protest whenever rebels fled to Charlemagne or appealed to that monarch's arbitration, and contested the supremacy of the imperial officials in Rome. Yet the pope was no absolute sovereign, nor, in the modern sense of the term, did any then exist. The Roman nobles were different from other aristocratic bodies elsewhere. Their power was chiefly derived from the high offices and large grants of money and land conferred on them by the popes. Every pope aggrandized his own kindred and friends, and these were the natural and often open adversaries of the next pontiff and his favourities. Thus the Roman nobility was powerful, divided, restless, and turbulent; the pope needed the support of an effective force for his own preservation; hence the necessity of creating an empire of the West.

Leo III. (795–816) further strengthened the ties between Charlemagne and the Church by sending the former the keys of the grave of St. Peter and the banner of Rome. Charlemagne had already joined to his office of patrician the function of high justice. The pope urged him to despatch an envoy to receive the oath of fealty from the Romans. Leo had antagonized the Romans, and during a procession had been attacked and barbarously maltreated (799). He fled to Charlemagne and returned guarded by his envoys; Charlemagne himself went to Rome in Nov. 800. As there was no one authorized to try a pope, Leo was permitted to clear himself of the charges against him by taking an oath on three altars. Then, on Christmas day, in St. Peter's, before an assemblage of Roman and Frankish lords, clergy, and people, the pontiff placed the imperial crown on Charlemagne's head and all proclaimed him emperor. Thus the new emperor was accepted by the Romans and consecrated by the pope. Yet Charlemagne was not sovereign of Rome; he possessed scarcely any regalia there, and was not in command of the army.

The death of Charlemagne in 814 was the signal for a further conspiracy of the nobles against the pope, who instantly put the ringleaders to death. He was severely blamed by the new emperor Louis for this violation of the imperial prerogative, as the emperor was determined to have his power recognized in Rome, and especially to insure that his assent must be secured for the election of a pope. To assure this he sent his son Lothair to be king of Italy, and the latter was crowned co-emperor in 823. In the following year Lothair promulgated a new constitution, to which Pope Eugenius II. (824–827) had to give his oath of adherence. The more direct power was to appertain to the pope—the supreme authority, presidency of the tribunals, and final judgment on appeal to the emperor. The new constitution also established the right of contending parties to select either the Roman or a Teutonic code for settlement of their disputes.

This is a convenient point to attempt a summary of the relations of the papacy with the City of Rome. By the donations and aid of the Franks it had become legal as well as actual ruler of the city. Charles the Great as emperor was the sovereign, but he never wished to take the place of the pope as chief of the Roman administration. The imperial *missus* of the constitution of 824 had as an associate a papal *missus*, and the two were ordered to refer all matters first to the pope; the emperor reserved a right of appeal to himself. But the power of the pope was secure only when he had outside support. At other times there was always danger that the nobles in the city would either revolt against him or, and more frequently, put in their own pope and use him for their own advantage. It must be noted, however, that the nobility as such never, before the middle of the 12th century, played a constitutional rôle in the administration of the city.

The City Officials.—The principal official was the prefect, who was the chief of police and judge in criminal matters. In civil cases he presided over the court and announced the decision, but was not himself a judge. He held his power from the pope except during periods of strife between an emperor and a pope, when the former sometimes usurped the right of appointment. Next in rank were the consuls of the Romans, or the dukes. They were nobles employed by the popes for special duties such as presiding over tribunals. Apparently the titles were applied to the same office, "duke" being used before the 11th century and "consul of the Romans" later, although in the period of transition the same man was sometimes styled both "duke" and "consul." Then there were "the seven judges," the *primicerius* and the *secundicerius*, who may be roughly described as first and under secretaries of state; the *arcarius*, or papal receiver; the *sacellarius*, or cashier;

the *protoscriniarius*, who was at the head of the papal chancery; the *primus defensor*, who was the advocate of the Church and administered its possessions; and the *nomenclator*, who pleaded the cause of widows, orphans and paupers. These men were called judges, a term then used generally for officials. (For example, the *judices de militia* were military officials and not judges at all.) These seven officials had apparently been created as need arose; the *primicerius* is mentioned in the 4th century, the *protoscriniarius* not until the ninth. They gradually ceased to be chiefs of administration and by the middle of the 11th century were thought of only as civil judges. For example, the *camerarius*, or treasurer, had taken over the duties of both the *arcarius* and *sacellarius*. In addition there were other civil judges, the *judices dativi*, who assisted the seven, but could not give judgment without the consent of some of "the seven ordinary judges." The latter were always members of the clergy; the *judices dativi* were not. For administrative purposes the city was divided into 12 districts. These 12 had succeeded the division of the city in the 6th century into 14 districts for civil administration and seven for ecclesiastical. Just when the change was made is uncertain, but Duchesne thinks it goes back to the time of the Byzantine rule. Finally it may be noted that "senator" was merely a title of honour carrying no power except when a usurping aristocrat bore the title. These statements as to the officials are based mainly on Halphen's study, which has done so much to correct former erroneous notions. Many details are still in doubt, but in general this outline applies to the period before the rise of the commune.

The fall of the Frankish empire left all Italy a prey to anarchy and torn by faction fights. The Saracens were advancing from the south, the Hungarians from the north. Anarchy was at its climax in Rome. The aristocracy gained strength and wrested fresh privileges from the pontiffs. Early in the 10th century Theophylact, who had been an official of the Sacred palace, was the chief of the Roman nobles. He was a senator, and his wife Theodora was styled "senatrix." She and her daughter Marozia were influential, and tradition has assigned to them both greater influence and more vice than can be proved by historical data. Marozia's husband was Alberic, the marquis of Spoleto. After Theophylact, Theodora and Alberic were all dead Marozia became the leader of the noble faction, and added to her power by marrying Guy, marquis of Tuscany. The pope was imprisoned by her and soon died, possibly murdered. Marozia was supreme, and raised her son to the papacy as John XI. When on Guy's death she married King Hugh of Italy (932), a revolt against her and her new husband was led by Alberic, her son; he was successful and became the ruler of the city. Of Marozia no more is heard.

Otto the Great.—Alberic, as "prince and senator of all the Romans," ruled Rome and the duchy until his death in 954. "His yoke was heavy on the Romans and on the Holy Apostolic See"; but the popes were docile and the nobles were kept in order by a stern hand. Alberic was so completely master of Rome that he may have dreamed of creating an hereditary dynasty. He gave his son the name of Octavian, and on his deathbed he made the nobles swear to elect Octavian pope at the next vacancy. The lad was then 16 years old, and the following year was elected pope with the name of John XII. His palace was the scene of scandalous licence, while his public acts were those of a tyrant. He desired to be both pope and prince, but utterly failed to be either. In 960, realizing the impossibility of maintaining his power without outside aid, he sought help from Otto I. and promised him the imperial crown. Otto vowed to defend the Church, to restore her territories, to refrain from usurping the power of the pope or the republic, and was crowned on Feb. 2, 962. Otto confirmed to the pope the territories granted by the Carolingians and even enlarged them, but he also revived the constitution of 824, by which the election of a pope required the imperial confirmation, and he reserved for himself the suzerainty over the papal territory as the Carolingians had done. John XII., finding a master in the protector he had invoked, joined the discontented nobles who were conspiring against the emperor. But the latter hastened to Rome in Nov. 963, assembled the clergy, nobles and heads of the people, and made them take an oath never again to elect a pope without his consent and that of his son. He also convoked a synod presided over by himself in St. Peter's, which judged, condemned and deposed Pope John and elected Leo VIII. (963–965), a Roman noble, in his stead. All this was done at the direct bidding of the emperor, who thus deprived the Romans of their most valued privilege, the right of choosing the pope. Moreover, Otto was hated as a foreign ruler and the clergy were resentful at the uncanonical deposition of a pope and the equally uncanonical election of a layman. On Jan. 3, 964, the Romans attacked the Vatican, where the emperor was lodged. The German knights repulsed them with much slaughter, but Otto departed in February, and John XII. returned with an army of followers and compelled the defenceless Leo VIII. to seek safety in flight. Soon afterwards Leo was deposed and excommunicated by a new synod, and many of his adherents were cruelly murdered. When on May 14, 964, John suddenly died, the Romans, amid violent struggles and tumults, elected Benedict V., and procured his consecration in spite of the emperor's veto. Otto appeared at the head of an army, besieged the city, reduced it by famine and, after holding a council which deposed Benedict, restored Leo VIII. to the papal throne.

The emperor's arbitrary exercise of power roused a long and obstinate resistance. When Leo VIII. died in 965, the imperial party elected John XIII. (965–972), who tried to create a party of nobles to offset the power of the party of Alberic. Upon this there was a general revolt. The nobles were led by Peter, prefect of Rome. The leaders of the people were 12 *decarconi*, a term of unknown derivation but probably indicating chiefs of the 12 regions. The new pope was seized and imprisoned; but the emperor quickly marched against Rome, and this was sufficient to produce a reaction which recalled the pope (Nov. 966), sent the prefect into exile and put several of the rebellious nobles to death. Shortly after the emperor sacked the city; many Romans were exiled, some tortured, others, including the 12 *decarconi*, killed.

The Crescentii.—Pope John XIII. was succeeded by Benedict VI. (973–974) and Otto I. by his son Otto II., a youth of 18. Thereupon the Romans, who had supported the election of another pope, and were in no awe of the new emperor, rose to arms under the command of Crescentius, a rich and powerful noble. They not only seized Benedict VI. by force, but strangled him in the castle of St. Angelo. The factions then successively elected popes who were either exiled or persecuted, and one of them is said to have been murdered. During this turmoil the anti-imperial party, led by Crescentius II., son of the Crescentius mentioned above, had taken possession of the government. Crescentius assumed the title of patrician and sought to imitate Alberic. Fortunately for him, the reigning pope was a detested tyrant, and the emperor Otto III. a child entirely guided by his mother. But the emperor was backed by a powerful party, and on coming to Rome in 996 was able, although only aged 15, to quell the rebellion, oust Crescentius from public life, and elect as successor to John XV. his own cousin, Gregory V. (996–999). This first German pope surrounded himself with compatriots, and by raising them to lofty posts even in the tribunals excited a revolt that drove him from the throne (Sept. 29, 996). Crescentius, being master of the castle of St. Angelo, resumed the title of patrician, expelled the German judges, reconstituted the government and created a new pope. The following year Otto III. came to Rome, and his party opened the gates to him. Although deserted by nearly all his adherents, Crescentius held the castle valiantly against its besiegers, until, on April 29, 998, he was forced to make terms, and the imperialists, violating their pledges, first put him to torture and then hurled him from the battlements.

Thus Otto III. was enabled to establish his mastery of Rome. He wished to reconstitute a Romano-Byzantine empire with Rome for his capital. Nevertheless he was German, and during his reign Germanic institutions made progress in Rome and many families of feudal barons arose. The Church made grants of lands, cities and provinces in the feudal manner, while the bishops, like feudal barons, became actual counts. Meanwhile the Roman barons were growing more and more powerful, and were neither submissive nor faithful to the emperor. On the contrary, they

resented his attitude as a master of Rome, and, when he subjected Tivoli to the Holy See, attacked both him and the pope with so much vigour as to put both to flight (Feb. 16, 1001).

By the emperor's death in Jan. 1002 the family of the Ottos became extinct; the papacy then began to decline, and the nobles, divided into an imperial and an anti-imperial party, were again predominant. They reserved to themselves the office of patrician, and, electing popes from their own ranks, obtained enlarged privileges and power. John Crescentius was elected patrician; one of his kinsmen was invested with the office of prefect, and the new pope John XVIII. (1003–09) was one of his creatures. His power lasted for ten years, until his death in 1012. Pope Sergius IV. having died the same year, the count of Tusculum compassed the election of Benedict VIII. (1012–24), one of his own kin. This pope expelled the Crescentii, changed the prefect and reserved the title of patrician for Henry II. whom he consecrated emperor on Feb. 14, 1014. He also succeeded in placing his own brother, Romano, at the head of the republic with the title of "Senator of all the Romans." The prefect still retained his authority, and the emperor was by right supreme judge; but when a violent revolt broke out the emperor only stayed to suppress it and then went to Germany in disgust. The pope, aided by his brother, conducted the government with energy; he awed the party of Crescentius and waged war against the Saracens in the south. When he died in 1024 there was a repetition of the same events that had followed the death of Alberic, and with no less fatal consequences. Benedict's brother, Romano, head of the republic, was, although a layman, elected pope. He took the name of John XIX. (1024–33), and in 1027 conferred the imperial crown on Conrad the Salic. The latter abolished the Lotharian edict of 824 and decreed that throughout Rome and its territory justice should be administered solely by the Justinian code.

The Three Rival Popes.—John XIX. was succeeded by his nephew, Benedict IX. (1033–45), whose brother became head of the republic. Thus Church and State assumed the aspect of hereditary possessions in the powerful house of the counts of Tusculum. The vices and excesses of Benedict were so monstrous that he was driven from the city and Sylvester III. elected by his opponents. Benedict still had some support and succeeded in driving out Sylvester; then, finding his position untenable, he sold the papacy to a reformer who took the name of Gregory VI. Benedict soon attempted to regain his office, and in 1045 three popes were struggling for the tiara in the midst of scandal and anarchy. The streets and neighbourhood of Rome swarmed with thieves and assassins; pilgrims were plundered; citizens trembled for their lives, and petty barons threatened the rival popes, who were obliged to defend themselves by force. This state of things lasted until Henry III. came to re-establish order. He summoned a synod which deposed the three popes, and then, with the consent of the Romans, assuming the right of election, proposed a German, Clement II., who was consecrated at Christmas 1046. Henry III. was then crowned, and also took the title of patrician.

Henry III. procured the election of four German popes in succession. But the fourth German pope, Victor II., died in 1057, and Henry III. had been succeeded in 1056 by the young Henry IV. under the regency of a weak woman, the empress Agnes. The nobles by violence and bribery brought about the election of Benedict X. The cardinals were opposed to him and, fleeing from the city, elected Nicholas II. (1059–61). This pope could only enter Rome when escorted by the troops of Godfrey of Tuscany. When Nicholas died the nobles, assisted by some Lombard bishops, elected Honorius II. and sought aid from the German king, while the cardinals chose Alexander II. (1061–73). Although supported by an armed force of Normans, the latter had to fight his way into Rome, whither Honorius II. soon followed and won a battle against the forces of Alexander II. with much slaughter. Both candidates were compelled to withdraw from the city until their claims were settled by the German court. Strife continued, but Alexander II. finally was recognized as pope and attempted to reform the church, though he had little power in the city.

At Alexander's funeral Hildebrand was seized by the crowd and acclaimed as pope. The cardinals who were favourable to him, hastened to go through the form of an election in order to give a legal warrant to what had been done by popular violence; he chose the name of Gregory VII. (1073–85) and secured recognition from Henry IV. Gregory confirmed his predecessor's decrees against simoniacal and non-celibate priests and forbade the clergy to receive investiture at the hands of laymen. As the high ecclesiastical dignitaries held much territory and were also high officials of the empire, this decree was certain to cause a fierce contest between the emperor and the pope. Some of the nobles had already shown their hostility to Gregory; at Christmas 1075 the prefect Cencius and other nobles seized Gregory while he was celebrating mass in Santa Maria Maggiore and dragged him away to imprisonment. The people were incensed at this outrage and fear of popular wrath compelled Cencius to release Gregory. About the same time Henry IV., exasperated by a letter in which Gregory had sharply rebuked him for his sins, declared Gregory deposed from the papacy, and Gregory in turn decreed the excommunication and deposition of the emperor. That monarch afterwards made submission to Gregory at Canossa (1077), then again turned against him and was again excommunicated. In 1081, with his anti-pope Clement III., he besieged Rome in vain. He was equally unsuccessful in each of the two following years, but at last forced his way into the city (March 1084) and compelled Gregory to seek refuge in the castle of St. Angelo. The emperor, as master of Rome, procured the consecration of Clement III., by whom he was crowned in turn. He then attacked and seized the capitol and assaulted the castle of St. Angelo in the hope of capturing the pope. But Robert Guiscard brought his Norman army to the rescue. Emperor and anti-pope fled; the city was taken, the pope liberated, and Rome was brutally sacked for three days by the Normans. After this Gregory, broken with grief and hated by the Romans, had to go away with the Normans and died at Salerno on May 25, 1085.

Victor III. was elected only after an interval of a year and reigned only a short time. He was consecrated in St. Peter's but was unable to maintain his position in Rome. Urban II. (1088–99), the next pope elected, also had little power in Rome, as the city was usually in the hands of the supporters of the anti-pope. It was not until 1096, when he had won prestige by preaching the crusade, that he could enter the city as its master, and even then the castle of St. Angelo was held by the followers of the anti-pope, until 1098.

Revolt Under Paschal II.—Pope Paschal II. (1099–1118) tried to rule the city through the faction of nobles who favoured him, but with little success, as the imperial party frequently had the upper hand. When Henry V. seized the pope in 1111 the people rose in his defence and forced Henry to leave the city; but under ordinary circumstances Paschal could not count on any hearty support. In 1116, when he wished to make one of the Pierleoni prefect, there was a bloody revolt and a rival was put in as prefect by the imperial partisans. Soon after this Henry V. came to Rome and Paschal had to flee. Later he returned with Norman troops but could not put down the revolt, and the opposition still held the capitol when Paschal died.

The cardinals met in haste and secretly elected Gelasius II. The election had scarcely been completed when Cencius Frangipani broke into the assembly, seized the pope and carried him bleeding to one of the Frangipani towers. As they had done when another Cencius had seized Gregory VII., the people of the 12 districts rose in their wrath and, led by the prefect (whose election Paschal had opposed), forced the Frangipani to give up their prisoner. The Frangipani fled to the emperor and he came to Rome. Gelasius had to flee to his native city of Gaeta, where he was safe under Norman protection. An anti-pope was chosen by the imperial party; but when Henry left Rome Gelasius was able to return, although the anti-pope was also in Rome and a new revolt threatened the life of Gelasius. Consequently he fled to France, where he died in 1119, having been pope a year and a few days.

Calixtus was next chosen and restored peace. The Frangipani succeeded in electing his successor Honorius II. (1124–30), who was quietly accepted by the Roman people. At his death some of

the cardinals chose Innocent II.; others, and the more numerous part, elected one of the Pierleoni, who took the name of Anaclete II. The greater part of the people now favoured the Pierleoni, and his rival, who was supported by the Frangipani, had to flee. He secured support in France and Germany, especially through the aid of Bernard of Clairvaux, and was finally recognized as pope almost everywhere except in Rome and among the Normans in Italy. Anaclete II. retained the upper hand in the city almost until the time of his death in 1138. In the following year Innocent attempted a military campaign against Roger of Sicily, but was captured by him and compelled to acknowledge his kingship, with which he had been invested by Anaclete. Humiliated, Innocent returned to Rome and there he was to suffer further humiliation.

Rise of the Commune.—Throughout upper and central Italy the cities were being organized as free and independent communes on a democratic basis. Their example was followed in the ancient duchy of Rome and almost in the immediate neighbourhood of the city. The same tendencies were at work in Rome. Gradually in the troubled times when the factions of the nobles were contending together and the papal rule was so weak, a lesser nobility had grown into power in the city, in alliance with the people, with whose interests they had much in common. They were irritated against the pope by his submission to the Normans and this irritation was greatly increased by his attitude toward Tivoli. In 1142 this city openly rebelled against the mother city, and the pope sent the Romans to subdue it. They were not only repulsed, but ignominiously pursued to their own gates. Afterwards, returning to the assault in greater numbers, they conquered the hostile town. Its defenders surrendered to the pope, and he immediately concluded a treaty of peace without consulting the people. The soldiery, still flushed with victory, were furious at this slight. They demanded the submission of Tivoli to the Roman people, as well as permission to demolish its walls and dwellings and expel its population. Innocent II. refused his consent and a revolution ensued. In 1143 the rebellious people rushed to the capitol, proclaimed the republic, reconstituted the senate, with the almost entire exclusion of the nobles, and declared the abolition of the temporal power. Just after this Innocent died.

The pontificates of the next two popes, together, lasted less than 17 months. The second, Lucius II. (1144–45), tried to withstand the revolution by seeking Norman aid and throwing himself into the arms of the feudal party, but this only precipitated the course of events. The people, after having excluded nearly all aristocrats from the senate, now placed at its head the noble Jordan Pierleoni, who had joined the revolutionary party. They named him patrician, and also conferred on him the judicial powers appertaining to the aristocratic and imperial office of prefect. The pope was requested to resign the temporal power, the regalia and every other possession and content himself with the tithes and offerings of the faithful. He indignantly refused, marched at the head of the nobles against the capitol, but was repulsed, and received a blow on the head from a stone, which is supposed to have caused his speedy death, Feb. 15, 1145. Eugenius III. was then elected (1145–53), but soon had to flee to Viterbo in quest of armed assistance, in consequence of the senate's resolve to prevent by force his consecration until he recognized the new state of things in the Eternal City.

It was at this time that Arnold of Brescia (*q.v.*) was absolved by the pope and ordered to make a pilgrimage to Rome. An arch-revolutionist, he began to preach and his eloquence brought him fame. But his influence on events has been greatly exaggerated in most accounts. The people had already formed an equestrian order, which was probably a mounted force of the lesser nobility, and also were fortifying the capitol. The revolution spread beyond the walls, several cities of the state proclaimed their independence, and the barons of the Campagna profited by the opportunity to act as independent sovereigns. Thus the whole domain of the Church was threatened with dissolution. The pope marched towards Rome with an army, but hoped to come to terms. The Romans in fact recognized his authority, and he in his turn recognized the republic. The office of patrician was abolished, and the prefect was revived. The senators received investiture from the pope, who returned to Rome at Christmas 1145.

The Commune Fully Constituted.—The commune now seems to have been fully constituted, so a short sketch will be given here of its more important features. The senate was drawn, at least in part, from the lower classes and the petty nobility, and this was the special characteristic of the new revolution. In 1144 there were 56 senators, but the number often varied. In 1151 there were 50; in 1163 only 25; in 1181 again 56, and still more in 1191. After that it was more usual to have only one or two senators and these were generally chosen from the aristocracy. From the few existing documents of the period we learn that the senators were divided into *senatores consiliarii* and ordinary senators. The former constituted a smaller council, which consulted with the head or heads of the republic on the more urgent and secret affairs of the State. The senate exercised its powers under the control of the council and parliament. The former was a deliberative assembly called together by the senate to discuss important affairs such as treaties or declarations of war. The councillors varied in number—at times nine, once as many as 84. Their advice was taken but not necessarily followed by the senate. The parliament was an assemblage of all the citizens. In it there was no discussion of the matters brought before it by the senate, but each matter was accepted or rejected by the people. Senators held office for only one year. They were elected usually by the whole people; but at times the pope was allowed to appoint an elector or electors to choose the senator or senators; in this latter case, however, the choice apparently had to be submitted to the popular assembly for ratification. The pope also was compelled to pay salaries to the senators and their officials.

The senate had usurped the right of coinage; and although by a treaty of 1188 it agreed to restore this right to the pope on condition that one-third of the money coined should be given to the senate, the pope did not take advantage of the retrocession and all the money was coined by the senate; Innocent III. even decreed that only senatorial coins should be used in the whole of the Campagna. The senate also seized for its own advantage the right of levying taxes on merchandise brought into the city. It also took over the appointment of judges, but in place of seven appointed a single Palatine judge for a term of three months. He was assisted by a *judex dativus*. Thus it is seen that while the pope still exercised certain rights he had actually lost control of the city.

The agreement with Pope Eugenius was of short duration. The revolution could not be checked; the Romans desired independence, and their spiritual lord fled to France, whence, in 1147, he proclaimed a new crusade, while the Romans were employed in demolishing Tivoli, banishing its inhabitants and waging war on other cities. Jordan Pierleoni was head of the republic, and Arnold, supported by the popular favour and the enthusiasm of the lower clergy, was preaching with even greater fervour than before. The new pope now re-entered Italy, proclaimed Arnold a schismatic, and advancing to Tusculum assembled an army in order to attack Rome. In this emergency the Romans applied to Conrad III., the first emperor of the house of Hohenstaufen; and their letters are expressive of Arnold's theories and his medley of ancient and modern, sacred and profane, ideas. "Rome," so they said, "is the fountain of the empire confided to you by the Almighty, and we seek to restore to Rome the power possessed by her under Constantine and Justinian. For this end we conquered and destroyed the strongholds of the barons who, together with the pope and the Normans, sought to resist us. These are now attacking us on all sides. Haste to Rome, the capital of the world, thus to establish thy imperial sway over the Italian and German lands." After long delay the king of the Romans replied to these appeals, stating that he would come "to re-establish order, reward the faithful and punish the rebellious." These words promised ill. In fact, Conrad had already arranged terms with the pope; but his life came to an end on Feb. 15, 1152.

Frederick Barbarossa.—He was succeeded by Frederick I., surnamed Barbarossa, who took no notice of letters urging him to come and receive the empire from the Roman people. In accord-

ance with his design of subduing all the independent cities, he made an agreement with the pope, in which he vowed to give no truce to the Romans, but subject them to their spiritual lord, whose temporal power should be restored. The pope, on his side, promised to crown him emperor. Thereupon the people again rose to arms and broke off all negotiations with Eugenius III. Frederick was in command of a powerful army, and was no friend of half measures. To increase the gravity of the situation, an English pope, Adrian IV., was elected (1154–59), who was also a man of strong and resolute temper. In fact, even before he was able to take possession of the Lateran, he requested the Romans to banish Arnold, who was directing his thunders against the papacy. These utterances increased the wrath of Adrian, who, encouraged by the knowledge that Frederick and his host were already in Italy, at last launched an interdict against Rome. It was the first time that a pope had laid an interdict on the Eternal City. This put a summary stop to the religious life of the inhabitants and men's minds were seized with terror; a fierce tumult broke out. Thereupon the senators implored pardon; but Adrian demanded the expulsion of Arnold before consenting to raise the interdict. Arnold was therefore obliged to leave Rome, and, abandoned by all, was forced to wander from castle to castle, until given up to Frederick Barbarossa and then consigned by the latter to the papal legates. The pope in his turn gave the reformer into the hands of the prefect, who hanged his prisoner, burnt his body at the stake, and cast his ashes into the Tiber.

But the Romans would not give up their commune. Their envoys went to meet Frederick near Sutri, and made an address in the usual fantastic style on the privileges of the Roman people and its sole right to confer the imperial crown. Frederick indignantly cut short their harangue, and they had to depart full of rage. He then continued his march, and, entering Rome on June 18, 1155, was forthwith crowned in St. Peter's by the pope. Thereupon the Romans rushed to arms and made a furious attack on the Leonine city and the imperial camp. A desperate battle went on throughout the day; many Romans perished by the sword or by drowning, but their fellow-citizens made such determined preparations to continue the struggle that Frederick, on June 19, hastily retreated, or rather fled, together with the pope and the cardinals. The commune still survived. Its existence was in truth favourable rather than injurious to Frederick, but he had not yet discerned that his best policy would be to support the commune against the pope. The latter, with keener acumen, made alliance with the communes of Lombardy and encouraged them in their resistance to the emperor. Adrian IV. died in 1159, and the anti-imperial party elected Alexander III. (1159–81), who energetically opposed the pretensions of Frederick, but, having to struggle with three anti-popes successively raised against him by the imperial party, was repeatedly driven into exile. During these schisms the senate quietly carried on the government, administered justice and made war on some neighbouring cities and barons. An army comprising many nobles marched against Tusculum, but found it defended by several valiant officers and a strong band of German soldiery, who, on May 29, 1167, inflicted on the Romans so severe a defeat that it is styled by Gregorovius "the Cannae of the middle ages." Shortly afterwards the emperor arrived in Rome with his anti-pope Paschal III., and Alexander had to flee. Then, at last, Frederick came to terms with the commune, recognized the senate, which accepted investiture at his hands, re-established the prefecture as an imperial office, and bestowed it on John, son of Peter di Vico. He departed hastily, as a deadly fever broke out and decimated his army.

Concord between Pope and Commune.—Meanwhile Pope Alexander continued Adrian's policy with better success, however, for the Lombard cities had now formed a league and inflicted a signal defeat on the emperor at Legnano on May 29, 1176. One of the results of this battle was the conclusion of an agreement between the pope and the emperor, the latter resigning his pretensions on Rome and yielding all that he had denied to Adrian. By the Treaty of Venice (Aug. 1, 1177), the anti-pope was forsaken, Alexander III. recognized and hailed as the legitimate pontiff and the prefect of Rome was again to be nominated by the pope, to whom the emperor restored the temporal power, acknowledging him the independent sovereign of Rome and of the ecclesiastical State. Frederick's troops accompanied the pope to Rome, where the commune was forced to make submission to him. But, proudly conscious as it still was of its strength, its surrender wore the aspect of a voluntary concession, and its terms began with these words: "It has been decreed by the council and deliberation of the whole Roman people," etc. The senators, elected yearly in November, had to swear fealty to the pope. On his return to Rome Alexander received a solemn welcome from all. He died on Aug. 30, 1181. The fact that between 1181 and 1187 there were three popes always living in exile proves that the commune was by no means crushed. On Dec. 20, 1187, Clement III. (1187–91) made a solemn agreement with the government of the capitol before coming to Rome. And this peace or *concordia* had the air of a treaty between potentates of equal importance. Rome confronted the pope from the same standpoint from which the Lombard cities had confronted the emperor after Legnano. This treaty was confirmed on the last day of May 1188 (*Anno XLIV.* of the senate). The pope was recognized as supreme lord, and invested the senators with their dignity. Almost all the old pontifical rights and prerogatives were restored to him. The pope might employ the Roman militia for the defence of his patrimony, but was to furnish its pay. The rights of the Church over Tivoli and Tusculum were confirmed; but the commune reserved to itself the right of making war on those cities, and declared its resolve to dismantle and destroy the walls and castle of Tusculum. In this undertaking the pope was to co-operate with the Romans, even should the unhappy city make surrender to him alone.

From all this it is clear that the Church had been made independent of the empire, and that the commune, despite its numerous concessions, was by no means subject to the Church. The republic had no patrician nor any other imperial magistrate and preserved its independence even as regarded the pope, who merely granted investiture to magistrates freely chosen by the people and had no legislative nor administrative power in the city. His temporal dominion was limited to his great possessions, to his regalia, to a supreme authority that was very indefinite, and to a feudal authority over the barons of the Campagna and many cities of a State that seemed ever on the point of dissolution. The senate continued to frame laws, to govern, and to administer justice. The army carried on the wars of the commune, as we see by the tragic fate of Tusculum, which was razed to the ground on April 19, 1191. In consequence, the nobles, seeing that the commune remained firmly established, began to adhere to it and succeeded in obtaining admission to the senate. In fact, whereas since 1143 plebeians and petty nobles had prevailed in its ranks, nobles of ancient descent are now found outnumbering the knights and burghers. In 1191 this state of things caused a sudden popular outbreak which abolished the aristocratic senate and gave the headship of the commune to a single senator, of unknown origin. During the two years he remained in office this personage stripped the pope of his revenues, despatched *justitiarii* even to the provinces, and with the aid of the parliament and council promulgated laws and statutes. He was overthrown by a counter-revolution; John Capoccio of the party of the nobles became senator for two years, and had been succeeded by one of the Pierleoni when, in 1197, a fresh revolution re-established a senate of 56 members, chiefly consisting of feudal barons in high favour with Henry VI., who had revived the imperial faction in Rome. But this emperor's life ended the same year, and the pope's in 1198, and the new pontiff, Innocent III. (1198–1216), began to make war on the nobles, who were again masters of the commune. Their leader was the prefect Peter di Vico. Owing to the revolution of 1143, most of the prefectorial attributes were now vested in the senate; nevertheless, Peter still retained a tribunal of police both within and without the city, and derived great strength from the vast possessions of the Vico family, in which the office of prefect now became hereditary. Very soon after this, however, the independent municipal office lost its true character. Then the popes made a point of according great pomp and dignity to this nominal

prefect, in order to overshadow the senator, who still represented the independence of the republic.

Innocent III., dissatisfied with this state of things, contrived by bribing the people to arrogate to himself the right of appointing a commissioner to elect the senator, who had to swear fealty and submission to the pope, and also that of nominating the provincial *justitiarii*, formerly chosen by the government of the capitol. This was a deadly blow to the commune, for the principal rights of the people—*i.e.*, the election of pope, prefect, and senate—were now lost. The general discontent provoked fresh revolutions, and the people made a loud outcry for a senate of 56 members; the pope, making a virtue of necessity, caused that number to be chosen by 12 *mediani* specially named by him for the purpose. Even this did not calm the popular discontent, and when, six months later, the pope again had a single senator elected the Romans rose to arms and in 1204 formed a government of "Good Men" (*Buoni Uomini*) in opposition to that created by the pope. But an amicable arrangement being concluded, the pope once more had 56 senators nominated; and when, soon after, he again reduced them to one, the people were too weary to resist (1205).

Pretensions of the Commune.—On Nov. 22, 1220, Honorius III. (1216–27) conferred the imperial crown on Frederick II., who confirmed to the Church the possession of her former States, of those bequeathed to her by Countess Matilda, and even of the March of Ancona. But it was soon seen that he sought to dominate all Italy, and was therefore a foe to be dreaded. The successor of Honorius, Pope Gregory IX. (1227–41), was speedily insulted and put to flight by the Ghibelline nobles, whose courage had revived, and the republic began to subdue the Latian cities on its own account. Peace was several times made and unmade by pope and people; but no enduring harmony was possible between them, since the former wished to subject the entire State to the Church, and the latter to escape from the rule of the Church and hold sway over "the universal land from Ceprano to Radicofani" formerly belonging to the duchy. Accordingly, the Roman people appointed judges, imposed taxes, issued coin, and made the clergy amenable to secular tribunals. In 1234 the senator Luca Savelli published an edict declaring Tuscia and Campania territories of the republic, and sent judges thither to exact an oath of obedience. He also despatched the militia to the coast, where it occupied several cities and erected fortresses; and columns were raised everywhere inscribed with the initials S.P.Q.R. The pope, unable to prevent but equally unable to tolerate these acts, fled from Rome, hurling his anathema against Savelli and his associates. The Romans sacked the Lateran and the houses of many cardinals and marched on Viterbo, but were driven back by the papal troops. The people had to make peace and submission in 1235, and were obliged to give up their pretensions of subjecting the clergy to ordinary tribunals and the urban territory to the commune. Thus matters were virtually settled on the footing established by Innocent III., thanks to the aid given to the pope by Frederick II., who had previously aided the rebellion.

Meanwhile the struggle between Frederick II. and the pope was once more renewed. The nobility was again split into a Guelph party headed by the Orsini and a Ghibelline party under the Colonna. In 1238 it was deemed advisable to elect two senators instead of one, in the hope of conciliating both factions by simultaneously raising them to power. Afterwards one only was elected, alternately an Orsini and a Colonna, then again two, and so on. But all these changes failed in their aims, since the struggle between emperor and pope exasperated party feeling in Rome. Frederick desired to emancipate the State from the Church, but he was opposed to the communal democracy, which was then the chief strength of the secular State in Italy. Thus, although he had a strong party in Rome, it seemed to dissolve at his approach, inasmuch as all feared that he might abolish the statutes and liberties of the commune. In fact, when he advanced towards Rome on the death of Gregory IX. in 1241, he was energetically repulsed by the people, and later even by Viterbo, a city that had always been faithful to him. After he had withdrawn, his adherents gained strength and put to flight his opponent, Innocent IV. (1243–54), the newly elected pope, who then from Lyons hurled an excommunication against him. On Frederick's death in Dec. 1250 the pope instantly returned to Rome with the set purpose of destroying the power of the Hohenstaufens.

Brancaleone.—The commune meanwhile being harassed by the factiousness of the nobility in 1252 decided on the election of an alien senator armed with ample powers, precisely as other communes gave the government into the hands of a podesta. Accordingly a Bolognese noble, Brancaleone degli Andalo, count of Casalecchio, and a Ghibelline, was invited to Rome. Before accepting office he insisted on making definite terms; he desired to hold the government for three years; and this although contrary to the statutes, was granted. Further, to insure his personal safety, he demanded that many scions of the noblest Roman houses should be sent as hostages to Bologna; and to this also the commune consented. Then, in Aug. 1252, he came with his judges and notaries, made oath to observe justice and the laws, and began to govern. He was head of the republic in peace and in war, supreme judge and captain in chief. He nominated the podestas of subject territories, despatched ambassadors, issued coin, concluded treaties, and received oaths of obedience. He convoked the council as seldom as was possible, although he frequently assembled the people in parliament. The chief complaint made against him was of undue severity in the administration of justice. He rendered the clergy amenable to secular tribunals, subdued the neighbouring cities of Tivoli, Palestrina, etc., and commanded in person the attacking force. But his greatest energy was directed to the repression of the more turbulent nobles, hanging some and banishing others. He recognized the expediency of winning the popular favour and was the first senator to add to his title that of "captain of the people." He befriended the people by promoting the organization of gilds, 13 in all. The admission of their heads into the councils of the commune in 1267 shows how far their interests had been promoted by Brancaleone.

When, on the expiration of his three years' term of office, Brancaleone's re-election was proposed, his enemies rose against him, accused him, threw him into prison, and vehemently protested against the continuance of "foreign tyranny." His life was spared only on account of the hostages sent to Bologna. The next senator chosen was a Brescian Guelph, Emanuele de Madio, a tool of the nobles, who were masters of the situation. But soon afterwards, in 1257, the people rose in revolt, drove the nobles from power, put the pope to flight, and recalled Brancaleone for another three years' term. He ruled more sternly than before, hung several nobles, and made alliance with Manfred, the representative of the Swabian party in Italy. This rendered him increasingly odious to the pope and procured his excommunication. But, disregarding the thunders of the Church, he marched against Anagni, the pope's birthplace, and Alexander was quickly obliged to humiliate himself before the senator of Rome. Brancaleone next set to work to destroy the fortified towers of the nobility, and in razing them to the ground ruined many of the adjacent dwellings. In 1258 Brancaleone died. Thus ended the career of a truly remarkable statesman. He was succeeded by his uncle, Castellano degli Andalo, who only retained office until the following spring (1259). Then the people, being bribed by the pope, joined with the nobles and overthrew him. His life too was saved by having followed his nephew's shrewd plan of sending hostages to Bologna. Two senators of Roman birth were next elected.

Charles of Anjou Senator.—At this period the fall of the empire had induced many Italian republics to seek strength by placing their governments in the hands of some prince willing to swear respect for their laws and to undertake their defence. In Rome the Guelphs and Ghibellines proposed various candidates for this office, and after many fierce quarrels ended by electing a committee of *boni homines*, charged with the revision of the statutes, reorganization of the city, and choice of a senator. This committee sat for more than a year without nominating anyone; then, the Guelph party being predominant, the majority agreed on the election as senator of Charles of Anjou, who after a long delay became senator, but held office for less than a year. Two Romans were elected in his stead, but soon

fell out with the pope, because the Guelph nobles again tried to exercise tyranny. The people, however, profited by these disturbances to rise on their own account, and formed a democratic government of 26 *boni homines* with Angelo Capocci, a Ghibelline, as its captain. By this government Don Henry, son of Ferdinand III., of Castile, was elected senator (1267). The rule of the new senator was very energetic, for he kept down the clergy, subdued the Campagna, persecuted the Guelph nobles, made alliance with the Tuscan Ghibellines, forcibly drove back the troops of King Charles, who was advancing towards Rome, and gave a splendid reception to Conradin. But the battle of Tagliacozzo (Aug. 23, 1268), followed by the murder of Conradin, proved fatal to the Ghibelline party. Charles was re-elected senator immediately after the battle, and the pope confirmed his powers for a term of ten years.

In 1278, the ten years' term having expired, the pope, after declaring that he left to the people the right of electing the senator, promulgated a new constitution (July 18, 1278), which, while confirming the rights of the Church over the city, prohibited the election of any foreign emperor, prince, marquis, count or baron as senator of Rome. Thus the Colonna, Savelli, Orsini, Annibaldi and other Roman nobles again rose to power, and the republic was again endangered and plunged into disorder. The Romans then gave the reconstitution of the city into the pope's hands by yielding to him the right of nominating senators. So Nicholas proceeded to name senators, alternating a Colonna with an Orsini, or simultaneously choosing one of each faction. The same power over the senate was granted with the same restriction to Martin IV. (1281–85), and he at once re-elected Charles of Anjou. Thus, greatly to the disgust of the Romans, the capitol was again invaded by French vicars, notaries, judges and soldiery. But the terrible blow dealt at Charles's power by the Sicilian Vespers (March 31, 1282) resounded even in Rome. The Orsini, backed by the people, rose in arms, massacred the French garrison, and quickly re-established a popular government. John Cencio, a kinsman of the Orsini, was elected captain and defender of the people, and ruled the city with the co-operation of the senator and a council of priors of the gilds. This government was of brief duration, for, although the pope had professed his willingness to tolerate experiment, he quickly arranged fresh terms, and, forsaking Charles of Anjou, again nominated two Roman senators. Pope and king both died in 1285, and Nicholas IV. (1288–92), also holding sway over the senate, favoured the Colonna in order to curb the growing mastery of the Orsini. But thus there were two powerful houses instead of one. In fact, John Colonna, when elected senator, ruled from the capitol as an independent sovereign, conducted in person the campaign against Viterbo, and subjected that city to the republic on May 3, 1291.

Boniface VIII. (1294–1303) tried to reduce the power of the Colonna family and succeeded for a time in exercising more power in Rome than any of the recent popes. This was due largely to the Jubilee which brought thousands of pilgrims to Rome. The citizens wished to profit by the gold which the pilgrims brought and for that reason were ready to postpone their rivalries.

Removal of the Popes to Avignon.—When the popes removed to Avignon the city was left almost entirely to govern itself. There was the same strife between the "ins" and the "outs," who persisted in using the names Guelphs and Ghibellines, although these names had lost their old meaning since the fall of the Hohenstaufens. The commune employed its freedom in trying to hold its own against the nobles, whose power was much lessened by the absence of the pope, and endeavoured to gain fresh strength by organizing the 13 regions. Accordingly, in 1305, a captain of the people was elected with 13 elders and a senator, Paganino della Torre, who governed for one year. The pope was opposed to these changes at first, but in 1310 he issued a brief granting Rome full permission to select its own form of government. Thus, the first pope in Avignon restored the rights of the Romans. The latter still considered Rome the Eternal City, the source of all law, and the only natural seat of the spiritual and temporal government of the world. To their republic, they thought, appertained a new and lofty destiny. In 1312, in spite of the opposition of the nobles, they insisted upon the coronation of the emperor Henry VII. In the same year, after a brief interval of rule by the nobles, the popular party again got the upper hand, only to be overthrown the following year.

Then the pope appointed King Robert of Naples as senator. Affairs took a fresh turn under Pope John XXII. (1316–34). Rome was still ruled by the vicars of King Robert; but, owing to the continued absence of the pope, matters grew daily worse. Trade and industry declined, revenue diminished, the impoverished nobles were exceedingly turbulent, deeds of murder and violence occurred on all sides; even by day the streets of the city were unsafe. Hence there was universal discontent. Accordingly the Italian Ghibellines hailed Louis the Bavarian as they had previously hailed Henry. The Roman people were roused to action, and, driving out the representatives and partisans of King Robert, in the spring of 1327 seized on the castle of St. Angelo and again established a democratic government. Regardless of the reproofs of the pope, they elected a haughty Ghibelline, Sciarra Colonna, captain of the people and general of the militia, with a council of 52 *popolani*, four to each region. Then ranged under the standards of the militia, the Romans gave chase to the foes of the republic, and Sciarra, returning victorious, ascended to the capitol, and invited Louis the Bavarian to Rome.

Encircled by a crowd of heretics, reformers and Minorite brethren, Louis convoked a parliament on the capitol, asking that the imperial crown might be conferred upon him by the people, from whom alone he wished to receive it. And the people proclaimed him their captain, senator and emperor. On Jan. 17, his coronation took place in St. Peter's. But, as he had neither money nor practical sense, his method of taxation and the excesses committed by himself and his over-excited philosophers speedily aroused the popular discontent. His ecclesiastical vicar, Marsilius of Padua, and John Janduno placarded the walls with insulting manifestos against the pope, whom the Minorites stigmatized as a heretic and wished to depose. The emperor decreed that henceforth the popes must reside in Rome—that if, when invited, they should fail to come they would be thereby held deposed from the throne. As a logical consequence, proceedings were immediately begun for the election of a new pope, Nicholas V., who on May 12 was proclaimed by the popular voice in St. Peter's square, and received the imperial sanction. But this ephemeral drama came to an end when the emperor departed with his anti-pope on Aug. 4. This caused the immediate downfall of the democratic government. A new parliament cancelled the emperor's edicts, and had them burnt by the public executioner. Meanwhile King Robert was again supreme in Rome, and being re-elected senator appointed vicars there as before. Anarchy reigned.

After the election of Benedict XII. (1334–42) confusion reached so great a pitch that, on the expiration of Robert's senatorial term, the Romans named 13 heads of regions to carry on the government with two senators, while the king still sent vicars as before. The people, for the sake of peace, once more granted the supremacy of the senate to the pope, and he nominated two senators. But in 1339 the Romans attacked the capitol, named two senators of their own choice, re-established a democratic government, and sent ambassadors to Florence to ask for the ordinances of justice by which that city had broken the power of the nobles, and also that a few skilled citizens should lend their help in the reconstitution of Rome. Accordingly some Florentines came with the *ordinamenti*, some portions of which may be recognized in the Roman statutes, and, after first rearranging the taxes, elected 13 priors of the gilds, a gonfalonier of justice, and a captain of the people after the Florentine manner. But there was a dissimilarity in the conditions of the two cities. The gilds having little influence in Rome, the projected reform failed, and the pope, who was opposed to it, re-elected the senators. Thereupon public discontent swelled. Another revolution in Rome re-established the government of the 13 elders and the two senators.

Cola di Rienzi.—The people, anxious to show their intention of respecting the papal authority, had despatched to Avignon as ambassador of the republic, in 1343, Cola di Rienzi (*q.v.*), who

begged the pope to return to Rome, to allow the city to celebrate a jubilee every 50 years, and then, as a personal request, asked to be nominated notary to the urban chamber. The pope consented to everything, and Rienzi communicated this good news to Rome in an emphatically worded epistle. After Easter, in 1344, he returned to Rome and found that the city was a prey to the nobles. He secretly built up a party of conspirators and in May 1347 convoked a parliament of the people and obtained its sanction for the following proposals: that all pending lawsuits should be at once decided; that justice should be equally administered to all; that every region should equip 100 foot soldiers and 25 horse; that the dues and taxes should be rearranged; that the forts, bridges, and gates of the city should be held by the rector of the people instead of by the nobility; and that granaries should be opened for public use. On the same day, amid general homage and applause, Rienzi was proclaimed head of the republic, with the title of tribune and liberator of the Holy Roman Republic, "by authority of the most merciful Lord Jesus Christ." The nobles withdrew scoffing but alarmed. Rienzi engaged a bodyguard of 100 men, and assumed the command of the 1,300 infantry and 390 light horse; he abolished the office of senator, retained the Thirteen and the general and special councils, and set the administration on a new footing. These measures and the prompt submission of the other cities of the State brought an instant increase of revenue to Rome.

The pope, willingly or unwillingly, accorded his approval to Rienzi's deeds. The provincial cities did homage to Rome and her tribune, and almost all the rest of Italy gave him its enthusiastic adherence. Great men like Petrarch were transported with joy. But on the convocation of a national parliament few representatives obeyed the summons and the scheme was a failure. Nevertheless, on Aug. 15, Rienzi caused himself to be crowned tribune with great pomp, and confirmed the rights of Roman citizenship to all natives of Italy. The nobles remained steadily hostile; conflict was unavoidable. At first Rienzi succeeded in vanquishing the Gaetani by means of John Colonna; he next endeavoured to suppress the Guelph and Ghibelline factions, and to restore Italy to "holy union."

The pope, however, was weary of toleration, and, coming to terms with the nobles, incited them to war. A battle took place in which 80 nobles, chiefly of the Colonna clan, were left dead; the aristocracy never again achieved the rule of the republic. Rienzi's head was turned by this sudden success, and in his great need of money he began to play the tyrant by levying taxes and exacting instant obedience. The papal legate saw his opportunity and seized it, by threatening to bring a charge of heresy against the tribune. Rienzi was dismayed. He declared himself friendly to the pope and willing to respect his authority; and he even sought to conciliate the nobles. At this moment certain Neapolitan and Hungarian captains, after levying soldiers with the tribune's consent, joined the nobles and broke out in revolt. On their proving victorious in a preliminary encounter with some of Rienzi's guards, the tribune suddenly lost heart, resigned the power he had held for seven months, and fled to Naples.

Meanwhile the Romans remained tranquil, intent on making money by the jubilee; but no sooner was this over than disorders broke out and the tyranny of the baronage recommenced. To remedy this state of things, application was made to the pope. He consulted with a committee of cardinals, who sought the advice of Petrarch, and the poet suggested a popular government, to the complete exclusion of the nobles, since these, he said, were strangers who ruined the city. The people had already elected the Thirteen, and now, encouraged by these counsels, on Dec. 26, 1351, chose John Perrone as head of the commune. But the new leader was unable to withstand the hostilities of the nobles; and in Sept. 1353 Francis Baroncelli was elected tribune. He was a follower of Rienzi, and did little beyond imitating his mode of government and smoothing the way for his return.

Rienzi, after various adventures, was at Avignon in confinement. Innocent VI. (1352–62) decided to send Cardinal Albornoz to Italy, in order to bring the State into subjection to the Church; and he further decided that Rienzi should accompany him to give him the support of his own popularity in Rome. In fact, directly the pair arrived Baroncelli was overthrown, the supremacy of the senate granted to the pope, and the government confided to Albornoz, who, without concerning himself with Rienzi, nominated a senator. Rienzi, profiting by his prestige and the apparent favour of the pope, was able to collect a band of 500 soldiers of mixed nationalities and on Aug. 1, 1354, took possession of the government. But his money ran short, and he resorted to violence to fill his purse. The result was a sudden revolt on Oct. 8, when the people stormed the capitol with cries of "Death to the traitor." Rienzi was killed.

Foreign Senators and the Banderesi.—Rome submitted to the pontiff, and the pope, instead of two senators, hastened to name a single one of foreign birth. This was a shrewd device of Albornoz and another blow to the nobles, with whom he was still at war. Thus was inaugurated, in 1358, a series of foreign senators, fulfilling the functions of a podesta, and changed every six months together with their staff of judges, notaries, and knights. The people approved of this reform as being inimical to the nobles and favourable to the preservation of liberty.

Hitherto the senators had been assisted, or rather kept in check, by the 13 representatives of the regions. In 1360 these were replaced by seven reformers, who soon became the veritable chiefs of the republic and were elected by ballot every three months, and the nobles, already shut out from power, were also excluded from the militia, which had been reorganized on the democratic system. Three thousand men, mostly archers, were enrolled under the command of two *banderesi,* with four *antepositi,* or lieutenants, constituting a supreme council of war. And the whole body was styled the *"Felix societas balestrariorum et pavesatorum."* It was instituted to support the reformers and re-establish order in the city and Campagna, to keep down the nobles and defend the republic. It fulfilled these duties with much severity. *Banderesi* and *antepositi* had seats in the special council beside those of the reformers, the gonfaloniers of the companies were seated beside the priors. Later these officials constituted the so-called *signoria dei banderesi.* When in 1362 the nobles made a riot in Rome, the *banderesi* drove them all from the city. The fight became so furious that all Rome was in arms, and even mercenaries were hired. Finally renewed submission was made to the pope.

On the death of Innocent VI. in 1362, an agreement was concluded with his successor, Urban V. (1362–70), who was obliged to give his sanction to the government of the reformers and *banderesi.* And then, Albornoz being recalled in disgrace to Avignon and afterwards sent as legate to Naples, these Roman magistrates were able, with or without the co-operation of the foreign senator, to rule in their own way. They did justice to the nobles by hanging a few more; and they defended the city from the threatening attacks of the mercenaries, who had become Italy's worst foes. It was at this period that the Roman statutes were revised and rearranged in the compilation which has come down to us supplemented by alterations of a later date.

Urban V. Begins to Destroy the Republic.—Urban V. (1362–70), no longer in safety at Avignon, decided to return to Italy. The Romans implored him to do so, and he was urged to it by the Italian *literati,* with Petrarch at their head. In April 1367 he left Avignon, and, entering Rome on Oct. 16, was given the lordship of the city. He showed much acumen in profiting by the first burst of popular enthusiasm to effect quick and dexterous changes in the constitution of the republic. After naming a senator, he abolished the posts of reformers and *banderesi,* substituting three conservators, or rather a species of municipal council, alone charged with judicial and administrative powers. The 13 leaders of the regions and the consuls of the gilds still sat in the councils, which were left unsuppressed. But all real power was in the hands of the pope, who, in Rome as in his other cities, nominated the principal magistrates. Thus, by transforming political into civil institutions, and concentrating the supreme authority in his own grasp, Urban V. dealt a mortal blow to the liberties of Rome. Yet he felt no sense of security among a people who, after the first rejoicings over the return of the Holy See, were

always on the brink of revolt. Besides, he felt himself a stranger in Italy, and was so regarded. Accordingly, in 1370 he decided to return to France, and died there on Dec. 19.

The Romans retained the conservators, conferring on them the political power of the reformers; they re-established the *banderesi* and the four *antepositi*. The new French pope, Gregory XI. (1370–78), had to be content with obtaining supremacy over the senate and the possession of the castle of St. Angelo. In Feb. 1376 the Romans nominated John Cenci captain of the people and gave him uncontrolled power over the towns of the patrimony and the Sabine land. The two councils were preserved, and a new magistracy was created, the "Three Governors of the Peace and Liberty of Rome."

Gregory XI. decided in 1376 to return to Rome and entered into a treaty with the republic, which, anxious for his return, promised him the same powers that Urban V. had had. He returned early in 1377, but was not able to get control of the government before his death in the following year. The next pope, Urban VI. (1378–89), whose election and acts provoked the Great Schism (1378–1417), had much trouble, but finally got himself recognized as supreme in Rome by promising a jubilee in 1389. He died before it could take place, and was succeeded by Boniface IX. (1389–1404). The latter was very shrewd. He crowned Ladislaus and by a skilful use of jubilees, of which he celebrated two, succeeded in bringing the city wholly under his power; he also reduced the Colonna to submission.

The next pope, Innocent VII. (1404–6), aided by Ladislaus of Naples, put down a revolt of the people, but had to make a concession that they might elect "seven governors of the liberty of the Roman republic." After Innocent's death King Ladislaus seized Rome, sacked it brutally and held sway over it until his death in 1414. Then the Romans revolted against the Neapolitans, and with the aid of the papal legate established a new government of 13 conservators.

Martin V. Supreme.—When after the Schism Martin V. was elected pope he made peace with Joanna, queen of Naples, who yielded Rome to him. Martin V. reduced the remains of the free Roman government to a mere civil municipality. Following the method of the other despots of Italy, he allowed the old republican institutions to retain their names and forms, their administrative and some of their judicial attributes, while all their political functions were transferred to the new government. Order was re-established and justice rigidly observed. Rome was in ruins; nobility and burghers were equally disorganized, the people unable to bear arms and careless of their rights, while the battered walls of the capitol recorded the fall of two republics.

Eugenius IV. (1431–47) was forced by a revolt to flee from Rome, and then the people re-established the "Seven Governors of Liberty." Later Eugenius recovered control over Rome. Under Nicholas V. (1447–55) there were conspiracies to restore the republic, headed by Stephen Porcari, who attempted to play the part of a Rienzi. He was pardoned the first time, but was executed after a second attempt. After that the Popes ruled Rome. Under Paul II. some scholars were seized on the charge of desiring to re-establish paganism in the republic. Under Sixtus IV. (1471–84) the Colonna were either put to death or made powerless, and the Orsini met the same fate under Alexander VI. (1492–1503). There was still a senator of Rome, whose nomination was entirely in the hands of the pope, still three conservators, and an elected council of 26 citizens. Now and then also a shadowy semblance of a popular assembly was held to cast dust in the eyes of the public, but even this was not for long. All these officials, together with the judges of the capitol, retained various attributes of different kinds. They administered justice and gave sentence. There were numerous tribunals, all with undefined modes of procedure, so that it was very difficult for the citizens to ascertain in which court justice should be sought. But in last resort there was always the supreme decision of the pope. Thus matters remained to the time of the French Revolution.

BIBLIOGRAPHY.—There is a good bibliography for mediaeval Rome in E. Calvi, *Bibliografia generale di Roma* (1906). The more important sources for the history of Rome in the middle ages, as far as they have been edited, are found in the *Liber Pontificalis*, edit. by Duchesne (1886–92) and by Mommsen, in the *Monumenta Germaniae Historica* (1896); in Baronius, *Annales Ecclesiastici* (best ed. Paris, 1864–82); and in the *Archivio della Reale Società Romana di Storia Patria*. *See* also Watterich, *Pontificum romanorum*, etc. (1862); Kehr, *Regesta pontificum*, etc. (1896). For the period 568–751 there is a good bibliography in C. Diehl, *Études sur l'administration byzantine* (1888); for 751–1252, in L. Halphen, *Études sur l'administration de Rome au moyen âge* (1907); for 1354–1471, in E. Rodocanachi, *Histoire de Rome* (1922). Each of these three books also has a bibliography of secondary works. Duchesne's *Les premiers temps de l'état pontifical, 754–1073* (1898) has corrected many errors formerly held. Older books which are still valuable are: Savigny, *Geschichte des römischen Rechts im Mittelalter;* J. Ficker, *Forschungen zur Reichs-und Rechtsgeschichte Italiens* (Innsbruck, 1868–74); F. Papencordt, *Geschichte der Stadt Rom.* (Paderborn, 1857); A. von Reumont, *Geschichte der Stadt Rom.* (1867–68). F. Gregorovius, *Geschichte der Stadt Rom* is a standard work and very interesting. It was finished in 1872 and consequently needs correction on many points. There is a fifth edition in German (Stuttgart, 1903 *seq.*) and an English translation, from the fourth edition, by Annie Hamilton (1894 *seq.*). P. Villari, *Il comune di Roma nel medio evo*, in his *Saggi storici e critici* (Bologna, 1890) is a "brilliant essay"; *cf.* also his *Mediaeval Italy from Charlemagne to Henry VII.* (1910). Camillo Re, *Statuti della città di Roma* (1880) prints the statutes, with a long introduction; *cf.* G. Gatti, *Statuti dei mercanti di Roma* (1885). For the time of Innocent III., A. Luchaire, *Innocent III.; Rome et Italie* (1904); *cf.* his article in *Revue Historique*, vol. 81 (1903). For Brancaleone, M. Rovere, *Brancaleone degli Andalò* (Udine, 1895). For the 14th and 15th centuries, the work of Rodocanachi, cited above, and also his *Les institutions communales de Rome* (1901), which is better for this later period than for the earlier ages. Hartmann Grisar S.J. announced a very elaborate work on the history of Rome and the popes in the middle ages, only the first volume, in German, was published (1899–1901, Eng. trans. 1911 *seq.*). O. Rössler, *Grundriss einer Geschichte Roms im Mittelalter* (1909) is useful. *See* also the two series *Storia politica de Italia*, one written by a *Società di professori* and the other by a *Società d'amici*, in which appeared the following useful volumes: G. Romano, *Dominazioni barbariche 395–1024* (1909); F. Bertolini, *Dominazioni germaniche* (1872); F. Lanzani, *Comuni* (1881); C. Cippola, *Signorie italiane* (1881) (all published at Milan). Some material is to be found in M. Creighton, *History of the Papacy* (2nd. ed., 1897) and in L. Pastor, *Geschichte der Päpste* (Leipzig, 1884 *seq.*), of which there is an English translation (St. Louis, 1898 seq.). A brief account is W. Miller's *Mediaeval Rome* (1902) in the Story of the Nations series.

(D. C. M.)

ROME, a city of Georgia, U.S.A., the county seat of Floyd county; 60 m. N.W. of Atlanta, at the confluence of the Etowah and the Oostanaula rivers to form the Coosa. It is served by the Central of Georgia, the Nashville, Chattanooga and St. Louis, and the Southern railways. Pop. 13,252 in 1920 (25% negroes); estimated locally at 14,500 in 1928. The city has a beautiful location (625 ft. above sea-level) on hills and surrounded by pine-clad ridges and cultivated valleys. A rayon plant is under construction (1928). Rome is an important cotton market, handling 100,000 bales a year. The city has a commission-manager form of government. De Soto camped for a month on the site of Rome in 1540. It was in the territory of the Cherokee Nation, and here Gen. John Sevier, in Oct. 1793, defeated a band of marauding Indians. The city was founded in 1834 and chartered in 1847. Its name was chosen by lot from several proposed by the four founders. In 1863 there were brilliant cavalry manoeuvres in the vicinity, resulting in the capture (on May 3) of 1,600 Union soldiers by Gen. Nathan B. Forrest with only 410 Confederates. On May 19, 1864, the city was taken by a detachment of Sherman's army. Before the Civil War Rome was an important river port.

ROME, a city of Oneida county, New York, U.S.A., 15 m. N.W. of Utica, on the Mohawk river, Wood creek and the State Barge canal; served by the New York Central and the New York, Ontario and Western railways. Pop. (1920) 26,341 (20% foreign-born white); 1928 local estimate, 33,000. The city lies at an altitude of 450 ft., on a level stretch between the river and the creek, which flow respectively into the Hudson river and through Oneida lake and the Oswego river into Lake Ontario. It is an important manufacturing city, with great brass and copper mills which employ three-fifths of the workmen of the city. About one-tenth of all the copper used in the United States is made here. The aggregate factory output in 1925 was valued at $49,986,271. The retail district of Rome stands on the old portage between the Mohawk river and Wood creek (about 1 m. apart)

which was used from time immemorial by the Indians and for nearly two centuries by the Dutch and English traders. To protect it Ft. Bull was built on Wood creek and Ft. Williams on the Mohawk, about 1725. The former was taken by French and Indians in March 1756, and the latter was destroyed by Col. Daniel Webb after the reduction of Oswego by the French in August of the same year. In 1758 Ft. Stanwix was erected by Gen. John Stanwix at a cost of £60,000, and permanent settlement began. Here in Oct.–Nov. 1768, Sir William Johnson and representatives of Virginia and Pennsylvania met with 3,200 Indians of the Six Nations and made a treaty with them, under which, for £10,460 in money and goods, they surrendered to the Crown their claims to what is now Kentucky, West Virginia and western Pennsylvania. The fort was dismantled immediately afterward. In 1776 it was rebuilt and renamed in honour of Gen. Philip Schuyler, but the old name clung to it in popular usage. On Aug. 2, 1777, Ft. Schuyler, containing about 750 men, under Col. Peter Gansevoort and Lieut.-Col. Marinus Willett, was besieged by an advance party of Col. Barry St. Leger's forces coming from the west. On Aug 6, Gen. Nicholas Herkimer, with some 800 men, on his way to the relief of the fort, was attacked by the main body of St. Leger's troops, ambuscaded in a ravine near Oriskany (*q.v.*), 6 m. east. During the action Willett, with 250 men and a small cannon, made a sortie from the fort, drew off a part of the enemy from Herkimer (so that he, though mortally wounded, was able to conduct the remnant of his force in orderly retreat down the valley), and brought back much booty. On Aug. 23, St. Leger, hearing exaggerated reports of enforcements approaching under Gen. Benedict Arnold, withdrew from the siege. The successful resistance to St. Leger contributed greatly to the American success at Saratoga. It was during the investment of Ft. Schuyler (or Stanwix) on this occasion that the Stars and Stripes was first raised (early Sunday morning on Aug. 3, 1777) in the face of an enemy. The making of it (from various pieces of stuff taken from clothing of different members of the garrison) "taxed the invention of the garrison," Col. Willett records, but "a decent one was soon contrived." In 1779 Ft. Schuyler was the headquarters of Col. Gozen Van Schaick when he destroyed the Onondaga villages; and on Oct. 22, 1784, a treaty was concluded here by three commissioners representing the United States and the chiefs of the Six Nations. In 1796 the township of Rome was organized, receiving its name "from the heroic defence of the republic made here." The village of Rome was incorporated in 1819 and in 1870 it was chartered as a city.

ROMFORD, a market town and outlying residential centre, 12½ m. E.N.E. from London by the L.N.E.R., in Essex, England, also served by the L.M.S.R. Pop. of urban district (1921) 19,442. Romford was included in the liberty of Havering-atte-Bower which until 1892 had a jurisdiction of its own distinct from that of the county. Romford has ironworks and electrical engineering works.

ROMILLY, SIR SAMUEL (1757–1818), English legal reformer, was the second son of Peter Romilly, and came of a Huguenot family that migrated to England. Samuel Romilly was born in Frith street, Soho, on March 1, 1757. He entered at Gray's Inn in 1778 and was called to the bar in 1783; his practice was mainly on the chancery side. In 1784 he became friendly with Mirabeau, and later supplied him with an account of House of Commons procedure for use in France. As a result of a visit to France he published in 1790 *Thoughts on the Probable Influence of the Late Revolution.* He married in 1798. In 1800 he became a K.C., and in 1806 he was solicitor-general in the Ministry of All the Talents, sitting as M.P. for Queenborough. It was now that Sir Samuel Romilly commenced the greatest labour of his life, his attempt to reform the criminal law of England, then at once cruel and illogical. He had already published *Observations* on the subject. By statute law innumerable offences were punishable by death, but, as wholesale executions would be impossible, the larger number of those convicted and sentenced to death at every assizes were respited, after having heard the sentence of death solemnly passed upon them. This led to many acts of injustice, as the lives of the convicts depended on the caprice of the judges, while at the same time it made the whole system of punishments and of the criminal law ridiculous. In 1808 Romilly managed to repeal the Elizabethan statute, which made it a capital offence to steal from the person. This success, however, raised opposition, and in the following year three bills repealing equally sanguinary statutes were thrown out by the House of Lords under the influence of Lord Ellenborough. Year after year the same influence prevailed, and Romilly saw his bills rejected; but his patient efforts and his eloquence ensured victory eventually for his cause by opening the eyes of Englishmen to the barbarity of their criminal law. The only success he had was in securing the repeal, in 1812, of a statute of Elizabeth making it a capital offence for a soldier or a mariner to beg without a pass from a magistrate or his commanding officer. Lady Romilly died on Oct. 29, 1818, and Sir Samuel committed suicide on Nov. 2,

See the *Memoirs of the Life of Sir Samuel Romilly written by himself, with a selection from his Correspondence, edited by his Sons* (3 vols., 1840); *The Speeches of Sir Samuel Romilly in the House of Commons* (2 vols., 1820); "Life and Work of Sir Samuel Romilly," by Sir W. J. Collins, in *Trans. of the Huguenot Society* (1908).

ROMNEY, GEORGE (1734–1802), English historical and portrait painter, was born at Dalton-in-Furness, Lancashire, on Dec. 26, 1734. His father was a builder and cabinet-maker, and the son, having manifested a turn for mechanics, was instructed in the latter craft, executing carvings of figures in wood, and constructing a violin, which he spent much time in playing. He was also busy with his pencil; and some of his sketches having attracted attention, his father apprenticed the boy, at the age of nineteen, to Steele, an itinerant painter of portraits and domestic subjects who had studied in Paris under Vanloo. In 1756 Romney married a young woman who had nursed him through a fever, and started as a portrait painter on his own account, travelling through the northern counties, executing likenesses at a couple of guineas, and producing a series of some twenty figure compositions, which were exhibited in Kendal, and afterwards disposed of by a lottery.

Having, at the age of twenty-seven, saved about £100, he left a portion of the sum with his wife and family, and started to seek his fortune in London, never returning, except for brief visits, till he came, a broken-down and aged man, to die. In London he rapidly rose into popular favour. His "Death of General Wolfe" was judged worthy of the second prize at the Society of Arts, but a word from Reynolds in praise of Mortimer's "Edward the Confessor" led to the premium being awarded to that painter, while Romney had to content himself with a donation of £50, an incident which led to the subsequent coldness between him and the president and prevented him from exhibiting at the Academy or presenting himself for its honours.

In 1764 he paid a brief visit to Paris, where he was befriended by Joseph Vernet; and his portrait of Sir Joseph Yates, painted on his return, bears distinct traces of his study of the works of Rubens then in the Luxembourg Palace. In 1766 he became a member of the Incorporated Society of Artists, and three years later he seems to have studied in their schools. He removed to Great Newport Street, near the residence of Sir Joshua, whose fame in portraiture he began to rival in such works as "Sir George and Lady Warren" and "Mrs. Yates as the Tragic Muse"; and his professional income rose to £1,200 a year. But this marked increase in his popularity had the effect of enlarging his ambitions. Realizing the need for more thorough knowledge, he was seized with a longing to study in Italy; and in the beginning of 1773 he started for Rome with Ozias Humphrey, the miniature painter. On his arrival he devoted himself to study, raising a scaffold to examine the paintings in the Vatican, and giving much time to work from the undraped model, of which his painting of a "Wood Nymph" was a result. At Parma he studied Correggio.

In 1775 Romney returned to London, establishing himself in Cavendish Square, and resuming his work as a portrait painter. The admiration of the town was divided between him and Reynolds. Romney became acquainted with Hayley, his future biographer, then in the zenith of his popularity as a poet. His influence on the painter seems to have been far from salutary. He encouraged Romney's excessive and morbid sensibility, and

tempted him to expend his talents on ill-considered, seldom-completed paintings of ideal and poetical subjects. About 1783 Romney was introduced to Emma Hart, afterwards celebrated as Lady Hamilton, and she became the model from whom he worked incessantly. He painted her as a Magdalene and as a Joan of Arc, as a Circe, a Bacchante, a Cassandra; and he confessed that she was the inspirer of what was most beautiful in his art. But her fascinations had their share in aggravating that nervous restlessness and instability, inherent in his nature, which finally ruined both health and mind.

In 1786 Alderman Boydell started his great scheme of the Shakespeare Gallery, apparently at the suggestion of Romney. The painter entered heartily into the plan, and contributed his scene from the *Tempest*, and his "Infant Shakespeare attended by the Passions," the latter characterized by the Redgraves as one of the best of his subject pictures. Gradually he began to withdraw from portrait painting, to limit the hours devoted to sitters, and to turn his thoughts to mighty schemes of the ideal subjects which he would execute. Already, in 1792, he had painted "Milton and his Daughters," which was followed by "Newton making Experiments with the Prism." He was to paint the Seven Ages, Visions of Adam with the Angel, "six other subjects from Milton—three where Satan is the hero, and three from Adam and Eve,—perhaps six of each." Having planned and erected a large studio in Hampstead, he removed thither in 1797, with the fine collection of casts from the antique which his friend Flaxman had gathered for him in Italy. But his health was now irremediably shattered. In the summer of 1799, suffering from great weakness of body and depression of mind, he returned to Kendal, where his faithful and long-suffering wife received and tended him. He died on Nov. 15, 1802.

See the *Memoirs* by William Hayley (1809) and by the artist's son, the Rev. John Romney (1830). In the fully illustrated *George Romney*, by Lord Ronald Sutherland Gower (1904), pictures, mainly studies, are reproduced not elsewhere to be found. But the great work upon the artist is *Romney*, by Humphry Ward and W. Roberts (1904), containing 70 illustrations, a biographical and critical essay, and a *catalogue raisonné* of the painter's works. *See* also Arthur B. Chamberlain, *Romney* (1910).

ROMNEY, HENRY SIDNEY, EARL OF (1641–1704), fourth son of Robert, 2nd earl of Leicester, was born in Paris in 1641. Sidney's handsome face helped his advancement at court, but the favour in which he was held by the duchess of York, to whom he was master of the robes, led to his temporary disgrace. In 1672 he was sent on a mission of congratulation to Louis XIV., and in 1677 became master of the robes to Charles II. He entered parliament in 1679, and became a close political ally of his nephew Sunderland, with whose wife he carried on an intrigue which caused scandal. Sunderland used this intimacy to further his political ends. Sidney was sent by Sunderland and others in 1679 on a special mission to urge William of Orange to visit England, a task which he discharged while acting as the official envoy of Charles II. at The Hague. He was recalled in 1682, but was again sent to Holland in 1685. He returned to England in the spring of 1688, and sought support for the prince of Orange in the event of his landing. He was allowed to leave England on giving his word not to visit The Hague, but he broke his promise on getting clear of England, and conveyed to William a duplicate of the invitation addressed to him by the English nobility, together with intelligence of affairs of state obtained through the countess of Sunderland.

He landed with William at Torbay, and received substantial rewards for his undoubted services, including the titles of Baron Milton and Viscount Sidney of Sheppey. William made him secretary of state in 1690, and in 1692, lord-lieutenant of Ireland. His inability to cope with the difficulties of this position led to his recall in the next year, when he became master-general of the ordnance. He was created earl of Romney in May 1694. On Anne's accession he was dismissed from his various offices. His titles became extinct on his death on April 8, 1704.

ROMNEY (New Romney), a municipal borough and one of the Cinque Ports in Kent, England, 75 m. S.E. by E. of London by the S.R.

Its harbour was the cause of the early importance of Romney and the annual assembly of the Cinque Ports, called the Brodhull, was held here owing to its central position. At the time of Domesday the archbishop of Canterbury and the bishop of Bayeux were joint lords. Romney also owed maritime service to the king, which consisted of supplying five ships to serve for 15 days in the year. A confirmation of liberties was granted by John in 1205. Important documents relating to the Cinque Ports are in the Guild Hall at New Romney. It lies on Romney Marsh, part of a level extending from Winchelsea in the south-west to Hythe in the north-east, which was within historic times in great part covered by an estuarine inlet of the sea. The river Rother, which now has its mouth at Rye Harbour, formerly entered the sea here, but had its course wholly changed during a great storm in 1287, and the gradual accretion of land led to the decay, not only of Romney, but of Winchelsea and Rye as seaports. Romney Marsh itself, is protected by a seawall, and its guardianship and drainage are in the hands of a special ancient corporation. The level affords pasturage for sheep. New Romney, which is now over a mile from the sea, has large sheep fairs in August, but little other trade. Of the five churches mentioned in the Domesday Survey only the Norman church of St. Nicholas remains.

ROMORANTIN, a town of central France, in the department of Loir-et-Cher, 31 m. S.E. of Blois by rail. Pop. (1926) 6,941. In 1560 Romorantin gave its name to an edict which prevented the introduction of the Inquisition into France. The town stands on the Sauldre at its confluence with the Morantin, whence its name (*Rivus Morantini*).

ROMSDAL, the valley of the river Rauma, in Norway. The Rauma is a torrent with several waterfalls (Mongefos, Vaermofos and Slettafos) which descends from Lake Lesjekogan to the Romsdal Fjord on the west coast (62° 30′ N.). The nearest port is Molde, from which steamers run to Veblungsnaes (30 m.) at the foot of the valley. A good road traverses the valley, which is one of the finest in southern Norway, flanked by steep mountains terminating in abrupt peaks—Vengetinder (5,960 ft.), Romsdalshorn (5,105), Troldtinder ("witch-peaks," 6,010) and others. Lake Lesjekogan also drains from the opposite end by the Laagen or Lougen river to the Glommen, and so to the Skagerrack, and the road follows its valley, the Gudbrandsdal.

ROMSEY (rŭm′zĭ), market town and municipal borough in Hampshire, England, 7 m. N.W. of Southampton by the S.R. Pop. (1921) 1,604. It is situated in the valley of the Test. The abbey church of SS. Mary and Elfleda is a fine Norman church little altered by later builders. A house founded here by Edward the elder (*c.* 910) became a Benedictine nunnery. The church, which is the only important relic of the foundation, is cruciform, with a low central tower. Building began in the first half of the 12th century, and continued through it, as the western part of the nave shows the transition to the Early English style, which appears in the west front. Decorated windows occur in the east end, beyond which a chapel formerly extended. Perpendicular insertions are insignificant. The nave and choir have aisles, triforium and clerestory. The transepts have eastern apsidal chapels, as have the choir aisles, though the walls of these last are square without. Foundations of the apse of a large pre-Norman church have been discovered below the present building. At the time of the Domesday Survey Romsey (*Romesyg, Romeseie*) was owned by the abbey, which continued to be the overlord until the dissolution. There is no evidence to show that Romsey was a borough before the charter of incorporation granted by James I. in 1608. In mediaeval times Romsey had a considerable share of the woollen trade of Hampshire, but by the end of the 17th century this manufacture began to decline.

ROMULUS, the son of Mars by the Vestal Rhea Silvia or Ilia, daughter of Numitor, who had been dispossessed of the throne of Alba by his younger brother Amulius. Romulus and Rĕmus, the twin sons of Silvia, were placed in a trough and cast into the Tiber by their grand-uncle. The trough grounded in the marshes where Rome afterwards stood, under the wild fig tree (*Ficus ruminalis*), which was still holy in later days. The babes were suckled by a she-wolf and fed by a woodpecker, and

then fostered by Acca Larentia, wife of the shepherd Faustulus. They became leaders of a warlike band of shepherds on the Palatine, and in course of time were recognized by their grandfather, whom they restored to his throne, slaying Amulius. They now founded a city on the site where they had been nurtured; later a quarrel broke out and Remus was slain. Romulus strengthened his band by offering an "asylum" to outcasts and fugitives, found wives for them by capture and waged war with their kinsmen. His most formidable foe was Titus Tatius (*q.v.*), king of the Sabines, but after an obstinate struggle he and Romulus united their forces and reigned side by side till Tatius was slain at Lavinium in the course of a blood-feud with Laurentum. Romulus then reigned alone till he suddenly disappeared in a storm. He was thereafter worshipped as a god under the name of Quirinus. Various rationalizing accounts also exist of the legend.

The whole story, probably first given by the annalists Fabius Pictor and Cincius Alimentus, is artificial and shows strong Greek influence. The birth, exposure, rescue, and subsequent adventures of the twins are a Greek tale of familiar type. Mars and his sacred beast, the wolf, are introduced on account of the great importance of this cult. The localities described are ancient sacred places; the Lupercal, near the *ficus ruminalis*, was naturally explained as the she-wolf's den. (*See* ROME, topography.) The *asylum* is pure Greek, both name and institution. The story was probably invented to give an explanation of the sacred spot named *inter duos lucos* between the arx and the Capitol. Another Greek touch is the deification of an eponymous hero. The rape of the Sabine women is clearly aetiological, invented to account for the custom of simulated capture in marriage; these women and also Titus Tatius represent the Sabine element in the Roman population. The name Romulus (=*Romanus*, cp. the forms *Siculus* and *Sicanus*) means simply "Roman," the derivation of Remus is obscure.

Romulus is regarded as the founder of the military and political institutions (*see* ROME), as Numa and his counterpart Ancus Marcius are of the religious institutions, of Rome.

Seeley, Introduction to his edition of Livy, bk. i.; E. Pais, *Storia di Roma* (1898), i. pt. 1, and *Ancient Legends of Roman History* (Eng. trans., 1906); J. B. Carter in Roscher's *Lexikon*, art. Romulus.

ROMULUS AUGUSTULUS, last Roman emperor of the West (Oct. 31, A.D. 475, to Sept. 4, 476), was elevated to the throne by his father, Orestes, "master of the soldiery" (Jordanes), who drove the emperor Julius (Nepos) to Dalmatia in the summer of 475. Romulus, who was then probably about 14 years old, owed his first name to an uncle, a *canes* of Patavio in Noricum; his nickname he probably owed to the barbarian soldiery; and by these two chances the last emperor successor of a Julius Caesar bore the names both of the first emperor and the first king. The reins of power were naturally held for him by his father, Orestes, nor is there any event of his reign worthy of record except the conclusion of peace with Gaiseric the Vandal. Shortly after his elevation to the throne, the barbarian mercenaries in the service of Rome presented to Romulus's father, Orestes, a demand that they should be allotted one-third of the lands of all Italy. With a last flicker of Roman courage and pride, Orestes refused: the mercenaries revolted under their leader and instigator, Odoacer (Aug. 23, 476), and in a very short while Orestes was defeated and beheaded and the Western empire came to an end. The victorious Odoacer was touched by the beauty and helplessness of Romulus, and spared his life, ordering him to retire to the villa built by Lucullus four centuries before, near Naples. Here he died at a date unknown to us.

RONALDSHAY, LAWRENCE JOHN LUMLEY DUNDAS, EARL OF (1876–), British administrator, was born June 11, 1876, the eldest surviving son of the 1st Marquess of Zetland and was educated at Harrow and Trinity College, Cambridge. From 1898–1907 he travelled extensively in Ceylon, India, Persia, Asiatic Turkey, Central Asia, Siberia, Japan, China and Burma. In 1900 he was appointed aide-de-camp to the staff of the viceroy, Earl Curzon, in India. He sat in the House of Commons as conservative member for the Hornsey division from 1907–16. A member of the royal commission on the public services in India from 1912–14 he was appointed governor of Bengal in 1916 in succession to Lord Carmichael of Stirling. He retained this appointment until 1922, when he was created G.C.S.I. and sworn of the privy council.

Lord Ronaldshay published *Sport and Politics under an Eastern Sky* (1902); *On the Outskirts of Empire in Asia* (1904); *A Wandering Student in the Far East* (1908); *An Eastern Miscellany* (1911); *Lands of the Thunderbolt: Sikhim, Chumbi and Bhutan* (1923); *The Heart of Aryavarta* (1925); *Life of Lord Curzon of Kedleston* (3 vols., 1927–28).

RONCESVALLES (Fr. *Roncevaux*), a village of northern Spain, in the province of Navarre; situated on the small river Urrobi, at an altitude of 3,220 ft. among the Pyrenees, and within 5 m. from the French frontier. Pop. (1920) 142. Roncesvalles is famous in history and legend for the defeat of Charlemagne and the death of Roland (*q.v.*) in 778. The small collegiate church contains several relics associated with Roland, and is a favourite place of pilgrimage. The battle is said to have been fought in the picturesque valley known as Valcarlos, which is now occupied by a hamlet (pop. in 1920, 996) bearing the same name, and in the adjoining defile of Ibaneta. Both of these are traversed by the main road leading north from Roncesvalles to St. Jean Pied de Port, in France.

RONDA, a town of southern Spain, in the province of Malaga; on the river Guadiaro and on the Algeciras-Bobadilla railway. Pop. (1920) 30,393. Ronda is built on a high rock nearly surrounded by the Guadiaro or Guadalevín, which flows through an abrupt chasm 530 ft. deep and 300 ft. wide, by which the old town is separated from the new. The stream was probably bridged by the Romans. Ronda has a considerable trade in leather, saddlery, horses, soap, flour, chocolate, wine and hats. The poet Vincente Espinel was born here in 1551.

A RONDA MILKMAN MILKING HIS GOAT FOR A CUSTOMER

Some remains of an aqueduct and theatre, about 7 m. N. of Ronda, are supposed to represent the *Acinipo* or *Arunda* of ancient geographers. Ronda gives its name to the Sierra or Serrania de Ronda, one of the main sections of the coast mountains which rise between the great plain of Andalusia and the Mediterranean.

RONDEAU, a structural form in poetry and (in the form of "rondo") in music. In poetry the rondeau is a short metrical structure which in its perfect form consists of 13 eight- or ten-syllabled verses divided into three strophes of unequal length, and knit together by two rhymes and a refrain. In Clement Marot's time the laws of the rondeau were laid down, and, according to Voiture, in the 17th century, the following was the type of the approved form of the rondeau:—

"Ma foy, c'est fait de moy, car Isabeau
M'a conjuré de luy faire un Rondeau:
Cela me met en une peine extrême.
Quoy treize vers, huit en *eau*, cinq en *ème*.
Je luy ferois aussi-tôt un bateau!

En voilà cinq pourtant en un monceau:
Faisons en huict, en invoquant Brodeau,
En puis mettons, par quelque stratagème,
Ma foy, c'est fait!

Si je pouvois encore de mon cerveau
Tirer cinq vers, l'ouvrage seroit beau;
Mais cependant, je suis dedans l'onzième,
Et si je croy que je fais le douzième,
En voilà treize ajustez au niveau.
Ma foy, c'est fait!"

All forms of the rondeau are alike in this, that the distinguishing metrical emphasis is achieved by a peculiar use of the refrain. Though we have a set of rondeaux in the *Rolliad* (written by Dr. Lawrence the friend of Burke, according to Gosse), it was not till modern times that the form had any real vogue in England.

Considerable attention, however, has lately been given in England to the form. Some English rondeaux are as bright and graceful as Voiture's own. Swinburne, who in his *Century of Roundels* was perhaps the first to make the refrain rhyme with the second verse of the first strophe, has brought the form into high poetry. In German, rondeaux have been composed with perfect correctness by Weckherlin, and with certain divergences from the French type by Götz and Fischart; the German name for the form is *rundum* or *ringel-gedicht*.

Although the origin of the refrain in all poetry was no doubt the improvisatore's need of a rest, a time in which to focus his forces and recover breath for future flights, the refrain has a distinct metrical value of its own; it knits the structure together, and so intensifies the emotional energy, as we see in the Border ballads, in the *Oriana* of Lord Tennyson, and in the *Sister Helen* of Rossetti. The suggestion of extreme artificiality —of "difficulty overcome"—which is one great fault of the rondeau as a vehicle for deep emotion, does not therefore spring from the use of the refrain, but from the too frequent recurrence of the rhymes in the strophes—for which there is no metrical necessity as in the case of the Petrarchan sonnet. The rondeau is, however, an inimitable instrument of gaiety, delicacy, colour and grace.

RONDEL, a form of verse closely allied to the rondeau (*q.v.*) but distinguished from it by containing 14 instead of 13 lines, and by demanding a slightly different arrangement of rhymes. The initial couplet is repeated in the middle and again at the close. The arrangement of rhymes is as follows: a, b b, a; a b, a b; a, b, b, a, a, b. This form, which was invented in the 14th century, was largely used in later mediaeval French poetry, but particularly by Charles d'Orléans (1391–1465), the very best of whose graceful creations are all rondels. The rondel, in French, may begin with either a masculine or a feminine rhyme, but its solitary other rhyme must be of the opposite kind.

One of the Prince d'Orleans' rondels may be given here as a type:—

Le temps a laissié son manteau
De vent, de froidure et de pluye,
Et s'est vestu de brouderie
De souleil luisant, cler et beau.
Il n'y a beste ne oyseau
Qu'en son jargon ne chante ou crie;
Le temps a laissié son manteau
De vent, de froidure et de pluye.
Rivière, fontaine et ruisseau
Portent, en livrée jolie,
Gouttes d'argent d'or faverie;
Chascun s'abille de nouveau;
Le temps a laissié son manteau
De vent, de froidure et de pluye.

Rondels existed in English from the 15th century, but the early specimens of it are very clumsy. It was revived in the 19th century. Correct examples are found in the poems of Robert Bridges, Dobson, Gosse and Henley. The following, by Austin Dobson, is a good example of what an English rondel should be in all technical respects.

Love comes back to his vacant dwelling,—
The old, old Love that we knew of yore!
We see him stand by the open door,
With his great eyes sad, and his bosom swelling.
He makes as though in our arms repelling
He fain would lie as he lay before;—
Love comes back to his vacant dwelling,—
The old, old Love that we knew of yore!
Ah! who shall help us from over-spelling
That sweet, forgotten, forbidden lore?
E'en as we doubt, in our hearts once more,
With a rush of tears to our eyelids welling,
Love comes back to his vacant dwelling,
The old, old Love that we knew of yore!

Théodore de Banville remarks that the art of the rondel consists in the gay and natural reintroduction of the refrain, which should always seem inevitable, while slightly changing the point of view of the reader. If this is not successfully achieved, "on ne fera que de la marqueterie et du placage, c'est-à-dire, en fait de poésie,—rien!" In Germany, the rondel was introduced, in the 18th century, under the name of *ringel-gedicht* by Johann Nikolaus Götz (1731–81).

RONDO, a musical form originally derived from the rondel in verse; as may be seen, long before the development of instrumental forms, in some of the *chansons* of Orlando di Lasso. The *rondeau en couplets* of Couperin and his contemporaries shows the same connection with verse. It consists of a single neatly rounded phrase alternating with several episodes (the *couplets*) without any important change of key. Ex. 1 shows Bach's handling of this early form. The later rondo is an important member of the sonata forms (*q.v.*), chiefly found in finales; but rondo-form sometimes occurs in slow movements, as in Ex. 2 which gives the outline of one of Beethoven's largest adagios. Philipp Emanuel Bach invented an extraordinary kind of rondo, not part of a sonata, but on a voluminous scale with wildly incoherent episodes and modulations.

The later sonata-style rondo forms may be divided into two main classes:

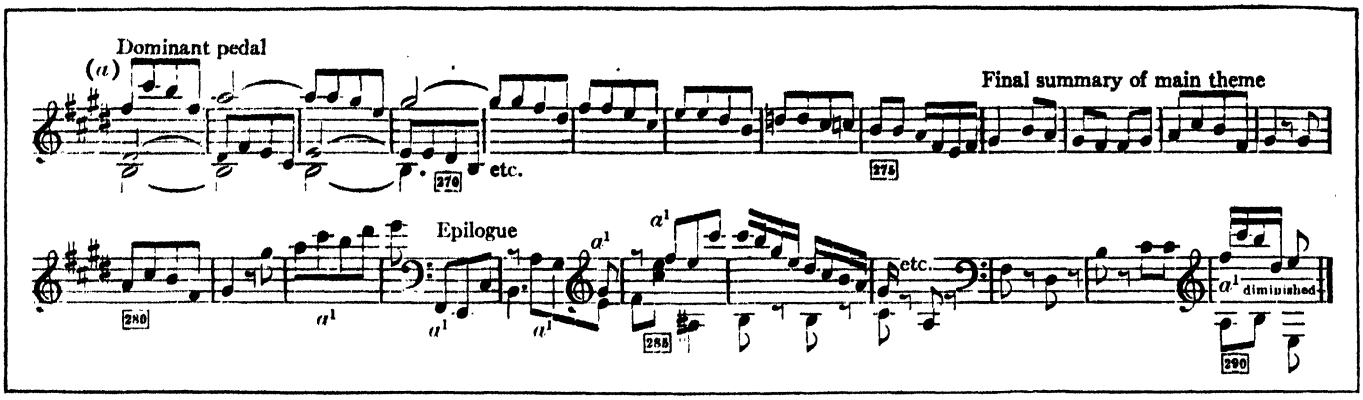
(i.) *Sectional rondos; i.e.*, with little or no development or transition between the episodes and the main theme; very characteristic of Haydn, who, however, may run away with it in unexpected developments. The name rondo implies at least two episodes, and a sectional rondo may have more. Beethoven in his early works shows the influence of Haydn in this type of rondo; *e.g.*, the finales of sonatas, opp. 10, No. 3, and 14, Nos. 1 and 2; and the slow movements of the sonatas, opp. 2, No. 2, and 13 (*Pathétique*). The sectional rondo last appears on a gigantic scale in the finale of Brahms's G minor pianoforte quartet, op. 25; and it lends itself, like the cognate idea of a dance with several "trios" to Schumann's pianoforte pieces and to some of his finales.

(ii.) *Rondos influenced by the form of a first movement* (for which *see* SONATA FORMS). In the normal scheme for this, which is Mozart's favourite rondo-form, the rondo-theme (which may contain several clauses) is followed by a well-organized transition to the key of the first episode, which key is chosen as if for the "complementary key" of a first movement. The return to the rondo-theme may be elaborate or abrupt, and the theme itself may be reduced to its first complete clause (but not to a mere fragment, without loss of the rondo effect). The second episode will be in a new key and may be followed by wide modulations, or itself be widely modulatory, or it may even be entirely a development of the previous material, as in the rondo of Beethoven's Sonata Op. 90, given on p. 525. When the rondo-theme returns again it is followed by a recapitulation of the first episode (perhaps preceded by the transitional passage suitably modified) in the tonic; after which the coda may contain a final return of the rondo-theme. When the second episode is concentrated on development the only difference between the rondo and a first movement is the slender fact that the whole first theme returns immediately after the first episode. Yet the rondo style can be recognised from the outset by the tunelike character of the main theme, and also by the fact that, unlike the most tuneful openings of first movements, it comes to a definite close instead of swinging continuously into the transition passage. A rondo with a development in its middle episode may return to the tonic with an immediate recapitulation of the first episode, omitting the expected second return of the main theme, thus: A, B (new key), A, C (development), B (tonic), A, Coda (where A is the rondo-theme and B and C the episodes). Mozart, Schubert and Brahms have a form, always worked on a very large scale, which consists only of A, B (new key), A, B (tonic), Coda; where a certain amount of development is edged in *à propos* of the transition-passage on its recapitulation. Only the style of the main theme can distinguish this from a first movement that omits its normal development-section.

In the rondos of classical concertos (*q.v.*) the orchestra (especially in Mozart) finds its opportunity in a series of accessory themes announced as soon as the solo instrument has given out the rondo-theme. These accessories are then held in reserve for the coda.

Two examples of rondo-forms are given on pp. 524–6:—

Ex. 1. *Gavotte en Rondeau* (Rondeau en Couplets) from Bach's Sixth Violin Solo.



Ex. 2. Outline of Sonata form Rondo with developing middle episode.

and indicate prevalent movement of accompaniment. Blank bars indicate prevalence of the same chord.

Nicht zu geschwind und sehr singbar vorautragen — Beethoven Op. 90.

RONSARD, PIERRE DE (1524–1585), French poet and "prince of poets" (as his own generation in France called him), was born at the Château de la Poissonnière, near the village of Couture in the province of Vendômois (department of Loir-et-Cher), on Sept. 11, 1524. His family is said to have come from the Slav provinces to the south of the Danube (provinces with which the crusades had given France much intercourse) in the first half of the 14th century. Pierre was the youngest son of Loys de Ronsard, *maître d'hôtel du roi* to Francis I. Pierre was sent to the Collège de Navarre at Paris when he was nine years old. It is said that the rough life of a mediaeval school did not suit him. He was quickly appointed page, first to the king's eldest son François, and then to his brother the duke of Orleans. When Madeleine of France was married to James V. of Scotland, Ronsard was attached to the king's service, and he spent three years in Great Britain. The latter part of this time seems to have been passed in England, though he had, strictly speaking, no business there. On returning to France in 1540 he was again taken into the service of the duke of Orleans, and travelled to Flanders and again to Scotland. After a time he was attached as secretary to the suite of Lazare de Baïf, the father of his future colleague in the Pléiade and his companion on this occasion, Antoine de Baïf, at the diet of Spires. Afterwards he was attached in the same way to the suite of the cardinal du Bellay-Langey. His diplomatic career was cut short by an attack of deafness which no physician could cure, and he devoted himself to study at the Collège Coqueret, the principal of which was Daurat—afterwards the "dark star" (as from his silence he has been called in France) of the Pléiade, and already an acquaintance of Ronsard's from his having held the office of tutor in the Baïf household. Antoine de Baïf, Daurat's pupil, accompanied Ronsard; Belleau shortly followed; Joachim du Bellay, the second of the seven, joined not much later. Muretus (Jean Antoine de Muret), a great scholar and by means of his Latin plays a great influence in the creation of French tragedy, was also a student here.

The Pleiade.—Ronsard's period of study occupied seven years, and the first manifesto of the new literary movement, which was to apply to the vernacular the principles of criticism and scholarship learnt from the classics, came not from him but from Du Bellay (*q.v.*). The *Défense et illustration de la langue française* of the latter appeared in 1549, and the Pléiade (or *Brigade*, as it was first called) may be said to have been then launched. The orthodox canon is beyond doubt composed of Ronsard, Du Bellay, Baïf, Belleau, Pontus de Tyard, Jodelle the dramatist, and Daurat. Some single and minor pieces, an epithalamium on Antoine de Bourbon and Jeanne de Navarre (1550), a "Hymne de la France" (1549), an "Ode à la Paix," preceded the publication in 1550 of the first four books of the *Odes* of Ronsard. This was followed in 1552 by his *Amours de Cassandre* with the fifth book of *Odes*. These books excited a violent literary quarrel. Marot was dead, but he left a numerous school, some of whom saw in the stricter literary critique of the Pléiade, in its outspoken contempt of merely vernacular and mediaeval forms, in its strenuous advice to French poetry to "follow the ancients," and so forth, an insult to Marot and his followers. An acute rivalry ensued between the followers of Clément Marot, the "École Marotique," and the new school. The Pléiade found a powerful supporter at court in Marguerite de Valois. Ronsard published his *Hymns*, dedicated to Marguerite de Savoie, in 1555; the conclusion of the *Amours*, addressed to another heroine, in 1556; and then a collection of *Oeuvres complètes*, said to be due to the invitation of Mary Stuart, queen of Francis II., in 1560; with *Elégies, mascarades et bergeries* in 1565. To this same year belongs his most important and interesting *Abrégé de l'art poétique français*.

Charles IX. gave him rooms in the palace; he bestowed upon him divers abbacies and priories; and he called him and regarded him constantly as his master in poetry. Neither was Charles IX. a bad poet. This royal patronage excited violent dislike to Ronsard on the part of the Huguenots, who wrote constant pasquinades against him, strove (by a ridiculous exaggeration of the Dionysiac festival at Arcueil, in which the friends had indulged to celebrate the success of the first French tragedy, Jodelle's *Cléopatre*) to represent him as a libertine and an atheist, and (which seems to have annoyed him more than anything else) set up his follower Du Bartas as his rival. According to some words of his own, which are quite credible considering the ways of the time, they were not contented with this variety of argument, but attempted to have him assassinated.

During this period Ronsard's work was considerable but mostly occasional, and the one work of magnitude upon which Charles put him, the *Françiade* (1572), has never been ranked, even by his most devoted admirers, as a chief title to fame. The metre (the decasyllable) which the king chose could not but contrast unfavourably with the magnificent alexandrines which Du Bartas and Agrippa d'Aubigné were shortly to produce; the general plan is feebly classical, and the very language has little or nothing of that racy mixture of scholarliness and love of natural beauty which distinguishes the best work of the Pléiade. Moreover it had the singular bad luck almost to coincide with the massacre of St. Bartholomew, which had occurred about a fortnight before its publication. The death of Charles made little difference in the court favour which Ronsard enjoyed, but, combined with his increasing infirmities, it seems to have determined him to quit court life. During his last days he lived chiefly at his house in Vendôme, the capital of his native province, at his abbey at Croix-Val in the same neighbourhood, or else at Paris, where he was usually the guest of Jean Galland, well known as a scholar, at the Collège de Boncourt. It seems also that he had a town house of his own in the Faubourg Saint-Marcel. He received gifts and endowments from foreign patrons, including Elizabeth of England. Mary, queen of Scots, who had known him earlier, addressed him from her prison; and Tasso consulted him on the *Gerusalemme*. He died at his priory of Saint-Cosme at Tours, and he was buried in the church of that name on Dec. 27, 1585.

After Ronsard's death the classical reaction set in under the auspices of Malherbe. After Malherbe the rising glory of Corneille and his contemporaries obscured the tentative and unequal work of the Pléiade, which was, moreover, directly attacked by Boileau himself, the dictator of French criticism in the last half of the 17th century. Then Ronsard was, except by a few men of taste, like La Bruyère and Fénelon, forgotten when he was

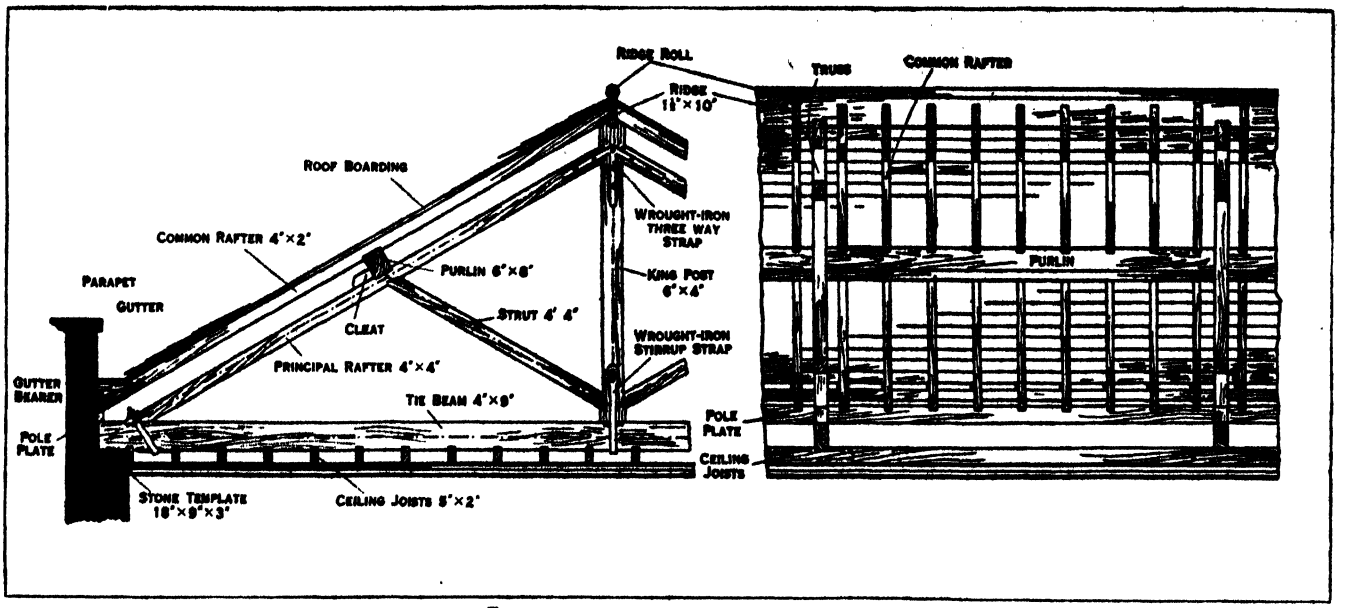
not sneered at. In this condition he remained during the whole 18th century and the first quarter of the 19th. The Romantic revival, seeing in him a victim of its special *bête noire* Boileau, and attracted by his splendid diction, rich metrical faculty, and combination of classical and mediaeval peculiarities, adopted his name as a kind of battle-cry, and for the moment exaggerated his merits somewhat. The critical work, however, of Sainte-Beuve in his *Tableau de la littérature française au 16ème siècle*, established his place in French literature.

Generally speaking, Ronsard is best in his amatory verse (the long series of sonnets and odes to Cassandre, Marie, Genèvre, Hélène—Hélène de Surgères, a later and mainly "literary" love —etc.), and in his descriptions of the country (the famous "Mignonne allons voir si la rose," the "Fontaine Bellerie," the "Forêt de Gastine," and so forth), which have an extraordinary grace and freshness. No one used with more art than he the graceful diminutives which his school set in fashion. He knew well too how to manage the gorgeous adjectives ("marbrine," "cinabrine," "ivoirine" and the like) which were another fancy of the Pléiade, and in his hands they rarely become stiff or cumbrous. In short, Ronsard shows eminently the two great attractions of French 16th-century poetry as compared with that of the two following ages—magnificence of language and imagery and graceful variety of metre.

BIBLIOGRAPHY.—Of editions of his *Oeuvres complètes* he himself published seven—the first in 1560, the last in 1584. Between his death and the year 1630 ten more complete editions were published, the most famous of which is the folio of 1609. From 1630 Ronsard was not again reprinted for more than two centuries. Just before the close of the second, however, Sainte-Beuve printed a selection of his poems to accompany the above-mentioned *Tableau* (1828). There are also selections by M. Noel (in the *Collection Didot*) and Becq de Fouquières. M. Prosper Blanchemain, who had previously published a volume of *Oeuvres inédites de Ronsard*, undertook a complete edition (8 vols., 1857–67) for the *Bibliothèque Elzévirienne*. Later editions are by Marty-Laveaux (1887–1893), and B. Pifteau (1891); and by P. Laumonier (2 vols., 1914). C. H. Page published a translation of his *Songs and Sonnets* with introductory essay and notes (Boston, 1924). As for criticism, Sainte-Beuve followed up his early work by articles in the *Causeries du lundi*, and the chief later critics have dealt with him in their collected works. In English A. Tilley's *Literature of the French Renaissance* (1904) and Saintsbury's *History of Criticism*, vol. ii. may be consulted. *See* also P. Champion, *Ronsard et son temps* (1905); P. de Nolhac, *Ronsard et l'humanisme* (1921); H. Franchet, *Le Poète et son oeuvre d'après Ronsard* (1923); P. Laumonier, *Ronsard* (1923); and S. de Ricci, *Catalogue d'une collection unique des éditions originales de Ronsard* (1925).

RÖNTGEN, DAVID, sometimes called DAVID DE LUNÉVILLE (1743–1807), German cabinet-maker, eldest son of Abraham Röntgen, was born at Herrenhag on Aug. 1, 1743 and died at Wiesbaden on Feb. 12, 1807. In 1753 his father migrated to Neuwied, near Coblenz, where he established a furniture factory. He learned his trade in his father's workshop, and succeeded to the paternal business in 1772. At that time the name of the firm was already well known, but although he is always reckoned as one of the foreign cabinet-makers and workers in marquetry who, like Oeben and Riesener, achieved distinction in France during the superb *floraison* of the Louis Seize style, he never ceased to live at Neuwied, where apparently the whole of his furniture was made, and merely had a shop, or show-room, in Paris. His first appearance there was in Aug. 1774. He soon acquired favour with Marie Antoinette who appointed him her *ébéniste-méchanicien*. The powerful trade corporation of the *maîtres-ébénistes* disputed his right to sell in Paris furniture of foreign manufacture, and in 1780 he found it advisable to seek admission to the corporation. He introduced a new style of marquetry, in which light and shade, instead of being represented as hitherto by burning, smoking or engraving the materials, were indicated by small pieces of wood so arranged as to create the impression of *pietra dura*. He was also proficient in constructing furniture in which mechanical devices played a great part, and unquestionably much of the reputation he enjoyed among contemporaries is explained by his mechanical genius. Röntgen also had shops in Berlin and St. Petersburg, and twice went to Russia when he sold to the Empress Catherine furniture to the value of 20,000 roubles, to which she added a personal present of 5,000 roubles and a gold snuff-box—in recognition of his ingenuity in surmounting a secretaire with a clock indicating the date of the Russian naval victory over the Turks at Cheshme, news of which had arrived on the previous evening. In 1793 the Revolutionary government seized the contents of his show-rooms and his personal belongings. Five years later the invasion of Neuwied led to the closing of his workshops to which prosperity never returned.

See F. de Salverte, *Les Ébénistes du XVIII. Siècle* (1927).



RÖNTGEN, WILHELM KONRAD VON (1845–1923), German physicist, was born at Lennep on March 27, 1845. He received his early education in Holland, and then went to study at Zürich. He then became assistant to Kundt at Würzburg and afterwards at Strasbourg, becoming *Privatdozent* at the latter university in 1874. Next year he was appointed professor of mathematics and physics at the Agricultural Academy of Hohenheim, and in 1876 he returned to Strasbourg as extraordinary professor. In 1879 he was chosen ordinary professor of physics and director of the Physical Institute at Giessen, whence in 1885 he removed in the same capacity to Würzburg. It was at the latter place that he made the discovery for which his name is chiefly known, the Röntgen rays. In 1895, while experimenting with a highly exhausted vacuum tube on the conduction of electricity through gases, he observed the fluorescence of a barium platinocyanide screen which happened to be lying near. Further investigation showed that this radiation had the power of passing through various substances which are opaque to ordinary light, and also of affecting a photographic plate. Its behaviour being curious in several respects, particularly in regard to reflection and refraction, doubt arose in his mind whether it was to be looked upon as light or not, and he was led to put forward the hypothesis that it was due to longitudinal vibrations in the ether, not to transverse ones like ordinary light; but in view of the uncertainty existing as to its nature, he called it X-rays. For this discovery he received the Rumford medal of the Royal Society in 1896, jointly with Philip Lenard, who had already shown, as also had Hertz, that a portion of the cathode rays could pass through a thin film of a metal such as aluminium. Röntgen also conducted researches in various other branches of physics, including elasticity, capillarity, the ratio of the specific heats of gases, the conduction of heat in crystals, the absorption of heat-rays by different gases, piezo-electricity, the electromagnetic rotation of polarized light, etc. Röntgen received the Nobel Prize for physics in 1901. He died at Munich on Feb. 10, 1923. *See* also X-RAYS.

ROOFS. A roof is the covering of a structure. Its chief purpose is to enclose the upper parts of a building as a protection against wind, rain and snow; in communities of dwellings, domestic buildings, industrial and commercial structures, fire-resistance is a necessary property of roofing.

Roofs may be flat, or may be inclined at an angle to suit the roof covering. Covering materials are selected for pitched roofs according to their resistance to rain and snow, durability in changes of temperature and in acid atmospheres, and for their artistic qualities in relation to architectural design. Modern buildings erected in concrete usually have flat roofs, consisting of concrete slabs surfaced with asphalt or with waterproofed cement coatings. Sufficient fall must be given to drain water off quickly and adequate gutters formed in the concrete to discharge the water in heavy storms.

For buildings erected in steel framework flat concrete roofs may be adopted, but in order to keep the eaves of a building at a lower level, while providing additional storeys in the accomodation, it is more usual in cities to adopt a Mansard type of roof, having the general form shown in fig. 5, but constructed in steel. Cross members are avoided as much as possible—except where required as floor girders—and the frame is made rigid by strong steel gussets at the changes of direction of the slopes. Two storeys in the roof—or more—can be obtained in this way.

While timber framework continues to be used for supporting roof coverings of lead, copper, zinc, special felts, asbestos sheets, slates and tiles—both for flat and pitched roofs—steel has largely replaced timber for the main supports and for many transverse members in the larger buildings, and even for semi-permanent

FIGS. 1 & 2.—KING-POST ROOF TRUSS

industrial buildings and stores, because of the rapidity with which materials can be prepared, assembled and erected. Steel is also economically justified for use in roof framing except for dwellings and small buildings, or for dye-works and bleach-works where rapid oxidation renders steel unsuitable. Roofs are often made with considerable projection at the eaves. This serves to protect the upper portion of the external walls and also possesses aesthetic value in design.

Forms of Roofs.—The simplest form is the "flat roof" consisting of horizontal wood joists laid from wall to wall as in floors. The roof must have sufficient fall to allow water to drain away into gutters placed at convenient points. The joists are covered with boards followed by a waterproof material such as asphalt, lead, zinc or copper. These flat roofs cannot be economically constructed for cold climates with heavy snowfalls; they are difficult to maintain weathertight under such conditions.

"Lean-to," "shed," or "pent" roofs are developments of the same form of construction as the flat roof, one end of the joists (now called "rafters") being lifted to form a decided slope, which enables slates, tiles, asbestos sheets and other materials to be employed in small units.

Simple roofs in general use with a double slope are called "coupled rafter roofs," the rafters meeting at the highest point upon a horizontal ridge-piece which stiffens the framework and gives a level ridge-line. In some old roofs the rafters are connected without any intervening ridge-plate, with the result that after a time the ridge instead of remaining level takes on a wavy outline, due to the fact that some of the timbers have settled slightly owing to decay or other causes, whilst others have remained firm. The lower ends of the rafters should rest upon a wood plate bedded on the top of the wall; this assists in spreading the weight over the wall, and provides fixing for the timbers. The simple "couple roof" consists merely of two sets of rafters pitched from plates on the walls on either side of the building and sloping upwards to rest against a common ridge-piece. There are no ties between the feet of the rafters, which therefore exert a considerable thrust against the supporting walls; this form of roof is only suitable for spans of 10 to 12 feet. Where the ends of the rafters are connected by ceiling joists which form a level ceiling the joists act as ties and prevent any outward thrust on the supports. Such roofs are termed "couple close roofs." When used for spans between 12 ft. and 18 ft. a binder supported by an iron or wood "king" tie every 5 or 6 ft. should be run along across the centres of the ceiling joists and the latter spiked to it. When ties are fixed about half-way up the rafters the roof is called a "collar roof," and may be used for spans up to 16 ft. This type of roof is commonly used in dwelling-houses where the fir framing is generally hidden from view by the ceilings. Where required extra support is obtained from partitions and cross walls. If the span is above 20 ft. without intermediate support, it is necessary to employ "principals" and "purlins." American usage sanctions much greater spans than English for simple raftered roofs. Frequently spans as great as 30 ft. or more are roofed without trusses or interior supports, provided that the feet of the rafters are adequately tied by means of ceiling or floor joists at or near the plate level. Principals are strong trusses of timber rigidly framed together and placed at intervals of about 10 ft. to support the weight of the roof covering. Purlins—stout timbers running longitudinally—are supported on the principal rafters at intervals of 6 to 8 ft., and on these the common rafters are fastened. Principals, or "roof trusses" as they are more often called, are framed together in various ways; they may be of timber members with iron fastenings, or entirely of steel, or again a combination of steel and timber. In the latter case they are called "composite trusses" and the use of steel is confined to tension members.

The "king-post truss" may be used for spans up to 30 ft. and is constructed as shown in figs. 1 and 2. It has a central post sustaining the "tie-beam" in the centre with struts projecting from its base to support the principal rafters at a point where the weight from the purlins renders strutting necessary. The members are connected by wrought-iron straps and bolts; a strap connects the king-post and tie-beam and is often fitted with a gib-and-cotter arrangement (iron folding wedges) which allows the whole truss to be tightened up should any settlement or shrinkage occur. "Queen-post trusses" have two queen-posts supporting the tie beam (fig. 3). Trusses of this type are suitable for spans up to 45 ft. The joints between the members are made in a similar manner to those of the king-post principal with wrought-iron straps. There are two purlins on each slope, one supported at the top of each "queen," the other about half-way down the principal rafter. A stout straining beam connects the heads of the queens. In fig. 4, *a* and *b* are details at the foot of the queen-post, and *c* at the head. In roofs of larger span, up to 60 ft., the tie-beam requires to be upheld at more than two points, and additional posts called "princesses" are introduced for this purpose. This also entails extra struts and purlins. In such large spans the straining beam often becomes of such a length as to require support and this is effected by continuing the principal rafters up to the ridge and introducing a short king-post to sustain the beam in the middle of its length.

Open Timber Roofs.—Open timber roofs of various types but principally of "hammer-beam" construction were used in the middle ages where stone vaulting was not employed. Many of

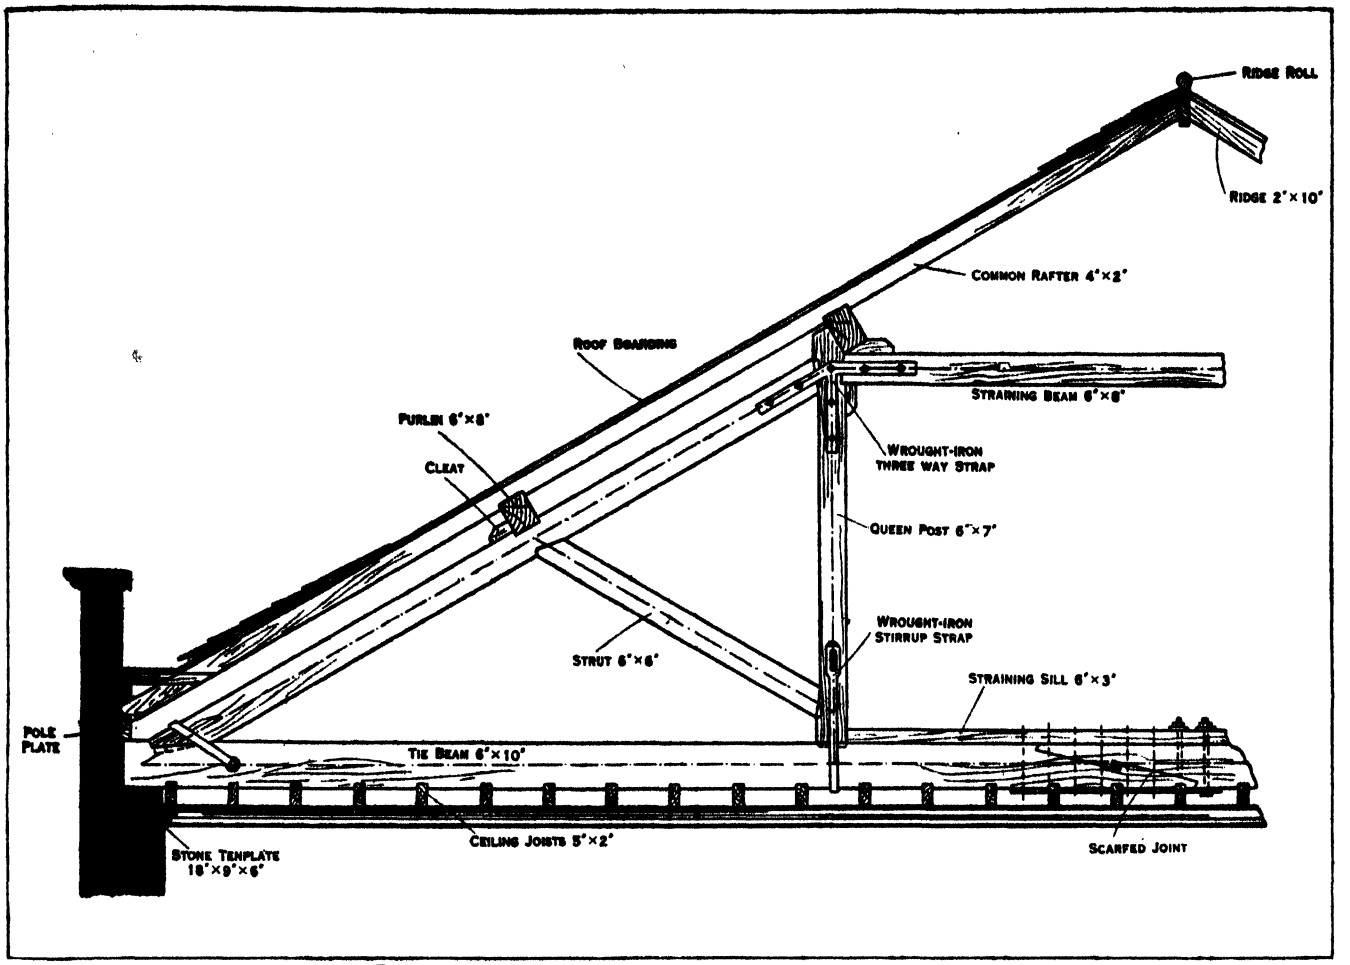


FIG. 3.—QUEEN-POST ROOF TRUSS: HALF ELEVATION, 38 FT. SPAN

these old roofs still exist in good preservation and exhibit the great skill of the mediaeval carpenters who designed and erected them. Such forms are still used, chiefly for ecclesiastical buildings and the roofs over large halls. In the best periods of Gothic architecture the pitch of these roofs was made very steep, sometimes as much as 60° with the horizon. In the hammer-beam

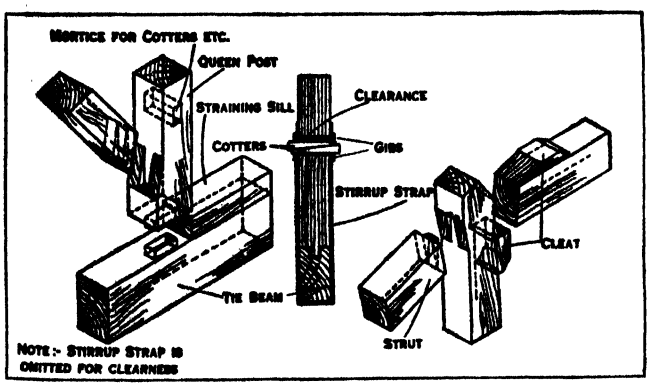

FIG. 4.—(A) DETAIL OF QUEEN-POST TRUSS AT B. (B) VERTICAL SECTION THROUGH QUEEN-POST. (C) DETAIL OF QUEEN-POST TRUSS AT HEAD: PURLIN AND WROUGHT-IRON STRAPS ARE OMITTED FOR THE SAKE OF CLEARNESS

type of roof the tie-beam at the foot of the rafters is omitted, a collar connecting the principal rafters at a point about halfway in their length, and the lower portion of the rafters consisting of struts and braces rigidly connected to relieve thrust upon the walls serving as abutments. There are two kinds of hammer-beam, the arched and the bracketed. The "hammer-beam" projects from the top of the wall and is bracketed from a corbel projecting from the wall some distance below. This form of roof has a style and dignity appropriate to the period in which it was developed.

The Mansard Roof (fig. 5) is a useful form of construction which obtains its name from François Mansart (*q.v.*). This kind of roof has been largely used in France and other European countries, and in America in the old colonial days. It is well adapted to some styles of architecture, but requires careful proportioning of the slopes for a satisfactory effect. In America the term "Mansard Roof" (*q.v.*) is reserved for roofs of double pitch sloping up from all 4 sides of building; the term "gambrel roof" (*q.v.*) being applied to double pitched roofs ending in gables. By the use of a Mansard roof extra rooms can be obtained without adding an additional storey to the building. Fig. 5, A, B, C, D and E show various sectional forms. A similar type of curb roof is often used having a flat lead or zinc-covered top in place of the pitched slate or tile-covered top of the ordinary Mansard roof.

Composite Roof Trusses of wood and iron are frequently used for all classes of buildings, and have proved very satisfactory. They are built upon the same principles as wooden roof trusses. The struts—that is, those members subjected to compressional stress—are of wood, and iron bars or rods are used for the ties, which have to withstand tensile forces. When shrinkage occurs, as usually happens in large trusses, the joints of the framing are tightened up by the bolts attached to the tie-rods. Figs. 6, 7 and 8 are the sections and plan of a simple method of constructing the roof for a small domestic building with plaster ceilings to the top rooms. It is a couple close roof with the addition of a collar and struts, and king-rod to every fourth rafter. Trimming is necessary for openings and where portions of the structure, such as chimney stacks, cut into the roof. A dragon tie is framed to the wall-plates at the hipped angles to receive the thrust from the hip rafters.

Steel Roof Trusses.—Because of their adaptability in form

and detail, speed of fabrication and general economy, roof principals of steel are now the most usual kind of roof support where trussed framing is required. They are particularly suitable for commercial buildings, and, while not artistic if judged by comparison with the traditional treatment of timber, are capable of

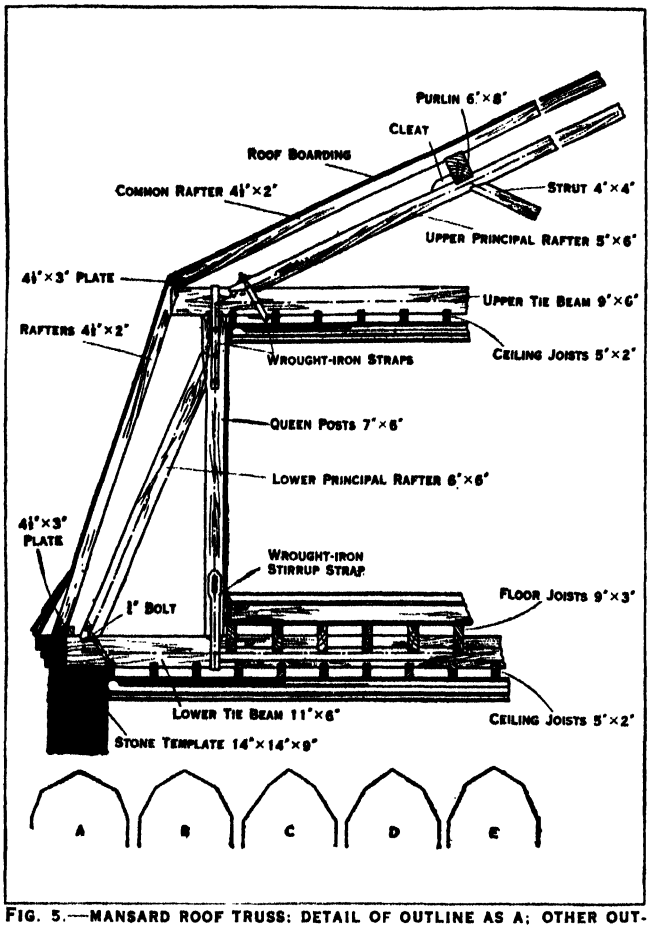

FIG. 5.—MANSARD ROOF TRUSS: DETAIL OF OUTLINE AS A; OTHER OUTLINES AT B, C, D AND E

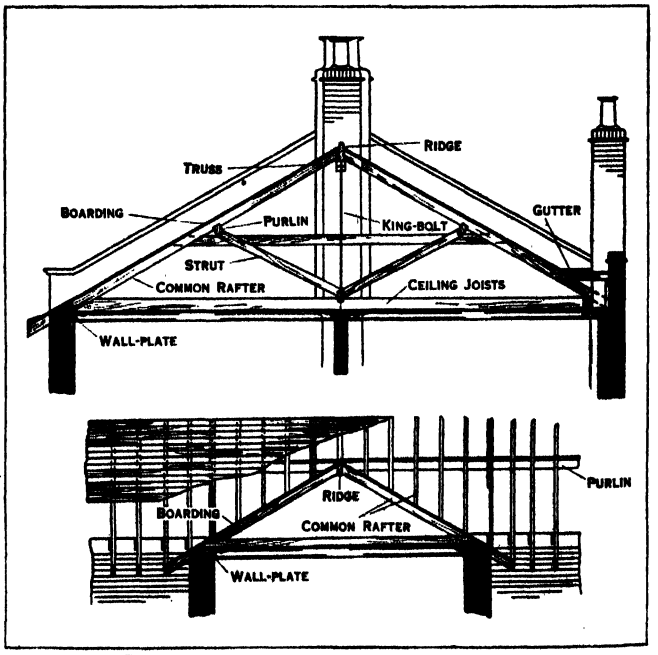
acceptable aesthetic form based on the economic suitability for their particular purpose.

In the early days of steel trusses, T sections for rafters and struts were usually employed, with rounds and flats for the tie bars. Modern methods of fabrication have gradually developed the use of the L (angle) section for nearly all structural members in roof trusses of moderate span, double angles being used for rafters and ties, single gusset plates riveted between the angles, and ties and struts of either single or double angle section riveted to the faces of the gussets.



The guiding principle is simplicity of form and of detail, and efficiency for service. Often more material is employed in a member than is strictly necessary—and a more economical use of material might be arranged—but usually economy of material means a loss in fabrication costs or the necessity of carrying stocks of many and variable sections of steel.

Double channels are very convenient and largely used for compression members in large span roofs and in unusual structures.

The types of trusses in modern use are given in fig. 9. These include the "queen rod," having vertical ties and inclined struts, the "trussed rafter," in which the struts are at 90° to the rafter, and variations of these forms. Perfect triangulation of steel frames is easy to arrange and the dimensions of the members can be suitably arranged by selection from a large number of standard sections of rolled steel.

Where large areas of uninterrupted floor space are required in textile sheds, garages, etc., a form of roof is often adopted in which main girders of the parallel type, up to 150 ft. span, support cantilever trusses, the main girders being placed to form the ridges of the slopes and the cantilevers attached at each side as shown in fig. 10. The gutters are central between the trusses and the girder spacing up to 30 ft. span. Clear bays are thus provided 150 ft. × 30 ft.

Domical Roofs.—Domes may be framed up with wood rafters cut to shape. For small spans this construction is satisfactory, but domes of considerable size are now framed in steel or in reinforced concrete. The outer dome of St. Paul's cathedral in London is of lead-covered wood, framed upon and supported by a conical structure of brickwork which is raised above the inner dome of brick. Concrete is a very suitable material for use in the construction of domes, with iron or steel reinforcement in the shape of bars, mesh, or perforated plates. One of the best modern examples of concrete vaulting and domical roofing without metal reinforcement occurs in the Roman Catholic cathedral at Westminster, a remarkable building designed by Mr. J. F. Bentley. The circle developed by the pendentives of a nave dome is 60 ft. in diameter. The thickness of the dome at the springing is 3 ft. gradually reduced to 13 in. at the crown; the curve of equilibrium is therefore well within the material. The domes were turned on closely boarded centering in a series of superimposed rings of concrete, averaging 4 ft. in width, and the concrete was not reinforced. The independent external covering of the domes is formed of 3 in. artificial stone slabs cast to the curve. They rest on radiating ribs 5 in. deep of similar material fixed on the concrete and rebated to receive the slabs; thus an air space of 2 in. is left between the inner shell and the outer covering, the object being to render the temperature of the interior more uniform. At the springing and at the crown the spaces between the ribs are left open for ventilation. The sanctuary dome differs in several respects from those of the nave. Unlike the latter, which seem to rest on the flat roofing of the church, the dome of the sanctuary emerges gradually out of the substructure, the supporting walls on the north and south being

FIGS. 6 & 7.—ROOF FOR DOMESTIC BUILDING

kept down so as to give greater elegance to the eastern turrets. The apsidal termination of the choir in the east is covered in with a concrete vault surmounted by a timber roof, in striking contrast to the domes covering the other portions of the structure. Fig. 12 is a section through the nave showing how the domes are buttressed, fig. 13 is a section through the sanctuary dome, and figs. 14 and 15 a section and part plan of the vaulting of the choir with its wood span roof above the concrete vault.

Covering Materials for Roofs.—There are many different roof-covering materials in common use, of which the principal

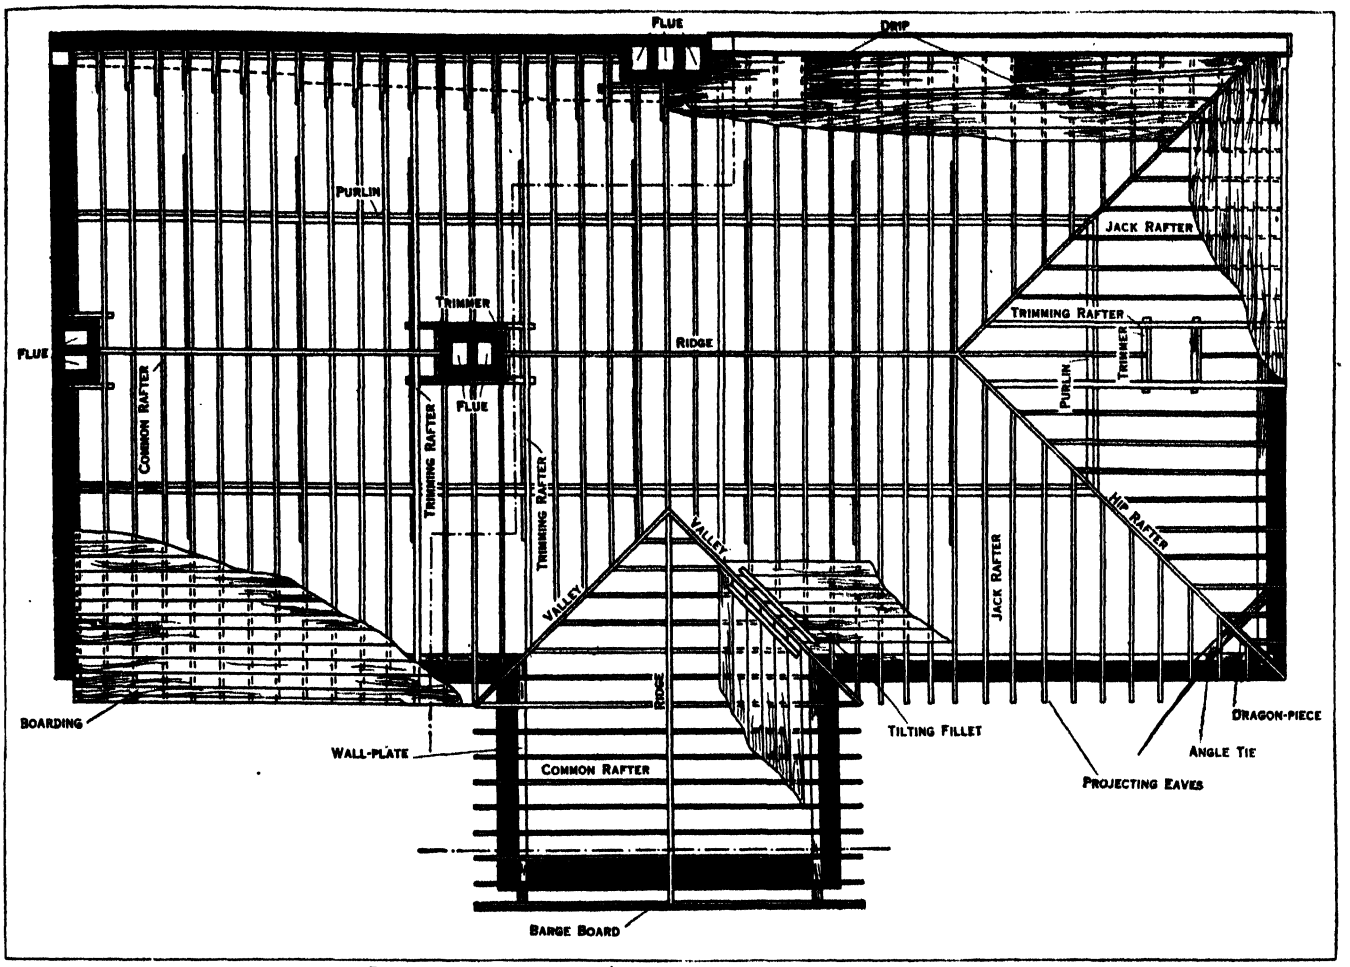


FIG. 8.—PLAN OF A ROOF SHOWING THE DETAILS OF CONSTRUCTION

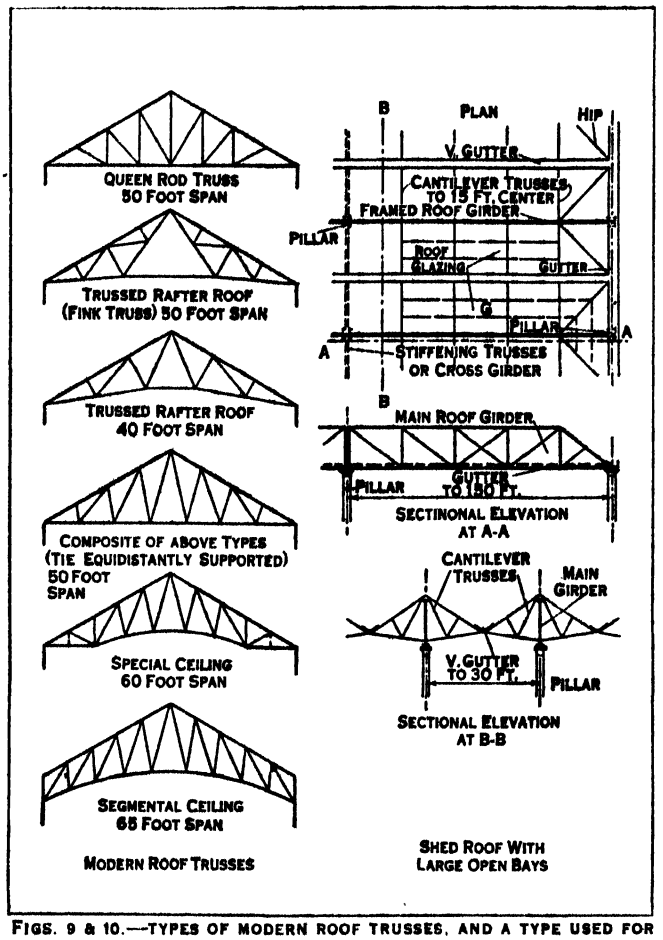

characteristics are given. The nature of the outer covering affects the details of roof construction in many respects. A light covering such as felt or corrugated iron can be safely laid upon a much lighter timber framing than is necessary for a heavy covering of tiles or slates.

Roofing felt is an inexpensive fabric of animal or vegetable fibre treated with bituminous preparations to make it capable of resisting the weather. It is used as a roofing material for temporary buildings. When exposed to the weather it should be treated with a compound of tar and slaked lime well boiled and applied hot, the surface being sprinkled with sand before it becomes hard. Bituminous felt is employed as a non-conducting and safeguarding under-cover to slates and tiles, used only for the roofs of important buildings. The felt is supplied in rolls containing from 25 to 35 yd. by 30 in. wide. The sheets should be laid with a lap of at least 2 in. at the joints and secured to the boarding beneath by large-headed clout-nails driven in about 2 in. apart.

Corrugated iron is supplied either black or galvanized. It is especially suited for the roofs of out-buildings and buildings of a temporary or semi-permanent character. Being to a large extent self-supporting, it requires a specially designed roof framework of light construction. If, as is usually the case, the sheets are laid with the corrugations running with the slope of the roof, they can be fixed directly on purlins spaced 5 ft. to 10 ft. apart according to the stiffness and length of the sheets. In pure air zinc coating of the galvanized sheets is durable for many years, but in large cities and manufacturing towns its life is short unless protected by painting. In such districts it has often been found that plain ungalvanized sheets well coated with paint will last longer than those galvanized, for the latter are attacked by corrosive influences through minute flaws in the zinc coating developed in the process of corrugation or transit or resulting from some defect in the coating. The stock sizes of corrugated sheets vary from 5 ft. to 10 ft. long, and from 2 ft. to 2 ft. 9 in. wide with corrugations measuring 3 in. to 5 in. from centre to centre. For roofing purposes the sheets are supplied in several thicknesses ranging from No. 16 to No. 22 Standard Wire Gauge. No. 16 is for exceptionally strong work, No. 18 and No. 20 are used for good-class work, and No. 22 for the roofs of temporary buildings. The sheets when laid should lap one full corrugation at their sides and from 3 in. to 6 in. at the ends. Riveting is the best method of connecting the sheets, although galvanized bolts, which are not so satisfactory, are frequently employed. The joints should be made along the crowns of the corrugations to avoid leakage. Holes can be punched during the erection of the roof. For attachment to timber framework, galvanized screws or nails with domed washers are used. Fixing to a steel framework is effected by galvanized hook bolts which clip the purlins and pass through the sheet. Sheets corrugated in the Italian pattern have raised half-rounds every 15 in. or so, the portions between being flat. Such sheets have a very neat appearance and give a better effect in some positions than the ordinary corrugations.

Zinc in sheets is a material largely used as a roof covering, and if care be taken to ensure metal of good quality, it is strong and durable, as well as light and inexpensive. Zinc is stronger weight for weight than lead, slate, tile or glass, but weaker than copper, wrought-iron or steel, although with the exception of the latter two it is not so durable under normal roofing conditions. It is not liable to easy breakage as are slates, tiles and glass. It is usually supplied in flat sheets, although it can also be had in the corrugated form similar to corrugated sheet-iron. When exposed to air, a thin coating of oxide is formed on the surface which protects the metal beneath from any further change, and obviates the necessity of painting. In laying the sheets, the use of solder and nails should be avoided entirely except for fixing clips and

tacks which do not interfere with the free expansion and contraction of the sheets. Zinc expands freely, and sheets laid with soldered seams or fixed with nails are liable to buckle and break away owing to movements caused by changes of temperature. The usual sizes of zinc sheets are 7 ft. or 8 ft. long by 3 ft. wide and weighing from 11½ to 25 oz. per sq.ft. The thickness varies from 25 to 19 Standard Wire Gauge. A dependable method of

FIGS. 9 & 10.—TYPES OF MODERN ROOF TRUSSES, AND A TYPE USED FOR LARGE UNINTERRUPTED FLOOR AREAS

laying zinc on flat roofs is with the aid of wood "rolls," about 2 in. × 2 in. in section, splayed at the sides, spaced 2 ft. 8 in. apart and fixed to the roof boarding with zinc nails. Iron nails should not be used as this metal affects the zinc. The sheets of zinc are laid between the rolls with their sides bent up 1½ in. or 2 in. against them, and held firmly in position by clips of zinc attached to the rolls. A cap of the same metal is then slipped over each roll and fastened down by tacks about 3 in. long soldered inside it so as to hook under the same clips that anchor the sheet. Drips of about 2½ in. are made in the slope at intervals of 6 ft. or 7 ft.—that is, the length of a sheet—and care must be taken at these points to keep the work waterproof. The lower sheet is bent up the face of the drip and under the projecting portion of the upper sheet, which is finished with a roll edge to turn off the water. The end of the roll has a specially folded cap which also finishes with a curved or beaded water check, and this in conjunction with the saddle piece of the roll beneath forms a weather-proof joint (figs. 16 and 17). The fall between the drips is usually about 1½ in. deep, but where necessary it may be less, the least permissible fall being about 1 in 80. Felt laid beneath zinc has the effect of lengthening the life of the roof and should always be used, as the edges of the boarding upon which it is laid are, when the latter warps, apt to cut the sheets. It also forms a cushion protecting the zinc if there is traffic across the roof.

Sheet-lead forms a much heavier roof covering than zinc, but it lasts a great deal longer and more easily withstands the attacks of impure air. Lead must be laid on a close boarding, for its great ductility prevents it from spanning even the smallest spaces without bending and giving way. This characteristic of the metal, however, conduces largely to its usefulness, and enables it to be dressed and bossed into awkward corners without the necessity of jointing. The coefficient of expansion for lead is nearly as great as that for zinc and much higher than for iron; precautions to allow free expansion and contraction must be taken when laying the lead covering. The manner of laying is with rolls and drips as in the case of zinc, the details of the work differing somewhat to suit the character of the material (*see* figs. 18, 19 and 20); the use of nails and solder should be avoided as far as possible. Contact with iron sets up corrosion in lead, and when nails are necessary they should be of copper; screws should be of brass. Lead is supplied in rolls of 25 to 35 ft. long and 6 ft. to 7 ft. 6 in. wide. That in general use varies from one-fourteenth to one-seventh of an inch in thickness. The weights most suitable for employment in roofing work are 7 or 8 lb. per square foot for flats and gutters, 6 lb. for ridges and hips, and 5 lb. for flashings.

As a roof covering copper is lighter, stronger and more durable than either zinc or lead. It expands and contracts much less than these metals, and although not so strong as wrought-iron and steel it is much more durable. From a structural point of view these qualities enable it to be classed as the best available metal for roof covering, although its heat-conducting properties require

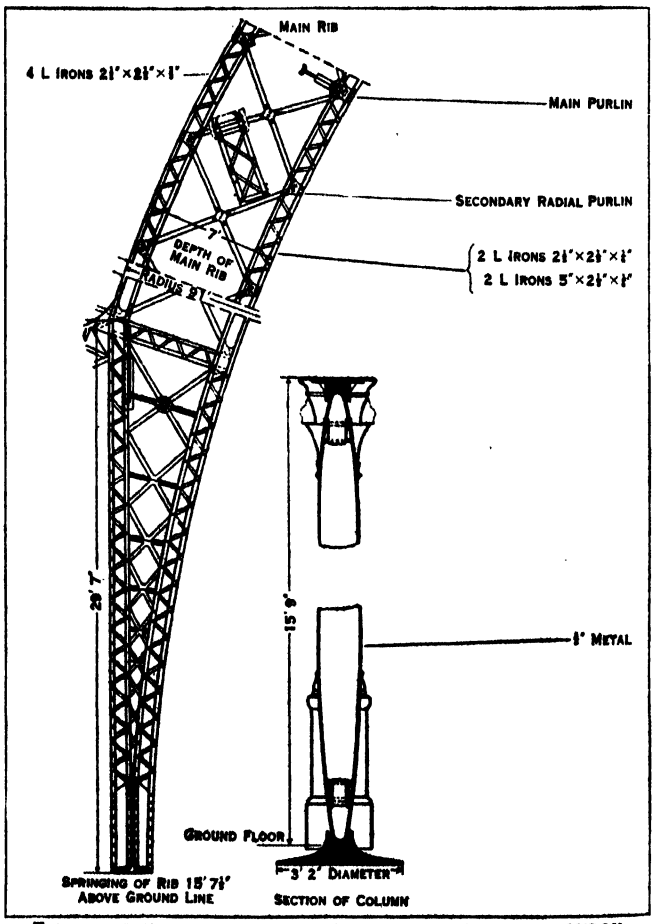

FIG. 11.—DETAIL OF MAIN RIB AND COLUMN: OLYMPIA, LONDON

it to be well insulated by layers of felt and other non-conducting material placed beneath the metal. On exposure to the air copper develops a feature of great beauty in the coating of green carbonate which forms upon its surface and protects it from further decomposition. Perhaps the chief disadvantage in the use of copper has been in its first cost, but it is now comparatively cheap and account must also be taken of the almost imperishable nature of the mental and that its light weight requires less substantial framework for its support. Copper roofing should be laid in a similar manner to zinc, with wood rolls at intervals of

about 2 ft. 4 in. It is, however, often laid with welted seams. The general stock sizes of sheets are from 4 ft. to 5 ft. 3 in. long and 2 ft. to 3 ft. 6 in. wide. The thickness almost invariably used is known as 24 S.W.G. and weighs 16 oz. per square foot. Thinner metal would suffice, but owing to the increased cost of rolling very little would be gained by adopting the thinner gauges.

In the United States of America "tin" roofs are quite commonly used. Sheets of wrought-iron coated either with tin or zinc are used of a size usually 14 in. by 20 in., though they may be had double this size. Preparation for laying is made by fixing an insulating foundation of somewhat stout paper or felt; this must be dry, else it is apt to spoil the impermeable covering laid upon it by causing it to rust. Junctions between the sheets are made by welted seams in which the four edges of the sheets are turned over so as to lock together, thus forming one large sheet of tin covering the roof. In high-class work of a permanent nature the seams in addition are soldered, rosin only being used as a flux. Each sheet also is secured to the roof with two or three tin cleats. The life of such a roof may be practically doubled by the application of a coat of good paint, which, however, adds considerably to the cost.

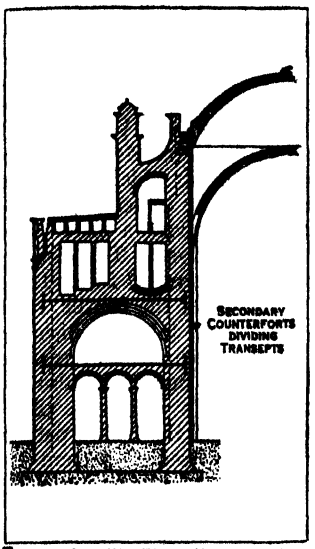

FIG. 12.—WESTMINSTER CATHEDRAL: SECTION THROUGH NAVE

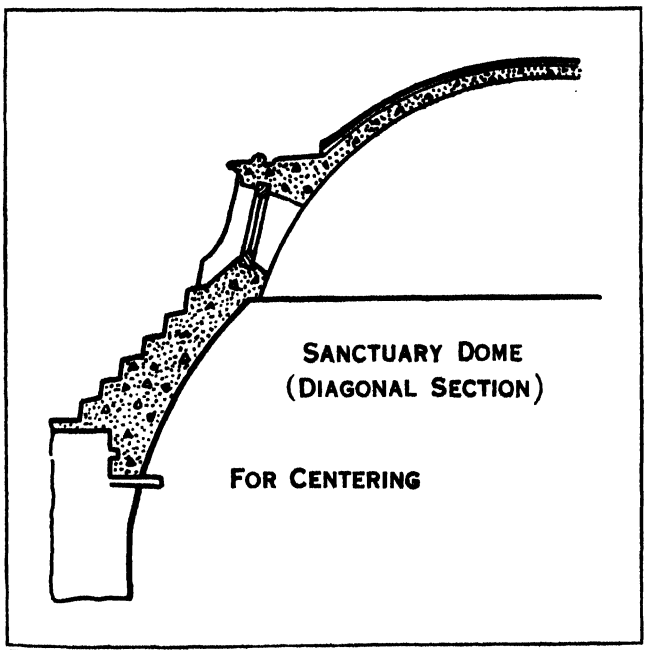
The greatest use of bituminous materials in modern roof coverings is in the form of tar and gravel or tar and slag roofs. These consist of three or more layers or plies glued to each other and covered by heavy coats of coal tar pitch. Onto the upper layer of pitch, before it has hardened, there is sprinkled a bed of gravel or slag, which is held in place by the pitch, and at the same time protects it. Flat tile roofs, terraces or promenades are frequently built in a somewhat similar manner, with an under layer of several plies of pitch and felt, covered with an inch thick bed of cement, on which the tile is laid. Adequate expansion joints, filled with some elastic cement, are usually installed in the tiled surface. Such roofs, either tile covered or gravel and slag covered, are perfectly water-tight, do not crack under extremes of heat and cold, and have become the most common type for the better class of flat roof, such as those of large modern office and apartment buildings, etc. If adequately flashed at the intersections with walls and parapets, they can be built perfectly level without fall or slope.



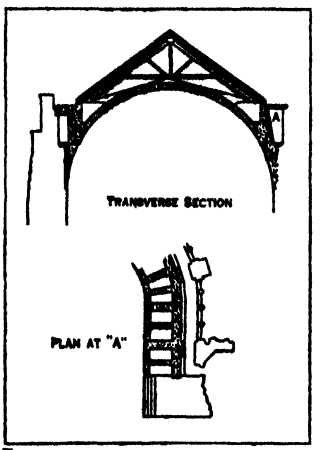


FIG. 13.—WESTMINSTER CATHEDRAL: DIAGONAL SECTION THROUGH SANCTUARY DOME

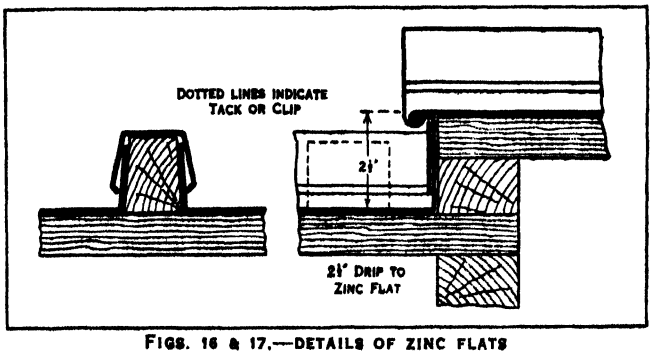
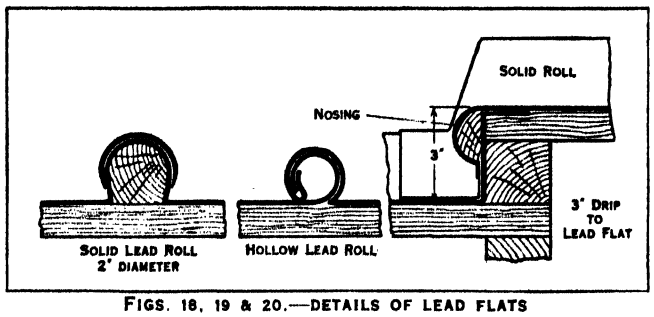


Slate (*q.v.*) is a strong and very impermeable material, and these qualities and the fact that it is easily split into thin plates suitable for laying, as well as its low cost, for many years caused it to be by far the most generally used of all materials for roof covering.

FIGS. 14 & 15.—WESTMINSTER CATHEDRAL: CHOIR-VAULTING

Slates are cut to many different sizes varying in length from 10 in. to 36 in. and in width from 5 in. to 24 in. There are perhaps thirty or more recognized sizes, each distinguished by a different name. In common practice those generally used are "large ladies," 16 in. by 8 in.; "countesses," 20 in. by 10 in.; and "duchesses," 24 in. by 12 in. Generally speaking, the rule governing the use of the different sizes is that the steeper the pitch the smaller the slate, and vice versa. Buildings in very exposed positions naturally require steeply pitched roofs, if they are to be covered and rendered weather-tight by small lapped units of covering.

Slates may be fixed by nailing at the head (*see* fig. 21) or at about the middle. The latter method is the stronger, as the levering effect of the wind cannot attain so great a strength. There is a small economy effected by centre nailing, as the margin is slightly larger and fewer slates are required to cover a given space; longer nails, however, are required, for as slates are laid at an angle with the pitch of the roof their centres cannot be made to approach so near to the slating battens or boarding as the head, which lies close on the surface to which it is fixed. Another important point is that the nail-holes in the centre-nailed slating are only covered by 3 in. of the tail (the amount of the "lap") of the course of slates above, and rain is very liable to be forced under by the wind and cause the wood battens or other woodwork to rot. Head-nailed slates, on the other hand, have their holes covered by two layers of slate, and are removed from exposure by the length of the gauge plus the lap, which in the case of "countess" slating equals 11 in.



FIGS. 16 & 17.—DETAILS OF ZINC FLATS

A point in favour of centre-nailing is that the slates are more securely held to the battens or boards and offer much more resistance to being lifted by the wind.

"Open slating" is an economical method of laying slates that is often adopted for the roofs of sheds, foundries and temporary buildings. The slates in the same course are not laid edge to edge as in close slating, but at a distance of two or more inches apart. This forms a roof covering light in weight and inexpensive, which,

although not strictly weather-proof, is sufficiently so for the buildings upon which it is used.

Slates are laid upon open battens fixed upon the rafters or upon close boarding or upon battens fixed upon boarding. The battens are ¾ in. or 1 in. thick and 1½ in. to 3 in. wide, and are spaced to suit the gauge of the slates. When close boarding is used it is often covered with inodorous asphalted felt, and to allow of ventilation of the materials, under-battens are sometimes fixed vertically, ridge ventilators introduced and air inlets arranged at the eaves. The beds of slates laid without provision for the admission of air have been found occasionally to have rotted so as to scale and crumble easily.

FIGS. 18, 19 & 20.—DETAILS OF LEAD FLATS

The nails used in slating are important and the durability of the work depends on a good selection. They should have large flat heads. The most satisfactory are those made of a composition of copper and zinc, but others of copper, zinc, galvanized iron and plain iron are used. Those of copper are most durable, but are soft and expensive while zinc nails are soft and not very durable; they will last for about twenty years. Iron nails even if galvanized are only employed in cheap and temporary work; they may be preserved by being heated and plunged in boiled linseed oil. The pitch of a roof intended for slating should not incline less than 25° with the horizontal, while for the smaller sizes 30° is a safer angle to adopt.

Modern slate roofs are frequently laid with varying courses and of varying thicknesses, usually with the heavier slate from three-quarters to an inch and a half thick at the eaves, with thinner and smaller slate in the upper part of the roof. Marked variation of colour is often sought by combining green and purple slate, or fading and unfading slate.

Tiles for roofing purposes are made from clay and baked in a kiln, like bricks. The clay from which they are made is, however, of a specially tenacious nature and prepared with great care so as to obtain a strong and non-porous covering. Tiles are obtainable in many colours, some having a beautiful effect when fixed and many improving with age. They comprise tints from yellowish red, red and brown to dark blue. As with bricks the quality depends to a large extent upon the burning; underburnt tiles are weak and porous, liable to early decay, while overburning, though improving the tiles as regards durability, will cause warping and variation of colour. Variation of colour is now deliberately obtained, and artistic effects are secured by sand facing, artificial rustication and by burning to metallic surfaces. The usual shape is the "plain tile," but they are made in various other shapes with a view both to easier fixing and lighter weight, and to ornamental effect. There are also several patented forms on the market for which the makers claim special advantages. The ordinary tiles are slightly curved in the direction of length to enable them to lie closely at their lower edges. Some of them have small "nibs" at the head by which they may be hung upon the battens without nails (*see* fig. 22). Nail-holes are provided, and it is advisable to nail every 4th or 5th course, at least. Others are made without the nibs, and are fixed either by nailing to the battens or boarding or hung by means of oaken pegs wedged in the holes to the battens, the pegs in the latter case acting in the same way as the above-mentioned nibs. Plain tiles are of rectangular form, the standard dimensions are 10½ in. long by 6½ in. wide. They are usually ½ in. thick and weigh about 2½ lb. each.

There are many forms of ornamental tiles, which are plain tiles having their tails cut to various shapes instead of moulded square. A number of patented forms of tiles also are on the market, some of which possess considerable merit. *Pantiles* are suitable for temporary and inferior buildings, if laid dry and on flat slopes, but if laid upon boards and felt and bedded and pointed in mortar, pantiles may prove an excellent covering. They are laid on a different principle from plain tiles, merely overlapping each other at the edges, and this necessitates bedding in mortar and pointing inside and sometimes outside with mortar or cement. This pointing plays an important part in keeping the interior of the building free from the penetration of wind and water. Pantiles are generally made to measure 13½ in. long by 9½ in. wide, and weigh from 5 lb. to 5½ lb. each. Moulded on at the head of each tile is a small projecting nib which serves for the purpose of hanging the tile to the lath or batten. They are laid with a lap of 3½ in., 2½ in. or 1½ in., giving a gauge (and margin) of 10 in., 11 in. and 12 in., respectively. The side lap is generally 1½ in., leaving a width of 8 in. exposed face. There are many other forms based upon the shape of the pantile, some of which are patented and claim to have advantages which the original form does not possess. Among such are "corrugated tiles," of the ordinary shape or with angular flutes, and also the Italian pattern "double roll tiles," "Foster's lock-wing tiles." Poole's bonding roll tiles are a development of the Italian pattern tile. French and Belgian tiles of the "Marseille" pattern are economical and therefore popular for housing schemes and cheap building.

Wood shingles are common roofing materials throughout the United States and Canada, and were at one time in general use in Europe. The present customary usage is to make them either of cedar or cypress, varying from 18 to 24 inches long, and from 6 inches to a foot or more wide. The butts at the thick end are from a half to three-quarters of an inch thick; the upper end tapers to not over one-eighth of an inch. They are usually laid from four and one-half to five and one-half inches to the weather. Owing to the fire risk, wood shingle roofs are gradually passing out of use, and in many localities are prohibited.

The 20th century has seen the development of many specialized roof materials, either with an asbestos or a bituminous felt base, designed for sloping roofs and intended to give an aesthetic effect similar to that of either shingles or slate. In the better and heavier types the units come separately as individual shingles; in the lighter and cheaper classes, the shingle shapes are cut upon strips.

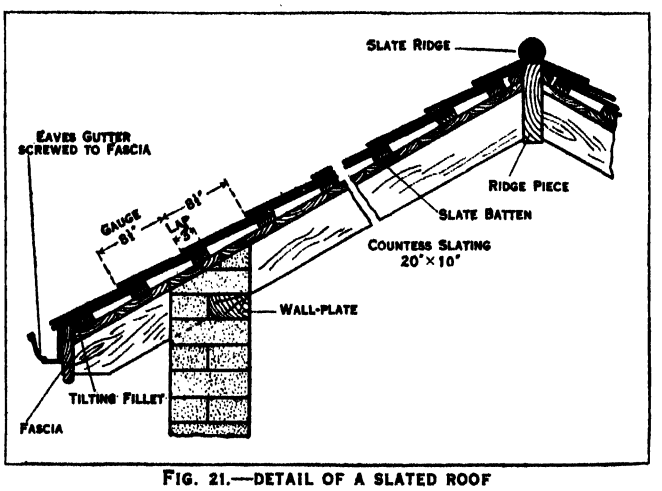


FIG. 21.—DETAIL OF A SLATED ROOF

Glass as a roof covering and the different methods of fixing it are dealt with in the article GLAZING.

There are many other materials used for roof covering besides those already described, many of them of considerable value. Some have in the past enjoyed considerable vogue, but have practically died out of use owing to the development and cheapening of other forms of roofing. Among these may be included

thatch and wood shingles, the use of which in these days is practically reduced to special cases. Other roofing materials are those of recent invention, some of which may have a great future, depending upon the development, reliability and aesthetic value of the products. Sheets of asbestos-cement used as slates or tiles make a light, strong and fireproof covering. Large terra-cotta tiles or slabs are much used in the United States of America. A

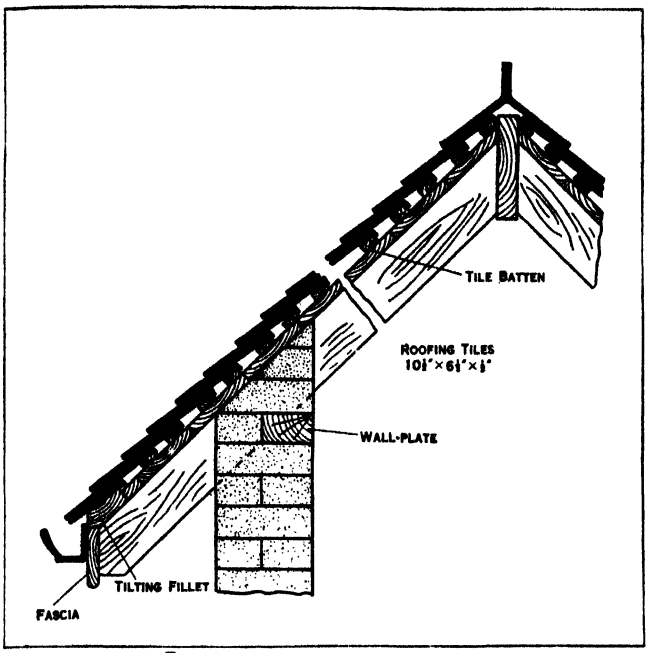

FIG. 22.—DETAIL OF A TILED ROOF

good form of flat roof is that in which concrete is used as a foundation for a waterproof layer of asphalt, laid to falls to allow the water to run off easily. This is the usual method adopted when a roof garden is required. Shingles or thatch look extremely well on a roof, but their use is debarred in a great many districts owing to the danger of fire. Galvanized iron tiles, zinc tiles and copper tiles may be employed on small areas with good effect. The London County Council (General Powers) Act, 1909, requires provision for a normal wind pressure of 28 lb. per sq.ft. if the inclination is 20° or more. Flat roofs must be designed to carry 56 lb. per sq.ft. in addition to their own weight. From the above particulars it is easy to calculate the weight of the roofing material and the wind pressure on the roof.

Regulations.—The London Building Act of 1894 and its amendments set forth with regard to roofs erected in the London district that every structure on a roof is to be covered with slate, tile, metal or other incombustible material, except wooden cornices and barge boards to dormers not exceeding 12 in. in depth, and doors and windows and their frames. Every dwelling-house or factory above 30 ft. in height and having a parapet must have means of access to the roof. The pitch of the roofs of warehouse buildings must not exceed 47°, and those of other buildings must not exceed 75°, but towers, turrets and spires are excepted. In domestic buildings not more than two storeys are to be formed in the roof, and if the floor is more than 60 ft. above the street level fireproof materials must be used throughout and a sufficient means of escape provided.

The Building and Health Laws and Regulations and Amendments affecting the city of New York are similar to those of London. They give very full working details as to the strengths of materials required to be used and the wind pressure to be provided against. They provide that where a building exceeds three storeys or 40 ft. in height and the roof has a pitch of over 60°, it shall be constructed of iron rafters and be lathed with iron or steel on the inside and plastered or be filled in with fireproof material not less than 3 in. thick and covered with metal, slate or tile.

Kidder, *Trussed Roofs and Roof Trusses;* J. Brandon, *Analysis of Gothic Architecture;* A. Pugin, *Ornamental Gables;* M. Emy, *L'Art de la charpenterie;* Viollet le Duc, *Dictionnaire;* J. K. Colling, *Details of Gothic Architecture;* G. Ellis, *Modern Practical Carpentry;* Jaggard & Drury, *Architectural Building Construction;* Blake, *Roofs & Roof Coverings;* J. W. Riley, *Carpentry & Joinery;* C. F. Mitchell, *Building Construction;* Rivington, *Building Construction.*

ROOK (*Corvus frugilegus*), throughout a great part of Europe, the commonest of the crow tribe. Besides its gregarious habits, which are distinctive, the rook is distinguished from the rest of the *Corvidae* by losing at an early age the feathers from its face, leaving a bare, scabrous and greyish-white skin that is visible at some distance. In the rare cases in which these feathers persist, the rook may be known from the crow (*q.v.*) by the rich purple gloss of its black plumage, especially on the head and neck, as well as by its voice. The sexes are very similar. It nests in colonies on large trees (occasionally on buildings), making a strong nest of twigs and earth and using it year after year. The three to five green eggs, marked with grey and brown, are laid in early April. In Britain the rook is resident and stationary, but in most of Europe it is either a summer or winter visitor. Its food is very varied, but includes a high percentage of noxious insects. The bird is thus of great value to the farmer. The rook of China (*C. pastinator*) has the feathers of its face only partially deciduous.

ROON, ALBRECHT THEODOR EMIL, COUNT VON (1803–1879), Prussian general field-marshal, was born at Pleushagen, near Colberg, in Pomerania, on April 30, 1803. He entered the corps of cadets at Kulm in 1816, proceeded to the military school at Berlin, and in Jan. 1821 joined the 14th (3rd Pomeranian) regiment. In 1826 he was appointed an instructor in the Berlin cadet school, and in 1832 published his *Grundzüge der Erd-, Völker- und Staaten-Kunde* (3 vols.), gaining a great reputation. This was followed by *Anfangsgründe der Erdkunde* (1834), *Militärische Länderbeschreibung von Europa* (1837) and *Die iberische Halbinsel* (1839).

Meantime, in 1832, he rejoined his regiment, and became alive to the very inefficient state of the Prussian army; and in 1842, after working on the Topographical Bureau at Berlin and as an examiner, was promoted to be major and attached to the staff of the VII. corps, in which post he occupied himself with schemes for its reform. In 1848 he was appointed chief of the staff of the VIII. Army Corps, and during the disturbances of that year served under the Crown Prince William (afterwards emperor), distinguishing himself in the suppression of the insurrection at Baden. At that time he broached the subject of his schemes of army reform. In 1850 came the revelation of defective organization and inefficiency leading to the humiliating treaty of Olmütz; next year Roon was made a full colonel and began active work as reorganizer of the army.

Prince William became regent in 1857, and in 1859 he appointed Roon (now lieutenant-general) a member of a commission to report on military reorganization. Supported by Manteuffel and Moltke, Roon was able to get his plans to create an armed nation, to extend Scharnhorst's system and to adapt it to Prussia's altered circumstances generally adopted. To attain this he proposed a universal three years' service, and a reserve (*Landwehr*) for the defence of the country when the army was actively engaged. During the Italian War he was charged with the mobilization of a division. At the end of 1859, though the junior lieutenant-general in the army, he succeeded von Bonin as war minister, and two years later the ministry of marine was also entrusted to him. His proposals of army reorganization met with the bitterest opposition, and it was not until after long fighting against a hostile majority in the chambers that, with Bismarck's aid, he carried the day. Even the Danish campaign of 1864 did not wholly convince the country of the necessity of his measures, and it required the war with Austria of 1866 (when he was promoted general of infantry) to convert obstinate opposition into enthusiastic support. After that von Roon became the most popular man in Prussia, and his reforms were ultimately

copied throughout continental Europe. His system, adopted after 1866 by the whole North German Confederation, produced its inevitable result in the war with France 1870–71. He was created a count, and in Dec. 1871, having resigned the ministries of war and marine, succeeded Bismarck as president of the Prussian ministry. Ill-health compelled him to resign in the following year. He was promoted field-marshal on Jan. 1, 1873, and died at Berlin on Feb. 23, 1879.

After his death his son published the valuable *Denkwürdigkeiten aus dem Leben des Generalfeldmarschalls Kriegsministers Grafen Roon* (2 vols., Breslau, 1892), and *Kriegsminister von Roon als Redner politisch und militärisch erläutert* (Breslau, 1895). His correspondence with his friend Professor Cl. Perthes, 1864–67, was also published at Breslau in 1895.

ROORKEE: *see* RURKI.

ROOSEVELT, FRANKLIN DELANO (1882–), American lawyer and public official, was born at Hyde Park, New York, on Jan. 30, 1882. He was educated at Harvard (A.B., 1904) and Columbia (LL.B., 1907) and admitted to the New York bar in 1907. He practised with Carter, Ledyard and Milburn, New York, 1907–10, and was a member of the New York senate 1910–13. In 1913 he resigned as senator to accept an appointment as assistant-secretary of the navy, which position he held until 1920. He was in charge of the inspection of U.S. naval forces in European waters in 1918 and of naval demobilization in 1919. In 1920 he was honoured with the Democratic nomination for vice-president of the United States. His career was interrupted in 1921 by an attack of infantile paralysis which left him crippled. During his slow recovery he was instrumental in establishing a foundation at Warm Springs, Va., for the treatment of the effects from infantile paralysis. During his period as State senator he fought constantly against Tammany influence in State and national affairs, but he was a warm supporter of Governor Smith and made the speeches placing him in nomination for president at the Democratic national conventions of 1924 and 1928. In 1928 he was persuaded by Governor Smith to accept the Democratic nomination for Governor of New York and he succeeded in carrying the State.

ROOSEVELT, THEODORE (1858–1919), 26th president of the United States, was born in New York city on Oct. 27, 1858. His father, Theodore Roosevelt, was of a Dutch family conspicuous for centuries in the affairs of the city of his birth; his mother, Martha Bulloch, came of Scotch-Irish and Huguenot stock, which had given men of distinguished quality to the service of Georgia and the South. It is not without significance that he came to consciousness of the world in which he lived at a period when his country was in the throes of a disastrous civil war and his own home was sharply divided in its sympathies. His father's devotion to the North and his mother's fervent adherence to the Southern cause may well have played a part in developing in him the passion for national solidarity which was one of the conspicuous elements of his personality. Young Roosevelt's ill-health necessitated tutors and withheld him from the rough-and-tumble companionship of boys his own age; but deliberately and with great persistence, he built up his frail body. He entered Harvard in 1876. His record for scholarship there was creditable but not extraordinary. He did his part in student activities, but was not conspicuous except as a somewhat odd young man whose speech at critical moments came tumbling over itself under the onrush of his thoughts. An important element of his education during this period were his hunting trips in the Maine woods. From the stalwart backwoodsmen the city boy learned something of the cares, the needs, the aspirations of common men; their courage, their simple wisdom, their feats of strength and endurance deeply impressed him. To be like them, and to be accepted by them as an equal, became a major ambition.

He was graduated from Harvard in 1880 and the same year married Alice Hathaway Lee, of Boston. At the Columbia Law school, and in the office of his uncle, Robert B. Roosevelt, he prepared himself for the bar. But the law did not attract him. His interest lay rather in literature, in natural history and in the prospect of useful and strenuous activity, which the world of politics presented. Against the counsel of his friends who urged that politics was a "dirty business" Roosevelt joined a local political club. His associates there had, indeed, been brought up in a rough school; but they were warm-hearted, sharp-witted, without pretence, and, in the main, honest. They saw the political game in terms of human values, being realists, practical in their methods, scornful of theories. As Roosevelt's first political mentors, they guided him (1881) through his initial campaign for the State legislature.

Within six weeks of the opening of the session, Roosevelt made his mark at Albany when he offered a motion to impeach a certain highly respectable judge who had proved over-lenient to a group of notorious financiers. Even at that time he understood the principles and perils of democratic government and was convinced that corruption struck directly at its foundations. He was sharply and at last successfully opposed, but his characterization of the sinister forces behind a corrupt legislature as "the wealthy criminal class" stuck in the public mind. Roosevelt was in the New York assembly three years; and in 1884 his party's candidate for speaker. They were years of sharp adjustment and discipline. A real diffidence in childhood had found refuge in an attitude of assertiveness which quickly put him at odds with his fellow legislators, but the isolation which came to him brought its own corrective. He acknowledged in after years that his first lesson in real politics was the lesson that power lies in the subordination of the individual to the team. He became the acknowledged leader of a small but potent group of young men who felt keenly the need of a new spirit in political life and were willing to fight both in the legislature and within the Republican party to keep the corrupting influences in check. As chairman of the New York delegation to the Republican convention in Chicago in 1884, Roosevelt supported the candidacy of Sen. George F. Edmunds on whom the progressive elements of the party had united, and with vigour and courage opposed the nomination of James G. Blaine. But when Blaine was chosen Roosevelt refused to desert the party, contending that Blaine, having been fairly nominated, had a right to the support of all loyal Republicans; pointing out that "a man cannot act both without and within the party." He was denounced by the "independents" and in the councils of the party was regarded with suspicion for his pre-convention fight upon the nominee. It became clear to him that, for the moment at least, his political career was ended. He had other, deeper reasons, moreover, for seeking new surroundings. The death of his wife early in 1884, following the birth of a daughter, had been followed 12 hours later by the death of his mother. When the campaign was over, therefore, he betook himself to the ranch which he had established the previous autumn on the banks of the Little Missouri River in Western Dakota. For three years he lived a ranchman's life. He hunted, rode on the roundup, did the daily chores of the ranch; with unflagging zeal he observed the wild life about him; he read widely, studied avidly the strange and various human nature which found untrammelled expression in the Dakota "Bad Lands," and at odd moments wrote biographies of Thomas H. Benton and Gouverneur Morris. Within six months of his coming, he virtually took the leadership of the forces of law and order in the region, organized a protective association to check the cattle-thieves and did active duty as deputy-sheriff. He found the men of the open range delightful companions. They bore with his inexperience and came greatly to admire his fearlessness, his patience in hardship, his wide knowledge. They helped him to become an American of the new time. A call from the Republicans in New York city to be their candidate for mayor brought Roosevelt back into politics in 1886. The widespread fear on the part of the propertied classes that Henry George, the candidate of the United Labor party, might be elected caused many Republicans, however, to vote for Abram F. Hewitt, the Democratic nominee, who was chosen, Roosevelt running third.

Official Appointments.—Immediately after the election, Roosevelt married Edith Kermit Carow, a friend of his childhood, and thereafter made his home at Sagamore Hill, near Oyster Bay, L.I. It was his intention to devote himself to literature; but his interest in public affairs drew him again into political

life. In 1889, President Harrison appointed him a member of the U.S. Civil Service commission in Washington, and for six years he directed the battle against the entrenched defenders of the "spoils system." While he was in office, more than 20,000 government positions were added to the classified service in which appointment and promotion was for merit only; but his efforts were useful beyond their immediate results. His critics—and they were numerous and vociferous—called him a publicity-hunter who was happy only in the full glare of the limelight. He did, indeed, all his life dramatize any movement in which he was engaged. The process was not deliberate; it was the inevitable effect of the qualities of mind and character which constituted his personality, plus a peculiar magnetism as difficult to trace and analyse as genius. It was Roosevelt's most valuable service in this cause that he made the public comprehend that the "spoils system" ran counter to the American ideal of life and government. He left the Civil Service commission in 1895 to become president of the police board of New York city. On the force money ruled, politics ruled; merit was only incidentally a consideration in appointments; police officers, high and low, used their power to extort bribes for "protection" from saloon-keepers, liquor-dealers, gamblers and prostitutes. Roosevelt built up the *morale* of the force by substituting a system of appointment and promotion by merit for the established system of bribery; by rewarding bravery and devotion, by swiftly punishing negligence and venality and by enforcing the laws regardless of "pressure." The politicians of both parties opposed him; all the sensational, and most of the "respectable" newspapers derided or scolded him; two of the four members of the police board of which he was chairman intrigued against him. He became the most discussed figure in the public life of the city.

During these tumultuous years, he was making an impression also on a growing number of his fellow-citizens outside New York. In addresses and essays, he reminded Americans of the principles on which their country was based. The political campaign of 1896 startled Roosevelt and for the first time he became conscious of the menace which lay in the popular unrest. During his earlier manhood other problems had engaged his interest—civic corruption, the spoils system, indifference to the obligations of citizenship, divided allegiance, foreign affairs, the national defence. Though he worked effectively in the New York legislature in behalf of legislation regulating labour in sweat-shops, there is no indication that he kept in close touch with the social, economic and industrial movements which were rapidly developing to a crisis. The events of the free-silver campaign, however, awakened him to conditions of supreme significance. He noted a new cleavage of sections in the economic rebellion of the West against the financial oligarchy of the East, and, in the demagogy which was stirring the poor against the rich, a class cleavage from which the country had hitherto happily been free.

The election of William McKinley to the presidency brought Roosevelt back to Washington as assistant secretary of the navy. He had since his first entrance on the political scene been an ardent advocate of preparedness. He frankly favoured a strong foreign policy and looked forward, in fact, to the ultimate withdrawal of the European powers from the Western Hemisphere. The conditions in Cuba had long convinced him that war with Spain was inevitable and that it was both right and necessary to drive the Spanish power from the Caribbean sea. With vigour, he set to work to make the navy ready. He reorganized the system of rank and promotion among naval officers; he adjusted the differences between the "line" and the "engineers." Finding the marksmanship inadequate, he asked Congress for $800,000 for target-practice, spent it and asked for half a million more. "The shots that hit," he pointed out, "are the shots that count!" When the United States battleship *Maine* was blown up in Havana harbour on Feb. 15, 1898, Roosevelt sharpened his efforts. During a temporary absence of his chief, John D. Long, he took it upon himself to instigate the preparations which he had in vain asked the secretary of the navy to make. He ordered great quantities of coal and ammunition, directed the assembling of the American fleet, stirred the arsenals and navy yards to activity and, finally, cabled Commodore George Dewey what would be expected of him in case war came.

The Spanish War.—On the outbreak of hostilities, in April, Roosevelt resigned from the Navy Department and joined with his friend, Leonard Wood, a young army surgeon, to organize the 1st U.S. Volunteer Cavalry. The regiment was an odd aggregation of diverse elements. It gave Roosevelt deep satisfaction to see North and South, East and West, side by side in the ranks, and to note the attachment of cowboy and millionaire, of clubman and miner. It was, indeed, largely his leadership which fused these normally incohesive elements, and dramatized the fallacy of socialistic agitators who claimed that there was a fundamental cleavage in the United States between the "haves" and the "have-nots." The history of the Santiago campaign on the Spanish side is a history of incredibly inept generalship, and, on the American side, of inefficiency and blundering. Roosevelt, who succeeded to the command of the regiment on the promotion of Wood after the first fight, established himself in the affection of his men by his solicitous care for their welfare, and his insistence on sharing their occasional privations on equal terms. In the battle of San Juan hill Roosevelt personally led the cavalry division in the assault of the Spanish outpost known as Kettle Hill and from that position, at the head of his brigade, charged across an intervening valley and up the slopes of the ridge which was the enemy's main line of defence. The advance of the Rough Riders, as they were popularly known, lacked military form and was called "the school-boy charge" by officers of the regular army who led the orderly advance of the regiments of regular infantry which captured the San Juan blockhouse. But the impetuous rush of Roosevelt and his men—joined by the 1st and 10th (coloured) cavalry, all dismounted—had a reckless and exultant sweep which contributed notably to breaking the Spanish spirit.

Governor of New York.—The Rough Riders were mustered out of service on Sept. 15, 1898. Two weeks later, the Republican party of New York State nominated Roosevelt as its candidate for governor. The party owing to scandals connected with the administration of the Erie canal had come into bad odour; and Thomas C. Platt, the Republican "boss," who distrusted Roosevelt as a radical of "altruistic" views, reluctantly agreed to his nomination. Roosevelt was elected by a scant majority, and instantly a struggle began between himself and Platt which lasted as long as he was governor. For years, this mild-mannered old gentleman with his penchant for arid theology and his genius for the manipulation of men, had carried Republican governors and legislatures in his pocket as a small boy carries marbles. To be pocketed by the "easy boss" seemed to Roosevelt altogether less desirable than never to have been elected governor at all; but to fight him meant to accomplish absolutely nothing; for the State legislature was in the main in the hands of the astute Platt. Roosevelt solved the dilemma by yielding on points not involving fundamental principles and insisting on going his own way on all issues of real importance. Roosevelt remained governor for two years. He reformed the administration of the canals, making the canal commission non-partisan; he introduced the merit system into many of the subordinate offices of the State; he secured extensive legislation to provide better protection for the workers of the State, and laws in behalf of forest preservation, the protection of wild life, and the purity of food products. When, in matters of economic legislation, Platt proved obdurate, Roosevelt went to the public for support.

By this means he was able to secure (1899) from Platt's own legislature, against his plaintive protests and the angry opposition of the conservative press, the important Ford Franchise Act, taxing corporation franchises. His administration as governor remains significant in American political history because it marks the beginning of an effort on his part to secure the subservience to government and law of great business combinations; an effort which culminated during his second term as president and definitely established a new trend in the United States both in business and politics. It became clear to Platt that his first apprehensions regarding Roosevelt had been only too accurate. He decided, therefore, to resist Roosevelt's desire to succeed himself

as governor by lifting him into the honourable seclusion of the vice-presidency. Neither President McKinley nor Senator Hanna, his astute political guide, approved the idea; Roosevelt and his Eastern friends laboured hard to prevent his nomination, but his friends in the West, out of a real enthusiasm, played into the hands of the man who was plotting their hero's political demise. The combination proved irresistible, McKinley refused to intervene and Roosevelt was nominated. He spoke a little ruefully of having "taken the veil," and made plans to beguile the dreary boredom of the vice-presidency with the study of law.

ROOSEVELT AS PRESIDENT

President McKinley was shot in Buffalo on Sept. 6, 1901, and died Sept. 14. On the same day Theodore Roosevelt took the oath as president of the United States. His sudden accession to power caused a flutter of apprehension in the ranks of what was known as "Big Business." The new president was, as a matter of fact, by nature a conservative, but he wore his conservatism with a difference, standing as far removed from the reactionary position of men like Platt and Hanna, as he was from the radicalism of Bryan. He recognized what many of the spokesmen of capital refused to recognize, that true conservatism demanded a just re-appraisal of industrial and economic conditions and prompt, far-reaching remedial action. On Feb. 18, 1902, he threw what was in effect a bomb into the financial world, when he announced through his attorney general, Philander C. Knox, that he had brought suit in behalf of the United States for the dissolution of a holding corporation known as the Northern Securities Company. The announcement caused consternation among such financiers as J. P. Morgan, Edward H. Harriman and James J. Hill. The holding company was a device designed by shrewd legal minds to evade the restrictions of the Sherman anti-Trust act of 1890, and was generally regarded as impregnable. In the Knight case (1895) involving the American Sugar Refining Company, the Supreme Court had, in fact, held that Congress was without constitutional power to forbid it.

Campaign Against Financial Interests.—When Roosevelt came to the presidency, the average American was moving rapidly toward the cynical conclusion that there was one law for the corporations and another for the individual; one law for the rich, another for the poor. The corporations carried on their existence in a kind of "twilight zone" between State and Federal authority, where neither seemed able to reach them; and when finally a body so revered and so obviously incorruptible as the Supreme Court admitted that Congress was powerless to check the growth and extension of the power of organized wealth, the common man began to wonder whether he would have to seek a corrective which other peoples had found effective. "The United States," said the New York *World* years later, "was never closer to a social revolution than at the time Roosevelt became president." Roosevelt, made aware of the danger first by the campaign of 1896, recognized that the fundamental principles of democratic government—equal justice and national solidarity—were being undermined and that on the outcome of the struggle between the financial powers and the government depended the future vitality of American Government. His vision and courage were vindicated by the courts which he had invoked. On April 9, 1903, the U.S. circuit court, sitting at St. Louis, ordered the dissolution of the Northern Securities Company; and on March 14, 1904, the Supreme Court affirmed the decree.

The anthracite coal strike in 1902 brought the menace of popular unrest to the surface. The miners, under the leadership of John Mitchell, were insistent in their demands; the operators led by J. P. Morgan and George F. Baer, president of the Philadelphia and Reading Railway, were obdurate. Roosevelt for the first time asserted the right of the President to act as representative of the public in an industrial dispute. The miners agreed to arbitrate, but the operators were indignant at the President's "interference" in what they regarded as their private concern. Roosevelt saw clearly what the operators failed to see, that the labour problem had entered upon a new phase; that the growth of industry necessitated a new approach to the questions affecting it; that the public was in no mood to suffer for the inability of the operators to recognize the parity of human rights with the rights of property, and that in a winter of coal famine lay the possible beginnings of irreparable discontent. After a long-drawn struggle he succeeded in impressing these views upon the operators.

The initiation of the Government's suit against the Northern Securities Company marked the beginning of a conflict between Roosevelt and the large financial interests which continued unabated throughout his administration and for years thereafter, until the outbreak of the World War (1914) brought a shift of issues and a truce. The business leaders were convinced that the President was a destroyer, and was shaking the foundations of the social structure and undermining the institution of private property. His objection, in regard to corporations, as he frequently pointed out, was not to size but to wrongdoing. In swift succession, the President ordered suits brought against the United States Steel Corporation, the Standard Oil Company, the American Sugar Refining Company and other powerful combinations. Meanwhile, he inspired important legislation involving the regulation of railroads. The Elkins law (Feb. 19, 1903) forbade rebates; the Hepburn rate bill (June 29, 1906) granted the interstate commerce commission the right to fix railroad rates. A Pure Food bill, forbidding the manufacture, sale or transportation of adulterated foods, drugs, medicines and liquors, became law on June 30, 1906; the following day another act, providing for the inspection of stockyards and packing-houses, was signed by the President. An Employers' Liability act was adopted. A department of commerce and labour, including a bureau of corporations, was established by congressional action on Feb. 14, 1903. President Roosevelt strengthened his position in reference to the excesses and transgressions of corporations by setting himself with equal firmness against the violence of labour agitation. He noted that the hunger for special privilege was not limited to the ranks of capital. He was by nature sympathetic to the labouring man and scrupulously fair to his interests, but struck at him fearlessly when he thought he was wrong, linking two advocates of violence in the ranks of labour on one occasion with a law-dodging railroad magnate, as "undesirable citizens."

Conservation.—Early in his administration, with the purpose of breaking the strangle-hold of a small minority on the sources of wealth which should be open to the honest endeavours of all the people, the President—under the guidance of Gifford Pinchot—embraced the policy of conservation. The established theory in regard to the national resources was that the general prosperity of the country could best be advanced by the development of these resources by private capital, and upon this theory land was either given away or sold for a trifle. Under this policy, over wide areas, the timber-lands had been stripped bare with reckless waste; the control of the nation's water power had to a dangerous extent passed into private hands; and the public grazing lands and the wealth in minerals and oil in the public domain were bringing enormous dividends to a few, but no returns whatsoever to the people as a whole to whom these natural resources belonged.

Under Roosevelt's administration the area of the national forests was increased from 43 to 194 million acres, the water power resources of those areas were put under government control to prevent speculation and monopoly, and cattle-raisers grazing their herds on the reserves were forced to pay for what they got. In March 1907 Roosevelt created the Inland Waterways commission, and in May 1908 held a conference of State governors at the White House in behalf of conservation. As a result of this conference he appointed a national conservation commission to prepare an inventory, the first ever made for any nation, of all the natural resources within the territory of the United States. A joint Conservation Congress held in Dec. 1908 was followed by a North American Conservation conference in Feb. 1909. The movement for the reclamation of land either excessively or insufficiently watered was essentially a part of the effort in behalf of conservation. It received congressional sanction in the Reclamation Act (June 17, 1902) and achieved its most noteworthy result in the building of the Roosevelt dam in

Arizona, which, by impounding the waters of the Salt river, turned a desert into one of the most fertile farming districts in the world. No policy of Roosevelt's administration excited deeper public interest or sharper opposition than his efforts in behalf of conservation. His official acts and the influence of his speeches and messages led to the adoption by both citizens and government of a new theory regarding natural resources. It is that the Government, acting for the people who are the real owners of public property, shall permanently retain the fee in public lands, leaving their products to be developed by private capital under leases which are limited in their duration and which give the Government complete power to regulate the industrial operations of the lessees.

Re-election.—The popularity which Roosevelt enjoyed at the end of his first term found emphatic expression in the election of 1904. By the largest majority which, up to that time, had been accorded any candidate, Roosevelt was chosen to succeed himself in the White House, receiving 7,623,486 popular votes and 336 electoral votes, against 5,177,971 popular votes and 140 electoral votes cast for Alton B. Parker, the Democratic nominee.

Foreign Policy.—Roosevelt's warfare with the forces popularly symbolized as "Wall Street" was punctuated at intervals during his administration by actions in the realm of international relations which greatly stimulated national pride. The President was brilliantly assisted in his conduct of foreign affairs, first by John Hay and then by Elihu Root, but he was in reality his own Secretary of State. His policy in regard to the army and navy was a highly important part of his foreign policy. He believed in the virtue of being ready as a preventive of war, pointing out the results of unpreparedness in the preface to his first book, *The History of the Naval War of 1812* (1882), and urging an effective army and navy in many of his later writings. He increased greatly the general efficiency of the army. His promotion of officers for merit in defiance of the rules of seniority and his order directing officers to demonstrate their ability to ride 90 m. in three successive days caused some criticism, especially in the more conservative element in the army. Roosevelt's services as Assistant Secretary of the Navy contributed vitally to the distinguished success of the American fleets during the Spanish War. As President he sought with great persistence to build up the navy's power and to make it as effective as possible, giving younger and more progressive officers the prestige of his support in their struggles within the service. When in 1907 he sent the battleship fleet around the world—against the advice of experts in naval construction—he did so partly to call the attention of the great powers, notably Japan, to the fighting strength of the United States, and partly to dramatize the navy and its needs to the American people. The voyage was brilliantly successful.

The attitude of Roosevelt in foreign affairs as in domestic was frank, clear-cut and firm. He knew the involutions of international politics in the Old World as no American president before him had known them, and he countered and checked his subtle opponents in diplomacy with skill and relish. He was bold—startlingly bold at times—but never reckless, calculating costs in advance, saying unambiguously what he had to say and taking account of the human equation. His handling of the German emperor in the matter of Venezuela in 1902 was so firm and so courteous that the emperor became his devoted admirer even though he recalled the ambassador who had failed to warn him that the President meant what he said. His action in regard to an old dispute with Great Britain over the boundary of Alaska was equally friendly and effective.

Swift and vigorous was his action (1903) in sending a cruiser to Panama immediately following its secession from Colombia. He was one of the first Americans to apprehend the part which the Pacific was destined to play, both commercially and politically, in world history. The long delay, moreover, during the Spanish War, in bringing one of the navy's greatest battleships, the *Oregon*, from the Pacific coast of the United States to the Atlantic, had convinced Roosevelt of the urgent need, if only for strategic reasons in the event of war, of a canal across the Isthmus of Panama. When, therefore, after years of fruitless negotiations, the opportunity came to him to acquire for the United States the right to build the canal, he acted promptly, convinced that to do otherwise was to invite a new and dangerous succession of postponements.

The charge was made that President Roosevelt had encouraged or even fomented the revolution in Panama; but no evidence has been produced to give the accusation the slightest support. Roosevelt's boast (1911) "I took Panama," must, moreover, be considered in conjunction with a phrase he added at the semi-jocose request of a French engineer who himself claimed the credit and the responsibility for the insurrection—"when Bunau-Varilla handed it to me on a silver platter." Roosevelt's leadership in the actual construction of the canal was of vital significance. When private engineers failed in the task, he appointed an army engineer, Col. George W. Goethals, as head of the Canal commission with autocratic powers. He broke the precedent which was supposed to prevent an American president from leaving the territory of the United States during his term of office in order to inspect the work and encourage the workers.

Roosevelt approved and eloquently defended the policy of national expansion adopted by the Government under President McKinley. Aside from the acquisition of the Canal Zone, however, he made no move to acquire further territory for the United States. To the surprise of Europe, he carried out the provisions of the American pledge not to annex Cuba, and launched that long-oppressed people as an independent republic under the protection of the United States but not under its Government. By assuming supervision of the finances of San Domingo, he put an end to controversies in that unstable republic which threatened to disturb the peace of Europe.

Roosevelt's action in bringing about peace between Japan and Russia in 1905 added greatly to his prestige at home and abroad. Portions of Roosevelt's papers, published since his death, reveal the extent to which international politics on the Continent were involved in a struggle which appeared to be localized in the Orient and indicate that it was Roosevelt's intervention which prevented in 1904 and again in 1906, during the Algeciras Conference, the outbreak of the World War which actually came in 1914. The Nobel Prize committee recognized his services in ending the Russo-Japanese War by conferring upon him its award for the promotion of international peace. In accepting the honour in an address at Christiania in 1910, he suggested the possibility of a League of Nations for the prevention of war. He was the first to send an international controversy for settlement to the International Court of Arbitration at The Hague and was instrumental in having the Second Hague Conference called. He was opposed, however, to peace treaties which promised more than human nature could be counted upon to fulfil, and had no patience with any policy remotely resembling "peace at any price."

His administration had a profound effect on the national prestige of his country. He found the Government of the United States, when he took up the reins, in the position among world powers of a new boy in school; he left it firmly established in the first rank, admired and feared, its favour sought after, its citizenship respected in the remotest corners of the globe.

Home Affairs.—In domestic affairs his influence was even more far-reaching. His success in drawing the leaders on both sides of the social and economic struggle back from the danger zone where extremes meet in violent disturbance was possible only because he had to an unprecedented degree the support of the public, regardless of party. His vigour, his courage, his abounding vitality, his lack of presidential pomposity, his familiarity with all manner of men, even his loudness of action or utterance, and his undisguised delight in driving the "band wagon," all endeared him to "plain folks." He entered into men's lives, kindled fires in them, impelled them to scorn ease and safety and rejoice to do the fine, the difficult thing. His power to inspire his followers to take a pride in their country and her welfare brought to his side hundreds of young men of ability, who asked no greater privilege than to serve under him in an enterprise which in its details was prosaic enough but which he had somehow invested

ith the spirit of high adventure. The President gave them ork to do in the Federal departments and in the island pos-ssions. Their high quality impelled the British ambassador, ames Bryce, an acute observer of governments, to remark to oosevelt that he had "never in any country seen a more eager, gh-minded and efficient set of public servants, men more useful id creditable to their country, than the men then doing the ork of the American Government in Washington and in the eld." Roosevelt had, indeed, the gift of stimulating men to ise themselves for the moment above the ordinary level of eir abilities and their desires.

SCIENTIFIC EXPEDITIONS AND TRAVELS

In March, 1909, Roosevelt retired from the Presidency. He lhered to a pledge which he had made after his election in)04 not to accept the nomination for the Presidency in 1908, id gave his support to the candidacy of William H. Taft, his ecretary of War. Taft was nominated and elected. On April), 1909, Roosevelt, accompanied by his son Kermit, sailed for frica on a scientific expedition under the auspices of the Smith-nian Institution in Washington.

Africa.—Roosevelt entered Africa at Mombasa, and for ten onths, moving slowly northward, he hunted big game and col-cted specimens. He was a keen naturalist, accepted by scientists his field as a trustworthy observer who had added substan-ally to the study of American fauna. He had a memory which l who came in contact with him agreed was astonishing in its nacity and accuracy; and for one who had given only the off-urs of a busy life to scientific study, his knowledge was wide id thorough; but he recognized its limitations and humbly elded to instruction.

Roosevelt emerged from the wilderness at Gondokoro at the d of Feb. 1910. Nothing showed better the fascination which exercised over the imaginations of men the world over than e interest which his reappearance created. An address at Khar-m on orderly government created a mild stir, but another ad-ess, delivered before the students of the University of Cairo, nouncing the assassination by nationalists of the pro-British emier, Boutros Pasha, brought him threats of assassination.

Europe.—Roosevelt's journey northward was in the nature of triumphal procession. An official at the Vatican precipitated unpleasant situation by stipulating certain conditions for an terview with the Pope, but Roosevelt's refusal to permit any nitation on his freedom of action was direct and emphatic. In ris he made a public address at the Sorbonne on "Citizenship in Republic," in Berlin he spoke at the University on "The World ovement," and, at the emperor's side, reviewed the Imperial uard, the first civilian who had ever reviewed German troops. Before he reached England, the king, Edward VII., died, and nen Roosevelt arrived in London it was as President Taft's spe-al ambassador to the funeral. His Romanes lecture at Oxford "Biological Analogies in History" was widely praised, but speech at the Guildhall in London in which he criticized what peared to him as the timid ineptitude of the British Government Egypt brought sharp rebukes from both sides of the Atlantic, it had the endorsement of the new king and of his Foreign Secre-ry. The address had certain momentous consequences in the ap-intment of Lord Kitchener as consul general to Egypt (in fect, governor) and the strengthening of a British position ich, through its control of the Suez canal and the road to dia, became of vital importance to the British Empire on the tbreak of the World War four years later. What remained to nglishmen, however, as the most striking memory of Roosevelt's y in England, was the walk he took through the New Forest th Sir Edward Grey, when he proved that, though he had spent s than a month altogether in England since his boyhood, he uld identify every bird which he saw or heard.

THE RETURN TO POLITICS

Roosevelt returned to the United States on June 18, 1910, embarking at New York, and received a tumultuous welcome. e had already been put in touch with the political situation. The struggle between the conservative and the progressive elements in the Republican party, which under Roosevelt had remained under the surface, had, under President Taft, developed into what threatened to become a definite schism. A new tariff law, the dismissal of certain commissions which Roosevelt had appointed, the President's position in a bitter controversy regarding western lands, and the general mood of the Administration led Roosevelt to believe that Taft, instead of carrying forward the policies of the former administration, was definitely aligned with their opponents.

Security for Roosevelt and his fame lay in his retirement to his home acres as a kind of national sage; but at the request of the governor of New York, Charles Evans Hughes, he plunged into a factional fight within the Republican Party in the State (1910) and was sharply defeated. In numerous addresses in many parts of the country, however, and in the columns of the *Outlook*, a weekly periodical of which he was "contributing editor," Roosevelt carried forward his fight for what he called the new nationalism; a struggle for "social justice and popular rule," the control by the people of their political instruments and their government for the purpose of providing a condition approximating equality of opportunity. "The new nationalism" was denounced as revolutionary; it was, in fact, essentially conservative, seeking, as it did, merely a reinvigoration of established American institutions. Certain mildly radical expedients which it proposed were: the recall of elective officers by popular vote, the referendum, intended to make the legislatures more directly responsive to the popular will, and the direct primary. The recall of judicial decisions, advocated by Roosevelt as a check on the reactionary tendency of the judiciary in its function as the interpreter of the constitution, frightened the conservatives. As the struggle between the two factions in the Republican Party became increasingly bitter, pressure was brought to bear upon Roosevelt to declare himself a candidate for the presidency; and on Feb. 25, 1912, to use his own phrase, he "threw his hat in the ring."

It was not in Roosevelt's nature, once he had entered a struggle of any sort, to strike with cushioned gloves. The quarrel between Roosevelt and Taft, brought into the open by the contest for delegates, proved distressing alike to the friends of the protagonists and to the general public. In the 13 States where presidential primaries were held, the result, however, gave evidence that the majority of the Republican voters wanted him as their candidate; for of 362 delegates thus selected, 278 favoured Roosevelt and 48 Taft. The President's strength, in fact, came largely from States which cast a very small Republican vote and in which the control of the political machinery was in the hands of the office-holders. In many cases, the progressive voters named protesting delegations who appeared before the Republican National Committee in Chicago before the convention met (June 22, 1912) to claim the seats which they declared had been fraudulently assigned to their rivals. By a margin of 15 votes—which were offered to Roosevelt, but on terms which he felt he could not accept—the convention was organized by his opponents.

In the stirring events of the convention—though not in the hall itself—Roosevelt played the dominant part. He was ready to agree on a compromise candidate, but only on condition that the rolls of the convention be purged of those delegates who, he insisted, had been fraudulently seated. The convention nominated Taft, and the defeated elements, under the leadership of Roosevelt, formed the Progressive Party. Its first convention, held in Chicago early in August, proved unique in American political history in the fact that women were admitted as delegates. Roosevelt announced the principles of his party, demanding what he had fought for throughout his presidency—the control of the government and the resources of the United States by the people rather than by the professional politicians and financiers; asking, in effect, for a return to fundamental principles. On Aug. 7, the convention nominated Roosevelt for president and Hiram Johnson of California, for vice-president. The Democrats, meanwhile, meeting in Baltimore, had nominated Woodrow Wilson for president. During the campaign, both Wilson and Taft concentrated their artillery on Roosevelt. At the height of the campaign,

1 Oct. 14, Roosevelt was shot by a maniac in Milwaukee as he as getting into the automobile which was to take him to the ıll where he was to speak; he insisted, however, on making his ldress and it was an hour and a half before he consented to be ken to a hospital. In the election, Wilson received 435 electoral ɔtes, Roosevelt 88 and Taft 8. The popular vote was 6,293,097 ır Wilson; 4,119,507 for Roosevelt; 3,484,956 for Taft, and ɔ1,873 for the Socialist candidate, Eugene V. Debs.

RETIREMENT

Roosevelt had expected defeat and it brought no bitterness. e returned to his editorial work on the *Outlook*, wrote his *Autoography* and only interrupted the life of a country gentleman move upon a little town in Wisconsin with a score of "char-ter witnesses" in May, 1913, to confound the editor of a agazine called *Iron Ore* who had rashly put in print a charge idely current, that the ex-president was occasionally or, in fact, equently, drunk. The defendant admitted that he had combed e country in vain for witnesses to substantiate his charge, ac-ıowledged his error and paid the six cents in damages which was l Roosevelt would accept.

In the autumn of 1913, Roosevelt went to South America to ldress numerous learned bodies and to secure specimens in the ngles of Brazil for the American Museum of Natural History. is journey from capital to capital—a repetition of his triumphal ogress through Europe—belied the theory that his action as esident regarding Panama had angered the South American peo-es. At the suggestion of the Brazilian government and accom-nied by a gallant Brazilian explorer, Col. Candido Rondon, he t out to determine the course of a hitherto unknown river, guely indicated on existing maps as the River of Doubt. The urney of 900 m. through primeval wilderness was arduous and ll of peril, with death by starvation awaiting the expedition it went too slow; and death in the rapids waiting if it went too st. Canoes were crushed in the treacherous waters; supplies were st; fever made sharp inroads. Finally Roosevelt himself was ken desperately ill, but he struggled forward, until at last, when aster seemed inevitable, the party reached civilization at the nfluence of the river they had charted with the Madeira, a tribu-ry of the Amazon. In honour of the exploit the Brazilian gov-nment christened the stream the Rio Roosevelt.

The World War.—He returned to the United States in May ı14. Early August brought the catastrophe in Europe which, President, he had foreseen and postponed. His sympathies ere with France and England, for he distrusted the German mperor whose imperious and unstable mind had during his presi-ncy caused him frequent irritation and anxiety; but he main-ined for a few weeks a neutrality in utterance if not "in ought," which he later regretted. But before September was er, he was once more in the centre of public discussion and bate. He saw earlier than the leaders of the administration in wer that America could not remain untouched by the gigantic ruggle, since any disturbance of the existing balance of power ɔuld have a profound effect not only on the foreign relations of e United States but on the personal lives of the American peo-e. America could afford to see England, France and their allies in, but she could not afford to see Germany win, for a German ctory implied an aggressive neighbour in Canada and in the aribbean and the adoption by the United States of the European ndition of an "armed peace." He wanted America to enter the ar on the side of the Allies because he was convinced that if e did not accept the gage of battle at that time, she would ve to accept it later under less favourable conditions. He eaded for preparedness, but he went beyond the immediate need what he was convinced was the ultimate necessity—an inter-ıtional tribunal backed by force to execute its decrees. He at-cked the divided allegiance—"fifty-fifty Americanism" was his ırase—which permitted certain Americans of German origin to aise all things German at the expense of the American institu-ɔns under which they lived; but at the same time he pleaded for stice for the German-American who kept his head and was yal.

The destruction of the *Lusitania* by a German submarine brought from Roosevelt a scathing denunciation of German methods of warfare, and successive attacks on what seemed to him the timid and inept statesmanship of the Wilson administration. There was a kind of berserker fury in these attacks. Between himself and his opponents in power he knew no middle ground of compromise and party truce; the issues that divided him from them were to his mind not political but moral. It seemed to him that Wilson was deliberately lulling the public into a sense of false security, permitting it to dissipate its spiritual energies in an orgy of acquisition while their president set about with gestures and phrases to exorcise an opponent both aggressive and armed. Once more Roosevelt appealed to the public conscience, and stirred it as never before.

In this last struggle of a stormy life, he rose to what seemed to many of his countrymen new heights of devotion, as he pleaded for the defence of those institutions which he had as president himself revitalized. "Let us pay with our bodies for our souls' desire!" The shift of issues had brought to Roosevelt's support many of the men who had been his bitterest enemies, and early in 1916 he was put forward as a candidate for the Republican nomination for president. He warned the public that he must not be nominated unless the nation were in an "heroic mood." An effort was made by the Progressives to persuade the Republicans to join them in nominating Roosevelt, but the majority of the Republican delegates were not ready to forgive the schism of 1912, and his suggestion that Gen. Wood be named as a compromise candidate never reached the convention. Roosevelt refused the nomination of the Progressive Party, and gave the Republican nominee, Charles Evans Hughes, his support.

When the United States entered the war in April 1917, "the Colonel," as he was affectionately known, offered to raise a division of volunteers from among the ranks of the "outdoor men" of the country who would be almost immediately ready for service; 250,000 men recorded their desire to go under his leadership to France and Congress passed a bill authorizing the creation of two divisions of volunteers, but the President refused his consent. "This is a very exclusive war," Roosevelt remarked, "and I have been blackballed by the committee on admissions." His four sons all went to the front; two were wounded, one Quentin, the youngest, a lieutenant in the Air Service, was killed in combat over the German lines. Roosevelt, forbidden to fight in the field, grimly and in bitter disappointment flung himself into the work that lay at hand. Here and there over the country he spoke for the Liberty Loan campaign, for the Red Cross and other relief agencies; and in the pages of the Kansas City *Star* and the *Metropolitan Magazine* fought week after week for speed in military preparation, for an honest facing of facts and for whole-hearted and unreserved participation in the war by the side of the allies, greeting the Administration's satisfaction over the "happy confusion" of the war preparations with words of stinging realism.

The fever he had contracted in Brazil returned now and again. For weeks he travelled and made public addresses in spite of it. In Feb. 1918, however, he became dangerously ill; was operated upon, recovered, returned to his full activity and was again laid low. His illness scarcely abated his ceaseless activity and in nowise seemed to weaken the force of his fighting spirit. At no previous period in his career was his following so large or so devoted. It seemed as though, in the intensity and grief of the war-years, his countrymen turned to him with new understanding and affection. While scholars talked of this or that notable act of an administration which was already acquiring a kind of glamour in the perspective of a decade, the common man called him "the great American" and let others analyse why. He died in his sleep on Jan. 6, 1919.

Character and Influence.—It can be said of Washington that he founded the American nation, and of Lincoln that he preserved it; it can be said of Roosevelt that he revitalized it. Twice, at critical times, through his vision, his ardour, his effective anger, his faith in American institutions and his peculiar understanding of all sections of the American people, he cleansed the body of the nation of treacherous poisons, and set its soul to work on labours

higher than the acquisition of physical comforts. He dreamed nobly for his country and impelled millions of his countrymen to dream nobly. He was the most versatile man who has ever been president of the United States. Apart from his gifts as politician, statesman and popular leader, he was eminent as naturalist, soldier, orator, historian; and was one of the most widely-read men of his time. *The Winning of the West* has faults of hasty composition inevitable in a book written in the off-hours of a crowded life, but it maintains its authority; his *Naval History of the War of 1812* has not been supplanted as the leading work on the subject. He was an assiduous and occasionally a brilliant writer. His narratives are lucid and swift, his descriptions full of colour and significant detail, his literary criticism straightforward and free from the jargon of the craft. His letters have taken a high place in epistolary literature; his volume of *Letters to his Children* is already a classic. His political writings, moreover, are direct and clear, open to the most untutored intelligence, and flashing at intervals with arresting epithets. Under the stress of emotion, in some of the prefaces of his hunting books, in a descriptive passage here and there—in his appeal, for instance for imagination in the writing of history—his prose became transmuted into the gold of poetry.

"A man who could do so much could not do everything perfectly, though few have ever done so many things so well," wrote his friend Albert Bushnell Hart (*Encyclopædia Britannica*, 12th edition). "It was more true of him than of most men that his defects were inherent in his virtues. There were few half-tones in Roosevelt's moral perceptions and fewer in his vocabulary; he saw things as either black or white, and he forgot sometimes that he had not previously seen them as he saw them at the moment. . . . The very intensity of his convictions sometimes blinded him to the sincerity and even to the justice of other points of view. Nevertheless, this intensity, this moral fervour, gave his ideas a momentum and a success which they could never have acquired had they proceeded from a more judicial mind. He scorned 'weasel words,' and on occasion he did not hesitate to describe his enemies as thieves and liars. His remarkable energy reminded observers of some great elemental force which, like any natural phenomenon, is controlled by its own necessary laws."

Writings.—Theodore Roosevelt's published works, including books, pamphlets, addresses, campaign speeches, contributions to the books of others, translations and periodical articles, number between two and three thousand titles and date from 1877 to his death. He wrote during his life not less than 150,000 letters, most of which are included with the Roosevelt papers in the Library of Congress in Washington. More has been written about him than about any other American. There have been many collections of Roosevelt's works, the latest and best being the Memorial edition, 24 vol. (1923–26); and the National edition, 20 vol. (1926).

Roosevelt's principal works are: *Naval War of 1812* (1882); *Hunting Trips of a Ranchman* (1885); *Thomas Hart Benton* (1887); *Gouverneur Morris* (1888); *Ranch Life and the Hunting Trail* (1888); *Winning of the West*, 4 vol. (1889–96); *New York* (1891); *Wilderness Hunter* (1893); *Hero Tales from American History* (with Henry Cabot Lodge) (1895); *American Ideals* (1897); *Rough Riders* (1899); *Oliver Cromwell* (1900); *Outdoor Pastimes of an American Hunter* (1905); *African and European Addresses* (1910); *African Game Trails* (1910); *New Nationalism* (1910); *Realizable Ideals* (1912); *History as Literature* (1913); *Progressive Principles* (1913); *Autobiography* (1913); *Through the Brazilian Wilderness* (1914); *Life Histories of African Game Animals* (with Edmund Heller) 2 vol. (1914); *America and the World War* (1915); *Book-lover's Holidays in the Open* (1916); *Fear God and Take Your Own Part* (1916); *Foes of our Own Household* (1917); *Great Adventure* (1918); *Theodore Roosevelt's Letters to his Children* (1919); *Theodore Roosevelt and his Time Shown in his Own Letters*, Ed. by J. B. Bishop, 2 vol. (1920); *Roosevelt in the Kansas City Star* (1921); *Letters to Anna Roosevelt Cowles* (1924); *Selections from Correspondence of Theodore Roosevelt and Henry Cabot Lodge* (1925).

BIBLIOGRAPHY.—The more important biographical studies are: L. F. Abbott, *Impressions of Theodore Roosevelt* (1920); Corinne Roosevelt Robinson, *My Brother Theodore Roosevelt* (1921); H. A. Beers, *Four Americans* (1920); Joseph Bucklin Bishop, *Theodore Roosevelt and His Times* (1920); Archie, Butt, *Letters* (1924); Lord Charnwood, *Theodore Roosevelt* (1924); Tyler Dennett, *Roosevelt and the Russo-Japanese War* (1925); Bradley Gilman, *Roosevelt the Happy Warrior* (1921); H. (H. HAG.)

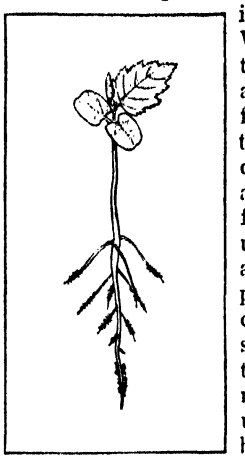
ROOT, ELIHU (1845–), American lawyer and political leader, was born at Clinton (N.Y.), on Feb. 15, 1845. He graduated at Hamilton college where his father was a professor in 1864, taught at the Rome (N.Y.) academy in 1865, and graduated at the University Law school, New York city, in 1867. As a corporation lawyer he soon attained high rank and was counsel in many famous cases. Politically, he became identified with the reform element of the Republican Party. He was U.S. attorney for the Southern District of New York (1883–85), and a delegate to the State Constitutional Convention of 1894, acting as chairman of its judiciary committee. From Aug. 1899 until Feb. 1904 he was secretary of war in the cabinets of Presidents McKinley and Roosevelt, and in this position reorganized the army and created a general staff, and in general administered his department with great ability during a period marked by the Boxer uprising in China, whither troops were sent under Gen. A. R. Chaffee, the insurrection of the Filipinos, the withdrawal of U.S. troops from Cuba and the establishment of a government for the Philippines under a Philippine Commission, for which he drew up the "instructions," in reality comprising a constitution, a judicial code and a system of laws. In 1903 he was a member of the Alaskan Boundary Tribunal. In July 1905 he re-entered President Roosevelt's cabinet as secretary of State, where he considerably improved the consular service. In the summer of 1906, while attending the Pan-American Conference at Rio de Janeiro, he was elected its honorary president, and during a tour through the Latin-American republics, brought about a better understanding between the United States and these republics. In general he did much to further the cause of international peace, and he concluded treaties of arbitration with Japan, Great Britain, France, Italy, Spain, Portugal, Austria-Hungary, Switzerland, Norway, Sweden, Denmark, Holland and other countries. Upon his resignation from the cabinet he was elected, in Jan. 1909, as U.S. senator from New York. In 1910 he was chief counsel for the United States before The Hague Tribunal for the arbitration of the long-standing dispute concerning fisheries between his country and Great Britain (*see* NEWFOUNDLAND). Upon his return, he was appointed by President Taft a member of the Permanent Court of Arbitration. In the same year he was elected president of the Carnegie Endowment for International Peace. Root thus took up again the work which he had initiated when secretary of State, and became the recognized leader of the peace movement in the United States. In 1912 he was awarded the Nobel Peace Prize. He strongly supported in the Senate the treaty of obligatory arbitration concluded between the United States and Great Britain in 1912, but failed to prevent amendments to the treaty being inserted by the Senate which prevented an exchange of ratifications.

He took a leading part in the passage of the Federal Reserve bill of 1913, providing for a Federal Bank under Federal control, in order to stabilize the finance of the country. In matters of foreign policy also his opinion had great weight. In 1915 a treaty negotiated by Secretary of State Bryan with Colombia provided for payment by the United States of $25,000,000 to Colombia in settlement of all outstanding claims between the two countries

arising out of the independence of Panama; Mr. Root opposed ratification, principally because a statement of regret on the part of the United States had been inserted in the preamble, though he also considered the sum too much. His opinion prevailed, and later on, in 1922, when the Senate finally ratified the treaty, the clause in question was omitted.

On March 4, 1915, his term as senator expired and he declined to be a candidate for re-election. That summer he was president of the New York State Constitutional Convention, and advocated, among other measures, the short ballot, means for remedying the law's delays, the reduction of costs involved in the administration of justice and measures which would facilitate the impeachment of unworthy public officials. After the declaration of war by the United States, on April 6, 1917, he gave his whole support to the Government. He was asked by President Wilson to head the mission which was sent to Russia shortly thereafter with a view to encouraging the Revolutionary Government under Kerensky to carry on the war with vigour. He accepted, but while in Russia the overthrow of the Moderates there by the Bolsheviks under Lenin frustrated the purposes of his mission.

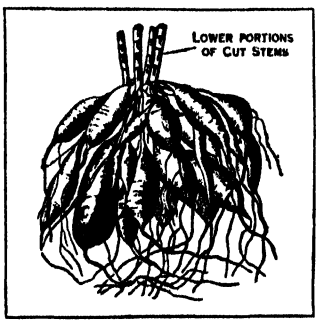


At the conclusion of the war, though not a member of the U.S. Mission to Paris to conclude peace, his advice was requested in the matter of the Covenant of the League of Nations and his views prevailed to a certain extent. To the Covenant as actually drafted, however, he was opposed. He was, nevertheless, of the opinion that the Covenant and the Treaty of Versailles should be accepted with reservations, to secure the interests of the United States, inasmuch as the President's re-election in 1916 and his presence as negotiator at Paris had led the other plenipotentiaries, however erroneously, to believe that he represented the opinion of his fellow countrymen. In Mr. Root's opinion it would be better to accept the Covenant with reservations, and by subsequent amendments to remove the obstacles which had originally stood in the way of its acceptance.

He accepted an invitation from the League of Nations to become a member of the Advisory Committee of Jurists which met at The Hague in 1920 for the purpose of devising a plan for a permanent court of international justice, in accordance with Art. 14 of the Covenant. His presence enabled the committee to frame a plan acceptable to all by which the judges were to be elected by the separate and concurrent action of the Council (in which the Great Powers had a preponderance) and the Assembly (in which the Small Powers were in a majority), each interest, real or alleged, having thus a veto upon the abuse of power by the other. The plan was accepted with modifications by the Council and Assembly on Dec. 14, 1920, and became the statute of the court. It functioned perfectly when the judges were elected in 1921.

Root was appointed by President Harding one of the U.S. delegates to the International Conference on Armament Limitation, which met at Washington in Nov. 1921. There he secured the adoption of the convention subjecting submarines to the requirements of surface vessels and prohibiting the use of noxious gases in warfare. He devised the Pacific agreements which resulted in the cancellation of the Anglo-Japanese alliance, and drafted the Four Power Pacific Treaty, which took its place. In Jan., 1929, he accepted an invitation to be a member of a committee of jurists meeting at Geneva to test and revise the original statutes of the Permanent Court of International Justice in the light of eight years' experience. He participated in every session held for this purpose and offered valuable suggestions. His main work, however, was the working out of a formula upon which the United States might see its way clear to become a member of the court. This Root protocol, as redrafted by Sir Cecil Hurst, was unanimously accepted by the committee of jurists, and is intended to replace the protocol of Sept. 23, 1926 drawn up in answer to the American Senate reservations. The changes made were only in the article on advisory opinions and were held to be favorable to the United States. The hope was general that the United States Senate would act favorably sometime after the report of the committee had been formally accepted by the League Council which meets in June, 1929.

A collection of Root's public addresses has been edited by Robert Bacon and James Brown Scott in eight volumes. He also published *Experiments in Government and the Essentials of the Constitution* (Princeton Lectures, 1913) and *American Ideals During the Past Half Century* (International Conciliation, no. 210, 1925).



ROOT, in popular use, the part of a plant which is normally below the surface of the earth. Botanically its application is more restricted. The embryo of a typical plant, for instance a pea plant, has an ascending axis which grows into the shoot, and a descending axis or radicle which grows into the root. When the seed germinates, the radicle is the first to appear; it grows downwards, and its primary function is to act as a holdfast for the plant; its most important function, however, is the absorption of water and dissolved nutrient substances from the soil, and it also frequently serves for storage of foodstuffs. The root is distinguished from underground shoots by not bearing leaves and by having its apex (growing point) protected by a cap (root-cap), which can be clearly seen by making a median vertical section through the root-tip; the cap protects it in its passage through the soil. The root also generally bears root-hairs, slender unicellular outgrowths of the outer layer, borne in the region a little behind the root-tip. The root-hairs serve to increase the surface of the root for absorption of water and mineral substances; they also are of service in bringing the root into intimate relationship with the soil particles; the older root-hairs are continually dying off, so that they are borne only on a small part of the area behind the apex. Branches of the root, which repeat the form and structure of the main root, are developed in regular succession from above downwards (acropetal), and owing to the fact that they originate in a definite position in the interior of the root (generally opposite the xylem masses) they develop in longitudinal rows and have to break through the overlying tissue of the parent root. True forking of the root (dichotomy) occurs in the Lycopodiaceae (the shoots of which also branch dichotomously), but is unknown in the higher plants.

FROM STRASBURGER'S "LEHRBUCH DER BOTANIK" (GUSTAV FISCHER)

FIG. 1.—SEEDLING (ULTIMATE ROOT-BRANCHES)

Roots which originate elsewhere than as acropetal outgrowths of a main root are known as *adventitious*, and may arise on any part of a plant. They are especially numerous on underground stems, such as the under side of rhizomes, and also develop from stem nodes under favourable conditions, such as moisture and absence of light; a young shoot or a cutting placed in moist soil quickly forms adventitious roots. They may also arise from leaves under similar conditions, as, for instance, from begonia leaves when planted in soil.

FROM STRASBURGER'S "LEHRBUCH DER BOTANIK" (GUSTAV FISCHER)

FIG. 2.—ROOT-TUBERS OF DAHLIA VARIABILIS

The forms of roots depend on their shape and mode of branching. When the central axis goes deep into the ground in a tapering manner without dividing, a *taproot* is produced. This kind of root is sometimes shortened, and becomes swollen by storage of food-stuffs, forming the *conical* root of carrot, or the *fusiform* or spindle-shaped root of radish, or the *napiform* root of turnip. In ordinary forest trees the first root protruded continues to elongate and forms a long primary root-axis, whence secondary axes come off. In primary plants, especially monocotyledons, the primary axis soon dies and the secondary axes take its place. When the descending axis is very short, and at once divides into thin, nearly equal fibrils, the root is called *fibrous*, as in many grasses; when the fibrils are thick and succulent, the root is *fasciculated*, as in *Ranunculus Ficaria*, and *Oenanthe crocata*; when some of the

fibrils are developed in the form of tubercules, the root is *tuberculate*, as in dahlia. Some of these so-called roots are formed of a stem and root combined, as in *Orchis*, where the tuber consists of a fleshy swollen root bearing at the apex a stem bud. As in the case of the stem, growth in length occurs only for a short distance behind the apex, but in long-lived roots increase in diameter occurs continually in a similar manner to growth in thickness in the stem.

Roots are usually underground and colourless, but in some cases where they arise from the stem they pass for some distance through the air before reaching the soil. Such roots are called *aerial*. They are well seen in the screw-pine (*Pandanus*), the Banyan (*Ficus indica*), and many other species of *Ficus*, where they assist in supporting the stem and branches. In the mangrove they often form the entire support of the stem, which has decayed at its lower part. In tree-ferns they form a dense coating around, and completely concealing, the stem; such is also the case in some Dracaenas and palms. In *epiphytes*, or plants growing in the air, attached to the trunks of trees, such as orchids of warm climates, the aerial roots produced do not reach the soil; they continue always aerial and greenish, and they possess stomata. Delicate hairs are often seen on these epiphytal roots, as well as a peculiar spongy investment formed by the cells of the epidermis which have lost their succulent contents and are now filled with air. This layer is called the *velamen*, and serves to condense the moisture contained in the air, on which the plant is dependent for its water-supply. Some leafless epiphytic orchids, such as species of *Angraecum*, depend entirely upon their aerial roots for nourishment; these perform the functions both of leaves and roots. A respiratory or aerating function is performed by roots of certain mangroves (*q.v.*), growing in swampy soil or water and sending vertical roots up into the air which are provided with aerating passages by which the root system below can communicate with true outside air.

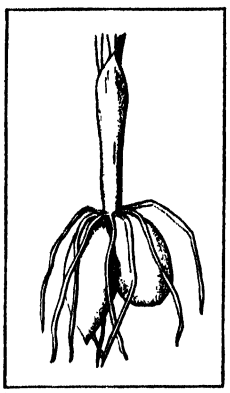


FIG. 3.—FLESHY ROOT OF ORCHIS

Parasitic plants, as the mistletoe (*Viscum*), broom-rape (*Orobanche*), dodder (*Cuscuta*) and *Rafflesia*, send root-like processes into the substance of the plants whence they derive nourishment. Leaf-buds are sometimes formed on roots, as in plum, cherry and other fruit trees; the common elm affords an excellent example, the young shoots which grow up in the neighbourhood of a tree arising from the roots beneath the soil. In some plants no roots are formed at all; thus in the orchid *Corallorhiza*, known as coral-root, a stem-structure, the shortly branched underground rhizome, performs all the functions of a true root, which is absent. In aquatic plants the root acts merely as a holdfast or is altogether absent as in *Salvinia*, *Utricularia* and others. The well known epiphyte *Tillandsia usneoides* (Spanish moss) is rootless.

For the interval structure of the root *see* PLANTS: *Anatomy*.

ROOT. In the ancient *arithmetike* (ἀριθμητική),—the theory of numbers of the Greeks—the numbers considered were primarily integers. A *square number* was therefore an integer that had two equal integral factors; for example, 9 was a square number, the product of the two equal factors 3 and 3. These factors represented the length of the side of a square of which the area is 9 square units. Each was therefore called a "side," and so the Latins spoke of "finding" a *latus* as modern writers speak of "extracting" a *square root*. The Arab writers of the 9th century spoke of such a factor as *root*, and their mediaeval translators adapted the word *radix* (compare "radish") with the adjective *radical* and the verb *extrahere* (pull out). In modern usage a root is one of the equal factors of any kind of a number or of an algebraic expression, the square root being one of the two equal factors: the cube root, one of three; the fourth root, one of four, etc. Thus the cube root of 216, $\frac{8}{27}$, 0·343 and $-\frac{8}{125}$ are respectively 6, $\frac{2}{3}$, 0·7 and $-\frac{2}{5}$. It is also customary to use such expressions as "the square root of 2," although 2 has no two equal factors, meaning that this root is approximately 1·414 . . . and designating the number of decimal places (or of significant figures) to which it is to be carried. Symbolically, $\sqrt{2}$ or $2_{\frac{1}{2}}$ means the square root of 2, and $\sqrt[3]{2}$ or $2_{\frac{1}{3}}$ means the cube root of 2, but *see* the "principal root" referred to later. The *index of the root* (indicating what root is to be found) is not written in the square-root symbol $\sqrt{}$, but it is inserted in the case of other roots. The expression "root 2" means in Great Britain the square root of 2, but in the United States the word "square" is used before "root" in this connection.

In the modern extension of the number system, every number has two square roots, one positive and the other negative; thus the square root of 4 is $+2$ or -2. It also has three cube roots; thus the cube root of 1 is 1, $-\frac{1}{2}+\frac{1}{2}\sqrt{-3}$, and $-\frac{1}{2}-\frac{1}{2}\sqrt{-3}$, as can be seen by cubing these numbers. Similarly, the number of nth roots of a number is n, of which (if n is even) two are real and the rest are imaginary (or complex; see *Complex Numbers*); or of which (if n is odd) one is real and the rest are imaginary. For example, the four fourth roots of 16 are $+2$, -2, $+2\sqrt{-1}$, and $-2\sqrt{-1}$; or as ordinarily written, ± 2, $\pm 2i$; and the three cube roots of 8 are 2, $-1\mp\sqrt{-3}$.

The symbol $\sqrt{}$ means the *principal root* of the number. Thus, $\sqrt{4}$ means 2, not -2; and $\sqrt[3]{8}$ means 2, not $-1\mp\sqrt{-3}$. The principal root of a positive number means the positive real root.

The common method of finding any root of a number is based upon the Binomial Theorem (*q.v.*) and is given in most textbooks on arithmetic and elementary algebra. Practically, however, in working physical problems, square and cube roots are found from tables (*q.v.*), by logarithms (*q.v.*) or by the use of such instruments as the slide rule or other computing machines. (*See* MATHEMATICAL INSTRUMENTS.)

A *root of an equation* is a value of the unknown quantity that will reduce the equation to an identity. For example, 3 is a root of the equation $x^2+4x-21=0$; for if 3 be substituted for x, we have $9+12-21=0$. There are two roots to this equation, the other being -7. Every rational integral algebraic equation has as many roots as the degree of the equation; for example, an equation of the fifth degree has five roots, not necessarily different and not all necessarily real. If unreal, the imaginaries (complex) roots enter in pairs. (*See* EQUATIONS.)

Dickson, *History of the Theory of Numbers* (1919–23); on the algebraic theory, G. Chrystal, *Algebra* (2nd ed., Edinburgh, 1889); on the history of terms and methods, D. E. Smith, *History of Mathematics* (Boston, 1923–25, especially vol. 2). (D. E. S.)

ROOT-CROPS. Many kinds of roots are cultivated for human use, some such as carrots, parsnips, etc., being grown extensively on a commercial scale. But what are commonly termed root-crops are those which are grown on farms in rotation with other field crops (*see* ROTATION OF CROPS; also TURNIPS, MANGOLD-WURZELS and BEET).

In a broad sense, however, all roots grown for human food are called root-crops, as are many grown for other useful purposes. The root-crops most commonly produced for human food include the beet, carrot, onion, parsnip, potato, radish, sugar beet, sweet potato and turnip. Representative minor root-crops are the chufa (*Cyperus esculentus*), cultivated by the negroes of the southern United States, and the so-called tule-potato (tubers of *Sagittaria latifolia*), cultivated by the Chinese in central California. Many roots grown for other economic purposes assume local importance as crops, as the liquorice, grown in southern Europe.

ROOT-CUTTER: *see* FARM (STATIONARY) MACHINERY.

ROOTHAM, CYRIL BRADLEY (1875–), English musician, was educated at Clifton College, St. John's College, Cambridge and the Royal College of Music. He became a university lecturer at Cambridge in 1913. He further promoted the cause of music in the university by his admirable productions at the Cambridge theatre as conductor of the musical society of the university; these included notable revivals of Purcell's *Fairy Queen*, in 1920, and of his *King Arthur* in 1928. His works include chamber and choral music; his choral setting of Milton's *Ode on the Nativity* received the Carnegie Trust award in 1928.

ROOZEBOOM, HENDRIK WILLEM BAKHUIS (1854–1907), Dutch physical chemist, was born on Oct. 24, 1854; he was at first (1878) assistant in the Chemistry institute at Leyden, then lecturer (1890), and finally (1896) professor of inorganic and physical chemistry at Amsterdam. He died on Feb. 8, 1907. Roozeboom is best known for the introduction into chemistry of the "phase rule" (*see* CHEMISTRY: *Physical*), which had been deduced previously by J. Willard Gibbs on thermodynamical grounds. With his students he made a large number of investigations of melting points and solubilities in studying the equilibria between solid and liquid phases in various systems. He started in 1904 to publish a compilation under the title of *Die heterogene Gleichgewichte vom Standpunkt der Phasenlehre*, which was completed in 1918, after his death, by his pupils.

See *Recueil Trav. Chim. Pays-Bas* (1908); *Ber. d. Deutsch Chem. Ges.* (1907).

ROPE AND ROPE-MAKING. Rope is made of animal or vegetable fibres and of metallic wires. Fibre rope alone will be considered here. (*See* WIRE ROPE.) "Cordage" is a term applied generally to yarns, twines, ropes and cables but refers specifically to "rope" in the industry.

Fibre rope is cordage of "stranded" construction, *i.e.*, fibres or hairs laid parallel and twisted together making a yarn; two or more of these yarns twisted together "forming" the strand and three or more of these strands twisted together "laying" the rope. Three or more ropes laid together make a "cable-laid" rope, sometimes referred to colloquially as "hawser-laid." The smallest fibre ropes made are approximately ¼ in. in circumference or $\frac{3}{16}$ in. in diameter so that any similar products of less than these dimensions are not rope in the usual acceptation of the term.

Two or more yarns twisted together, either plain twisted or laid, are twine regardless of the form of put-up; laid twine is sometimes referred to as "corded." Single yarns are known as yarns except binder twine, which is a single yarn product. This group of products is known as "ply and yarn goods" in the hard fibre cordage industry and as yarns, twines or cords in the soft fibre industry. Braided construction of yarns, such as sash cords, is sometimes referred to as "rope."

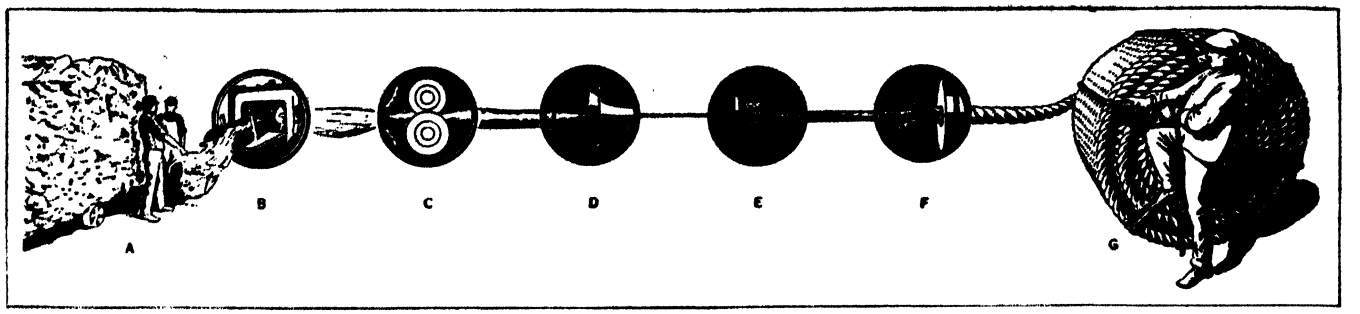
Early History of Rope-Making.—The beginning of rope-making is lost in antiquity. In his very earliest days man must have had something to serve as cords and twines: strips of hide or of bark, pliant reeds and rushes, withes of tough woods, fibrous roots, hairs of animals. As the need for stronger and longer lines developed it was met by twisting a number of these together and forming a rope or cord. There is no record of who first performed this operation.

Not only were ancient civilized nations accomplished rope-makers, but savage tribes in all parts of the world made ropes and cords. The North American Indian, for instance, made cordage of such fibre plants as yucca and agave, the inner bark of trees, hair and skins. The native Peruvians were good rope-makers, using a substance known as "totora." The Egyptians made rope of hides, papyrus and palm fibre. Specimens of Egyptian ropes of papyrus have been taken from ancient tombs and some are estimated to be not less than 3,500 years old. It is known that rope was made in China at a very remote period.

There are numerous records of the use of rope among the Greeks and Romans. The triumphal arch at Orange (A.D. 41), illustrates a coil of rope, pulley and anchor in bas-relief. A painting on a drinking cup in the British Museum shows an Attic sailing ship, 6th century B.C., with ropes and sails. Historians also occasionally mention the use of rope in connection with some great undertaking. Herodotus tells us that Xerxes, during his invasion of Greece (480 B.C.), crossed his army over the Hellespont upon bridges of boats held together by enormous cables stretched from shore to shore.

Rope-making had been going on for centuries with little change up to the time of the introduction of machinery about the middle of the 19th century. In the early days all the yarn was spun by hand. The hemp was first hackled by combing it straight over a board studded with sharp steel teeth. A bunch or "head" of this hackled hemp was placed around the spinner's waist, who attached a few fibres to a hook on the spinning wheel and, as the hook was revolved by means of a large wheel turned by hand, walked backwards away from the wheel feeding the fibre from the supply around his waist, preserving the uniformity and proper size of the yarn. Several yarns were twisted together by use of a hand wheel and several hooks, forming the "strand" and three or more strands twisted together "laying" the rope. Horse-power was used in old times for forming and laying rope which was too large to be made by hand. The term "rope-walk" came from the long low buildings used and the walking back and forth of the spinners and rope-makers. In the early days every community of any size had its rope-walk, there being 173 in the United States in the year 1810. These walks were often 900 ft. or more in length. Many were in the open air.

The crude methods of rope-making of centuries ago are still used in many parts of the world to-day. Improved rope-walk methods are used extensively to-day for making extra large ropes and all but the smaller sizes of tarred hemp ropes; it is also an economical and quick method of making ropes to special order for immediate delivery.



Raw Materials.—In the United States and European countries soft fibres, principally hemp (coming mostly from Russia, Italy and the United States) and flax were used for rope until the second quarter of the 19th century. Hemp is still used for tarred hemp rope and fittings for marine purposes. Abaca commonly referred to as Manila fibre, because it is grown almost exclusively in the Philippine Islands and exported principally from the port of Manila, has established itself as the best material for rope-making where strength and durability are the prime requirements. Henequen, sometimes misnamed sisal, is next in importance as a rope fibre, and comes from Yucatan, Mexico and Cuba. Sisals are important rope fibres and come principally from Java, Africa, Bahamas. Other fibres used are New Zealand, Mauritius, Maguey and Istle fibres. Jute and cotton are used to a limited extent in the manufacture of ropes of stranded construction. Cotton is used to a greater extent in the manufacture of braided cords.

Present Manufacturing Processes.—The primary object of twisting fibres together in a rope is that, by mutual friction, they may be held together when a strain is applied to the whole. Hard twisting has the further advantage of compacting the fibres and preventing, to some extent, the penetration of moisture when the ropes are exposed to water; but the yield of rope from a given length of yarn diminishes in proportion to the increase of twist.

The rope-making process is essentially the same, no matter what kind of fibre is used. The process divides itself into five operations. First, selection of fibre; second, preparing the sliver; third, spinning the yarn; fourth, forming the strands; fifth, laying the strands into rope. With cable-laid ropes there is another operation, laying the strands of the cable, which are in fact completed ropes, into the finished cable.

At the start of the manufacturing process the bales of fibre are opened and heads of fibre shaken out. The fibre is put through several processes of combing and straightening. These operations are, in general, all of the same kind. The fibre is slowly carried along on a series of bars connected by endless chains, the bars being studded with sharp steel pins, like combs, that stand upright as the fibre passes along with them. A similar set of combs, moving very much faster, pulls the fibre rapidly away from the first set, combing it out at the same time. Fine jets of lubricant are sprayed on the fibre as it enters the first machine.

The fibre is delivered from the machine in a heavy, continuous stream or sliver which is coiled by hand or machine into a receptacle, or on the floor. Several of these slivers are then fed into a similar machine, and the kinks and unevenness further removed by a repetition of the same process. This preparation or combing is repeated from 8 to 12 times on five different machines, each operation combing the fibre and producing a smaller and more even sliver, until finally it comes out of the finisher in a continuous stream as water flows from a hose.

BY COURTESY OF THE COLUMBIAN ROPE CO.

PROCESSES THROUGH WHICH FIBRE PASSES IN THE MANUFACTURE OF ROPE: (A) FIBRE FROM BALES WITH TANGLES SHAKEN OUT; (B) THE BREAKER WHERE THE FIBRE IS COMBED; (C) SLIVER (FIBRE AFTER IT IS COMBED) COMPRESSED INTO COMPACT FORM; (D) FIBRE TWISTED INTO YARN; (E) YARN DRAWN THROUGH A GUIDE AND TWISTED INTO A READY OR STRAND; (F) STRANDS LAID UP INTO ROPE; (G) FINISHED ROPE COILED AND READY FOR SHIPPING

The thoroughness with which these operations are carried out—the care taken in preparing the fibre—is largely responsible for the uniformity and excellence of the finished product.

In the preparation of the sliver, the object has been merely to eliminate all sorts of dirt and foreign matter and to lay these fine, thread-like strands parallel with one another so that they can be more easily spun together. As the sliver enters the spinning machine it is taken from the rollers by another series of fine combs. From the combs it passes through a funnel-shaped tube and is then wound about a little capstan. It is between the tube and the capstan that the yarn comes into being. The friction on the revolving capstans draws the yarn through the machine. From the capstans it is automatically wound on a large spool about 12 in. long, named a bobbin. The capstans and the bobbin whirl very fast, and the combination of this whirling motion and the drawing forward of the revolving capstans, spins the heretofore parallel fibres into what is known as a yarn. For different sizes of yarn and for yarns designed for various purposes, a varying number of twists per foot are imparted to the yarn. This yarn is the first merchantable product of the cordage mill and may be sold in this original form or used as the basis of other cordage products.

A rope is usually formed of three or four strands, each strand composed of a number of yarns laid parallel and slightly twisted together. Making these strands is "forming." As the strand is twisted it is wound on a large reel and appears as a smooth, round strand composed of a number of individual yarns. This is known as the "ready." The yarn has a tendency to untwist; to overcome this the twist of the ready or strand is made in the opposite direction. The result is that the tendency of the yarn to untwist in one direction, and the tendency of the ready to untwist in the other direction balance each other.

The rope-making operation is "laying." In laying the rope, three or four of the reels containing the readies or strands are put on the laying machine, and the strands are led through a "block," wound around the capstan, and reeled on the finishing end of the laying machine. In laying there is a different twisting problem, for the ready is neutral—that is, it has no tendency to untwist—and if the readies were twisted together without altering this neutral condition the rope would continually untwist. So an extra twist is added to the ready as it is passed into the machine, this twist being computed so that it will be just sufficient to counteract the tendency of the three strands to untwist when they are formed into a rope. All good rope is absolutely neutral; if cut off in 5 to 10 ft. lengths and laid on the ground, it will not untwist of its own accord.

Cable-laid rope consists of three completed ropes, nine of the simple strands which form an ordinary rope. The same method of balancing the twisting strands is used, an additional twist or foreturn being given to the three-strand ropes just before they are laid up, so that their tendency to untwist in one direction shall exactly counterbalance the tendency of the cable to untwist in the opposite direction.

Uses and Care of Rope.—The uses of rope are many and varied. The marine and fishing industries consume more than half of the rope produced. Cable-laid rope is also used extensively for the drilling of oil, water and gas wells. Ropes are used in the transmission of motive power. (*See* POWER TRANSMISSION, MECHANICAL.) Small cotton ropes are used extensively in textile mills for small machine drives. Rope is used on the farms for hoisting, hauling, harness and many other uses. Rope is used in building and engineering projects construction. In the home also it has many applications.

The useful life of rope depends on the quality of the rope, and on the care and treatment it receives. To give the best service, it must be made of high grade raw material, selected with a thorough knowledge of what the rope is to do. It must be so made that every strand will be of even tension. It must be properly treated with a lubricant which will at once preserve and lubricate. There are three general sources of damage which will shorten the life of rope; first, mechanical injury, such as bending over too sharp a pulley, second, damage from chemicals, such as acids, and third, damage from climatic or other conditions of storage, such as moisture or dry rot. It should be stored in a cool dry place with air circulation. (J. S. McD.)

In addition to the heavy rope there are many varieties of cord and twine made by means of the preparing, spinning and doubling machines. The fishing industry takes many different types for lines and nets, while the variety of cord and twine for other industrial and for household purposes is almost unlimited. All yarn from long vegetable fibre is more or less rough as it leaves the spinning frame, even after two or more threads have been twisted together. It is therefore necessary, for many uses, to impart a polish to the cord or twine. Special machines are used for this purpose. Bobbins of yarn, equal to the number required, and depending upon the capacity of the machine, are placed in a bank or creel, and the ends are collected and passed under a roller which is immersed in hot starch. The yarns become saturated with this starch, but, as they emerge from the starch-box, the superfluous starch is removed by passing the yarns between two rollers. The yarns now pass over a series of drying cylinders and polishing rollers, and are finally rewound by the same machine on to other bobbins. This machine is termed a bobbin-to-bobbin polishing machine. In some cases the hot drying cylinders are replaced by a system of hot-air drying. The finished yarns are now made up by machinery into hanks, balls or cheeses, according to which happens to be the best state for future use and for transport.

Driving Ropes.—It has already been stated that cotton driving ropes are extensively applied in the transmission of motive power. Although the mechanical efficiency of transmission by ropes is less than that obtained by wheel gearing, rope driving has several compensating advantages:—

1. It is practically noiseless.
2. It occupies less space than belt driving, and the slip is not so great.
3. The turning movement is better; machines therefore run more steadily and production is increased.
4. Shafts may be run at higher speeds.
5. Greater range of drives; anything from 10 ft. to over 80 ft.,

and much greater distances when carrier pulleys are used.

6. The drive is usually obtained by a number of ropes; if one should break, the rope may be removed and the machinery run, in most cases, until stopping-time.

The number of ropes to be used depends upon the power to be transmitted; upon the sectional area of the ropes, and upon the surface speed of the driving pulley. The speed of the rope may vary from 2,000 ft. to 6,000 ft. or over per minute. In some few exceptional cases 60 ropes have been used on one pulley; the number usually varies between 15 and 40. (*See* POWER TRANSMISSION: *Mechanical.*)

The foregoing refers exclusively to ropes made from fibrous yarns; metallic ropes appear under the heading WIRE ROPE.

See T. Woodhouse and P. Kilgour, *Cordage and Cordage Hemp and Fibres* (1919); Robert Chapman, *A Treatise on Rope-making* (1868); H. R. Carter, *Modern Flax, Hemp and Jute Spinning and Twisting* (1925); P. J. Stopford, *Cordage and Cables* (1925); "U.S. Government Master Specifications for Rope Cotton," *Bureau of Standards Cir.* 326, (1927).

ROPE MOULDING, in architecture and the decorative arts, a convex half or quarter round moulding, spirally channelled, so that it resembles a rope; also called cable moulding (*q.v.*).

ROPES, JOHN CODMAN (1836–1899), American military historian and lawyer, was born at St. Petersburg on April 28, 1836. He graduated at Harvard in 1857, was admitted to the bar in 1861 and became a successful lawyer. He founded in 1876 the Military Historical Society of Massachusetts for the collection and discussion of evidence relating to the Civil War. To it he presented his military library and his collection of prints and medals. He died at Boston on Oct. 28, 1899. His principal work is an unfinished *Story of the Civil War,* to which he devoted most of his later years; this covers the years 1861–62 (1894–98). It was completed in five volumes in 1913 by W. R. Livermore. *The Army under Pope* (in "Campaigns of the Civil War," vol. iv., 1881) is a detailed narration of the Virginia campaign of Aug.–Sept., 1862, which played a great part in reversing contemporary judgment on the events of those operations, notably the condemnation of Gen. Fitz John Porter's conduct. His *Campaign of Waterloo* (1892) is a standard work.

ROPE-WALKING, the art of walking, dancing and performing tricks on a rope or wire stretched between two supports.

ROPEWAYS AND CABLEWAYS. The aerial ropeway is essentially an intermittent handling device and may be defined as that method of handling materials which consist of drawing receptacles—such as buckets or skips—suspended from ropes and by means of ropes, from place to place, such receptacles being manually or automatically filled and discharged. There is no limit to the length of a ropeway installation, since it may consist of any number of units, while the length of a single unit may be as much as 4½ miles.

Historical.—At what period of history ropeways were first used it is impossible to say, but the fact that ropes and pulley blocks—which are the essential parts of a ropeway—were known to the ancients, seems to render a pedigree of at least 2,000 years possible. An old engraving shows a ropeway in use in the City of Danzig in 1644. This was the work of Adam Wybe, a Dutch engineer, and is a single ropeway in its simplest form, consisting of an endless rope passing over pulleys suspended on posts; to the rope were attached a number of small buckets which carried earth from a hill outside the city to the rampart inside the moat. The rope was probably of hemp.

In modern ropeways wire ropes are exclusively used, which date back from about 1860, when a ropeway was erected in the Harz mountains. Since then several systems have been evolved, but space does not permit of entering into details of all the possible applications of a ropeway; it must suffice, therefore, to mention the two principal types, which are known as single and double ropeways. In the former, one endless travelling rope both supports and conveys the load, while in the latter the load carriers are supported by a stationary rail rope on which they are hauled along by an independent endless hauling rope. The systems are also termed, respectively, mono-cableway and bi-cableway, but since a cableway is generally understood to be a different type of aerial transport altogether the names single and double ropeway are preferable.

Such aerial transport resembles in substance vehicular rail transport; in this case, however, the rolling stock is suspended from a rope which serves as a rail, instead of running on the permanent way of a light railway. It is obvious that a single overhead rope as a track, has enormous advantages over a pair of rails laid on the ground, as in the orthodox rail-track with its sleepers, the cost of preparation of the ground has to be considered, which may involve the construction of embankments, bridges, etc. When building a ropeway the overhead rope should run in a bee-line from place to place—say from an undeveloped area to the nearest available point where main transport is available, whereas in the case of a light railway, owing to limitations of grade, usually about 3%, the permanent way has to traverse a tortuous route, three or four times as long possibly, as the bee-line of the rope-track, which, moreover, may be negotiated with safety on a grade of 40%. For example, a ropeway may be cited, which has a total length of 5,400 ft. with a total difference in altitude of 2,000 ft., the ground which it covers could not have been negotiated by a rail track of less than 15 m. in length, graded at 1 in 42. It is essential to take as straight a line as possible when laying out a ropeway because curves generally necessitate angle-stations, which entail expenditure of more capital and increase in working cost. On the other hand, ground that would be difficult for the railway engineer, such as steep hills, deep valleys and turbulent streams, has no terrors for the ropeway erector.

The Single Ropeway.—The single ropeway consists essentially of an endless running rope from which the carriers are suspended and with which they move in the following way:—The receptacles are fitted with simple curved hangers pivoted from a Λ-shaped saddle, which holds sufficiently tight by frictional contact to the rope and therefore travels with the same. The suspended frame of the load carrier is also fitted by the side of the Λ-shaped saddle with the small grooved pulley which engages at the terminals with shunt rails and thus disengages itself from the running rope; the frame of the load carrier becomes stationary on these shunt rails for filling or emptying, after which it is pushed on to the returning rope again. Or the carriers may be permanently fixed to this rope and move with it. The ropeway itself consists of an endless rope running between two terminal drums, one of 6 to 10 ft. diameter, known as the driving drum, being provided with power receiving and transmitting gear, while the drum at the opposite terminal is fitted with tightening gear. The endless rope is supported on suitable pulleys which are, in turn, supported on standards or trestles spaced at intervals, varying with the nature of the ground. The rope runs at an average speed of 4 m. per hour, at which speed the bucket or skip can be arranged to load and unload itself automatically. Generally speaking, the single ropeway is not so suitable for heavy loads and long distances as the double. The work of Ropeways Ltd. favours the single-rope system. The founder of that firm, J. Pearce Roe, introduced multiple sheaves for supporting the rope at each standard. The maximum load carried on such a ropeway is 150 tons per hour. Another installation on the same system serves an iron mine in Spain and spans 6,500 yd. of very rough country so steep that in many places even the sure-footed mule cannot keep on the track. This ropeway can deal with 85 tons per hour. The greatest distance covered on any one section of the single ropeway is 7,100 yd., or about 4 miles. The Dorada ropeway which is the longest in the world—47 m. in length—is built on the single-rope system. It has 15 units and a capacity of 20 tons per hour. In addition to the conveyance of merchandise, principally coffee, it is also occasionally used for passenger traffic.

The Double Ropeway.—This consists, as already stated, of an independent rail rope and a separate continuous hauling rope disposed parallel to one another. The carrier runs on the stationary rope which is fitted with running heads having grooved steel wheels. The load is borne by a hanger pivoted from the carrier and conveyed along the rail rope by the endless hauling rope at an average speed of 4 to 6 m. per hour. A great variety of clips have been introduced for the purpose of coupling the

carriers to the hauling rope, but these are automatically connected and disconnected at the shunt rails of the terminals. The hauling is operated by driving gear at one end and controlled at the other by tightening gear, just as in the single rope system. The rail ropes of a double ropeway are sectionalized every 2 or 3 m., whilst the longest section for a hauling rope is about 9 miles. Such ropeways will support single loads of 6 cwt. to a ton or more.

Motive Power.—The power required for a ropeway will vary according to conditions but is relatively moderate. If the aggregate down gradients exceed the up gradients the power consumption may be nil or the ropeway may even produce power which may be harnessed to drive other machines; or it may have to be absorbed by some form of brake device. In a Japanese ropeway 1,800 yd. in length, which runs mostly at an incline of 1 in 1½, the force generated is absorbed by a hydraulic brake, the revolving fan of which drives the water against fixed vanes which repel and heat it. In this way 50 h.p. is absorbed and the speed brought under the control of a hand brake.

The initial outlay for a ropeway is usually moderate, though of course it varies according to topographical conditions.

Ropeways are largely independent of weather conditions and their working need not be interrupted even by heavy snowfalls. Their construction is very simple and there is little to get out of order. Sound workmanship and good material will ensure a relatively long life. The ground space occupied by ropeway installations, beyond that occupied by the terminals is exceedingly small and is confined to the emplacements of the standards which, in modern ropeways are few and far between.

Aerial Cableways.—The aerial cableway is a development of the ropeway and is a conveyor capable of hoisting and dumping at any desired point. The load is carried along a track consisting of a single span of suspended cable which covers a comparatively short distance as rope haulage goes. The trackway may either run in a more or less horizontal direction, *i.e.*, the terminals may be on the same level, or it may be inclined at such an angle that the load will descend by gravity. The trackway or rail rope rests upon saddles of hard wood or iron on the tops of terminal supports usually known as towers, which may likewise be constructed of wood or iron, and if the exigencies of the work render it desirable they can be mounted on trolleys and rails, in which case the cableway is rendered portable and can be moved about, which is sometimes a great advantage in connection with dock and harbour work. The motive power may be either steam, gas, or electricity. The motor is situated in what is termed the head tower, which is occasionally a little higher than the tail tower. The span between the two towers sometimes extends to 2,000 ft., but this is exceptional. Objects weighing as much as 8 tons are handled by such devices. The load, which may be carried in a skip or tray, is borne by an apparatus called the carrier, which is a modification of a running head, consisting of pulleys and blocks and running along the main cable or trackway. This carrier is also fitted with pulleys or guides for the dump line, and is drawn along the main cable by an endless hauling rope which passes from the carrier over the head tower and is wound several times around the drum of the winding engine to secure frictional hold, then back over the head tower to the tail tower, returning to the rear end of the carrier. The hoisting rope passes from the engine to the fall-block for raising the load. The dump line comes from the other side of the winding engine drum and passes to a smaller block attached to the rear end of the skip or tray. The whole weight of the skip is borne by the hoisting rope, while the dump line comes in slack but at the same rate of speed. Whenever it is desired to dump the load the dump line is shifted to a section of the drum having a slightly larger diameter, and being thus drawn in at a higher rate of speed the load is discharged. The engine is then reversed and the carriage brought back for the next load.

This is, in outline, the mode of operating all cableways. These appliances have rendered great service as labour-savers in navvying, mining and quarrying work; for instance in placer-mining cableways have been found very useful when fitted with a self-filling drag-bucket which will take the place of a great number of hands. Cableways can be worked at a great speed; a good mean speed, however, would be 500 to 750 ft. per min. for conveying, and 200 to 300 ft. per min. for hoisting. *See* also TELPHERAGE.

(G. F. Z.)

ROPS, FÉLICIEN (1833–1898), Belgian painter, designer and engraver, was born at Namur, in Belgium, on July 7, 1833; he spent his childhood in that town, and afterwards in Brussels, where he composed in 1856, for his friends at the university, the *Almanach Crocodilien*, his first piece of work. He also brought out two *Salons Illustrés*, and collaborated on the *Crocodile*, a magazine produced by the students. The humour shown in his contributions attracted the attention of publishers. He designed, among other things, frontispieces for Poulet-Malassis, and afterwards for Gay and Doucé. In 1859–60 he contributed some of his finest lithographs to a satirical journal in Brussels called *Uylenspiegel*. About 1862 he went to Paris and worked at Jacquemart's. He subsequently returned to Brussels, where he founded the short-lived International Society of Etchers. In 1865 he brought out his famous "Buveuse d'Absinthe," which placed him in the foremost rank of Belgian engravers; and in 1871 the "Dame au Pantin." After 1874 Rops resided in Paris. His talent was stimulated by travels in Hungary, Holland and Norway. He executed 600 original engravings enumerated in Ramiro's *Catalogue of Rops' Engraved Work* (Paris, Conquet, 1887), and 180 from lithographs (Ramiro's *Catalogue of Rops' Lithographs*, Paris, Conquet, 1891), besides a large number of oil-paintings in the manner of Courbet, and of pencil or pen-and-ink drawings, several very remarkable water-colour pictures, among which are "Le Scandale," 1876; "Une Attrapade," 1877 (now in the Brussels Museum); a "Tentation de St. Antoine," 1878; and "Pornocrates," 1878. From 1880 to 1890 Rops devoted himself principally to illustrating books: *Les Rimes de joie*, by Théo Hannon; *Le Vice suprême* and *Curieuse*, by J. Péladan; and *Les Diaboliques*, by Barbey d'Aurévilly; *L'Amante du Christ*, by R. Darzens; and *Zadig*, by Voltaire; and the poems of Stéphane Mallarmé have frontispieces due to his fertile and powerful imagination. Before this he had illustrated the *Légendes Flamandes*, by Ch. de Coster; *Jeune France*, by Th. Gautier; and brought out a volume of *Cent Croquis pour réjouir les Honnêtes Gens*. His last piece of work, an advertisement of an exhibition, was done in November 1896. Rops died on Aug. 23, 1898, at Essonnes, Seine-et-Oise, on his estate, where he lived in complete retirement with his family. Rops joined the Art Society of the "XX.," formed at Brussels in 1884, as their revolutionary views were in harmony with the independence of his spirit. After his death, in 1899, the Libre Esthétique, which in 1894 had succeeded the "XX.," arranged a retrospective exhibition, which included about fifty paintings and drawings by Rops. His engraved work is the most important, both as to mastery of technique and originality of ideas. Hardly any artist of the 19th century equalled him in the use of the dry-point and soft varnish.

In 1896 *La Plume* (Paris) devoted a special number to this artist, fully illustrated. E. Deman, Brussels, brought out a volume in 1897 entitled *Félicien Rops et son oeuvre*—papers by various writers. We may also mention a study of *Félicien Rops*, by Eugène Demolder (Paris, 1894), and another by the same writer in *Trois Contemporains* (1901); *Les Ropsiaques*, by Pierre Gaume (London, 1898), and the notice by T. K. Huysmans in this volume called *Certains*. *See* also E. Romiro, *Félicien Rops* (1905).

RORQUAL, a name for a species of *Balaenoptera*, large whales of elongated shape, with a small back fin and longitudinal folds on the throat (*see* CETACEA). The flippers are small, the head small and flat, the whalebone coarse and short, the tail much compressed. There are probably four species. Sibbald's rorqual or blue whale (*B. musculus*) is the largest of all animals, reaching lengths of over 100ft. The common rorqual (*B. physalus*) is some 20ft. shorter, slate colour above and white beneath. (For illustration *see* CETACEA.)

RORSCHACH, a busy commercial town in the Swiss canton of St. Gall, situated on the south-west shore of the Lake of Constance, and by rail 62 m. N.E. of Zürich. In 1925 its population

was 11,250, mostly German-speaking. From 1408 to 1798 it belonged to the abbot of St. Gall, and then to the canton Säntis (named canton of St. Gall in 1803) of the Helvetic Republic.

ROS, SIR RICHARD (b. 1429), English poet, son of Sir Thomas Ros, lord of Hamlake (Helmsley) in Yorkshire and of Belvoir in Leicestershire, was born on March 8, 1429. In Harl. ms. 372 the poem of "La Belle Dame sanz Mercy," first printed in W. Thynne's *Chaucer* (1532), has the ascription "Translatid out of Frenche by Sir Richard Ros." "La Belle Dame sanz Mercy" is a long and rather dull poem from the French of Alain Chartier, and dates from about the middle of the 15th century. It is written in the Midland dialect, and is surprisingly modern in diction. The opening lines—

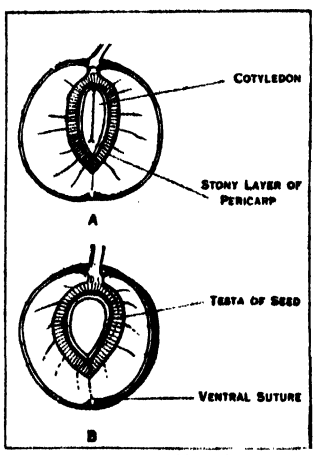
> Half in a dreme, not fully wel awaked,
> The golden sleep me wrapped under his wing,

have often been quoted, but the dialogue between the long-suffering lover and his lady does not maintain this level.

See W. W. Skeat, *Chaucerian and Other Pieces* (1897); and Dr. H. Gröhler, *Ueber Richard Ros' mittelenglische Uebersetzung* . . . (Breslau, 1886).

ROSA, CARL AUGUST NICHOLAS (1842–1889), English musical impresario, was born at Hamburg on March 22, 1842, his family name (which he subsequently changed) being Rose. He started as a solo violinist, studying at Leipzig and Paris. In 1867 he met and married the famous operatic soprano Madame Parepa (1836–74). In 1875 he started the Carl Rosa Opera company, for producing the best operas in English versions, and both during his own life and after his death this company popularized good music in England, encouraging native composers and training many singers. Carl Rosa married a second time in 1881. He died in Paris on April 30, 1889.

ROSA, SALVATOR (1615–1673), Italian painter of the Neapolitan school, was born in Arenella, in the outskirts of Naples, on July 21, 1615, according to Passeri. His father, Vito Antonio de Rosa, an architect, sent him to study in the convent of the Somaschi fathers. Salvator went to his uncle Paolo Greco to learn painting, then to his brother-in-law Francesco Fracanzaro, a pupil of Ribera, and afterwards to Ribera himself. He obtained some instruction under the battle-painter Aniello Falcone, but chiefly painted alone. Encouraged by Lanfranco he went to Rome in 1635 to study; but, catching fever, he returned to Naples and Falcone, and for a while painted nothing but battle-pieces. He went on to the landscape art peculiarly characteristic of him—wild scenes peopled with shepherds, seamen or especially soldiers. He then revisited Rome, and was housed by Cardinal Brancaccio. In 1646 he took part in the insurrection of Masaniello against the Spaniards but on the approach of Don John of Austria he escaped to Rome. He was a man of facile and versatile genius, an actor, poet and musician as well as a painter. It was about this time that Rosa wrote his satire named *Babylon*, under which name Rome was indicated.



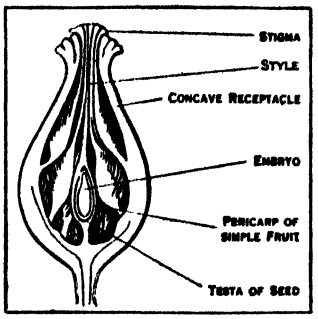
Cardinal Giancarlo de' Medici now invited the painter to Florence. Salvator remained in the Tuscan capital for the better part of nine years, introducing there the new style of landscape; he had no pupils, but various imitators. Lorenzo Lippi the painter poet, and other *beaux esprits* shared with Rosa the hospitalities of the cardinal, and they formed an academy named *I Percossi* (the Stricken). He was well acquainted also with Ugo and Giulio Maffei, and housed with them more than once in Volterra, where he wrote four other satires—*Music, Poetry, Painting* and *War*. Finally he reverted once more to Rome, and hardly left that city again. To confute his detractors he wrote the last of the series, entitled *Envy*. Among the pictures of his closing years were the "Battlepiece" now in the Louvre; "Pythagoras and the Fishermen"; the "Oath of Catiline" (Pitti Gallery); and "Saul and the Witch of Endor" (Louvre), which is almost his latest work. He died on March 15, 1673.

Rosa was a leader in that tendency towards the romantic and picturesque which has differentiated modern from old art. He himself courted reputation for his historical works, laying comparatively little stress on his landscapes; in portraits he was forcible. In chiaroscuro he is simple and effective; his design has energy and a certain grandeur. Among his pictures not already mentioned we may name, in the National Gallery, London, "Mercury and the Dishonest Woodman"; in the Pitti Gallery are many representative pictures including his own portrait and a grand portrait of a man in armour. Other works are at Chantilly, Chatsworth, Leningrad, Vienna and in Rome (Gall. Nazionale and Colonna). His etchings reflect his sympathy with the rough and ready life of the soldier and peasant. He also produced a number of large mythological and historical plates.

See G. B. Passeri, *Vite dei Pittori, Scultori ed Architetti* (Rome, 1772); F. Baldinucci, *La Vita di S. Rosa* (Venice, 1830); Lady Morgan, *Life and Times of S. R.* (1824); G. A. Cesareo, *Poesie e lettere di S. R.* (Naples, 1892); Leandro Ozzola, *Vita e Opere di Salvator Rosa* (Strasbourg, 1908); E. W. Manwaring, *Italian Landscape in 18th Century England* (New York, 1925).

ROSA, MONTE, the name of a great glacier-clad mountain mass (Aostan patois word *roëse*, a glacier) which rises south-east of Zermatt, and on the frontier between Switzerland and Italy. Ten summits in this huge mass are distinguished by name, of which four (Nordend, 15,132 ft., Zumsteinspitze, 15,004 ft., Signalkuppe or Punta Gnifetti, 14,965 ft., and Parrotspitze, 14,643 ft.) rise on the frontier. The five lower summits are on the Italian slope, but the highest of all, the Dufourspitze, 15,217 ft. (named by the Swiss government in honour of General Dufour, the head of the survey which first accurately fixed the position of these points), rises west of the frontier ridge, on a buttress, and being entirely in Switzerland, is its highest peak (and not, as often stated, the Dom, 14,942 ft., in the Mischabel group). The summit of the Dufourspitze was first attained in 1855 by a large English party, including G. and C. Smyth, and C. Hudson. The Zumsteinspitze was first climbed in 1820, the Signalkuppe (on top of which there is now a club hut) in 1842, the Nordend in 1861 and the Parrotspitze in 1863.

ROSACEAE, in botany, a large cosmopolitan family of seed-bearing plants which belong to the series Rosales of dicotyledons and containing about 100 genera with 2,000 species. The plants vary widely in manner of growth. Many are herbaceous, growing erect, as *Geum*, or with slender creeping stem, as in species of *Potentilla*, sometimes sending out long runners, as in strawberry; others are shrubby, as raspberry, often associated with a scrambling habit, as in the brambles and roses, while apple, cherry, pear, plum and other British fruit trees represent the arborescent habit. Vegetative propagation takes place by means of runners, which root at the apex and form a new plant, as in strawberry; by suckers springing from the base of the shoot and rising to form new leafy shoots after running for some distance beneath the soil, as in raspberry; or by shoots produced from the roots, as in cherry or plum. The scrambling of the brambles and roses is effected by means of prickles on the branches and leaf-stalks.



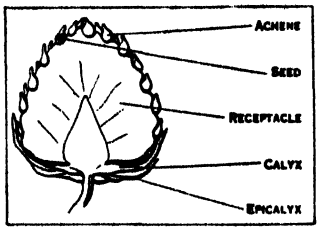
FROM GROOM, "ELEMENTARY BOTANY" (G. BELL & SONS)

CHERRY (PRUNUS CERASUS)

A. Vertical section of the drupe of Cherry, cut vertically through the ventral and dorsal suture; B. fruit cut vertically in a plane at right angles to preceding one

The leaves, which are arranged alternately, are simple, as in apple, cherry, etc., but more often compound, with leaflets palmately arranged, as in strawberry and species of *Potentilla*, or pinnately arranged, as in the brambles, roses, mountain ash, etc. A difference in this respect often occurs in one and the same genus, as in *Pyrus*, where apple (*P. Malus*), and pear (*P. communis*) have simple leaves, whereas mountain ash or rowan (*P. aucuparia*) has pinnately compound leaves. In warm climates the leaves are often leathery and evergreen. The leaves are stipulate, the stipules being sometimes small and short-lived, as in *Pyrus* and *Prunus* (cherry, plum, etc.), or more important structures adnate to the base of the leaf-stalk, as in roses, brambles, etc. The flowers,

which are regular, generally bisexual, and often showy, are sometimes borne singly, as in some species of rose, or of the cloudberry (*Rubus chamaemorus*), or few or more together in a corymbose manner, as in some roses, hawthorne and others. The inflorescence in agrimony is a raceme, in *Poterium* a dense-flowered spike, in *Spiraea*, a number of cymes arranged in a corymb. The parts of the flowers are arranged on a pentamerous plan, with generally considerable increase in the number of stamens and carpels. The shape of the thalamus or floral receptacle, and the relative position and number of the stamens and carpels and the character of the fruit, vary widely and form distinguishing features of the different suborders, six of which may be recognized.

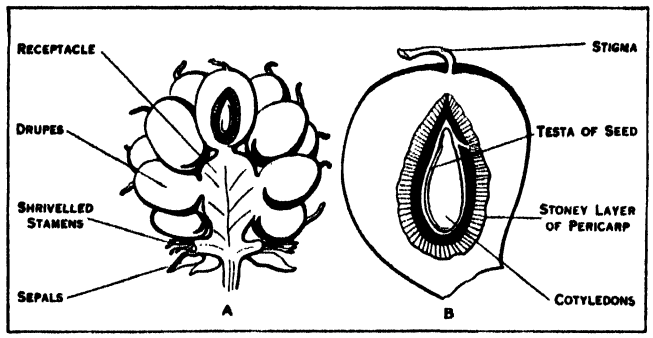


FROM GROOM, "ELEMENTARY BOTANY" (G. BELL & SONS)

DOG ROSE (ROSA CANINA), SHOWING VERTICAL SECTION OF COMPOUND FRUIT

Suborder I. Spiraeoideae is characterized by a flat or slightly concave receptacle on which the carpels, frequently two to five in number, form a central whorl; each ovary contains several ovules, and the fruit is a follicle except in *Holodiscus*. The plants are generally shrubs with simple or compound leaves and racemes or panicles of numerous small white, rose or purple flowers. This suborder is nearly allied to the family Saxifragaceae, chiefly north temperate in distribution. The largest is *Spiraea*, numerous species of which are cultivated in gardens; *S. salicifolia* occurs in Britain apparently wild in plantations, but is not indigenous. The native British meadow-sweet is *S. Ulmaria;* dropwort is *S. Filipendula.*

Suborder II. Pomoideae is characterized by a deep cup-shaped receptacle with the inner wall of which the two to five carpels are united; the carpels are also united with each other, and each contains generally two ovules. The fruit is made up of the large fleshy receptacle surrounding the ripe ovaries, the endocarp of which is leathery or stony and contains one seed. The plants are shrubs or trees with simple or pinnately compound leaves and white or rose-coloured often showy flowers. The genera are distributed through the north temperate zone, extending southwards in the New World to the Andes of Peru and Chile. The largest genus, *Pyrus,* with about 65 species, includes apple (*P. Malus*), pear (*P. communis*), wild service (*P. torminalis*), rowan or mountain-ash (*P. aucuparia*) and white beam (*P. Aria*). *Mespilus* (medlar) and *Cotoneaster* are also included. (*See* separate articles for most of the above.)



Suborder III. Rosoideae is characterized by the receptacle being convex and swollen, as in strawberry, or cup-shaped, as in rose, and bearing numerous carpels, each of which contains one or two ovules, while the fruit is one-seeded and indehiscent. The genera are grouped in tribes according to the form of the receptacle and of the fruit. The Potentilleae bear the carpels on a large, rounded or convex outgrowth of the receptacle. In the large genus *Rubus* the ripe ovaries form drupels upon the dry receptacles; the genus is almost cosmopolitan, but the majority of species occur in the forest region of the north temperate zone and in the mountains of tropical America. *R. fruticosus* is blackberry, *R. Idaeus,* raspberry, and *R. Chamaemorus,* cloudberry. In the flower of *Potentilla, Fragaria* (strawberry) and a few allied genera an *epicalyx* is formed by stipular structures arising at the base of the sepals. The fruits consist of numerous dry achenes borne in *Fragaria* on the much-enlarged succulent torus, which in the other genera is dry. In *Geum* (avens) and *Dryas* (an arctic and alpine genus) the style is persistent in the fruit, forming a feathery appendage (*Dryas*) or a barbed awn (avens), either of which is of service in distributing the fruit. The Potentilleae are chiefly north temperate, arctic and alpine plants.

STRAWBERRY (FRAGARIA VESCA), SHOWING VERTICAL SECTION OF COMPOUND FRUIT

The Roseae comprise the large genus *Rosa* (150 species), characterized by a more or less urn-shaped torus enclosing the numerous carpels which form dry one-seeded fruits enveloped in the bright-coloured fleshy torus. The plants are shrubs bearing prickles on the stems and leaves; many species have a scrambling habit resembling the brambles. The species of *Rosa,* like those of *Rubus,* are extremely variable, and a great number of subspecies, varieties and forms have been described. Petals are often wanting, as in *Alchemilla* (lady's mantle) and *Poterium,* and the flowers are often unisexual and frequently wind-pollinated, as in salad burnet (*Poterium Sanguisorba*), where the small flowers are crowded in heads, the upper pistillate, with protruding feathery stigmas, and the lower staminate (or bisexual), with exserted stamens. *Agrimonia* (agrimony) has a long spike of small honeyless flowers with yellow petals; in the fruit the torus becomes hard and crowned by hooked bristles which ensure the distribution of the enclosed achenes.

BLACKBERRY (RUBUS FRUTICOSUS); SHOWING (A) VERTICAL SECTION OF COMPOUND FRUIT, (B) VERTICAL SECTION OF SINGLE DRUPE (ENLARGED)

Suborder IV. Neuradoideae contains only two genera of desert-inhabiting herbs with yellow flowers; and the five to ten carpels are united together and with the base of the cup-shaped torus, which enlarges to form a dry covering round the one-seeded fruits.

Suborder V. Prunoideae is characterized by a free solitary carpel with a terminal style and two pendulous ovules, and the fruit a one-seeded drupe. The torus forms a cup from the edge of which spring the others parts of the flower. The plants are deciduous or evergreen trees or shrubs with simple leaves often with small caducous stipules, and racemes or umbels of generally showy, white or pink flowers. There are five genera, the chief of which is *Prunus,* to which belong the plum (*Prunus communis*), with several well-marked subspecies—*P. spinosa* (sloe or blackthorn), *P. insititia* (bullace), *P. domestica* (wild plum), the almond (*P. Amygdalus*) with the nearly allied peach (*P. persica*), cherry (*P. Cerasus*), birdcherry (*P. Padus*) and cherry laurel (*P. Laurocer-*

asus). The tribe is distributed through the north temperate zone, passing into the tropics.

Suborder VI. Chrysobalanoideae resembles the last in having a single free carpel and the fruit a drupe, but differs in having the style basal, not terminal, and the ovules ascending, not pendulous; the flowers are also frequently zygomorphic. The genera are tropical evergreen trees or shrubs, the great majority being South American.

In North America the family is represented by about 40 genera, the largest being *Crataegus* (hawthorn) with about 70

species, *Rubus* (bramble) with 40 species, *Potentilla* (cinquefoil, five-finger) with about 40 species, *Prunus* (plum, *cherry*, etc.) with 20 species, and *Rosa* with 15 species. *Potentilla* is the most generally distributed genus in the United States.

ROSAMOND, known as "The Fair" (d. *c.* 1176), mistress of Henry II., king of England, is believed to have been the daughter of Walter de Clifford of the family of Fitz-Ponce. Rosamond is said to have been Henry's mistress secretly for several years, but was openly acknowledged by him only when he imprisoned his wife Eleanor of Acquitaine as a punishment for her encouragement of her sons in the rebellion of 1173–74. Rosamond died in 1176, and was buried in the nunnery church of Godstow before the high altar. The body was removed by order of St. Hugh, bishop of Lincoln, in 1191, and was, seemingly, reinterred in the chapter house. The story that she was poisoned by Queen Eleanor first appears in the French Chronicle of London in the 14th century. The romantic details of the labyrinth at Woodstock, and the clue which guided King Henry II. to her bower, were the inventions of story-writers of later times. There is no evidence for the belief that she was the mother of Henry's natural son William Longsword, earl of Salisbury.

ROSARIO, a city and river port of Argentina, in the province of Santa Fé, on the west bank of the Paraná, 186 m. by rail N.W. of Buenos Aires. Pop. (1922, estimate) 265,000. It ranks next to Buenos Aires in size and in trade. It is accessible to ocean-going steamers of 26 ft. draught. The city stands on the eastern margin of the great pampean plain, 65 to 75 ft. above the wide river-bed washed out by the Paraná. It extends back a considerable distance from the river, and there are country residences and gardens of the better class along the line of the Central Argentine railway and northward toward San Lorenzo. The city is laid out with chessboard regularity, and the streets are well paved, lighted with gas and electricity, traversed by tramway lines, and provided with sewers and water mains. The Boulevard El Santafecino is an attractive residence street with double driveways separated by a strip of garden and bordered by fine shade trees. The chief edifices of an official character are the custom-house, post-office, municipal hall and law courts. There is a large charity hospital, and the English and German colonies maintain a well-equipped infirmary. The largest sugar refinery in Argentina is here, and there are flour-mills, breweries and some smaller manufactures. The city is chiefly commercial, being the shipping port for a large part of northern Argentina, among its exports being wheat, flour, baled hay, linseed, Indian corn, sugar, rum, cattle, hides, meats, wool, quebracho extract, etc. The railway connections are good, including the Buenos Aires and Rosario and the Central Argentine lines to the national capital, the Buenos Aires and Rosario line northward to Tucumán, where it connects with the Government line to Salta, Jujuy and the Bolivian frontier, the Central Argentine line westward to Córdoba, with connections at Villa María for Mendoza and the Chilean frontier, and two narrow-gauge lines, one running to Santa Fé and the other to Córdoba. The port of Rosario is well equipped with modern appliances for handling freight.

Rosario was founded in 1730 by Francisco Godoy, but it grew so slowly that it was still a small village up to the middle of the 19th century. In 1854 Gen. Justo José de Urquiza, then at the head of the Argentine Confederation, made it the port of the ten inland provinces then at war with Buenos Aires, and in 1857 imposed differential duties on the cargoes of vessels first breaking bulk at the southern port.

ROSARY, a popular devotion of the Roman Catholic Church, consisting of 15 Paternosters and Glorias and 150 Aves. The word also denotes the chaplet of beads for counting the prayers. It is divided into three parts, each containing five decades, a decade comprising 1 Pater, 10 Aves and a Gloria, in addition to a subject for meditation selected from the "mysteries" of the life of Christ and of the Blessed Virgin. The Christian practice of repeating prayers is traceable to early times: Sozomen mentions (*H.E.* v. 29) the hermit Paul of the 4th century who threw away a pebble as he recited each of his 300 daily prayers. It is not known precisely when the mechanical device of the rosary was first used. William of Malmesbury (*De gest. pont. Angl.* iv. 4) says that Godiva, who founded a religious house at Coventry in 1043, left a string of jewels, on which she had told her prayers, that it might be hung on the statue of the Blessed Virgin. Thomas of Cantimpré, who wrote about the middle of the 13th century, first mentions the word "rosary" (*De apibus,* ii. 13), using it in a mystical sense as Mary's rose-garden. Jacob Sprenger, a Dominican, founded the first confraternity of the rosary at Cologne in 1474. The feast of the Rosary of the Blessed Virgin Mary was ordered to be observed on the first Sunday in Oct. in such churches as maintained an altar in honour of the rosary. Clement XI., by bull of Oct. 3, 1716, directed the observance of the feast by all Christendom.

Petit, *Les Confrères musulmanes* (Paris, 1899), and E. Arnold, *Pearls of the Faith, or Islam's Rosary* (London, 1882). There is an excellent article, "Rosenkranz," by Zöckler in Herzog-Hauck, *Realencyklopädie,* 3rd ed. vol. 17, pp. 144–150.

ROSAS, JUAN MANUEL DE (1793–1877), tyrant of Buenos Aires and outstanding figure in the history of Argentina, was born on March 30, 1793, in the city of Buenos Aires, where his father took an active part in defeating the English in 1807. Juan Rosas received a meagre education and at an early age left his parents. For a time he subsisted as a *vaquero,* or cowboy, but later purchased a cattle-run of his own, Los Cerrillos. The anarchical state of the country since winning its independence enabled him to obtain leave to arm his cowboys, whom he made the most efficient fighting force in the country. By adroit use of this weapon, and by strict attention to his own interest, he rapidly became the dominant figure in the province of Buenos Aires. As governor of the province from 1829 to 1832, he gave it the first peace it had known in 20 years, so that in 1835, after a brilliant Indian campaign, he was unanimously elected dictator of Buenos Aires, and held that position until 1852. Throughout his régime, he waged a war of extermination against the leaders of the interior provinces who sought to combine against him or to set up for

themselves as independent rulers. In spite of the continual combinations, domestic and foreign, in which this policy embroiled him, and of wars with Paraguay, Chile, Peru, Brazil, Uruguay, France and England, from which he had scarcely a moment's freedom, he broke the powers of the *caudillos* and upheld the supremacy of Buenos Aires in the country. In 1852 he was finally overthrown by a coalition of his neighbours and disaffected generals. He took refuge in England, at Swaythling, near Southampton, where he lived in poverty until his death on March 17, 1877.

(W. B. P.)

ROSCELLINUS (RUCELINUS or ROUSSELIN) (*c.* 1050–*c.* 1122), often called the founder of Nominalism (*see* SCHOLASTICISM), was born at Compiègne (Compendium). He studied at Soissons and Reims, was afterwards attached to the cathedral of Chartres, and became canon of Compiègne. It seems most probable that Roscellinus was not strictly the first to promulgate nominalistic doctrines; but in his exposition they received more definite expression, and, being applied to the dogma of the Trinity, attracted universal attention. Roscellinus maintained that it is merely a habit of speech which prevents our speaking of the three persons as three substances or three Gods. If it were otherwise, and the three persons were really one substance or thing (*una res*), we should be forced to admit that the Father and the Holy Spirit became incarnate along with the Son. Roscellinus seems to have put forward this doctrine in perfect good faith, and to have claimed for it at first the authority of Lanfranc and Anselm. In 1092, however, a council convoked by the archbishop of Reims condemned his interpretation, and Roscellinus, who was in danger of being stoned to death by the orthodox populace, recanted his error. He fled to England, but having made himself unpopular by an attack on the doctrines of Anselm, he left the country and repaired to Rome, where he was well received and became reconciled to the Church. He then returned to France, taught at Tours and Loc-menach (Loches) in Brittany (where he had Abelard as a pupil), and finally became canon of Besançon. He is heard of as late as 1121, when he came forward to oppose Abelard's views on the Trinity.

Of the writings of Roscellinus, nothing is preserved except a letter to Abelard, mainly concerned with the doctrine of the Trinity (ed. J. A. Schmeller, Munich, 1850). *See* F. Picaret, *Rosselin, philosophe et théologien* (1896), and authorities quoted under SCHOLASTICISM.

ROSCIUS GALLUS, QUINTUS (*c.* 126–62 B.C.), Roman actor, was born, a slave, at Solonium, near Lanuvium. He studied the delivery and gestures of the most distinguished advocates in the Forum, especially Q. Hortensius, and won universal praise for his grace and elegance on the stage. He especially excelled in comedy. Cicero took lessons from him. The two often engaged in friendly rivalry to try whether the orator or the actor could express a thought or emotion with the greater effect, and Roscius wrote a treatise in which he compared acting and oratory. Q. Lutatius Catulus composed a quatrain in his honour, and the dictator Sulla presented him with a gold ring, the badge of the equestrian order, a remarkable distinction for an actor in Rome, where the profession was held in contempt. Like his contemporary Aesopus, Roscius amassed a large fortune, and he appears to have retired from the stage some time before his death. In 76 B.C. he was sued by C. Fannius Chaerea for 50,000 sesterces (about £400), and was defended by Cicero in a famous speech.

See H. H. Pflüger, *Cicero's Rede pro Q. Roscio Comoedo* (1904).

ROSCOE, SIR HENRY ENFIELD (1833–1915), English chemist, was born in London on Jan. 7, 1833. After studying at University college, London, where he came under the influence of Graham and Williamson, he went to Heidelberg to work under R. W. Bunsen. In 1857 he succeeded Sir E. Frankland in the chair of chemistry at Owens college, Manchester, where he remained for 30 years, and from 1885 to 1895 he was M.P. for the south division of Manchester. He served on several royal commissions on educational questions, in which he was keenly interested, and from 1896 to 1902 was vice-chancellor of London university. He was elected a fellow of the Royal Society in 1863 and awarded a Royal Medal in 1873. He was knighted in 1884, and died at Leatherhead, Surrey, on Dec. 18, 1915.

Roscoe's first published paper (1854) deals with the analysis of certain varieties of gneiss, but this problem was set him in order to acquire analytical skill. His scientific work includes a memorable series of researches carried out with Bunsen between 1855 and 1862, in which they laid the foundations of comparative photochemistry; this work was subsequently continued by Roscoe alone. In 1867 he began an elaborate investigation of vanadium and its compounds, which probably constitutes his chief contribution to inorganic chemistry; he devised a process for preparing the metal in a pure state. He was the author of researches on niobium, tungsten, uranium, perchloric acid, the solubility of ammonia, etc. Roscoe also investigated the "constant boiling mixtures" of the common volatile acids with water; he proved that the compositions of the mixtures depended on the external pressure and so they could not be definite compounds. He was very interested in spectrum analysis, but although he lectured and wrote on the subject he did little research in this direction. His publications include: *Lectures on Spectrum Analysis* (1869); a *Treatise on Chemistry* (the first edition of which appeared in 1877–92); *A New View of Dalton's Atomic Theory*, with Dr. A. Harden (1896); and an *Autobiography* (1906). The *Treatise on Chemistry*, written in collaboration with Carl Schorlemmer (1834–92), is a standard work.

See Obituary notice, *Proc. Roy. Soc.*, vol. 93 (1916–17).

ROSCOE, WILLIAM (1753–1831), English historian and miscellaneous writer, was born on March 8, 1753 at Liverpool, the son of a market-gardener and publican. In 1769 he was articled to a solicitor, and in 1774 he commenced business as an attorney. Roscoe was also a political pamphleteer, and like many other Liberals of the day hailed the promise of liberty in the French Revolution. The commercial crisis of 1816 brought to Roscoe great difficulties, and forced him to sell his great collection of books and pictures. Some of these were secured by friends and placed in the library of the Liverpool Athenaeum. Roscoe now found a pleasant task in arranging the library of his friend Coke of Holkham. He died on June 30, 1831.

The first edition of his *Poetical Works* was published in 1857, and is sadly incomplete, omitting, with other verses known to be from his pen, the *Butterfly's Ball*, a fantasy, which has charmed thousands of children since it appeared in 1807. Other verses are in *Poems for Youth, by a Family Circle* (1820).

The *Life* by his son Henry Roscoe (2 vols., 1833) contains full details of Roscoe's career, and there are references to him in the *Autobiographical Sketches* of De Quincey, and in Washington Irving's *Sketch Book*.

ROSCOMMON, WENTWORTH DILLON, 4TH EARL OF (*c.* 1630–1685), English poet, was born in Ireland about 1630. He was a nephew of Thomas Wentworth, earl of Strafford, and was educated partly under a tutor at his uncle's seat in Yorkshire, partly at Caen in Normandy and partly at Rome. After the Restoration he returned to England, and was well received at court. In 1649 he had succeeded to the earldom of Roscommon, and he was now put in possession by act of parliament of all the lands possessed by his family before the Civil War.

His reputation as a didactic writer and critic rests on his blank verse translation of the *Ars Poetica* (1680) and his *Essay on Translated Verse* (1684). The essay contained the first definite enunciation of the principles of "poetic diction," which were to be fully developed in the reign of Queen Anne. Roscommon, who was fastidious in his notions of "dignified writing," was himself a very correct writer, and quite free from the indecencies of his contemporaries. He saw clearly that a low code of morals was necessarily followed by a corresponding degradation in literature, and he insists that sincerity and sympathy with the subject in hand are essential qualities in the poet. He has the distinction of having been the first critic to avow his admiration for *Paradise Lost*. He was buried in Westminster Abbey on Jan. 21, 1685.

Roscommon's poems were collected in 1701, and are included in Anderson's and other collections of the British poets. He also translated into French from the English of Dr. W. Sherlock, *Traitté touchant l'obéissance passive* (1686).

ROSCOMMON, a county of Ireland in the province of Connaught, bounded north-east by Leitrim, north-west by Sligo, west

by Mayo, west and south by Galway, east by Longford and east and south by Westmeath and Offaly County. The area is 629,633 ac., or about 985 sq.m. Pop. (1926) 83,504. The greater part of the county belongs to the great limestone plain of central Ireland. In the north-east, on the Leitrim border, the Braulieve mountains, consisting of flat-topped ridges, attain an elevation in Cashel mountain of 1,377 ft.; and in the north-west the Curlew mountains, of similar formation, between Roscommon and Sligo, rise abruptly to a height over 800 feet. In the east the Slievebawn range, formed of sandstone, have a similar elevation. The Shannon forms nearly the whole eastern boundary of the county, and on the west the Suck from Mayo forms for over 50 m. the boundary with Galway till it unites with the Shannon at Shannon Bridge. The other tributaries of the Shannon within the county are the Arigna, the Feorish and the Boyle. The lakes formed by expansions of the Shannon on the borders of Co. Roscommon are Loughs Allen, Boderg, Boffin, Forbes and Ree. Other lakes within the county are Lough Key in the north and Lough Gara (mostly in Co. Sligo) in the north-west. The county town, Roscommon, has a population of 1,830.

The district was granted by Henry III. to Richard de Burgo, but remained almost wholly in the possession of the native septs. Until the time of Elizabeth, Connaught was included in the two districts of Roscommon and Clare, but in 1579 it was further subdivided by Sir Sydney, and was assigned its present limits. All the old proprietors were dispossessed at the Cromwellian settlement, except the O'Conor family headed by the O'Conor Don. Within the county are the ruins of Crogan, the palace of the kings of Connaught. The principal ancient castles are the stronghold of the M'Dermotts on Castle island, Lough Key, the dismantled castle of the M'Donoughs at Ballinafad, and the extensive fortress at Roscommon rebuilt by John d'Ufford, justiciary of Ireland in 1268. There are fragments of a round tower at Oran. The abbey of Boyle is in good preservation, and has good Norman arches. The Irish bard Carolan, who died in 1738, is buried by the ruined church of Kilronan, in the extreme north of the county. The bishopric of Elphin was united with Kilmore and Ardagh in 1833, and the former cathedral and episcopal buildings are largely modernized.

The administrative county of Roscommon returns four members to Dáil Eireann.

ROSE, the name of a distinguished family of German chemists. VALENTINE ROSE the elder was born on Aug. 16, 1736 at Neu-Ruppin, and died on April 28, 1771 at Berlin, where he was an apothecary and, for a short time, assessor of the Ober Collegium Medicum. He was the discoverer of "Rose's fusible metal." His son, VALENTINE ROSE the younger, born on Oct. 31, 1762, at Berlin, was also an apothecary in that city and assessor of the Ober Collegium Medicum from 1797. It was he who in 1800 proved that sulphuric ether contains no sulphur. He died in Berlin on Aug. 10, 1807, leaving four sons, one of whom, Heinrich, was a distinguished chemist, and another, Gustav, a crystallographer and mineralogist. HEINRICH ROSE, born at Berlin on Aug. 6, 1795, began to learn pharmacy in Danzig. During the summer of 1816 he studied at Berlin under M. H. Klaproth, and in the autumn entered a pharmacy at Mitau. In 1819 he went to Stockholm, where he spent a year and a half with J. J. Berzelius, and in 1821 he graduated at Kiel. Returning to Berlin he became a *Privatdozent* in the university in 1822, extraordinary professor of chemistry in 1823 and ordinary professor in 1835, and there he died on Jan. 27, 1864. He devoted himself especially to inorganic chemistry and the development of analytical methods, and the results of his work are summed up in the successive issues of his classical work, *Ausführliches Handbuch der analytischen Chemie* (Berlin, 1829; 6th revised ed. in French, Paris, 1861). He was the discoverer of antimony pentachloride and Columbium compounds.

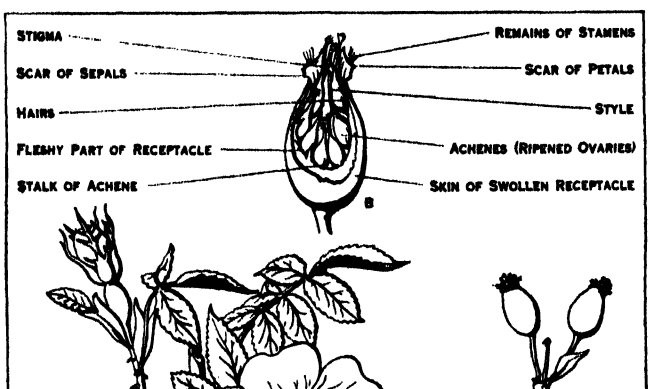
His brother, GUSTAV ROSE (1798–1873), born at Berlin where he became successively *Privatdozent* (1823), extraordinary professor of mineralogy (1826) and ordinary professor (1839). He explored Southern Asia under the direction of Humboldt, and also made detailed studies of Vesuvius and Etna and of the extinct volcanoes of Auvergne. The science of petrography, according to G. vom Rath, originated with him. He was the first in his own country to use the reflecting goniometer for the measurement of the angles of crystals, and to teach the method of studying rocks by means of microscopic sections.

In addition to many scientific memoirs he published *Elemente der Krystallographie* (1830); *Mineralogischgeognostische Reise nach dem Ural, dem Altai und dem Kaspische Meere* (1837–42); *Das Krystallochemische Mineral-system* (1852); and *Beschreibung und Eintheilung der Meteoriten* (1863).

ROSE, JOHN HOLLAND (1855–), English historian, was born at Bedford, and educated at Owens college, Manchester. In 1911 he was appointed reader in modern history, and in 1919 Vere-Harmsworth professor of naval history, at Cambridge university. His researches were directed to the French revolutionary and Napoleonic era on which he became a recognized authority.

His numerous historical works include *The Life of Napoleon I.* (1902); *The Development of the European Nations, 1870–1900* (1905); *William Pitt and the Great War* (1911); *The Personality of Napoleon* (1912); *The Origin of the War* (1914); *Nationality as a Factor in Modern History* (1916) and many articles and papers.

ROSE (*Rosa*). The rose has for all ages been the favourite flower, and has a place in general literature that no other plant can rival. In most cases the rose of the poets and the rose of the botanist are one and the same in kind, but popular usage has attached the name rose to a variety of plants whose kinship to the true plant no botanist would for a moment admit. The rose gives its name to the family Rosaceae, of which it may be considered the type. The genus consists of species varying in number, according to the diverse opinions of botanists, from 30 to 180, or even 250, exclusive of the many hundreds of mere garden varieties. The wide discrepancy above alluded to illustrates very forcibly the extreme variability of the plants, their adaptability to various conditions, and consequently their wide dispersion over the globe, the facility with which they are cultivated, and the readiness with which new varieties are continually being produced in gardens by the art of the hybridizer or by careful selection. The species are natives of all parts of the Northern Hemisphere but, except at considerable elevations, are scantily represented in the Tropics.



They are erect or climbing shrubs, never herbs or trees, generally more or less copiously provided with straight or hooked prickles of various shapes and with glandular hairs, as in the sweet-brier or in the moss-rose of gardens. The leaves are invariably alternate, provided with stipules, and unequally pinnate, the leaflets varying in number from 1 to 11 and even 15, the odd leaflet always being at the apex, the others in pairs. The flowers are solitary or in loose cymes (cluster-roses) produced on the ends of the shoots. The flower-stalk expands into a vase- or urn-shaped dilatation, called the receptacle or receptacular tube, which ultimately becomes fleshy and encloses in its cavity the numerous carpels or fruits. From the edge of the urn or "hip" proceed five sepals, often more or less compound like the leaves and overlapping in the bud. Within the sepals are five petals, generally broad or roundish in outline, with a very short stalk or none at all, and of very various shades of white, yellow or red. The very numerous stamens originate slightly above the sepals and petals; each has a slender filament and a small two-celled anther. The carpels are very numerous, ultimately hard in texture, covered with hairs, and each provided with a long style and button-like stigma. The carpels are concealed within the receptacular tube and only the stigmas as a rule protrude from its mouth. Each carpel contains one ovule.

The so-called fruit is merely the receptacular tube, which, as previously mentioned, becomes fleshy and brightly coloured as an attraction to birds, which devour the hips and thus secure the dispersion of the seed. The stamens are in whorls, and, according to Payer, they originate in pairs one on each side of the base of each petal so that there are ten in each row; a second row of ten alternates with the first, a third with the second, and so on. By repeated radial and tangential branching a vast number of stamens are ultimately produced, and when these stamens assume a petaloid aspect we have as a consequence the double

flowers which are so much admired. Under natural circumstances rose flowers do not secrete honey, the attraction for insects being provided by the colour and perfume and the abundance of pollen for food. The stigmas and anthers come to maturity at the same time, and thus, while cross-fertilization by insect agency is doubtless most common, self-fertilization is not prevented.

The large number of species, subspecies, varieties and forms described as British may be included under about 12 species. Among them may be mentioned *R. spinosissima*, the Scotch rose, much less variable than the others; *R. rubiginosa* (or *R. eglanteria*), the sweet-brier, represented by several varieties; *R. canina*, the dog rose, including numerous subspecies and varieties; the large-fruited apple rose, *R. pomifera;* and *R. arvensis*, the parent of the Ayrshire roses. Cultivated roses are frequently "budded" or worked upon the stems of the brier or *R. canina*, or upon young seedling plants of the same species; and upon stems of an Italian rose called the Manetti. Other species, notably *R. polyantha* and *R. rugosa*, also are used for stocks and do well.

The numerous forms native to North America may be referred to about 20 species. These are widely distributed and include several well-known wild roses. The smooth rose (*R. blanda*), usually lacking prickles, with flowers about 3 in. broad, occurs abundantly from Newfoundland to Saskatchewan and southward to New Jersey and Missouri. The prickly rose (*R. acicularis*), with spiny stems, leaves composed of from 5 to 9 leaflets, and solitary flowers, 2½ in. broad, ranges from Quebec to Alaska and south to Colorado. The pasture rose (*R. virginiana*), from ½ to 6 ft. high, with few or solitary flowers, 2 to 3 in. across, sometimes double, occurs from Newfoundland to Wisconsin and south to Georgia. This is the most common wild rose of the Eastern States and Canada. The prairie rose (*R. setigera*), with climbing

DOG ROSE (ROSA CANINA), SHOWING SPRAY WITH FLOWERS, LEAVES AND THORNS
(A) Fruit (pips), (B) One pip cut vertically to show achenes or true fruits inside the ripened receptacle (pome)

stems, leaves usually with three leaflets, bears rose-pink flowers which turn white with age. This handsome rose, which grows wild from Ontario to Wisconsin and south to Florida and Texas, has become naturalized eastward to New England. The California rose (*R. californica*), a sparsely prickly shrub, 3 to 9 ft. high, flowering nearly the year round, sometimes forms thickets along streams. The Cherokee rose (*R. laevigata*), a vigorous evergreen climber native to China and Japan, widely planted in the Southern States and running wild as if indigenous, was first described botanically from American plants.

Roses have been grown for so many centuries and have been crossed and recrossed so often that it is difficult to refer the cultivated forms to their wild prototypes. The older roses doubtless originated from *R. gallica*, a native of central and southern Europe. *R. centifolia* (the cabbage rose), a native of the Caucasus, contributed its share. A cross between *R. gallica* and *R. indica* was the source of the important Bourbon roses. The yellow-flowered Austrian and Persian brier originated from *R. lutea*, a native of Austria and the East. The monthly or China roses sprang from the Chinese *R. indica*, and these, crossed with others of the *R. centifolia* or *gallica* type, are the source of the "hybrid perpetuals." Tea roses and noisettes also acknowledge *R. indica* as one of their progenitors. A magnificent race called "hybrid teas" have been evolved by crossing the tea roses and hybrid perpetuals. They are much more vigorous in constitution than the true tea roses, while quite as beautiful in blossom and more perpetual in bloom than the hybrid perpetuals. By crossing the Japanese *R. Wichuriana* with hybrid perpetuals a beautiful and vigorous race of climbers has been produced.

The Banksian rose is a Chinese climbing species, with small white or fawn-coloured flowers of great beauty, but rarely seen; the Macartney rose (*R. bracteata*) is also of Chinese origin. Its nearly evergreen deep green leaves and large white flowers are very striking. The Japanese *R. rugosa* is also a remarkable species, notable for its bold rugose foliage, its large white or pink flowers, and its conspicuous globular fruit. *R. damascena* is cultivated in some parts of the Balkans for the purpose of making attar of roses. In Germany the same variety of rose is used, while at Grasse a strain of the Provence rose is cultivated for the same purpose. In India *R. damascena* is grown largely near Ghazipur for the purpose of procuring attar of roses and rose water. Rose water is chiefly produced in Europe from the Provence or cabbage rose, *R. centifolia*, grown for the purpose at Mitcham, England, and abundantly in the south of France. Conserve of roses and infusion of roses, two medicinal preparations, are prepared from the petals of *R. gallica*. A conserve of roses is made in the Caucasus.

Cultivation.—The rose is so universal a favourite that some portion of the garden must necessarily be devoted to it, if the situation be at all favourable. Many choice roses will not, however, thrive in the vicinity of large towns, since they require a pure air, and do not endure a smoky atmosphere. The best soil for them is a deep rich strong loam free from stagnant moisture. Very light sandy or gravelly soils, or soils which are clayey and badly drained, are not suitable. Light soils would be improved by a dressing of strong loam in conjunction with cow-dung or nightsoil; the latter, provided it is properly prepared and not too fresh, is indeed the very best manure for roses in all but soils which are naturally very rich. Heavy soils are improved by adding burned earth or gritty refuse, with stable manure and leaf-mould, peat moss litter, etc.; and damp soils must necessarily be drained by trenching. Tea roses may, however, be grown to perfection in a gravel soil, provided it be well manured. Roses generally require a constant annual supply of manure, and, if this is given as a mulching in autumn, it serves to protect their roots through the winter. They also require liberal supplies of water during the growing season, unless the surface is mulched or top-dressed from time to time with well-rotted manure. Mulching with manure however, during the growing season has the disadvantage that it enriches the top layer of soil and encourages the formation of surface roots which often perish from lack of moisture during hot weather; and many growers prefer to rely on keeping a top mulch of fine soil by frequent and vigorous hoeing.

An open situation, not shaded but sheltered from strong winds, is what the rose prefers. October and November are the best months for planting roses, but if the weather be wet or frosty and the soil sticky, the plants should be placed in a sheltered place and protected by green boughs or matting until suitable conditions prevail. The planting should never be deep, the uppermost layer of roots being about 2 or 3 in. below the general level

of the surface, and the soil should always be kept stirred with the hoe during the summer months. In regard to pruning, roses vary considerably, some requiring close cutting and others only thinning out; some again, such as strong growing climbers, may be safely pruned in autumn, and others are better left till spring. Instructions on this point as to the several groups of varieties will be found in most rose catalogues. It may be laid down as a general rule that the more strongly growing varieties should be less severely cut back than the weakly varieties; and, again, the more tender the variety, the later in the spring should the pruning be done, April being the best month for pruning teas and noisettes.

Where dwarf beds of roses are required, a good plan is to peg down to within about 6 in. from the ground the strong one-year-old shoots from the root. In due time blooming shoots break out from nearly every eye, and masses of flowers are secured, while strong young shoots are thrown up from the centre, the plant being on its own roots. Before winter sets in, the old shoots which have thus flowered and exhausted themselves are cut away, and three or four or more of the strongest and best ripened young shoots are reserved for pegging down the following season, which should be done about February. In the meantime, after the pruning has been effected, plenty of good manure should have been dug in lightly about the roots. Thus treated, the plants never fail to produce plenty of strong wood for pegging down each succeeding season.

One of the most troublesome fungoid pests of the rose is the mildew (*Sphaerotheca pannosa*). The young shoots, leaves and flower-buds frequently become covered with a delicate white mycelium, which by means of the suckers it sends into the underlying cells robs its host of considerable amounts of food, and causes the leaves to curl and fall early. The spores are produced in great abundance and carried by animals and the wind to other plants, and so the disease is rapidly spread. Later the mycelium increases and forms a thick velvety coating on the young shoots, and in this the winter stage of the fungus is produced. Spraying with potassium sulphide (1 oz. to 2 to 3 gal. of water) is a good means of checking the spread of the disease.

The rose rust (*Phragmidium subcorticatum*) appears on both cultivated and wild roses in the spring, bursting through the bark in the form of copious masses of orange powder consisting of the spores of the fungus. These spores infect the leaves, and produce on them in the summer small dots of an orange colour and, later, groups of spores that are able to live through the winter. The last, the teleutospores, are of a dark colour, and it is by these that the disease is started in the spring. It is therefore important that all the affected leaves should be destroyed in the autumn, and the bushes should be sprayed with a copper mixture in the spring to prevent the infection of the leaves by spores brought from a distance. Many other fungi attack the rose, but perhaps the only other one that merits mention here is *Actinonema Rosae*. This attacks the leaves, forming large dark blotches upon them and frequently causing them to fall prematurely.

A very large number of insect pests are found upon the rose, but the best known and most formidable on account of their great powers of reproduction are the aphides. More than one species is found upon the rose, though *Aphis rosae* is the commonest. Their attack should be checked by the use of a quassia or nicotine spray. The larvae of some of the *Tortrix* moths fold the leaves almost as soon as they are developed from the bud, and do considerable damage in this way and by devouring the leaves, while several "looper" caterpillars are also found feeding on the foliage. Many species of saw-fly larvae are also known to attack the rose, feeding either upon the leaves or devouring the young shoot. These larvae should be carefully searched for and destroyed whenever found.

Pemberton, *Roses, their History, Development and Cultivation* (1908); L. H. Bailey, *The Standard Cyclopedia of Horticulture* (1914–27), and the publications of the National Rose Society.

ROSEBERY, ARCHIBALD PHILIP PRIMROSE, 5TH EARL OF (1847–1929), British statesman, born in London on May 7, 1847, was the son of Archibald, Lord Dalmeny (1809–1851) and Catherine, daughter of the 4th earl Stanhope. Lady Dalmeny married, after her husband's death, the duke of Cleveland. Young Dalmeny was educated at Brighton and at Eton, where he had as slightly junior contemporaries A. J. Balfour and Randolph Churchill. In 1866 he matriculated at Christ Church, Oxford, but went down in 1868, by the request of the dean, rather than abandon the possession of a small racing stud. In the same year he succeeded his grandfather, the 4th earl, in the earldom and the family estates. After some time spent in travel he acquired an English country house called The Durdans, Epsom, which he largely rebuilt and adorned with some of the finest turf portraits of George Stubbs. He had a famous stable, and, later, won the Derby three times, in 1894, 1895 and 1905. In 1878 he married Hannah, only child of Baron Meyer Amschel de Rothschild.

Though impeded in his political career by his exclusion from the House of Commons, Lord Rosebery's reputation as a social reformer and orator was steadily growing. In 1878 he was elected Lord Rector of Aberdeen and in 1880 of Edinburgh University, where he gave an eloquent address upon Patriotism. In 1880 he entertained Gladstone at Dalmeny, and during the "Mid Lothian campaign" he arranged the demonstrations. In August 1881 he became under-secretary at the home office, his immediate chief being William Harcourt. His work was practically confined to the direction of the Scottish department of the office, and he resigned in 1883. He resumed office (1884) as first commissioner of works with a seat in the cabinet.

In the brief Gladstonian government of 1886 Lord Rosebery threw in his lot with the old leader, and was foreign secretary. His views on foreign policy differed materially from those of Granville and Gladstone. His mind was dwelling constantly upon the political legacy of the two Pitts; he was a reader of John Seeley; he had himself visited the colonies; had predicted that a war would not, as was commonly said, disintegrate the empire, but rather the reverse; had magnified the importance of taking colonial opinion, and had always been a convinced advocate of some form of Imperial Federation. He was already taunted with being an Imperialist, but his independent attitude won public approval. In January 1889 he was elected a member of the first county council of London, and on Feb. 12, chairman of that body by 104 votes to 17. With a view to the impending political campaign he found it necessary to resign the chairmanship of the county council in June. In November of this year, however, Lady Rosebery died, and he withdrew for a period from public business. In January 1892 he again for a few months became chairman of the county council. In October he received the Garter.

In August 1892, upon the return of Gladstone to power, he was induced with some difficulty (for he was suffering at the time from insomnia) to resume his position as foreign minister. He strongly opposed the evacuation of Egypt; he insisted upon the exclusive control by Great Britain of the Upper Nile Valley, and also upon the retention of Uganda. In 1893 the question of Siam came near to causing serious trouble with France, but the crisis was averted, and the lines were laid down for preserving Siam, if possible, as a buffer state between the English and French frontiers in Indo-China. In the spring of 1895 he was clear-sighted enough to refuse to join the anti-Japanese league of Russia, France and Germany at the end of the China-Japan War.

Lord Rosebery's personal popularity had been increased at home by his successful intervention in the coal strike of December 1893, and when in March 1894 the resignation of Gladstone was announced, his selection by Queen Victoria for the premiership was generally welcomed, but the malcontents in his own party, who considered that William Harcourt should have been the prime minister, or who were perpetually intriguing against a leader who did not satisfy their idea of radicalism, made Lord Rosebery's personal position no easy one. The support of the Irish Nationalists was endangered by his insistence that the goodwill of England, the "predominant partner," was essential to the success of Home Rule. On June 24, 1895, the government fell.

For the state of disorganization and discontent in the Liberal Party during the next ten years of opposition *see* LIBERAL PARTY. The breach between William Harcourt and Rosebery had never been healed, and Rosebery found himself also, to his great grief, at variance with Gladstone. He declined to support Gladstone's demand for intervention on behalf of the Armenians at the risk of a European war, and on Oct. 8, 1896, he announced to the Liberal whip, Thomas Ellis, his resignation of the Liberal leadership. For some time he held aloof from party politics, "ploughing his furrow alone," as he afterwards phrased it.

In 1898, on the death of Gladstone, he paid a noble and eloquent tribute in the House of Lords to the life and public services of his old leader. He gave a general support to the policy of the Salisbury government on the South African War. But the war had brought to the front a section antagonistic to the war and known in the jargon of the day as pro-Boers. These had won the qualified support of Campbell-Bannerman, the leader in the House of Commons. Lord Rosebery maintained for the most part a sphinx-like seclusion, but in July 1901 he at last came forward strongly as the champion of the Liberal Imperialist section of the party, which included Asquith, Grey and Haldane. At a meeting at Chesterfield (Dec. 1901), he spoke of "cleaning the slate" of the old party cries, and eventually spoke of his separation from the "tabernacle" of Campbell-Bannerman. But the main body of the party stood by Campbell-Bannerman, and a partial reconciliation was effected. Chamberlain's tariff reform campaign helped to bring the Liberal Imperialists nearer to the rest of the party. Rosebery's own pronouncements on the tariff issue were hesitating, and to some extent contradictory. But though he eventually came into line with his colleagues on tariff reform, he finally broke with Campbell-Bannerman on the question of Home Rule for Ireland. On the fall of the Conservative government in Dec. 1905, Campbell-Bannerman was invited to form a cabinet, and Rosebery retired from party politics, though he encouraged his immediate associates to join the new government.

Rosebery continued eloquent and witty addresses on miscellaneous subjects. No public man of his time was more fitted to act as unofficial national orator; none more happy in the touches with which he could adorn a social or literary topic and charm a non-political audience; and on occasion he wrote as well as he spoke. His *Pitt* (1891) was already a classic; his *Appreciations and Addresses* and his *Peel* (containing a remarkable comment on the position of an English prime minister) were published in 1899; his *Napoleon: the Last Phase*—an ingenious, if paradoxical attempt to justify Napoleon's conduct in exile at St. Helena—in 1900; his *Cromwell* in the same year. In 1906 he published an appreciation of his old friend Randolph Churchill, inspired by the publication of Winston Churchill's *Life* of his father.

Lord Rosebery took an active part in the constitutional crisis in 1910 and 1911. He treated the Parliament Bill as a revolutionary measure, which in effect constituted single-chamber government, and did his utmost to arouse the nation to a sense of its danger. While, however, he bitterly condemned the conduct of ministers in going to "a young and inexperienced King" for contingent guarantees, he declined to follow the extreme course, recommended by the "die-hards," of rejecting the bill. He shrank from the scandal of a great creation of peers. If the bill were allowed to pass, the House of Lords would be left with some vitality; if the creation of peers were forced, they would have none at all. He showed his own estimate of the impotence of the House after the passage of the bill by ceasing to attend its debates; and indeed he took no further part in public life till the outbreak of war in 1914 fired his patriotism. As lord-lieutenant of Midlothian and Linlithgowshire he promoted recruiting and other war-like activities among his own people and helped to hearten the nation and to avert a premature peace by occasional speeches. In 1921 he published a number of collected papers under the title of *Miscellanies: Literary and Historical*. He was chancellor of Glasgow university in 1908, as he had long been chancellor of London university, and he was chosen lord rector of St. Andrew's university for the year of its quincentenary celebration in 1911.

Lord Rosebery had two sons and two daughters. His eldest son, Lord Dalmeny (b. Jan. 1882), entered parliament in 1906 as Liberal member for Mid Lothian, but retired in 1910; he was well known as a cricketer, captaining the Surrey eleven in 1905 and 1906. The younger son, Neil Primrose (1882–1917) was under-secretary for the Foreign Office in 1915 and parliamentary secretary for munitions in 1916. He died of wounds received in action in Palestine on Nov. 18, 1917. The elder daughter, Lady Sybil, in 1903 married Captain Charles Grant; the younger, Lady Margaret, in 1899 married the 1st earl of Crewe.

Lord Rosebery died at his home at Epsom, Surrey, May 21, 1929.

ROSEBURG, a city of western Oregon, U.S.A., on the South Umpqua river, 200 m. S. of Portland, between the Cascade and the Coast ranges; the county seat of Douglas county. It is on the Pacific highway and the Southern Pacific railroad. Pop. (1920) 4,381 (95% native white); 1928 local estimate, over 7,000. Roseburg is the metropolis of the fertile Umpqua valleys. The city was founded in 1858 and incorporated in 1872.

ROSECRANS, WILLIAM STARKE (1819–1898), American soldier, was born in Kingston (O.), on Sept. 6, 1819, and graduated in 1842 from the U.S. Military Academy. After serving (1843–47) as assistant professor at West Point, he resigned (April 1854) and went into business in Cincinnati. On the outbreak of the Civil War he volunteered for service under McClellan and helped raise the Ohio "Home Guards," with which he served in the West Virginian operations of 1861 as brigadier general. He was second in command to McClellan during this campaign, and succeeded to the command when that officer was called to Washington. In the latter part of 1861 he conducted further successful operations in the same region, and early in 1862 was transferred to the West as a major general of volunteers. He took part in the operations against Corinth, and when Gen. John Pope was ordered to Virginia, Rosecrans took over command of the army of the Mississippi, with which he fought the successful battles of Iuka and Corinth. Soon afterwards he replaced D. C. Buell in command of the forces. In December he advanced against Gen. Braxton Bragg, and on Dec. 31 to Jan. 3 fought the bloody, indecisive battle of Stone river (Murfreesboro), after which Bragg withdrew his army to the southward. In 1863 Rosecrans, refusing to advance until the isolation of Vicksburg was assured, did not take the offensive until late in June. The operations thus begun were most skilfully conducted and Bragg was forced back to Chattanooga, whence he had to retire. But Rosecrans sustained a great defeat at the battle of Chickamauga (*q.v.*), and was soon besieged in Chattanooga. He was then relieved from his command. Later he did good service in Missouri, and in March 1865 was made brevet-major general U.S.A. He resigned in 1867, and in 1868 became minister to Mexico. He was a representative in Congress from California, 1881–85, and register of the treasury, 1885–93. Under an act of Congress he was, on March 2, 1889, restored to the rank of brigadier general and retired. He died near Redondo (Calif.), March 11, 1898. On May 17, 1902 his body was reinterred with military honours in the National Cemetery at Arlington.

See Edward Channing, *History*, vol. vi.; J. B. McMaster, *History of the People During Abraham Lincoln's Administration* (1927).

ROSEGGER, PETER (1843–1918), Austrian poet and novelist, known down to 1894 under the pseudonym *Petri Kettenfeier*, was born at Alpl near Krieglach in Upper Styria, on July 31, 1843, the son of a peasant. His work includes novels, poems, miscellaneous and religious writings and some books which are autobiographical in character, notably *Waldheimat* (1873) and *Mein Weltleben* (1898). He died on June 26, 1918.

Rosegger's *Ausgewählte Schriften* appeared in 30 volumes (1881–94); a popular edition (1895–1900); his *Schriften in steirischer Mundart* (3 vols., 1894–96). *See* also H. Möbius, *P. Rosegger* (1903).

ROSELLE AND ROSELLE PARK, two contiguous boroughs of Union county, New Jersey, U.S.A., adjoining Elizabeth on the west; served by the Central of New Jersey, the Lehigh Valley and (for freight) the Rahway Valley railways. Pop. (1920) of Roselle 5,737; of Roselle Park, 5,438; and the combined population of the two was estimated locally at over 17,000

in 1928. They are residential suburbs.

ROSELLINI, IPPOLITO (1800–1843), Italian Egyptologist, was born at Pisa. He studied under Mezzofanti at Bologna, and in 1824 became professor of oriental languages at Pisa. He is best known as the associate of J. F. Champollion (*q.v.*), whom he accompanied in his Egyptian explorations (1828), the account of which he published as *Monumenti dell' Egitto e della Nubia* (Florence, 1832–40, 10 vols. fol.).

ROSEMARY, botanically *Rosmarinus officinalis,* a plant of the mint family (Labiatae), the only representative of the genus and a native of the Mediterranean region. It is a low shrub with linear leaves, dark green above, white beneath, and with margins rolled back on to the under face. The flowers are in small axillary clusters. Each has a two-lipped calyx, from which projects a bluish two-lipped corolla enclosing two stamens. The fruit consists of four smooth nutlets. Rosemary was highly esteemed by the ancients for its aromatic quality and medicinal uses. In modern times it is valued mainly for its perfume; the oil is obtained by distillation. Rosemary plays an important part in literature and folk-lore, being an emblem of remembrance.

ROSENHEIM, a town and watering-place in the republic of Bavaria, at the confluence of the Mangfall and the Inn, 40 m. by rail S.E. of Munich. Pop. (1925) 17,998. Rosenheim is frequented for its saline and sulphur baths, and there are saltworks.

ROSENKRANZ, KARL (1805–1879), German philosopher of the Hegelian school, was born at Magdeburg on April 23, 1805. He was professor of philosophy at Königsberg from 1833 until his death on July 14, 1879. Rosenkranz was a loyal Hegelian. In the great division of the school, he, in company with Michelet and others, formed the "centre," midway between Erdmann and Gabler on the one hand, and the "extreme left" represented by Strauss, Feuerbach and Bruno Bauer. With F. W. Schubert he edited Kant's *Sämtliche Werke* (Leipzig, 12 vols., 1838–42), the last vol. of which contains his *Geschichte der kantischen Philosophie.*

See his autobiography entitled *Von Magdeburg nach Königsberg* (1873), which deals with his life up to the time of his settlement at Königsberg; Quäbicker, *Karl Rosenkranz* (1899), and J. Hutchison Stirling, *The Secret of Hegel* (1865) part 6.

ROSENWALD, JULIUS (1862–), American merchant and philanthropist, was born in Springfield, Ill., on Aug. 12, 1862, and was educated in the public schools. From 1885 to 1906 he was president of Rosenwald and Weil, clothing manufacturers, Chicago. In 1895 he became vice president and treasurer of the mail order house of Sears, Roebuck and Company, Chicago; from 1910–25 president, and from then on chairman of the board. The gross sales of the company, which approximated $2,000,000 in 1896, increased to $290,000,000 in 1927. He was, during the World War, a member of the advisory commission of the council of national defence by appointment by President Wilson, and in Aug. 1918 went on a special mission to France for the secretary of war. In 1910–20 he served in Washington as a member of the President's industrial conference.

In 1916 Rosenwald founded the Sears, Roebuck and Company employees' savings and profit sharing pension fund, to enable those who remain in the employ of the company ten years or more to secure an income after the close of their active business careers, or, in case of death, to provide an estate for their families. The fund has paid to employees who have left the service of the company, in cash and in shares of the company's capital stock, an amount equivalent to nearly $13,000,000. All of the fund's assets are invested in the company's capital stock, and on Dec. 31, 1927, it amounted to approximately 400,000 shares, having a market value of about $35,500,000 of which $5,500,000 was contributed by the employees. In Dec. 1921 Rosenwald pledged $21,000,000 to safeguard the interest of Sears, Roebuck and Company during the critical period of business readjustment after the war. In 1920 and 1921 the company had paid no dividends on its common stock and it was apparent that its capital at the end of 1921 must show impairment. By Rosenwald's action the company was enabled to readjust its finances without injury to its capital.

The Julius Rosenwald fund with assets of $20,000,000 is dedicated to "the well-being of mankind." It is the expressed intention of the founder that the entire fund, both capital and interest, shall be expended within a reasonable time; the income and part of the capital has been used to aid in the building of rural schools for negroes in 14 Southern States. By 1927 more than 4,000 Rosenwald schools, with a capacity for 467,000 pupils and 10,000 teachers had been built (409 in 1927). These buildings cost over $18,000,000, of which 59% has come from public funds, 20% from negroes, 4% from whites and 17% from the Rosenwald fund. Rosenwald has devoted much time to work for philanthropic, educational and civic organizations. He gave $100,000 to the Hoover German children's relief fund in 1920–21, $250,000 to the fund for Hampton-Tuskegee (negro educational institutions), $250,000 for a building to house Jewish philanthropic organizations of Chicago; and (with Mrs. Rosenwald) $3,000,000 for the University of Chicago. He founded dental infirmaries in the Chicago public schools. He also pledged $3,000,000 for an industrial museum in Chicago, and a total of $6,000,000 for Jewish colonization work in Russia. He has contributed $25,000 to each of 20 Y.M.C.A. and Y.W.C.A. buildings (costing $3,850,000) for negroes in 18 cities serving a negro urban population of more than 1,250,000. It is estimated that, in addition to the creation of the Julius Rosenwald fund, Rosenwald has given $15,000,000 for educational, civic and philanthropic causes. In recognition of his work on behalf of education of the coloured he has been given the William E. Harmon award for distinguished achievement in race relations. He is a trustee of the University of Chicago, the Chicago Orchestra association and other bodies; is chairman of the bureau of public efficiency and honorary chairman of the Jewish charities, all of Chicago; and is trustee of the Baron de Hirsch fund, Rockefeller foundation, Tuskegee normal and industrial institute, and many other organizations.

ROSES, WARS OF THE, a name given to a series of civil wars in England during the reigns of Henry VI., Edward IV. and Richard III. Their importance in the general history of England is dealt with elsewhere, and their significance in the history of the art and practice of war is small. They were marked by a ferocity and brutality practically unknown in the history of English wars before and since. The honest yeoman of Edward III.'s time had evolved into a professional soldier of fortune, and had been demoralized by the prolonged and dismal Hundred Years' War, at the close of which many thousands of ruffians, whose occupation had gone, had been let loose in England. At the same time the power of feudalism had become concentrated in the hands of a few great lords, who were wealthy enough and powerful enough to become king-makers. The disbanded mercenaries enlisted indifferently on either side, corrupting the ordinary feudal tenantry with the evil habits of the French wars, and pillaged the countryside, with accompaniments of murder and violence, wherever they went. It is true that the sympathies of the people at large were to some extent enlisted: London and, generally, the trading towns being Yorkist, the country people Lancastrian—a division of factions which roughly corresponded to that of the early part of the Great Rebellion, two centuries later, and similarly in a measure indicative of the opposition of hereditary loyalty and desire for sound and effective government. But there was this difference, that in the 15th century the feeling of loyalty was to a great extent focussed upon the great lords.

It is from the Wars of the Roses that there originated the deep-rooted dislike of the professional soldier which was for nearly four centuries a conspicuous feature of the English social and governmental system, and it is therefore in their results rather than their incidents that they have affected the evolution of war. They withdrew the English army system from European battlefields precisely at the moment of transition when the regimental and technical organization of armies was becoming a science and seeking models, and the all-powerful English longbow at the moment when the early, scarcely effective firearms were, so to speak, struggling for recognition as army weapons. On the other hand, they destroyed the British military organization. The national army, aloof from the main streams of military progress, remained for 150 years an aggregation of county levies armed

with bills and bows.

The first campaign, or rather episode, of these wars[1] began with an armed demand of the Yorkist lords for the dismissal of the Lancastrian element in the king's council, Henry VI. himself being incapable of governing. The Lancastrians, and the king with them, marched out of London to meet them, and the two small armies (3,000 Yorkists, 2,000 Lancastrians) met at St. Albans (May 22, 1455). The encounter ended with the dispersion of the weaker force, and the king fell into the hands of the Yorkists. Four years passed before the next important battle, Blore Heath, was fought (Sept. 23, 1459). In this the earl of Salisbury trapped a Lancastrian army in unfavourable ground near Market Drayton, and destroyed it; but new political combinations rendered the Yorkist victory useless and sent the leaders of the party into exile. They made a fresh attempt in 1460, and, thanks partly to treason in the Lancastrian camp, partly to the generalship of Warwick, won an important success and for the second time seized the king at Northampton (July 10, 1460). Shortly afterwards, after a period of negotiation and threats, there was a fresh conflict. Richard duke of York went north to fight the hostile army which gathered at York and consisted of Lancashire and Midland Royalists, while his son Edward, earl of March, went into the west. The father was ambushed and killed at Wakefield (Dec. 30, 1460), and the Lancastrians, inspired as always by Queen Margaret of Anjou, moved south on London, defeated Warwick at St. Albans (Feb. 17, 1461), and regained possession of the king's person. But the young earl of March, now duke of York, having raised an army in the west, defeated the earl of Pembroke (Feb. 2, 1461) at Mortimer's Cross (5m. west of Leominster). This was the first battle of the war which was characterized by the massacre of the common folk and beheading of the captive gentlemen—invariable accompaniments of Edward's victories, and notably absent in Warwick's. Edward then pressed on, joined Warwick, and entered London, the army of Margaret retreating before them. The excesses of the northern Lancastrians in their advance produced bitter fruit on the retreat, for men flocked to Edward's standard. Marching north in pursuit, the Yorkists brought their enemy to bay at Towton (*q.v.*), 3m. south of Tadcaster, and utterly destroyed them (March 29, 1461). For three years after Towton the war consisted merely of desultory local struggles of small bodies of Lancastrians against the inevitable. The duke of York had become King Edward IV., and had established himself firmly. But in 1464, in the far north of England, the Red Rose was again in the field. Edward acted with his usual decision. His lieutenant Montagu (Warwick's brother) defeated and slew Sir Ralph Percy at Hedgley Moor, near Wooler (April 25, 1464), and immediately afterwards destroyed another Lancastrian army, with which were both Henry VI. and Queen Margaret, at Hexham (May 8, 1464). The massacres and executions which followed effectively crushed the revolt. For some years thereafter Edward reigned peacefully, but Warwick the king-maker and all the Neville following having turned against him (1470), he was driven into exile. But at a favourable moment he sailed from Flushing with 1,500 retainers and Burgundian mercenaries, and eluding the Lancastrian fleet and the coast defence troops, landed at Ravenspur (Spurn Head) in Yorkshire in March 1471. His force was hardly more than a bodyguard; the gates of the towns were shut against him, and the country people fled. But by his personal charm, diplomacy, fair promises and an oath of allegiance to King Henry VI., sworn solemnly at York, he disarmed hostility and, eluding Montagu's army, reached his own estates in the Wakefield district, where many of his old retainers joined him. As he advanced south, a few Yorkist nobles with their following rallied to him, but it was far more the disunion of the Warwick and the real Lancastrian parties than his own strength which enabled him to meet Warwick's forces in a pitched battle. At Barnet, on Easter Eve, April 14, 1471, the decisive engagement was fought. But in the midst of the battle reinforcements coming up under the earl of Oxford to join Warwick came into conflict with their own party, the badge of the Vere star being mistaken for Edward's *Rose-en-soleil*. From that point all the mutually distrustful elements of Warwick's army fell apart, and Warwick himself, with his brother Montagu, was slain. For the last time the unhappy Henry VI. fell into the hands of his enemies. He was relegated to the Tower, and Edward, disbanding his army, reoccupied the throne. But Margaret of Anjou, his untiring opponent, who had been in France while her cause and Warwick's was being lost, had landed in the west shortly after Barnet, and Edward had to take the field at once. Assembling a fresh army at Windsor, whence he could march to interpose between Margaret and her north Welsh allies, or directly bar her road to London, he marched into the west on April 24. On the 29th he was at Cirencester, and Margaret, engaged in recruiting an army, was near Bath. Edward hurried on, but Margaret eluded him and marched for Gloucester. At that place the governor refused the Lancastrians admittance, and seeking to cross the Severn out of reach of the Yorkists, they pushed on by forced marches to Tewkesbury. But Edward too knew how to march, and caught them up. The battle of Tewkesbury (May 4, 1471) ended with the destruction of Margaret's force, the captivity of Margaret, the death of her son Edward (who, it is sometimes said, was stabbed by Edward IV. himself after the battle) and the execution of 16 of the principal Lancastrians.

This was Edward's last battle. The rest of his eventful reign was similar in many ways to that of his contemporary Louis XI., being devoted to the consolidation of his power, by fair means and foul, at the expense of the great feudatories. But the Wars of the Roses were not yet at an end. For 14 years, except for local outbreaks, the land had peace, and then Richard III.'s crown, struck from his head on Bosworth Field (Aug. 22, 1485), was presented to Henry earl of Richmond, who, as Henry VII., established the kingship on a secure foundation. A last feeble attempt to renew the war, made by an army gathered to uphold the pretender Lambert Simnel, was crushed by Henry VII. at Stoke Field (4m. south-west of Newark) on June 16, 1487.

ROSETTA (Coptic *Rashit*, Arabic *Rashid*), a town situated at the western or "Rosetta" mouth of the Nile on the west bank, and called Bolbitine by the Greeks. When the other branches and the Alexandria canal silted up, Rosetta prospered like its sister port of Damietta on the eastern branch; the main trade of the overland route to India passed through it until Mehemet Ali cut a new canal joining Alexandria to the Nile. Rosetta is now much decayed. A railway joins it to Alexandria. The celebrated Rosetta Stone which supplied Champollion with the key for the decipherment of the ancient monuments of Egypt was found near Fort St. Julien, 4 m. N. of the town, in 1799, by Boussard, a French officer. It is a basalt stele inscribed in hieroglyphic, demotic and Greek with a decree of the priests assembled at Memphis in favour of Ptolemy V. Epiphanes. It was ceded to the English at the capitulation of Alexandria (1801) and is now in the British Museum.

ROSETTE, an ornament, usually circular, oval or polygonal, formed by a series of petals or leaves radiating from the centre and symmetrically disposed. The form undoubtedly originated as an attempt to represent, systematically, the corolla of an open flower. Egyptian rosettes were thus, probably, representations of the open lotus. In Assyrian ornament, and in the Persian work based upon it, rosettes are one of the most common ornaments and are used, by continuous repetition, to form decorative bands. Although common in archaic pottery of the Greek islands, they were little used in the developed art of Greece itself. The Romans, on the other hand, used the form lavishly and gave it great richness by employing the complex acanthus leaf as the basic radiating form. It was used not only at the centre of each face of the Corinthian capital, but also to decorate the little panels between the modillions (*q.v.*) or scrolled brackets of the Corinthian order and as a decoration for the centre of the coffers or sunk panels of

[1]The name, as is well known, comes from the "white rose of York" and the "red rose of Lancaster"; but these badges, though more or less recognized as party distinctions, by no means superseded the private devices of the various great lords, such as the "falcon and fetterlock" of Richard duke of York, the "rose in sun" of Edward IV., the "crowned swan" of Margaret, the Vere star, and even the revived "white hart" of Richard II.

a coffered vault or ceiling. The rosette almost went out of use in the mediaeval period save as it sometimes occurred as an individual flower in Gothic naturalistic ornament. In the Perpendicular period in England, the popularity of the heraldic Tudor rose gave a new importance to the rosette idea, and rosettes were frequently employed, repeated at regular intervals, to decorate hollow mouldings. Renaissance rosettes in design are based upon those of Rome, but were used even more lavishly, owing to the immense development of wooden coffered and panelled ceilings.

In metal-work the idea of the rosette was probably developed independently, owing to the ease with which little drops of metal could be soldered or fastened in a circle, to a basic utensil. Such rosettes, formed either of a simple circle of nearly hemispherical shape, or of one large hemisphere surrounded by several smaller ones, are favourite late Bronze and early Iron age decorations in the metal-work of the Celts, Scandinavians and northern Europe generally. (T. F. H.)

ROSEVILLE, a city of Placer county, California, U.S.A., on Secret Ravine (a tributary of the Sacramento river) 18 m. N.E. of Sacramento. It is on Federal highway 40, and is served by the Southern Pacific railway lines. Pop. 4,477 in 1920 (82% native white); estimated locally at 7,800 in 1928. There are immense railroad construction and repair shops and freight-classification yards here, and the largest ice-manufacturing and storage plant in the country, for the refrigeration of fruit and vegetable cars.

ROSE WINDOW or **WHEEL WINDOW,** in architecture, a term applied to any decorated, circular window. Undecorated circular windows are found in certain imperial Roman structures, used especially in the upper portions of rooms or pierced through vaults, as in the tomb of the time of Hadrian known as the Casale dei Pazzi, near Rome, but structural decoration of such forms was apparently not attempted until the Byzantine and Romanesque periods. One of the earliest decorated circular windows extant is that of the Italian Romanesque church of S. Maria in Pomposa, possibly as early as the 10th century, in which the decoration consists of a pierced marble slab of great richness, with a design of interlaces and birds purely Byzantine. In French Romanesque work circular windows also appear, but in the earlier examples, such as the 11th century apse of S. Sernin at Toulouse, they are undecorated, like those of the Roman empire. Meanwhile, in Mohammedan work, the cusped circle had been a common form, usually, however, not as a window, but as the outer boundary of a sunk hemisphere, as in the mosque of Ibn Touloun at Cairo (876–78).

The crusaders probably saw many examples of such forms; in any case it is only after the earlier crusades and especially towards the middle of the 12th century that the idea of making a rich decorative motive out of a round window appeared. From then on the simple rose window became more and more common, and was, in fact, a distinguishing characteristic of many transitional and early Gothic cathedrals. It was particularly used at the west end of the nave and the ends of the transepts. An exceptional early use is the round window which lighted the triforium roof space from the nave in the original form of Notre Dame at Paris (before 1177). In the west front of Laon cathedral (completed prior to 1200) there is an enormous rose window with 12 semi-circles around the edge and the central foiled and cusped circle separated from the apexes of these semi-circles by a considerable distance, the connection between being made by little radiating colonnettes like spokes. This window is remarkably advanced for its date, as the filling, like that of the Paris triforium, is essentially bar tracery. The rose window of the west front of Chartres cathedral (1194–1212) consists, on the other hand, of plate tracery, the circle being filled with a thin plate of stone, through which are pierced many small foiled or cusped holes. A similar form of plate tracery within a circle is used to cap the twin windows of the clerestorey bays.

The introduction of developed bar tracery gave a compelling impetus to rose window design. The general scheme consisted of a series of radiating forms, each of which was tipped by a pointed arch at the outside of the circle. The bars between these forms were joined at the centre by a pierced circle of stone and the forms themselves frequently treated like little traceried windows with subsidiary, subdividing bars, arches and foiled circles. The most beautiful examples of this type are those of the west front of Rheims cathedral (end of the 13th century) and the transepts of Rheims, Amiens and Notre Dame at Paris (all of the last half of the 13th century). The introduction of the wavy lines of flamboyant tracery completely changed the character of French rose windows, but they continued basically radiating in design. The radiating elements consisted of an intricate network of wavy, double curved bars, creating all sorts of interesting circles and flame shapes, and incidentally, furnishing a diagonal bracing to the whole composition which added materially to its structural strength. The rose at the end of the transept at Beauvais (early 16th century) is characteristic.

The influence of the French rose windows was widespread from an early period. Variations of the form appear in a multitude of late Italian Romanesque churches, as in the widely varying type in the late 12th century west front of S. Pietro in Toscanella, and the more normal example in S. Zeno at Verona (late 12th century). In England the rose window has never been so popular as in France. Those in the transepts of Westminster Abbey are more characteristically French than English. The most typically English examples are in the transepts of Lincoln cathedral; that on the north from the Early English period is a remarkably delicate example of plate tracery; that on the south from the Curvilinear period of the early 14th century is striking because it is not radiating in design, and therefore completely at odds with the French prototypes. (*See* TRACERY.) (T. F. H.)

ROSEWOOD, the name given to several distinct kinds of ornamental timber. That, however, so called in the United Kingdom is Brazilian rosewood, the *palissandre* of the French, the finest qualities of which, coming from the provinces of Rio de Janeiro and Bahia, are believed to be the produce principally of *Dalbergia nigra,* a leguminous tree of large dimensions, called *cabiuna* and *jacaranda* by the Brazilians. The same name, jacaranda, is applied to several species of *Machaerium,* also trees belonging to the family Leguminosae; and there can be no doubt that a certain proportion of the rosewood of commerce is drawn from these sources.

Rosewood is exported in large quantities from Rio de Janeiro, Bahia, Jamaica and Honduras. The heartwood attains large dimensions, but as it begins to decay before the tree arrives at maturity it is always faulty and hollow in the centre. On this account squared logs or planks of rosewood are never seen, the wood being imported in half-round flitches 10 to 20 ft. in length and from 5 to 12 in. in their thickest part. Owing to its irregular form, the wood is sold by weight, and its value varies within wide limits according to the richness of colour. Rosewood has a deep ruddy brown colour, richly streaked and grained with black resinous layers. It takes a fine polish, but, on account of its resinous nature, it is somewhat difficult to work. The wood is very much in demand both by cabinet-makers and pianoforte-makers, by whom it is used both solid and in veneer.

The wood of *Dalbergia latifolia,* a native of the East Indies, used for ornamental furniture and carvings under the name of black wood, is frequently termed East Indian Rosewood. The *Bois de Rose* of the French, the Portuguese *Pao de Rosa,* and the German *Rosenholz* is a Brazilian wood, the produce of *Physocalymma floribundum,* called in the United Kingdom tulip wood, and very highly esteemed on account of its beautiful rose colour and grain.

ROSICRUCIANISM. What is known as the Society of Rosicrucians (*Rosenkreuzer*) was really a number of isolated individuals who early in the 17th century held certain views in common (which apparently was their only bond of union); for of a society holding meetings, and having officers, there is no trace. So far as the numerous works are concerned it is evident that the writers who posed as Rosicrucians were moral and religious reformers, and utilized the technicalities of chemistry (alchemy), and the sciences generally, as media through which to make known their opinions, there being a flavour of mysticism or

occultism promotive of inquiry and suggestive of hidden meanings discernible or discoverable only by adepts.

The publication of the *Allgemeine und General-Reformation der ganzen weiten Welt* (Cassel, 1614), and the *Fama Fraternitatis* (Cassel, 1615) by the theologian Johann Valentin Andrea (1586–1654), caused immense excitement throughout Europe, and they not only led to many re-issues, but were followed by numerous pamphlets, favourable and otherwise, whose authors generally knew little if anything, of the real aims of the original author, and doubtless in not a few cases amused themselves at the expense of the public. It is probable that the first work was circulated in ms. about 1610. The authors generally favoured Lutheranism as opposed to Roman Catholicism. Others, like John Heydon, admitted they were not Rosicrucians, but under attractive and suggestive titles to their works sought to make Hermeticism and other curious studies more useful and popular, and succeeded, for a time at least.

A fabulous origin was ascribed to the so-called society which would carry its date back to the 15th century. It was alleged that a certain Christian Rosenkreuz made a pilgrimage to the East about 1422, and brought back the knowledge of certain mysteries which formed the basis of the society. This story is almost certainly baseless and euhemeristic, being invented to explain the origin of the word *Rosenkreuzer*. There is some evidence for the existence of Rosicrucians in the 16th century; they are, however, not to be distinguished from the Illuminati (*q.v.*). The polemical literature on the subject occupies some 80 pages of Gardner's *Catalogue Raisonné of works on the Occult sciences*.

The influence that Rosicrucianism had in the modernizing of ancient freemasonry early in the 18th century must have been slight, if any, though it is likely that as the century advanced, and additional ceremonies were grafted on to the first three degrees, Rosicrucian tenets were occasionally introduced into the later rituals. So far, however, as the real foundation ceremonies of craft masonry are concerned, whether before or after the premier Grand Lodge was formed, it is most unlikely that such a society as the freemasons would adopt anything of a really distinctive character from any other organization.

In *The Muses' Threnodie* by H. Adamson (Perth, 1638) are the lines—

> "For what we do presage is riot in grosse,
> For we are brethren of the Rosie Crosse;
> We have the Mason Word and second sight,
> Things for to come we can fortell aright."

Dr. Begemann considers that possibly during the decade from 1720 to 1730 a kind of Rosicrucian or Hermetic influence took place in the lodges of London, some additions to the ritual of that period not having been derived from operative masonry; but in the previous century no such influence is traceable. Several modern societies have been formed from time to time (some of which are still flourishing in Great Britain) for the study of Rosicrucianism and allied subjects, but in no sense are they directly derived from the "Brethren of the Rosy Cross" of the 17th century, though keen followers thereof. By far the most important of these is the "Societas Rosicruciana in Anglia," with headquarters in London. (*See* its *Transactions*.)

BIBLIOGRAPHY.—Hargrave Jennings, *The Rosicrucians, their Rites and Mysteries* (three editions, 1870–87); A. E. Waite, *The Real History of the Rosicrucians, founded on their own Manifestoes and on Facts and Documents collected from the Writings of Initiated Brethren* (1887); and John Yarker, *The Arcane Schools* (1909).

ROSIN or **COLOPHONY,** the resinous constituent of the oleo-resin exuded by various species of pine, known in commerce as crude turpentine. The separation of the oleo-resin into the essential oil-spirit of turpentine and common rosin is effected by distillation in large stills. Rosin (a later variant of "resin," *q.v.*), varies in colour, according to the age of the tree whence the turpentine is drawn and the amount of heat applied in distillation, from an opaque almost pitchy black substance through grades of brown and yellow to an almost perfectly transparent colourless glassy mass. The commercial grades are numerous, ranging by letters from A, the darkest, to N, extra pale,—superior to which are W, "window glass," and WW, "water white" varieties, the latter having about three times the value of the common qualities.

Rosin is a brittle and friable resin, with a faint pine-like odour the melting-point varies with different specimens, some being semi-fluid at the temperature of boiling water, while others do not melt till 220° or 250° F. It is soluble in alcohol, ether, benzene and chloroform. In addition to its extensive use in soap-making, rosin is largely employed in making inferior varnishes sealing-wax and various cements. It is also used for preparing shoemakers' wax, as a flux for soldering metals, for pitching lager beer casks, for rosining the bows of musical instruments and numerous minor purposes. In pharmacy it forms an ingredient in several plasters and ointments.

The chief region of rosin production is the South Atlantic and Eastern Gulf states of the United States. American rosin is obtained from the turpentine of the swamp pine, *Pinus australis* and of the loblolly pine, *P. Taeda*. The main source of supply in Europe is the "landes" of the departments of Gironde and Landes in France, where the cluster pine, *P. Pinaster*, is extensively cultivated. In the north of Europe rosin is obtained from the Scotch fir, *P. sylvestris*, and throughout European countries local supplies are obtained from other species of pine.

ROSKILDE or ROESKILDE, a town of Denmark in the *amt* (county) of Kjøbenhavn (Copenhagen), 20 m. by rail W. of Copenhagen, on the great lagoon-like inlet named Roskilde Fjord. Pop. (1928) 13,540. Its chief interest is historical. It was the capital of the kingdom until 1443, and the residence of the bishops of Zealand until the Reformation. The cathedral was consecrated in 1084, but of this early building only foundations walls remain; the present structure of brick was begun in 1215 and enlarged and restored at various later dates. It contains the tombs of most of the Danish kings from Harold I. (987).

ROSMEAD, HERCULES GEORGE ROBERT ROBINSON, 1ST BARON (1824–1897), British colonial administrator was born on Dec. 19, 1824. He was of Irish descent on both sides; his father was Admiral Hercules Robinson, his mother a Miss Wood of Rosmead, County Westmeath, from which he afterwards took his title. Passing from Sandhurst into the 87th Foot he attained the rank of captain; but in 1846, through the influence of Lord Naas, he obtained a post in the Board of Public Works in Ireland, and subsequently became chief commissioner of fairs and markets. His energy in these positions, notably during the famine of 1848, and the clearness and vigour of his reports secured for him at the age of 30 the office of president of the island of Montserrat. He was governor of St. Christopher from 1855 to 1859, when he was knighted in recognition of his services in introducing coolie labour into the island. Subsequently he was governor of Hong-Kong, of Ceylon (K.C.M.G. in 1869), and, in 1872, of New South Wales. It fell to his lot to annex the Fiji islands to the British empire, and his services were rewarded in 1875 by promotion to G.C.M.G.

In 1879 he was transferred to New Zealand, and in 1880 he succeeded Sir Bartle Frere as high commissioner of South Africa. He arrived in South Africa shortly before the disaster of Majuba and was one of the commissioners for negotiating a peace which was personally distasteful to him. It left him with the task of conciliating on the one hand a Dutch party elated with victory and on the other hand a British party almost ready to despair of the British connection. He was called home in 1883 to advise the Government on the terms of the new convention concluded with the Transvaal Boers in Feb. 1884. On his return to South Africa he found that a critical situation had arisen in Bechuanaland where Boer commandoes had seized large tracts of territory and proclaimed the "republics" of Stella and Goshen (*see* KRUGER S.J.P.). They refused to retire within the limits of the Transvaal as defined by the new convention, and Robinson, alive to the necessity of preserving this country—the main road to the north—for Great Britain, took action which led to the expedition of Sir Charles Warren and the annexation of Bechuanaland early in 1885. Robinson won Kruger's confidence by his fair-mindedness while he seconded Rhodes's efforts to unite the British and Dutch parties in Cape Colony. His mind, however, was that of the admin

istrator as distinguished from the statesman, and he was content to settle difficulties as they arose. In 1887 Robinson was induced by Rhodes to give his consent to the conclusion of a treaty with Lobengula which secured British rights in Matabele and Mashona lands. In May 1889 Robinson retired. In his farewell speech he declared that there was no permanent place in South Africa for direct imperial rule. This was interpreted to mean that South Africa must ultimately become independent—an idea repugnant to him. He explained in a letter to *The Times* in 1895 that he had referred to the "direct rule of Downing Street over the Crown colonies, as contrasted with responsible colonial Government." He was made a baronet in 1891.

Early in 1895, when he had entered his 71st year and was not in robust health, he yielded to Lord Rosebery's entreaties, and went out again to South Africa, in succession to Sir H. Loch. The Jameson raid produced a permanent estrangement between him and Cecil Rhodes, and he was out of sympathy with the new colonial secretary, Joseph Chamberlain, who had criticized his appointment, and now desired Robinson to take this opportunity of settling the whole question of the position of the Uitlanders in the Transvaal. Robinson answered that the moment was inopportune, and that he must be left to choose his own time. Alarmed at the imminent danger of war, he confined his efforts to inducing the Johannesburgers to lay down their arms on condition that the raiders' lives were spared, not knowing that these terms had already been granted to Jameson. He came home to confer with the Government, and was raised to the peerage as Baron Rosmead. He returned to South Africa later in the year, but was compelled by ill-health, in April 1897, to quit his post, and died in London on Oct. 28, 1897.

ROSMINI-SERBATI, ANTONIO (1797–1855), Italian philosopher, was born at Rovereto, Italian Tirol, on March 25, 1797. In 1828 he founded a new religious order, the Institute of the Brethren of Charity, known in Italy generally as the Rosminians. The members might be priests or laymen, who devoted themselves to preaching, the education of youth, and works of charity—material, moral and intellectual. They have branches in Italy, England, Ireland, France and America. In London they are attached to the church of St. Etheldreda, Ely Place, Holborn. Rosmini's *The Five Wounds of the Holy Church* and *The Constitution of Social Justice* were placed (1849) upon the Index. Rosmini at once declared his submission and retired to Stresa on Lago Maggiore, where he died on July 1, 1855. Before his death he had the satisfaction of learning that the works in question were dismissed, that is, proclaimed free from censure by the Congregation of the Index. Twenty years later, the word "dismissed" (*dimittantur*) became the subject of controversy, some maintaining that it amounted to a direct approval, others that it was purely negative and did not imply that the books were free from error. The controversy continued till 1887, when Leo XIII. finally condemned 40 of his propositions and forbade their being taught.

The most comprehensive view of Rosmini's philosophical standpoint is to be found in his *Sistema filosofico*, in which he set forth the conception of a complete encyclopaedia of the human knowable, synthetically conjoined, according to the order of ideas, in a perfectly harmonious whole. Rosmini laid down ideal being as the fundamental principle of all philosophy and the supreme criterion of truth and certainty.

Of his numerous works—collected ed. (17 vols., Milan, 1842–44) supplemented by *Opere postume* (5 vols., Turin, 1859–74)—the most important are the *New Essay on the Origin of Ideas* (Eng. trans., 1883); *The Principles of Moral Science* (1831); *The Restoration of Philosophy in Italy* (1836); *The Philosophy of Right* (1841–45). The following have also been translated into English: *A Catholic Catechism*, by W. S. Agar (1849); *The Five Wounds of the Holy Church* (abridged trans. with introd. by H. P. Liddon, 1883); *Maxims of Christian Perfection*, by W. A. Johnson (1889); *Psychology* (Anonymous) (1884–88); *Sketch of Modern Philosophy*, by Lockhart (1882); *The Ruling Principle of Method Applied to Education*, by Mrs. W. Grey (Boston, Mass., 1887); *Select Letters*, by D. Gazzola. Rosmini's *Sistema filosofico* was translated by Thos. Davidson (*Rosmini's Philosophical System*, 1882, with a biographical sketch and complete bibliography); *see* also *Lives* by G. S. Macwalter (1883) and G. B. Pagani (1907); C. Werner, *Die italienische Philosophie des 19. Jahrhunderts* (1884); F. X. Kraus, "Antonio Rosmini: sein Leben, seine Schriften," in *Deutsche Rundschau*, liv. lv. (1888); "Church Reformation in Italy" in the *Edinburgh Review*, cxiv. (July 1861); and numerous recent Italian works, for which Baldwin's *Dictionary of Philosophy* or Pagliani's *Catalogo Generale* (Milan, 1905) should be consulted.

ROSNY, JOSEPH HENRY, a pseudonym covering the collaboration of the French novelists, Joseph Henri Honoré Boëx (1856–), and his brother Séraphin Justin François Boëx (1859–). The novels of J. H. Rosny are full of scientific knowledge, of astronomy, anthropology, zoology and, above all, sociology. The stories are approached from the point of view of society rather than of the individual, but the characters, strongly individualized and intensely real, are only incidentally typical. The elder Rosny was the sole author of the earlier novels, and began novel-writing as an avowed disciple of Zola. Among these earlier works may be mentioned *Le Bilatéral* (1886), and the "prehistoric" novel, *Vamireh* (1891), a masterpiece of its kind. MM. Rosny were among the writers who in 1887 entered a formal protest in the *Figaro* against Zola's *La Terre*, and they were designated by Edmond de Goncourt as original members of his academy. Among their other novels the more famous are: *Daniel Valgraive* (1891); *L'Indomptée* (1895), the history of a girl medical student in Paris; *Le Serment* (1896, dramatized 1897); *Les Ames perdues* (1899), an anarchist novel; *La Charpente* (1900); *Thérèse Degaudy* (1902); *Le Crime du docteur* (1903); *Le Docteur Harambur* (1904); *Le Millionaire* (1905); *Sous le fardeau* (1906); *La Guerre de feu* (1911) and *La Carapace* (1914).

ROSS, BETSY (1752–1836), heroine of one of the most picturesque legends which has grown up around the origin of the American flag, was born in Philadelphia, Pa., on Jan. 1, 1752. She married John Ross, whose brother, George Ross, was one of the signers of the Declaration of Independence.

The versions of the flag story as told by her descendants, agree in the following main points: Washington, accompanied by Robert Morris and Gen. George Ross, called at the little upholstery shop in Arch street, where she was carrying on the business in which she and her husband had been engaged, and asked if she could make a flag. She said she never had made one, but that she could try. They thereupon produced a design, rather roughly drawn. She examined it and, noticing that the stars were six-pointed, suggested that they should be made with five points. The gentlemen agreed with her that five points would look better, but that the six-pointed stars would be easier to make. She then showed them how a five-pointed star could be made with a single clip of the scissors. Washington then and there changed the sketch and the three gentlemen left. Soon after a new design was sent to her, coloured by William Barrett, a painter of some note. She thereupon set to work to make the famous flag, which was soon completed and approved.

This story was first presented by William J. Canby, grandson of Betsy Ross, in a paper read in 1870 before the Historical Society of Pennsylvania, and it was verified by other descendants of the family who remembered the story as frequently told to them. No contemporary documentary evidence has ever been found to support the story, nor has any, on the other hand, been found which gives the honour to anyone else. All that has been verified is that there was a Mrs. Ross living in Philadelphia at the time of the flag's adoption, and that she was an upholsterer and flagmaker by trade. She died at Philadelphia on Jan. 30, 1836.

Canby's claims are ably presented by L. Balderston in *The Evolution of the American Flag* (1909). *See* also P. D. Harrison, *The Stars and Stripes* (1914); G. H. Preble, *Origin and History of the American Flag* (new ed., 1917); S. Abbott, *Dramatic Story of Old Glory* (1919).

ROSS, SIR JAMES CLARK (1800–1862), British rear-admiral and Polar explorer, was born in London on April 15, 1800. He entered the navy in 1812 accompanying his uncle, Captain (afterwards Sir) John Ross, on his first Arctic voyage in search of a North-West passage (1818). Between 1819 and 1827 he made four Arctic expeditions under Parry, and in 1829–33 again under his uncle, and determined (1831) the position of the North Magnetic Pole. In 1834 he was promoted captain, and in 1835–38 worked on the magnetic survey of Great Britain. In 1839–43 he

commanded the Antarctic expedition of the "Erebus" and "Terror." (*See* POLAR REGIONS.) He wrote *A Voyage of Discovery and Research to Southern and Antarctic Regions* (1847). He was elected to the Royal Society in 1848, and was captain of the "Enterprise," in the first Franklin search expedition. He died at Aylesbury on April 3, 1862.

ROSS, JANET ANNE (1842–1927), English writer, daughter of Sir Alexander Cornewall Duff Gordon, was born in London on Feb. 24, 1842. She is the original of Rose Jocelyn in Meredith's *Evan Harrington*. She married in 1860 Henry Ross, a banker in Egypt and a great traveller, and her life in Egypt, where she spent six years, is described very vividly in her *Fourth Generation: Reminiscences* (1912). From 1863 to 1867 she was a correspondent of *The Times*. In 1867 she and her husband settled in Italy, where her house was a centre for the lovers of Italian culture. She died in Florence on Aug. 23, 1927. Her publications include: *Three Generations of English Women* (2 vols., 1888); *The Land of Manfred* (1889); *Old Florence and Modern Tuscany* (1904); *Lives of the Early Medici* (1910); *Letters of Principal J. M. Lindsay to Janet Ross* (1922).

ROSS, SIR JOHN (1777–1856), British rear-admiral and Arctic explorer, son of the Rev. Andrew Ross, entered the Royal Navy in 1786. In 1808 he captained the Swedish Fleet, and in 1812 was promoted commander. In 1818 he commanded an Arctic expedition fitted out by the Admiralty, but failed to discover much that was new; but in 1829–33 he made a second Arctic expedition, which achieved important geographical and scientific results. In 1850 he undertook a third voyage in search of Sir John Franklin, and in the following year he attained flag-rank.

His publications include—*Voyage of Discovery for the Purpose of Exploring Baffin's Bay* (1819); *Narrative of a Second Voyage in Search of a North-West Passage, including the Discovery of the North Magnetic Pole* (1835); *Memoirs and Correspondence of Lord De Saumerez* (1838).

ROSS, JOHN, or KOOESKOOWE (1790–1866), chief of the Cherokee Indian nation, was of Scottish-Indian descent, born among the Cherokees in Georgia in 1790. He was principal chief from 1828 until his death. In 1830–31 he applied to the Supreme Court of the U.S. for an injunction restraining the State of Georgia from executing its laws within the Cherokee territory, but the court dismissed his suit on the ground that it had no jurisdiction. A small party among the Cherokees under the leadership of John Ridge, a subchief, were disposed to treat with the U.S. for the removal of their nation west of the Mississippi, and in Feb. 1835, while Ridge was negotiating at Washington, Ross proposed to cede the Cherokee lands to the U.S. for $20,000,000. The U.S. Senate resolved that $5,000,000 was sufficient. Both the Ridge treaty and the $5,000,000 proposal were rejected in a full council of the Cherokees Oct. 1835. The council authorized Ross to renew negotiations, but before leaving for Washington he was arrested by the Georgia authorities on the ground that he was a white man residing in the Indian country contrary to law. He was soon released, but in December of this year a few hundred Cherokees concluded a treaty of removal with the U.S. Indian commissioner at New Echota. When Ross learned this he called a council in Feb. 1836, and at this meeting the treaty was declared null and void and a protest against the proceedings at New Echota was signed by more than 12,000 Cherokees. Notwithstanding Ross's opposition, the Senate in the following May ratified the treaty and in Dec. 1838, Ross, with the last party of Cherokees, left for the West (*see* GEORGIA). During the Civil War, Ross signed a treaty with the Confederate States in Oct. 1861, but in the summer of 1862 was forced (by Union sympathizers in the nation) to proclaim neutrality and soon afterwards went over to the Union lines. He was in Washington treating with the Federal Government in Feb. 1863 when the treaty with the Confederate States was abrogated by the Cherokees. He died at Washington on Aug. 1, 1866.

See C. C. Royce, "The Cherokee Nation of Indians" in the *Fifth Annual Report of the Bureau of Ethnology* (1887), and T. V. Parker, *The Cherokee Indians* (New York, 1907).

ROSS, SIR RONALD (1857–), British physician and bacteriologist, was born at Almora, India, on May 13, 1857. He studied medicine at St. Bartholomew's hospital, London, and in 1881 entered the Indian medical service. In 1892 he commenced a series of special investigations on the subject of malaria, in 1895 undertook the experimental verification of the theory that the micro-organisms of this disease are spread by mosquitoes, and in 1897–98 investigated the life history of the parasites. In 1899 he retired from the Indian medical service, and, after a journey to west Africa in 1899 for the study of malaria-bearing mosquitoes, devoted himself to research and teaching, joining the Liverpool school of tropical medicine as lecturer and subsequently becoming professor of tropical medicine at Liverpool university. In 1913 he became physician for tropical disease at King's college, London, and later, director-in-chief of the Ross Institute and Hospital for Tropical Diseases. During the World War, Ross was appointed to the R.A.M.C. and became War Office consultant in malaria. After the War he was consultant in malaria for the Ministry of Pensions. In 1902 he received the Nobel Prize for medicine, in 1911 a K.C.B. and in 1918 a K.C.M.G. He received the Royal Medal of the Royal Society, of which he was a fellow, in 1901. He was editor of *Science Progress*, and his other publications include *The Prevention of Malaria* (1910), *Philosophies* (1910), *Psychologies* (1919), *The Revels of Orsera*, a romance (1920), and *Memoirs* (1923), as well as mathematical and medical works. (*See* MALARIA.)

ROSS, a town in Herefordshire, England; 133 m. W. from London and 12 S.E. from Hereford by the G.W.R. Pop. (1921) 4,665. It is situated on the river Wye. There are manufactures of machinery and agricultural implements, and cider and malt are produced. The church of St. Mary the Virgin, surmounted by a lofty spire, shows good Decorated and Perpendicular work. The market house (1670) is a picturesque building supported on columns, the upper portion serving as a town hall. The town owes much to John Kyrle (d. 1724), eulogised by Pope (*Moral Epistle*, 1732). Wilton Castle, near the town, was burned by the Royalists during the Civil War. The inhabited portion is modern.

Ross was granted to the see of Hereford by Edmund Ironside, but became crown property in 1559.

ROSS AND CROMARTY, northern county, Scotland. The mainland portion is bounded north by Sutherland and Dornoch Firth, east by the North Sea and Moray Firth, south by Beauly Firth and Inverness-shire and west by the strait of the Minch. The island portion (for details *see* HEBRIDES) consists of the northern part of Lewis-with-Harris, and many smaller islands, all but eleven uninhabited, are scattered principally off the west coasts of Lewis and the mainland. The area of the mainland is 1,572,294 acres and of the islands 404,413 acres, giving a total for the county of 1,977,248 acres (excluding water). The inhabited islands belonging to the mainland are all situated off the west coast. They are Bernera, Gillean (lighthouse), Croulin, Horisdale, Dry, Ewe, Martin and Tanera More. On the North Sea front the chief indentations are Beauly Firth and Inner Moray Firth, marking off the Black Isle from Inverness-shire; Cromarty Firth, bounding the districts of Easter Ross and the Black Isle; Moray Firth, separating Easter Ross from Nairnshire; and Dornoch Firth, dividing north-east Ross from Sutherlandshire. On the Atlantic face—which is a coastline of more than 300 m.—the principal sea lochs and bays, from S. to N., are Loch Duich, Loch Alsh, Loch Carron, Loch Kishorn, Loch Torridon, Loch Shieldaig, Upper Loch Torridon, Gairloch, Loch Ewe, Gruinard Bay, Little Loch Broom and Enard Bay.

Almost all the southern boundary with Inverness-shire is guarded by a rampart of peaks, ranging from 3,400 to nearly 3,900 ft. To the north of Glen Torridon rise the masses of the Liatach, with summits of 3,456 and 3,358 ft. On the north-eastern shore of Loch Maree rises Ben Slioch (3,217), while the Fannich group contains at least six peaks of more than 3,000 ft. The isolated mass of Ben Wyvis (3,429) is the most noteworthy feature in the north-east, and the Challich Hills in the north-west with peaks of 3,483 and 3,474 ft. are equally conspicuous, though less solitary. Only a small fraction of western and southern Ross is under 1,000 ft. in height. Easter Ross and the peninsula of the Black Isle are comparatively level. The longest stream is the

Orrin, which rises in An Sithean and flows mainly east by north to its confluence with the Conon after a run of about 26 m., during a small part of which it forms the boundary with Inverness-shire. At Aultgowrie the stream forms the falls of Orrin in a narrow gorge. From its source in the mountains in Strathvaich the Blackwater flows south-east for 19 m. till it joins the Conon, forming soon after it leaves Loch Garve the picturesque falls of Rogie. Within a short distance of its exit from Loch Luichart the Conon pours over a series of graceful cascades and rapids and then pursues a winding course of 12 m., mainly E. to the head of Cromarty Firth. The falls of Glomach, in the south-west, are the deepest in Britain (370 ft. sheer). Twelve miles south by east of Ullapool are the three falls of Measach, close to the gorge of Corriehalloch.

The Oykell, throughout its course, forms the boundary with Sutherlandshire, to which it properly belongs. The largest and most beautiful of the many freshwater lakes is Loch Maree (*q.v.*). Of the straths or valleys the more important run from the centre eastwards, such as Strathconon (12 m.), Strathbran (10 m.), Strathgarve (8 m.), Strathpeffer (6 m.) and Strathcarron (14 m.). Excepting Glen Orrin (13 m.), in the east central district, the longer glens lie in the south and towards the west. In the extreme south Glen Shiel (9 m.) runs between fine mountains to its mouth on Loch Duich. General Wade's road passes down the glen. Farther north are Glen Elchaig (9 m.), Glen Carron (12 m.), in the latter of which the track of the Dingwall and Skye railway is laid, and Glen Torridon (6 m.).

Geology.—The central portion of the county is occupied by the younger highland schists or Dalradian series. On the eastern side of the county the Dalradian schists are covered unconformably by the Old Red Sandstone. The western boundary of the younger schist is formed by the great pre-Cambrian dislocation line which traverses the county from Elphin on the north by Ullapool to Glen Carron. Most of the area west of the line of disturbance is covered by Torridonian Sandstone, mainly dark reddish sandstones, grits and shales, resting unconformably on the ancient Lewisian gneiss. Within the Torridonian tract the gneiss occupies large areas north of Coigach, on the east of Enard Bay, between Gruinard Bay and Loch Maree. The Lewisian gneiss is everywhere penetrated by basic dikes, generally with a N.W.-S.E. direction; some of these are of great breadth. The Torridonian rocks are succeeded unconformably by a series of Cambrian strata which is confined to a narrow belt west of the line of main thrusting. Glacial striae are found upon the mountains up to heights of 3,000 ft., and much boulder clay is found in the valleys and spread over large areas in the eastern districts. Raised beaches occur at 100, 50 and 25 ft. above the present sea-level; they are well seen in Loch Carron. (*See*, further, HEBRIDES.)

Agriculture and Industries.—The most fertile tracts lie on the eastern coast, especially in Easter Ross and the Black Isle, where the soil varies from a light sandy gravel to a rich deep loam. Among grain crops oats is that most generally cultivated, but barley and wheat are also raised. Turnips, mangolds and potatoes are the chief green crops. On the higher grounds there is a large extent of good pasturage which carries heavy flocks of sheep, blackfaced being the principal breed. Most of the horses are maintained for the purposes of agriculture. The herds of cattle, mainly native Highland or crosses, are large. Owing partly to the unkindly nature of the bulk of the surface—which offers no opportunity for other than patchwork tillage—the number of small holdings is enormous, half the total number being under 5 acres, and the average size under 20 acres. Over 800,000 acres are devoted to deer forests, a greater area than in any other county in Scotland. The natural woodland has largely disappeared, but afforestation has been undertaken recently. Apart from agriculture, the salmon fisheries in the bays and river mouths, and the herring, cod and ling fisheries are the only considerable industry. There are distilleries near Dingwall, Tain and Invergordon.

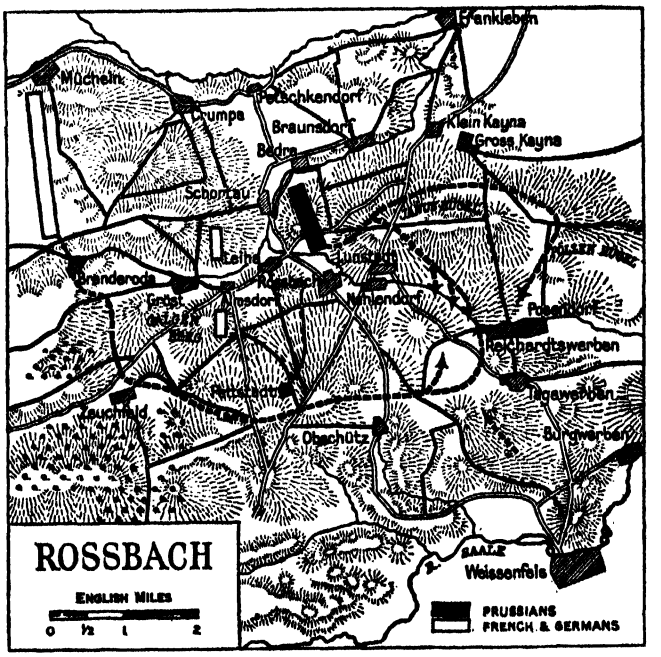
The L.M.S. railway entering the county to the north of Beauly runs northwards to Dingwall, and then strikes off to the north-east by Invergordon and Tain, where it bends to the west by north, leaving the shire at Culrain, having largely followed the coast throughout. At Muir of Ord it sends off the Black Isle branch and at Dingwall a branch to Strathpeffer, as well as a line to Strome Ferry and Kyle of Loch Alsh on the south-western shore.

Population and Administration.—The population of the county in 1921 was 70,818; 42,440 on the mainland and 28,378 on the islands. Thus Ross and Cromarty, though the third largest in size, is the fourteenth county in population. In 1921 there were 4,860 persons who spoke Gaelic only and 35,810 speaking Gaelic and English. The chief towns and villages are Stornoway (pop. 4,079), Dingwall (2,323), Tain (1,551), Cromarty (1,126), Invergordon (1,384). Ullapool is a fishing port near the mouth of Loch Broom. The county returns one of the Inverness members to parliament. Dingwall, Tain and Fortrose are royal burghs, and Dingwall is the county town. Ross and Cromarty forms a sheriffdom, and there are resident sheriffs-substitute at Dingwall and Stornoway, the former also sitting at Tain and Cromarty. The shire is under school-board control and there are academies at Dingwall and Fortrose.

History and Antiquities.—It may be doubted whether the Romans ever effected even a temporary settlement in the area of the modern county. At that period, and for long afterwards, the land was occupied by Gaelic Picts, who, in the 6th and 7th centuries, were converted to Christianity by followers of St. Columba. Throughout the next three centuries the natives were continually harassed by Norse pirates, of whose presence tokens have survived in several place-names (Dingwall, Tain, etc.). At this time the county formed part of the great province of Moray. When the rule of the Celtic *maormors* or earls ceased in the 12th century, consequent on the plantation of the district with settlers from other parts (including a body of Flemings), by order of David I., who was anxious to break the power of the Celts, the bounds of Moravia were contracted and the earldom of Ross arose. At first Ross proper only included the territory adjoining Moray and Dornoch Firths. The first earl was Malcolm MacHeth, who received the title from Malcolm IV. After his rebellion in 1179 chronic insurrection ensued, which was quelled by Alexander II., who bestowed the earldom on Farquhar Macintaggart, then abbot of Applecross, and in that capacity lord of the western district. William, 4th earl, was present with his clan at the battle of Bannockburn (1314), and almost a century later (1412) the castle of Dingwall, the chief seat on the mainland of Donald, lord of the Isles, was captured after the disastrous fight at Harlaw in Aberdeenshire, which Donald had provoked when his claim to the earldom was rejected. The earldom reverted to the crown in 1424, but James I. soon afterwards restored it to the heiress of the line, the mother of Alexander MacDonald, 3rd lord of the Isles, who thus became 11th earl. In consequence, however, of the treason of John MacDonald, 4th and last lord of the Isles and 12th earl of Ross, the earldom was again vested in the crown (1476). Five years later James III. bestowed it on his second son, James Stewart, whom he also created duke of Ross in 1488. By the 16th century the whole area of the county was occupied by different clans, the Rosses, Munroes, Macleods, Macdonalds and Mackenzies. The county of Ross was constituted in 1661, and Cromarty in 1685 and 1698, both being consolidated into the present county in 1889. (*See* CROMARTY, county.) Apart from occasional conflicts between rival clans, the only battles in the shire were those of Invercarron (1650), when Montrose was crushed by Colonel Strachan, and Glenshiel (1719) when the Jacobites, under the earl of Seaforth, aided by Spaniards, were defeated, near Bridge of Shiel, by General Wightman.

Stone circles, cairns and forts are found in the eastern district. A vitrified fort crowns the hill of Knockfarrel in the parish of Fodderty, and there is a circular dun near the village of Lochcarron. Some fine examples of sculptured stones occur, the finest being at Shandwick. Among old castles are those of Lochslin, in the parish of Fearn, said to date from the 13th century, which, though ruinous, possesses two square towers in good preservation: Balone, in the parish of Tarbat, once a stronghold of the earls of Ross; the remains of Dingwall Castle, their original seat; and Eilean Donain in Loch Alsh, which was blown up by English war-

ships during the abortive Jacobite rising in 1719.



ROSSANO, a city of Calabria, Italy, in the province of Cosenza, 24 m. N.N.E. from that town direct, with a station 4 m. distant on the line from Metaponto to Reggio. It is picturesquely situated on a precipitous spur of the mountain mass of the Sila overlooking the Gulf of Taranto, the highest part of the town being 975 ft. above sea-level. Rossano is the seat of an archbishop, and in the cathedral is preserved the *Codex Rossanensis*, an uncial ms. of the Gospels of Matthew and Mark in silver characters on purple vellum, with twelve miniatures, of great interest in the history of Byzantine art, belonging to the 6th century A.D. Marble and alabaster quarries are worked in the neighbourhood.

Rossano (*Roscianum*) was one of the important fortresses of Calabria. Totila took it in 548. In the 14th century Rossano was made a principality for the great family of De Baux. Passing to the Sforza, and thus to Sigismund of Poland, it was united in 1558 to the crown of Naples by Philip II. of Spain.

ROSSBACH, a village of Prussian Saxony in the district of Merseburg, 8 m. S.W. of that place and N.W. of Weissenfels, famous as the scene of Frederick the Great's victory over the allied French and the army of the Empire on Nov. 5, 1757. For the events preceding the battle *see* SEVEN YEARS' WAR. The Prussian camp on the morning of the 5th lay between Rossbach (left) and Bedra (right), facing the Allies, who, commanded by the French general, Charles de Rohan, prince de Soubise, and Joseph Frederick William, duke of Saxe-Hildburghausen, General Feldzeugmeister of the Empire, had manoeuvred in the preceding days without giving Frederick an opportunity to bring them to action, and now lay to the westward, with their right near Branderoda and their left at Mücheln (*see* sketch). The advanced posts of the Prussians were in the villages immediately west of their camp, those of the Allies on the Schortau hill and the Galgenberg.

The Allies possessed a numerical superiority of two to one in the battle itself, irrespective of detachments,[1] and their advanced post overlooked all parts of Frederick's camp. They had had the best of it in the manoeuvres of the previous days, and Hildburghausen determined to take the offensive. He had some difficulty, however, in inducing Soubise to risk a battle, and the Allies did not begin to move off their camping-ground until after eleven on the 5th, Soubise's intention being probably to engage as late in the day as possible, with the idea of gaining what advantages he could in a partial action. The plan was to march the Allied army by Zeuchfeld, round Frederick's left (which was covered by no serious natural obstacle), and to deploy in battle array, facing north, between Reichardtswerben (right) and Pettstädt (left). The duke's proposed battle and the more limited aim of Soubise were equally likely to be attained by taking this position, which threatened to cut off Frederick from the towns on the Saale. This position, equally, could only be gained by marching round the Prussian flank, *i.e.*, by a flank march before the enemy. The obvious risk of interference on the exposed flank was provided against by a considerable flank guard, and in fact it was not in the execution of their original design but in hastily modifying it to suit unfounded assumptions that the Allies met with disaster.

Frederick spent the morning watching them from a house-top in Rossbach. The initial stages of their movement convinced him that the Allies were retreating southward towards their magazines, and about noon he went to dinner, leaving Captain von Gaudi on the watch. This officer formed a different impression of the Allies' intentions, for the columns which from time to time became visible in the undulations of the ground were seen to turn eastwards from Zeuchfeld. Gaudi's excited report at first served only to confirm Frederick in his error. But when the king saw for himself that hostile cavalry and infantry were already near Pettstädt, he realized the enemy's intentions. The battle for which he had manoeuvred in vain was offered to him, and he took it without hesitation. Leaving a handful of light troops to oppose the French advanced post (or flank guard) on the Schortau hill, the Prussian army broke camp and moved—half an hour after the king gave the order—to attack the enemy. The latter were marching in the normal order in two main columns, the first line on the left, the second line on the right; farther to the right was a column consisting of the reserve of foot, and between the first and second lines

PLAN OF THE BATTLE OF ROSSBACH, NOV. 5, 1757

was the reserve artillery on the road. The right-wing cavalry was of course at the head, the left-wing cavalry at the tail of the two main columns. At first the regulation distances were preserved, but when wheeling eastward at Zeuchfeld there was much confusion, part of the reserve infantry getting in between the two main columns and hampering the movements of the reserve artillery, and the rest, on the outer flank of the wheel, being unable to keep up with the over-rapid movement of the wheeling pivot. A weak flank guard was thrown out towards Rossbach. When it was seen that the Prussians were moving, as far as could be judged, eastward, it was presumed that they were about to retreat in order to avoid being taken in flank and rear; and the Allied generals thereupon hurried the march, sending the cavalry on ahead.

Frederick had no intention either of forming up parallel to the enemy or of retreating. As his army could move as a unit twice as fast as the enemy's, he intended to make a détour, screened by the Janus Hügel and the Pölzen Hügel, and to fall upon them suddenly from the east. If at the moment of contact the Allies had already formed their line of battle facing north, the attack would strike their right flank; if they were still on the move in column eastwards or north-eastwards, the heads of their columns would be crushed before the rest could deploy in the new direction—deployment in those days being a lengthy affair. To this end General von Seydlitz, with every available squadron, hurried eastward from Rossbach, behind the Janus Hügel, to the Pölzen Hügel; Colonel von Moller, with eighteen heavy guns, came into action on the Janus Hügel at 3.15 against the advancing columns of the Allied cavalry; and the infantry followed as fast as possible. When they came under the fire of Moller's guns, the Allied squadrons, which were now north of Reichardtswerben and well ahead of their own infantry, suffered somewhat heavily; but it was usual to employ heavy guns to protect a retreat, and they contented themselves with bringing some field-guns into action. They were, however, amazed when Seydlitz's thirty-eight squadrons suddenly rode down upon the head and right flank of their columns from the Pölzen Hügel *"avec une incroyable vitesse."* Gallantly as the leading German regiments deployed to meet him,

[1] V. der Goltz (*Rossbach bis Jena*, 1906 edition) gives 41,000 Allies and 21,600 Prussians as the combatant strengths. Berndt's statistical work, *Zahl im Kriege*, gives the respective forces engaged as Allies 43,000, Prussians 21,000. Other accounts give the Allies' total strength as 64,000 and the Prussians' as 24,000.

the result was scarcely in doubt for a moment. Seydlitz threw in his last squadron, and then himself fought like a trooper, receiving a severe wound. The mêlée drifted rapidly southward, past the Allied infantry, and Seydlitz finally rallied his horsemen in a hollow near Tagewerben, ready for fresh service. This first episode was over in half an hour, and by that time the Prussian infantry, in échelon from the left, was descending the Janus Hügel to meet the already confused and disheartened infantry of the Allies. The latter, as their cavalry had done, managed to deploy some regiments on the head of the column, and the French in particular formed one or two columns of attack—then peculiar to the French army—and rushed forward with the bayonet. But Moller's guns, which had advanced with the infantry, tore gaps in the close masses, and, when it arrived within effective musketry range, the attack died out before the rapid and methodical volleys of the Prussian line. Meanwhile the Allies were trying in vain to form a line of battle. The two main columns had got too close together in the advance from Pettstädt, part of the reserve which had become entangled between the main columns was extricating itself by degrees and endeavouring to catch up with the rest of the reserve column away to the right, and the reserve artillery was useless in the middle of the infantry. The Prussian infantry was still in échelon from the left, and the leftmost battalions that had repulsed the French columns were quickly within musket-shot of this helpless mass. A few volleys directed against the head and left flank of the column sufficed to create disorder, and then from the Tagewerben hollow Seydlitz's rallied squadrons charged, wholly unexpectedly, upon its right flank. The Allied infantry thereupon broke and fled. Soubise and the duke, who was wounded, succeeded in keeping one or two regiments together, but the rest scattered over the countryside. The battle had lasted less than an hour and a half, and the last episode of the infantry fight no more than fifteen minutes. Seven Prussian battalions only were engaged, and these expended five to fifteen rounds per man. Seydlitz and Prince Henry of Prussia, the cavalry and the infantry leaders engaged, were both wounded, but the total loss of the king's army was under 550 officers and men as compared with 7,700 on the part of the Allies. (C. F. A.)

ROSSE, WILLIAM PARSONS, 3RD EARL OF (1800–1867), Irish astronomer and telescope constructor, was born at York on June 17, 1800, a son of the 2nd earl, Lawrence. Until his father's death he was known as Lord Oxmantown. Entered at Trinity college, Dublin, in 1818, he proceeded to Magdalen college, Oxford, in 1821, and in the same year he was returned as M.P. for King's County, a seat which he resigned in 1834. He was Irish representative peer from 1845, president of the British Association in 1843, president of the Royal Society from 1849 to 1854, being awarded the Royal Medal in 1851, and chancellor of the University of Dublin from 1862. He died at Monkstown on Oct. 31, 1867.

The first constructor of reflecting telescopes on a large scale, William Herschel, never published anything about his methods of casting and polishing specula, and Lord Rosse had no help towards his brilliant results. His speculum metal is composed of four atoms of copper (126·4 parts) and one of tin (58·9 parts), a brilliant alloy. Chiefly owing to the brittleness of this material, Lord Rosse's first larger specula were composed of a number of thin plates of speculum metal (16 for a 3-foot mirror) soldered on the back of a strong but light framework made of a brass (2·75 of copper to 1 of zinc), which has the same expansion as his speculum metal. In Brewster's *Edinburgh Journal of Science* for 1828 he described his machine for polishing the speculum, which in all essential points remained unaltered afterwards. In Sept. 1839 a 3-foot speculum was finished and mounted, but, though the definition of the images was good, its skeleton form allowed the speculum to follow atmospheric changes of temperature very quickly, so Lord Rosse decided to cast a solid 3-foot speculum. Hitherto a great difficulty in casting specula was the fact that they generally cracked while cooling. Rosse experimented, ingeniously overcame this difficulty, and successfully cast a solid 3-foot speculum in 1840. In 1842 he began a speculum of 6 ft. diameter, and in 1845 this great reflector was mounted and ready for work.

From 1848 to 1878 it was but with few interruptions employed for observations of nebulae (*see* NEBULA); and many previously unknown features in these objects were revealed by it, especially the similarity of "annular" and "planetary" nebulae, and the remarkable "spiral" configuration in many of the nebulae. A special study was made of the nebula of Orion, and the resulting large drawing gives an extremely good representation of this complicated object. (*See* TELESCOPE.)

See Ball, *Great Astronomers* (London, 1895).

ROSSELLINO, ANTONIO (1427–*c.* 1479), Florentine sculptor, was the son of Mateo Gamberelli, and had four brothers. The Gamberelli were a family of stonecutters of Settignano. Antonio's works are full of religious sentiment, and executed with the utmost delicacy of touch and technical skill. The style of Antonio and his brother Bernardo is a development of that of Donatello and Ghiberti; it possesses all the refinement and sweetness of the earlier masters, but is not equal to them in vigour or originality. Antonio's chief work, still in perfect preservation, is the lovely tomb of a young cardinal prince of Portugal, who died in 1459. It occupies one side of a small chapel, also built by Rossellino, on the north of the nave of San Miniato al Monte. The recumbent effigy of the cardinal rests on a handsome sarcophagus, and over it, under the arch which frames the whole, is a beautiful relief of the Madonna between two flying angels. The tomb was begun in 1461 and finished in 1466.

ROSSELLINO, BERNARDO (1409–1464), sculptor, the eldest brother of Antonio. In Sept. 1439 he acquired a house in the Via Proconsolo, Florence, and opened a botega with his four brothers. His finest piece of sculpture is the tomb, in the Florentine Santa Croce, of Leonardo Bruni of Arezzo, the historian of Florence, executed in 1443. In the church of S. Stefano at Empoli is an annunciation dated 1447. The tomb of Beata Villana at S. Maria Novella, Florence, was ordered in 1451. Bernardo's works as an architect were numerous and important. He was probably associated with Alberti in the construction of the Rucellai palace, Florence, and in extensive restorations and reconstructions of churches under Nicholas V. in Rome. Between the years 1461 and 1464 (when he died while engaged on the Lazzari monument at Pistoia) he occupied the important post of *capo-maestro* to the Florentine duomo.

See Wilhelm Bode, *Die Italienische Plastik* (1902).

ROSSETTI, CHRISTINA GEORGINA (1830–1894), English poet, was the youngest of the four children of Gabriele Rossetti. (*See* article on her brother DANTE GABRIEL ROSSETTI.) She was born at 38 Charlotte Street, Portland Place, London, on Dec. 5, 1830. She enjoyed the advantages and disadvantages of the strange society of Italian exiles and English eccentrics which her father gathered about him, and she shared the studies of her gifted elder brother and sister. As early as 1847 her grandfather, Gaetano Polidori, printed privately a volume of her *Verses*, in which the richness of her vision was already faintly prefigured. In 1850 she contributed to *The Germ* seven pieces, including some of the finest of her lyrics. In her girlhood she had a grave, religious beauty of feature, and sat as a model not only to her brother Gabriel, but to Holman Hunt, to Madox Brown and to Millais. In 1853–54 Christina Rossetti for nearly a year helped her mother to keep a day-school at Frome-Selwood, in Somerset. Early in 1854 the Rossettis returned to London, and the father died.

In poverty, in ill-health, in extreme quietness, she was now performing her life-work. She was twice sought in marriage, but each time, from religious scruples (she was a strong high-church Anglican), she refused her suitor; on the former of these occasions she sorrowed greatly, and her suffering is reflected in much of her early song. In 1861 she saw foreign countries for the first time, paying a six weeks' visit to Normandy and Paris. In 1862 she published what was practically her earliest book, *Goblin Market*, and took her place at once among the poets of her age. In this volume, indeed, is still to be found a majority of her finest writings. *The Prince's Progress* followed in 1866. In 1867 she, with her family, moved to 56 Euston Square, which became their home for many years. Christina's prose work *Commonplace*

appeared in 1870. In April 1871 her whole life was changed by a terrible affliction, known as "Graves's disease"; for two years her life was in constant danger. She had already composed her book of children's poems, entitled *Sing-Song,* which appeared in 1872.

After a long convalescence, she published in 1874 two works of minor importance, *Annus Domini* and *Speaking Likenesses.* The former is the earliest of a series of theological works in prose, of which the second was *Seek and Find* in 1879. In 1881 she published a third collection of poems, *A Pageant,* in which there was evidence of slackening lyrical power. She now gave herself almost entirely to religious disquisition. The most interesting and personal of her prose publications (but it contained verse also) was *Time Flies* (1885)—a sort of symbolic diary or collection of brief homilies. In 1890 the S.P.C.K. published a volume of her religious verse. She collected her poetical writings in 1891. In 1892 she was led to publish a very bulky commentary on the Apocalypse, entitled *The Face of the Deep.* After this she wrote little. Her last years were spent in retirement at 30 Torrington Square, Bloomsbury, which was her home from 1876 to her death. In 1892 her health broke down finally, and she had to endure terrible suffering. From this she was released on Dec. 29, 1894. Her *New Poems* were published posthumously in 1896.

In spite of her manifest limitations of sympathy and experience, Christina Rossetti takes rank among the foremost poets of her time. In the purity and solidity of her finest lyrics, the glow and music in which she robes her moods of melancholy reverie, her extraordinary mixture of austerity with sweetness and of sanctity of tone with sensuousness of colour, Christina Rossetti, in her best pieces, may challenge comparison with the most admirable of our poets. The union of fixed religious faith with a hold upon physical beauty and the richer parts of nature has been pointed to as the most original feature of her poetry. Hers was a cloistered spirit, timid, nun-like, bowed down by suffering and humility; her character was so retiring as to be almost invisible. All that we really need to know about her, save that she was a great saint, was that she was a great poet. (E. G.)

See the *Poetical Works* of C.G.R., with Memoir by W. M. Rossetti (1903); Edmund Gosse, *Critical Kit-Kats* (1896); an article by Ford Madox Hueffer in the *Fortnightly Review* (March, 1904); and another in *The Christian Society* (Oct. 1904). The *Family Letters of Christina Rossetti* were edited by W. M. Rossetti in 1908; *Selected Poems of Christina G. Rossetti,* edited by C. B. Burke (1913); T. Watts-Dunton, *Old Familiar Faces* (1916); Marjorie A. Bald, *Women Writers of the Nineteenth Century* (1923).

ROSSETTI, DANTE GABRIEL (1828–1882), English poet and painter, was born on May 12, 1828, at 38 Charlotte Street, London. He was the second of the four children of Gabriele Rossetti (1783–1854), Italian poet and liberal, a political refugee from Naples, who came to England about 1824, and married in 1826 Frances Mary (d. 1886), sister of Byron's physician, Dr. John Polidori. The elder Rossetti became professor of Italian at King's College, London, and was a subtle and original, if eccentric, commentator on Dante. His other children were Maria Francesca (1827–76), who eventually entered an Anglican sisterhood, and is known to scholars by her valuable *Shadow of Dante;* William Michael (*q.v.*); and Christina (*q.v.*) the poet.

Dante Gabriel Rossetti was educated at King's College School, London. On leaving school he went (1843) to Cary's Art academy (known as Sass's), near Bedford Square, and then (about 1846) to the Royal Academy Antique school. He did not find the instruction he desired in the Royal Academy schools, and asked Ford Madox Brown to take him as a pupil. Brown remained his friend even after Rossetti had transferred his admiration to Holman Hunt.

Pre-Raphaelite Brotherhood.—The point of Pre-Raphaelite crystallization which had so great though brief an influence upon Rossetti's life and art was found at a chance meeting, in 1848, between Rossetti, Millais and Holman Hunt in Millais's house in Gower Street, where certain prints from early Italian frescoes were studied. Rossetti proposed the formation of a "Brotherhood" with lofty aims, and they were joined by J. Collinson, F. G. Stephens, T. Woolner and W. M. Rossetti. Brown, though invited, declined to become a P-R.B. Rossetti's first effort was "The Girlhood of Mary, Virgin," which in March 1849 was exhibited at the "Free Exhibition," at Hyde Park Corner. The style of this famous picture was jejune, its handling was timid, while its coloration and tonality were dry, not to say thin. Its technique owed something to Brown, but its mysticism was Rossetti's own. Such was his advent in art under the Pre-Raphaelite banner. "Ecce Ancilla Domini!" the smaller picture which is now in the Tate Gallery, London, was his one perfect expression of the original motive of the "Brotherhood." He chose virginal white and its harmonies as its aptest coloration, and the intense light of morning sufficed for its tonality. There is real grace and sweetness in the figure of the Virgin, for which his sister Christina was the model. This picture was exhibited at the Portland Gallery in 1850 and was violently attacked by the critics at the time.

In December 1850 appeared the first of the four numbers of *The Germ,* the organ of the "Brotherhood," in which Rossetti had a leading place in verse and prose. He contributed to it some of his most famous poems—*The Blessed Damozel,* six sonnets and four lyrics.

The attack on the Pre-Raphaelites by the critics prejudiced their sales, and Rossetti turned to water-colours. His first considerable effort in this medium, which proved well-suited to his talent, was the illustration to Browning's poem "The Laboratory," depicting a lady's visit to an old poison-monger to obtain a fatal potion for her rival in love. This wonderful gem of colour marked the opening of the artist's second period, and his departure from that phase of Pre-Raphaelitism of which "Ecce Ancilla Domini!" was the crowning achievement. Other water-colours followed including the original (pen and ink) of "Hesterna Rosa," a gambling scene (1852), and "Dante drawing the Angel" (1852). "Found" was begun in 1853; but this piece of pictorial moralizing (the analogue of the poet's *Jenny*), vigorous and intensely pathetic as it is, was never really finished.

Marriage to Elizabeth Siddal.—Rossetti had now become acquainted with the beautiful Elizabeth Siddal, whose sumptuous and individual type moved Hunt, Millais and Rossetti to paint her. Rossetti painted her innumerable times, and they became engaged to be married about 1851. The friends called her "Lizzy" and "Guggums," though the names ill suited her tragic temperament and ominous beauty. By 1854 the Brotherhood, championed by John Ruskin, was respectable, but at the moment of success the group was broken up. Ruskin became Rossetti's patron and friend; it was rather a onesided friendship, for Rossetti was not prepared to accept Ruskin's pretensions. In May 1860 Rossetti and Elizabeth Siddal were married, but the two years of their marriage were painful years, for she was dying of tuberculosis. She gave birth to a still-born child, and on Feb. 11, 1862, she died of an overdose of laudanum, which she took from time to time to allay her sufferings. In the meantime Rossetti had met William Morris and Burne-Jones, both of them his enthusiastic disciples. To these new friendships are due Rossetti's part in the luckless decorations of the Oxford Union (1857–8). To the exhibition of the Pre-Raphaelites in 1857 he sent many works, including the "Wedding of St. George and Princess Sabra" and "Arthur's Tomb" (both in the Tate Gallery, London). "Bocca Baciata," the portrait (in oils) of a woman, a work of wonderful fire, and the pictures on the pulpit at Llandaff Cathedral, marked the close of the second epoch in Rossetti's art and the beginning of the third, last and most powerful of all the phases of his career. The picture "Dr. Johnson at the Mitre" (Tate Gallery), when the "pretty fools" consulted the lexicographer on Methodism, is a good example of his humour. In 1861 Rossetti published the exquisite translations in *The Early Italian Poets,* later revised as *Dante and his Circle* (1874).

Achievements in Painting.—With Morris he began to take a keen interest in decorative art. He produced several fine designs for stained glass, and had a large share in the revival of stained-glass painting as an art. The practice of designing on a large scale, and employing masses of splendid deep-toned colours, was probably largely responsible for the development of his powers in painting at this period (1862–63). He produced at this time a

striking and highly imaginative triptych (Tate Gallery), representing three events in the careers of Paolo and Francesca. The composition of the group of figures with the circular window behind them, is as fine as it was comparatively novel in Rossetti's practice. Other outstanding works are "Beata Beatrix" (Elizabeth Siddal as the blessed Beatrice contemplating the eternal) (1865), now in the Tate Gallery; "Proserpina in Hades" (1874), perhaps the most original, if not the most poetical and powerful of all his output; "Sibylla Palmifera" (1870); "Venus Verticordia," "Lilith," the better of the two versions is now referred to (1873); "Monna Vanna," in the Tate Gallery (1866); "Aurea Catena" (Janey Morris) (*c.* 1869); "La Ghirlandata" (1878); "Pandora," another study of Mrs. Morris (1871); "The Blessed Damozel" (1877); and the famous "Dante's Dream," now in the Walker Art Gallery at Liverpool. Nearly all Rossetti's last work was exhibited by the Royal Academy and at the Burlington Fine Art Club in 1883, after his death.

Development As a Poet.—The literary side of Rossetti developed *pari passu* with his achievements as a painter. After his wife's death he moved from Blackfriars to 16, Cheyne Walk, (The Queen's House), Chelsea, where for a short time A. C. Swinburne, W. M. Rossetti and Theodore Watts-Dunton lived with him. Rossetti had felt his wife's death—and perhaps his own remorse for having so frequently betrayed her—so acutely that in the first paroxysm of his grief he insisted upon his poems (then in manuscript) being buried in her coffin. But in 1869 they were disinterred and published in 1870. The volume contained the poems printed in *The Germ*, the sonnet-sequence *The House of Life*, very much enlarged at a later date. From this time to his death he continued to write poems and produce pictures—in the latter relying more and more upon his manipulative skill and less and less upon his inventive faculty. He depended also to some extent on the assistance of an artist whose name was Treffry Dunn.

In 1871 Robert Buchanan, in an unsigned article in the *Contemporary Review* on "The Fleshly School of Poetry," made a fierce attack on Rossetti's poems from a moral point of view, to which he answered by one on the "Stealthy School of Criticism." The attack was deeply felt by him, and his tendency towards gloomy brooding was further increased about 1868, by persistent insomnia. The result of this malady was a nervous shrinking from personal contact with any save a few intimate friends, which was aggravated by the use of narcotics, and at one time he saw scarcely anyone save his own family and Theodore Watts-Dunton. Fears were felt for his sanity, and in 1872 he was under medical care. He was frequently away with William Morris at Kelmscott, in Oxfordshire; indeed he was for some time (1872–74) a co-tenant of Kelmscott. This friendship was broken by the disputes arising out of the reorganization of the Morris firm, but Mrs. Morris was still an occasional visitor at Cheyne Walk.

While his *Ballads and Sonnets* was being printed (1881) his health began to give way and he died on April 9, 1882. His *Ballads and Sonnets* contained much of his best work, including the completed *House of Life*, and the fine ballads, *Rose Mary*, *The White Ship*, and *The King's Tragedy*.

ROSSETTI, WILLIAM MICHAEL (1829–1919), English author and critic, born in London, second son of Gabriele and Frances Rossetti. In 1845, owing to pressure of family circumstances, he entered the Excise Office, afterwards the Inland Revenue Office, where he remained till 1894, retiring with the rank of under-secretary. He was a founder of the Pre-Raphaelite Brotherhood, and edited its organ *The Germ*, to which he contributed several papers of criticism and some verse. From 1850 onward, he wrote on matters of art and literature for *The Spectator* and other papers, defending the Pre-Raphaelite cause.

W. M. Rossetti is best remembered for his work in connection with Shelley (1869), Blake and Walt Whitman. His edition and memoir of Shelley (1869), with a carefully emended text and a dispassionate study of the poet's life, was invaluable at the time of its publication.

In 1874 he married Lucy (1843–1894), daughter of Ford Madox Brown, by whom he had five children.

W. M. Rossetti's most important works are: Blank verse translation of Dante's *Inferno* (1865); *Fine Art, Chiefly Contemporary* (1867); *Aldine Edition of Blake's Poems* (1874); *Lives of Famous Poets* (1878); *Collected Works of D. G. Rossetti* (1886–1904); *Life of Keats* (1887); *D. G. Rossetti: His Family Letters with Memoir* (1895); Memoir of D. G. Rossetti prefixed to *New Poems* (1896); *Ruskin, Rossetti, Pre-Raphaelitism* (1899), the first of a series of Family records; *Gabriele Rossetti—A Versified Autobiography* translated and supplemented (1901); *Some Reminiscences* (1906); *Democratic Sonnets* (1907).

ROSSI, PELLEGRINO LUIGI EDOARDO, COUNT (1787–1848), Italian economist, and statesman, was born at Carrara on July 13, 1787. He was educated at Pavia and Bologna. In 1815 he supported Joachim Murat, and on his fall left the country and went to Geneva, where he lectured on Roman law. He was made a citizen of Geneva, and as member of the extraordinary diet of 1832, was employed to draw up a revised Constitution, the *Pacte Rossi*. This was rejected, and Rossi went to France, where he was professor of political economy in the College de France, and in 1834 professor of constitutional law at Paris university. In 1839 he was given a peerage and in 1845 sent to Rome, where he became French ambassador. After the revolution of 1848 he stayed in Rome, and became minister of the interior under Pius IX. He was assassinated on the steps of the House of Assembly on Nov. 15, 1848.

As a statesman, Rossi was a man of signal ability and intrepid character, but it is as an economist that his name will be best remembered. His *Cours d'économie politique* (1838–54) gave in classic form an exposition of the doctrines of Say, Malthus and Ricardo. His other works were *Traité de droit pénal* (1829); *Cours de droit constitutionnel* (1866–67); and *Mélanges d'économie politique, d'histoire et de philosophie* (2 vols., 1857).

See le Comte Fleury d'Ideville, *Le Comte Pellegrino Rossi, sa vie, ses oeuvres, sa mort* (1887).

ROSSINI, GIOACHINO ANTONIO (1792–1868), Italian operatic composer, was born at Pesaro on Feb. 29, 1792. His father was town trumpeter and inspector of slaughter-houses, his mother a baker's daughter. The elder Rossini was imprisoned by the Austrians in 1796, and the mother took Gioachino to Bologna, earning her living as a *prima donna buffa* at various theatres of the Romagna, where she was ultimately rejoined by her husband. Gioachino remained at Bologna in the care of a pork butcher, while his father played the horn in the bands of the theatres at which his mother sang. The boy learned singing and the pianoforte, and at thirteen appeared at the theatre of the Commune in Paër's *Camilla*—his only appearance as a public singer (1805). He was also able to play the horn. In 1807 he was admitted to the Conservatorio of Bologna, but his insight into orchestral resources was gained rather by scoring the quartets and symphonies of Haydn and Mozart, than from his teachers. At Bologna he was known as "il Tedeschino" on account of his devotion to Mozart. His first opera, *La Cambiale di Matrimonio*, was produced at Venice when he was eighteen. Two years before he had received the prize at the Conservatorio of Bologna for his cantata *Il pianto d'armonia per la morte d'Orfeo*. Between 1810 and 1813, at Bologna, Rome, Venice and Milan, Rossini produced operas of which the successes were varying. *Tancredi*, produced at the Fenice, Venice (1813) made him famous. The libretto was an arrangement of Voltaire's tragedy by J. A. Rossi. Traces of Paër and Paisiello were undeniably present in frag-

ments of the music. But the sweetness and clarity of such melodies as "Mi rivedrai, ti rivèdrò" and "Di tanti palpiti," conquered Venice. Italians would sing "Mi rivedrai" in the law courts until called upon by the judge to desist. Rossini continued to write operas for Venice and Milan during the next few years, but without repeating the success of *Tancredi.*

In 1815 he retired to Bologna, where Barbaja, the impresario of the Naples theatre, engaged him as musical director of the Teatro San Carlo and the Teatro Del Fondo at Naples, on the understanding that he compose for each of them one opera a year. His payment was to be 200 ducats (about £35 or $175) per month; he was also to receive a share in the gaming-tables, also owned by Barbaja, amounting to about 1,000 ducats (£175 or $875) per annum. General enthusiasm greeted the court performance of his *Elisabetta regina d' Inghilterra,* in which Isabella Colbran, whom Rossini afterwards married, took a leading part. The opera was the first in which Rossini wrote the ornaments of the airs instead of leaving them to the fancy of the singers, and also the first in which the *recitativo secco* was replaced by a recitative accompanied by a quartet of strings. In *Almaviva* (Rome, 1816) the libretto, a version of Beaumarchais' *Barbier de Séville* by Sterbini, was the same as that already used by Paisiello in his *Barbiere,* an opera which had enjoyed European popularity for more than a quarter of a century. But Rossini had created such a masterpiece of musical comedy that the title of *Il Barbiere di Siviglia* passed inevitably to his opera.

Between 1815 and 1823 Rossini produced twenty operas. Of these *Otello* formed the climax, contrasting interestingly with the treatment of the same subject at a similar point of artistic development by Verdi. In deference to the taste of the day the story was made to end happily! The opera *Cenerentola* (1817) is to be ranked with the *Barbiere,* as a masterpiece in comedy. *Mose in Egitto* was produced at Naples in 1818. In 1821, Rossini married Isabella Colbran. In 1822 he directed his *Cenerentola* in Vienna, where *Zelmira* was also performed. After this he returned to Bologna; but an invitation from Prince Metternich to "assist in the general re-establishment of harmony" brought him to Verona at the opening of the Congress on Oct. 20, 1822. Here he made friends with Chateaubriand and Madame de Lieven.

In 1823, at the suggestion of the manager of the King's Theatre, London, he came to England, being much fêted on his way through Paris. In England he was given a generous welcome, which included an introduction to King George IV. and the receipt of £7,000 after a residence of five months.

In 1824 he became musical director of the Théâtre Italien in Paris at a salary of £800 per annum, and when the agreement came to an end he was appointed chief composer to the king and inspector-general of singing in France. The production of *Guillaume Tell* in 1829 brought his career as a writer of opera to a close. The libretto was by Étienne Jouy and Hippolyte Bis, but their version was revised by Armand Marrast. The music is free from the conventions discovered and utilized by Rossini in his earlier works, and marks a transitional stage in the history of opera. In 1829 he returned to Bologna on family business. His return to Paris was delayed by the July Revolution of 1830 until November 1830. Six movements of his *Stabat Mater* were written in 1832 and the rest in 1839, the year of his father's death, and the success of the work bears comparison with his achievements in opera; but his comparative silence during the period from 1832 to 1868 makes his biography appear almost like the narrative of two lives—the life of swift triumph, and the long life of seclusion, of which the biographers give us pictures in stories of the composer's cynical wit, his speculations in fish culture, his mask of humility and indifference. His first wife died in 1845, and political disturbances in the Romagna compelled him to leave Bologna in 1847, the year of his second marriage with Olympe Pelissier, who had sat to Vernet for his picture of "Judith and Holofernes." After living for a time in Florence he settled in Paris in 1855, where his house was a centre of artistic society. He died at Passy on Nov. 13, 1868.

See Stendhal, *Vie de Rossini* (1823); A. Azevedo, *G. Rossini, sa vie et ses œuvres* (1865); H. de Curzon, *Rossini* (1920).

ROSSLYN, ALEXANDER WEDDERBURN, 1ST EARL OF (1733–1805), Lord Chancellor of Great Britain, was the eldest son of Peter Wedderburn (a lord of session as Lord Chesterhall), and was born in East Lothian on Feb. 13, 1733. He was educated at Edinburgh university and entered the Inner Temple in 1753. It was always his intention to practise at the English bar, but in deference to his father's wishes he qualified as an advocate in Edinburgh in 1754, and practised there for three years. In 1757, following a quarrel with Lockhart, then dean of faculty, he left the Scottish bar, and was called at the Inner Temple. He engaged Thomas Sheridan and Macklin to teach him oratory and to eliminate his native accent. His countrymen, Lords Bute and Mansfield, were also useful to him, and it was he who suggested to Bute a pension for Dr. Johnson. Bute's influence got him into parliament in 1761, and he took silk in 1763. In 1767 he married an heiress. His political career after this is complicated in the extreme. In 1768 he was a Tory, but next year he resigned his seat over the Wilkes business, thereby winning enormous popularity in the country, and getting a pocket-borough from Clive in 1770. His new associates, however, distrusted him, and with reason; in January 1771 he deserted to the North ministry and was made solicitor-general. As Junius said "there is something about him which even treachery cannot trust." Throughout the American war he savagely attacked the colonies, and in 1778 he was made attorney-general. In 1780 he became Chief Justice of the Common Pleas with the title of Baron Loughborough. During North and Fox's coalition he was a commissioner of the great seal, and appears as leader of the Whigs in the Lords, with full expectations of the Woolsack. The King's recovery, however, blighted their hopes, and in 1792 Loughborough seceded from Fox, and became Lord Chancellor in Pitt's Tory cabinet. In 1801, Pitt's resignation was the end of him; Addington had no room for him, but he received the earldom of Rosslyn, and retired. He died at his country house near Windsor on Jan. 2, 1805, and was buried in St. Paul's.

At the bar Wedderburn was the most elegant speaker of his time, and, although his knowledge of the principles and precedents of law was deficient, his skill in marshalling facts and his clearness of diction were marvellous; on the bench his judgments were remarkable for their perspicuity, particularly in the appeal cases to the House of Lords. For cool and sustained declamation he stood unrivalled in parliament, and his readiness in debate was universally acknowledged. In social life, in the company of the wits and writers of his day, his faculties seemed to desert him. He was not only dull, but the cause of dulness in others.

ROSTAND, EDMOND (1869–1920), French dramatist, was born on April 1, 1869, the son of a prominent Marseilles journalist and economist. His first play, a burlesque, *Les romanesques,* was produced on the 21st of May 1894 at the Théâtre Français. He took the motive of his second piece, *La Princesse lointaine* (Théâtre de la Renaissance, 5th April 1895), from the story of the troubadour Rudel and the Lady of Tripoli. The part of Mélisande was created by Sarah Bernhardt, who also was the original Photine of *La Samaritaine* (Théâtre de la Renaissance, 14th April 1897), a Biblical drama in three scenes taken from the gospel story of the woman of Samaria. The production of his "heroic comedy" of *Cyrano de Bergerac* (28th December 1897, Théâtre de la Porte Saint-Martin), with Coquelin in the title rôle, was a triumph. No such enthusiasm for a drama in verse had been known since the days of Hugo's *Hernani.* The play was quickly translated into English, German, Russian and other European languages. For his hero he had drawn on French 17th-century history; in *L'Aiglon* he chose for his theme the unhappy life of the duke of Reichstadt, son of Napoleon I. and Marie Louise, under the surveillance of Metternich at the palace of Schönbrunn. *L'Aiglon,* in six acts and in verse, was produced (March 15, 1900) by Sarah Bernhardt at her own theatre, she herself playing the part of the duke of Reichstadt, one of her most famous later rôles. In 1902 Rostand was elected to the French Academy. *Chantecler,* produced in February 1910, had Lucien Guitry in the title rôle. During the

World War he wrote chiefly patriotic verse. He died in Paris on Dec. 2, 1920.

His son, MAURICE ROSTAND, author of plays, made a sensation in 1928 by the production of *Napoléon IV.*, in which it was sought to ascribe responsibility for the death of the Prince Imperial to Queen Victoria.

The following works by Edmond Rostand were published posthumously: *La dernière nuit de Don Juan* (1921); *Le cantique de l'aile* (1922); *Le Vol de la Marseillaise* (1922). *See* G. Haraszti *Edmond Rostand* (1913); J. Suiberville, *Le Théâtre d'Edmond Rostand* (1919).

ROSTOCK, a town of Germany, in the republic of Mecklenburg-Schwerin, one of the most important commercial cities on the Baltic. It is situated on the estuary of the Warnow, 8 m. from the port of Warnemünde on the Baltic, 177 m. N.W. of Berlin by rail, 80 m. E.N.E. of Lübeck, and 106 m. S. of Copenhagen. Pop. (1925) 70,206. It is probable that the site was occupied by a village from very early times but the first definite mention of the settlement occurs in the 12th century. The town received its municipal charter in 1218. The earliest signs of commercial prosperity date from about 1260. In the 14th century it joined the Hanseatic League; and was one of the original members of the powerful Wendish Hansa, in which it exercised an influence second only to that of Lübeck. The most prosperous epoch of its commercial history began in the latter half of the 15th century. Rostock never entirely lost the independence which it enjoyed as a Hanse town; and in 1788, as the result of long contentions with the rulers of Mecklenburg, it secured for itself a peculiar and liberal municipal constitution. In 1880 this constitution was somewhat modified, and the city became less like a state within a state. It has belonged to Mecklenburg-Schwerin since 1695.

The town consists of three parts—the old town to the east, and the middle and new towns to the west—of which the first retains some of the antique features of a Hanse town. The town has four gates, one of them dating from the 14th century.

Rostock has five old churches: St. Mary's dating from 1398 to 1472, one of the most imposing Gothic buildings in Mecklenburg, with two Romanesque towers and containing a magnificent bronze font and a curious clock; St. Nicholas's, begun about 1250 and restored in 1450, and again in 1890–94; St. Peter's, with a lofty tower built in 1400, which serves as a landmark to ships at sea; St. James's, completed in 1588, and the church of the Holy Rood, begun in 1270. St. Mary's church contains a monument marking the original tomb of Hugo Grotius, who died in Rostock in 1645, though his remains were afterwards removed to Delft. Among other buildings are the curious 14th century Gothic town hall, the façade of which is concealed by a Renaissance addition; the former palace of the grand dukes, built in 1702; and the university buildings, erected in 1867–70. The university of Rostock was founded in 1418. From 1437 till 1443 it had its seat at Greifswald in consequence of commotions at Rostock; and in 1760 it was again removed, on this occasion to Bützow. The professors appointed by the city, however, still taught at Rostock, so that there were practically two universities in the duchy until 1789, when they were reunited at the original seat.

Rostock has a considerable trade, being the chief commercial town of Mecklenburg and vessels drawing 19 ft. of water are able to get up to the wharves. By far the most important export is grain; but bricks, sugar and salt are also shipped. The chief imports are coal, herrings, timber, wine and colonial goods. A train-ferry service to Denmark runs from Warnemünde, the outpost of Rostock.

ROSTOPTSCHIN, COUNT FEODOR VASSILIEVICH (1763–1826), Russian general, was born on March 23, 1763, in the government of Orel. The Tsar Paul made him in 1796 adjutant-general, grand-marshal of the court, then minister of the interior. He was disgraced in 1801 for his opposition to the French alliance, but was restored to favour in 1810, and was appointed military governor of Moscow. He was charged with its defence against Napoleon. He is alleged to have instigated the burning of Moscow the day after the French had made their entry; it is certain that the prisons were opened by his order, and that he took no means to stop the outbreak. He defended himself against the charge of incendiarism in a pamphlet printed in Paris in 1823, *La Vérité sur l'incendie de Moscou,* but he subsequently made grave admissions. Shortly after the Congress of Vienna, to which he had accompanied the tsar Alexander, he was disgraced. He only returned to Russia in 1825, and died at Moscow on Feb. 12, 1826.

His *Mémoires écrits en dix minutes* were posthumously published at St. Petersburg in 1853, his *Oeuvres inédites* in Paris in 1894. A partial account of his life was written by his grandson A. de Ségur (Paris, 1872). *See* also Varnhagen von Ense, *Denkwürdigkeiten,* vol. ix.; G. Tzenoff, *Wer hat Moskau im Jahre 1812 in Brand gesteckt* (1900).

ROSTOV-ON-DON, a seaport of Russia in the North Caucasian Area, in 47° 15′ N., 39° 40′ E., on the Sea of Azov, 25 m. from the point where the Don river reaches that sea by a number of mouths, only two of which are used, one for shipping and one for rafts. A channel through the former has been dredged with a minimum depth of 14 ft., and a stone quay exists along the river front 4,300 yd. long. The river is frost bound for 100 days per annum on an average. Trade consists of transit from rail or river vessels to lighters or local steamers on which cargoes are carried to Taganrog roads, there to be loaded for foreign voyages. Very few vessels from foreign ports reach Rostov itself. Imports and exports are thus practically the same as those of Taganrog (*q.v.*). Rostov is an industrial centre with shipbuilding yards, a dyeing industry, zinc, tobacco, boot and shoe factories, and other enterprises. There is a fishing industry. It is linked by rail with the north and west, with the Volga river and with the Caspian Sea. Pop. (1926) 233,491, much swollen in summer by seasonal hands coming in for the grain shipping industry.

ROSTOV VELIKIY, a town of Russia in the province of Yaroslavl, in 57° 14′ N., 39° 15′ E., near Lake Rostov or Nero. Rostov was founded by the Slavs about 862, and played a great part in early Russian history as the centre of the Rostov principality. Its pink washed Kreml (or citadel) walls have iron doors with quaint legends and paintings in each square, *e.g.,* a crow on a branch with the legend "I sing only to relieve my sorrow." Its ancient cathedral, with the famous peal of bells, its numerous church domes, its 12th century shrines and relics, the alleys and closes of its market, give a wonderful picture of mediaeval Russian life. After the Mongol invasion of 1239–42, it rapidly declined and in 1474 was purchased by Ivan III. and annexed to Moscow. It was repeatedly plundered by Tatars, Lithuanians and Poles in the 15th, 16th and 17th centuries. The population (19,952 in 1926) is mainly employed in the drying of vegetables and medicinal herbs, in coffee and chicory preparation and in flour-milling. There is fishing in the lake. The district was once famous for its enamelled *ikons.*

ROSTRA ("beaks"), in Roman antiquities, the orators' platform which stood in Rome between the Comitium and the Forum, opposite the Curia. In 338 B.C. it was decorated by Gaius Maenius with the prows of ships captured from the people of Antium. From that time it was called *Rostra,* having previously been known as *templum* (literally "consecrated place"), since it had been consecrated by the augurs. Here were exhibited the statues of famous Romans, and State documents and memorials (the laws of the Twelve Tables, etc.). Caesar had it pulled down, intending that it should be rebuilt on the west side of the Forum, but it was left for Augustus to carry out his plan. The use of the term *Rostra Vetera* by classical authors makes it doubtful whether the old platform was entirely demolished, unless the name was simply transferred to the new rostra of Augustus to distinguish it from the *Rostra Iulia.* This consisted of a rectangular platform, 78 ft. long, 11 ft. above the level of the Forum, reached by steps from the back; in front there was a marble balustrade with an opening in the centre where the speaker stood. In the existing remains, the holes in which the beaks of the ships were fastened are visible. *See* ROME: *Archaeology.*

Richter "Topographie der Stadt Rom" (1901), in I. von Mueller's *Handbuch der klassischen Altertumswissenschaft;* H. Thédenat, *Le Forum Romain,* (third ed. 1904); J. E. Sandys, *Companion to Latin Studies* (1921).

ROSWELL, a city of south-eastern New Mexico, U.S.A., the county seat of Chaves county; 150 m. N.W. of El Paso (Texas), at an altitude of 3,570 ft., near the Pecos river, on Federal highway 366 and the Santa Fe railway. Pop. (1920) 7,033 (94% native white); estimated locally at 9,500 in 1928. It is a trade centre for fertile farmlands (40,000 ac. irrigated by artesian wells) and an extensive stock-raising region; the seat of the New Mexico Military Institute and junior college (a state institution, established in 1898); and the gateway to the Lincoln National Forest of 1,500,000 ac. in the Gallina, Capitan, White, Sacramento, and Guadalupe mountains. The Artesia oilfield is 40 m. south. Roswell was founded in 1885, as a cattle-trading point. The railway reached it from the S. in 1894 and from the E. in 1898. The city was incorporated in 1890.

ROSYTH, village and naval base of Fifeshire, Scotland, on the north shore of the Firth of Forth, 2¼ m. by rail from Dunfermline, with a halt on the L.N.E. line from Edinburgh to Dunfermline. The plans for the establishment of a large naval base here, drawn up in 1903, were modified in 1908; 285 ac. of foreshore and 1,184 of land behind were purchased, and work begun in 1909.

The original scheme included a high-level main basin covering an area of 55 ac., with an entrance lock from the fairway, a dry dock, a submarine tidal basin, and the construction of an entrance channel. A great sea-wall was built to form the southern boundary of the docks, the number of which was increased from one to three. Great progress had been made by the outbreak of the World War, and operations were pushed on vigorously. Rosyth was used as a secondary base to Scapa Flow, particularly for battle-cruisers. It was decided in 1925 to reduce the dockyard to the basis of a "care and maintenance" establishment.

ROTA, COURT OF, one of the departments of the mediaeval papal organization in the Vatican. The Rota was the supreme court of appeal of Christendom. It declined in importance when a special court of appeal for Italy was set above it, and more so as the geographical jurisdiction of the pope was gradually lessened. After the Council of Trent the old arrangements were replaced by the Congregations, permanent committees of cardinals which deal with definite branches of business. The Rota, however, was restored to its functions as supreme court of appeal by Pope Pius X. in 1908.

See CURIA ROMANA; and art. "Rota" in the *Catholic Encyclopaedia.*

ROTARY CLUB, a local organization of business men founded for the purpose of furthering business service and fostering social relations. The first Rotary was founded in the city of Chicago, Ill., on Feb. 23, 1905, by a lawyer, Paul P. Harris. The members met in rotation at the offices or places of business of the various members. This method suggested the name, Rotary Club. Similar clubs were organized in other cities of the United States of America, and in August 1910, at Chicago, the 16 clubs then in existence formed the National Association of Rotary Clubs. In 1912, after the formation of the Winnipeg, Canada, and the Dublin, Ireland, clubs the organization became the International Association of Rotary Clubs. In 1922 the name was changed to Rotary International. At the present time (June, 1928) Rotary International includes 2,923 clubs in 44 countries. There are about 137,000 members.

There is nothing secret about Rotary. Its constitution and by-laws can be obtained by anyone. Its aims and objects are to encourage and foster: 1. The ideal of service as the basis of all worthy enterprise. 2. High ethical standards in business and professions. 3. The application of the ideal of service by every Rotarian to his personal, business and community life. 4. The development of acquaintance as an opportunity for service. 5. The recognition of the worthiness of all useful occupations and the dignifying by each Rotarian of his occupation as an opportunity to serve society. 6. The advancement of understanding, goodwill and international peace through a world fellowship of business and professional men united in the ideal of service.

Membership in Rotary is based upon activity in a business or profession. One representative of each business, profession or institution in a community may be elected to membership. A second active member, who is a junior member of the firm or organization of which the first active member is a senior member, may be elected to membership. Men who have distinguished themselves by some meritorious service may be elected to honorary membership. The affairs of each club are administered by a board of directors assisted by various standing committees. The officers (president, vice-president, secretary and treasurer) are elected annually. Clubs hold weekly luncheon meetings. Membership in the club is forfeited if the required standard of attendance is not maintained. Clubs are banded together in districts. The club executives in each district meet in conference each year. Delegates and members of the clubs meet in annual district conference. In June, 1928 there were 69 such districts, not including those in the British Isles. The affairs of the district are administered by a governor, who is nominated by the district conference, and who is elected by the delegates at the international convention. The governor is the representative of Rotary International in his district. Each year representatives of all the clubs in Rotary International assemble in convention. The annual international convention elects a president who, with a board of directors, administers the affairs of Rotary International. The constitution provides that of the 12 directors, at least 5 must be from countries other than the United States of America. A permanent secretariat, consisting of the secretary, assistant secretaries, and staff, is maintained at Chicago, Ill. Branch secretariats are maintained in London, England, and at Zurich, Switzerland. The official publication is *The Rotarian,* published at Chicago.

(A. H. SA.)

IN THE BRITISH ISLES

The Rotary movement in the British isles was started in 1911. The first actual Rotary club was organised in Dublin by an Irish gentleman who had lived for many years in the United States. Shortly afterwards clubs were founded in London and Manchester by business men belonging to those cities who had seen something of the movement in America. Subsequently clubs were formed in Belfast, Glasgow, Edinburgh, Liverpool and Birmingham. These eight clubs formed, in May 1914, the British Association of Rotary Clubs, which was entrusted with the work of extending the movement and of preserving its aims and objects.

The British Rotary club differs in no essential way from that of North America. Its constitution provides for a membership limited to a single representative in each club of a given classification of trade or profession who must be either proprietor, active partner, or managing director, holding an executive position, or sole agent of a local branch. The club must meet weekly for luncheon and is expected at such meeting to provide a speaker on a topic of general interest, preferably one reflecting in some way the Rotary ideal of service in personal, business and community life. The club appoints its president and council at an annual meeting and is entirely autonomous so far as its local affairs are concerned. Party politics and sectarian religion are rigidly excluded from the proceedings. The fact that the member enjoys the exclusive privilege of representing his classification gives him no right to use his privilege for personal advantage. Mutual trading is in no way encouraged, but rather the reverse.

The Rotary clubs in Great Britain and Ireland have increased progressively in numbers since 1914 and there are now (1928) nearly 300. The governing body, formerly the British Association of Rotary Clubs, is now Rotary International, the clubs in Great Britain and Ireland, organized into fifteen districts, forming an administrative area organisation known as R.I.B.I. (Rotary International: Britain and Ireland). The headquarters are at 34, Norfolk Street, Strand, London. (V. C.)

ROTARY ENGINE. A type of steam engine in which the use of reciprocating parts is avoided with the object of saving the energy wasted in converting reciprocal or to-and-fro movement into rotary movement. The rotary principle has never had any practical success in competing with the smaller reciprocating engines, but steam turbines (which are really a class of rotary engine) have furnished the solution of the problem for moderate and large size installations. Many rotary mechanisms have been tried in the past. Some have comprised a flap piston

rotating within a cylinder, the pressure of the steam causing rotation. Sometimes the flap has a sliding action within the piston, the shaft of the latter being mounted eccentrically in relation to the bore. More or less complicated arrangements of levers and of gears have also been patented, with multiple pistons. Watt's famous attempt was really a semi-rotary engine, with a radial piston which swung to and fro and actuated a pinion and rack device for working the rods of pit pumps.

In the earlier periods of aeroplane construction rotary engines were much employed, notably the Gnome and the Le Rhone, but the radial engine forms the equivalent of these types now. Yet the rotary principle finds great success in certain other directions, such as pumps, blowers and gas-exhausters. The latter are in principle blowers reversed. In a well-known type the piston or drum is set with its axis eccentrically in the cylinder, and radial blades slide in its slots, making a gas-tight fit against the bore. The drum rotates and pumps the gas from the inlet which is at one side of the cylinder to the outlet at the other side. (*See* TURBINE.)

ROTARY TILLER: *see* CULTIVATING MACHINERY.

ROTATION OF CROPS. Rotation of crops cannot be planned and executed successfully without, at the same time, giving consideration to all other factors affecting successful farming. These are: (1) the crops and live stock that are naturally and economically adapted to the locality; (2) the type of farming best adapted to the size of the farm; (3) highest-profit combination of crops; (4) the economic balance of crop production with live stock; (5) the system of farming that best controls costs and best distributes power and labour demands throughout the year; (6) the maintenance of soil fertility; (7) the place given to less profitable enterprises in providing a better balanced business and in utilizing all the available resources; (8) the selection of high-yielding varieties, the control of plant and animal diseases and insects; (9) the production of high-quality marketable products; (10) the consideration of short-time adjustments in production, to meet market conditions without disrupting the planned economic procedure.

Every farm has some kind of cropping system, whether it be a single crop grown year after year on the same land, or several crops that change from field to field. It is only, however, when a series of crops are grown one after another in regular and orderly fashion, that there exists a crop rotation. While the more essential reasons for following a crop rotation hold in most localities, the most profitable combination of crops and live stock for different regions shows wide variation. In an eastern corn belt area of the United States, a comparison was made of the variation over a seven year period in the number of acres of crops on the successful and unsuccessful farms. This showed that the variation in crop acreage from year to year was much greater on the unsuccessful farms. The good farmer follows a well-considered plan of cropping his land.

Classes of Crops to Include in the Rotation.—In general a crop rotation is made up of three classes of crops, namely: (1) cultivated or intertilled crops; (2) small grain crops; (3) grass, or leguminous crops, grown in the order named. Some of the oldest observations in agricultural practice have shown the influence of a preceding crop on a succeeding one. It is also well known that certain legumes have a beneficial influence on crops succeeding them, and sometimes on the crops that accompany them. Poor lands that remain in sod for a few years are improved in physical condition and producing powers. Soil fertility can, therefore, best be maintained when the three classes of crops are grown in order and in recurring succession.

How to Plan a Rotation.—In planning a crop rotation, a rough map of the farm, showing each field, its acreage, and what crop is growing on it, should be made. If there are too many small fields, too few acres in leguminous crops, or other deficiencies, the map will help locate them. The number of fields and the number of years in rotation should correspond, if possible. Sometimes it is advisable to have two independent or separate rotations on the same farm. The varying conditions which exist on a farm with respect to soil, feeding requirements, etc., may call for a flexibility in cropping system, in order that the highest success in farming may be realized.

The cultivated crop or crops included in the rotation will give a chance to kill weeds that may become bad where uncultivated crops are grown. Since some weeds are much worse in cultivated crops, while others are worse in small grain or sod crops, they can be more easily managed by alternating these crops. Cotton, corn and potatoes represent the three cultivated crops that occupy the largest crop acreage. There are many others used in different areas that must be considered in planning a crop rotation. The important small grain crops are wheat, oats, rye and barley. The third essential class of crop to consider for the rotation is that of the grasses or legumes. These crops have the larger growth near the ground and when turned under are valuable for green manure. This supplies the soil with organic matter, makes more moisture available to crops in dry years, helps get rid of excess moisture in wet years, and will help check erosion of hilly or sloping lands and make all lands more easily tilled. Also by alternating deep-rooted and shallow-rooted plants, the plant food can be taken from different depths in the soil. Further, many plant diseases and harmful insects can be controlled by the practice of crop rotation. The distribution of labour and the amount and cost of equipment are also important considerations. The acreage and proportion of different crops must be so adjusted that the available labour can handle most of the work.

Applying sound business principles in determining the crop rotation is the key to its successful establishment and maintenance. The benefits accruing may be summarized as follows: the good crop rotation (1) takes care of and improves the soil; (2) helps control weeds, destroys insects and plant diseases; (3) supplies and removes plant food more evenly; (4) often results in saving labour; (5) aids in economical use of land, labour and capital; (6) makes farming more systematic; (7) when planned and developed with sufficient elasticity, adjustments can be made in acreages of cultivated crops, small grain crops or grass crops, to take advantage of market conditions. (H. M. DI.)

ROTHAMSTED EXPERIMENTAL STATION, an institution founded by J. B. Lawes (1816–1900) in 1843 on his estate of Rothamsted, an ancient manor at Harpenden, England. Coming early (1834) into possession, he began about 1838 to try the effects of various substances on plant growth. Among others he used bone meal, but, finding it inactive on turnips he treated it with sulphuric acid to obtain the soluble substance then known as superphosphate of lime. This had a high fertilizer value. He proved that the same product could be obtained by treating naturally occurring calcium phosphate with sulphuric acid and so he found a use for the vast deposits then being discovered. Other experiments showed the value of ammonium compounds as fertilizer, while the value of potassium compounds was already recognized. In 1843 he set up a factory near London to produce these "artificial fertilizers." The industry has since developed enormously and now several million tons are made annually. Wishing to continue the agricultural experiments, he invited a young chemist, J. H. Gilbert (1815–1901) to join him in the spring of 1843, and the two men worked together till 1900 when Lawes died: this is the longest partnership in the history of science. The first laboratory was in the barn; field plots were laid out to study the effects of the new fertilizers: in these a uniform system of cropping was and indeed still is followed year after year: thus on the Broadbalk field nothing but wheat has been grown, so that the 85th successive crop is now on the land: on Hoos field barley has been grown every year since 1852 and the Park grass has been hayed every year since 1856. The weights of the crop were carefully recorded and at subsequent dates measurements of weather and of soil conditions were started; the present day records are very elaborate.

Lawes and Gilbert also made experiments on the feeding of animals, adopting the original and then somewhat startling plan of killing and analyzing the animals at the end of the trial to ascertain the fate of the food. They were thus able to prove that animal fat was produced not only from vegetable fat, then regarded as its sole source, but from carbohydrates and protein,

and they thus established the basis for the quantitative studies of animal nutrition which have since yielded much knowledge. For many years their data remained the best and most complete. Later on, in 1879, Warington studied the nitrifying processes in the soil; these were the first soil bacteriological investigations in England.

In 1900 Lawes died, having previously set up a trust and endowed it with £100,000 for the continuance of the experiments: Gilbert died in 1901. A. D. Hall was thereupon appointed director and he immediately proceeded to bring the work into line with the needs of modern farming. One of the most lucid of English agricultural writers, he set out so clearly and concisely the lessons to be drawn from the Rothamsted experiments that they were at once apprehended by the best farmers and their advisers: he thus played a great part in establishing the enlightened attitude towards science now prevalent among the rural community. He recognized also that agricultural research had become too complex to be carried on by one or two men only but required groups of workers. His studies of soil and plant nutrition aroused considerable scientific interest, and, more important, showed how much science could do to help agriculture. Up till then no British Government had ever made any grants for agricultural research; in 1909, however, when the Development Commission was set up, the principle of Government assistance was recognized. This led to the need for organizing agricultural research and education in the United Kingdom and in 1912 Hall left Rothamsted to devote himself wholly to this work. Rothamsted became the recognized institution for the study of soil and plant nutrition and received grants from the Development Commission and other sources; in consequence expansion became possible. The present (1928) director, E. J. Russell, was then appointed. New departments were set up for studying the microbiology of the soil and the physical and chemical properties of the soils and serious efforts were begun to reduce the ancient art of cultivation to an exact science. The mass of field data had become so great that no ordinary scientific worker could deal with it: a Statistical department was therefore established to extract as much information as possible, notably to study the correlations between crop yields, weather and soil conditions, and fertilizer treatment. New methods of field experiments were introduced which largely eliminate the effects of soil heterogeneity, one of the chief difficulties of the field investigator. In 1919 laboratories for the study of plant pathology were added and to-day the total body of scientific workers numbers about fifty, aided by competent technical assistants. (E. J. R.)

ROTHE, RICHARD (1799–1867), Lutheran theologian, was born at Posen on Jan. 28, 1799. He studied theology in the universities of Heidelberg and Berlin (1817–20) under Karl Daub (1765–1836), Schleiermacher and Neander. In the autumn of 1823 he was appointed chaplain to the Prussian embassy in Rome, of which Baron Bunsen was the head. This post he exchanged in 1828 for a professorship in the Wittenberg theological seminary, of which in 1832 he became also second director and *ephorus*. In 1837 he became professor and director of a new clerical seminary at Heidelberg; in 1849 he was professor and university preacher at Bonn, but in 1854 he returned to Heidelberg as professor of theology, and afterwards became member of the Oberkirchenrath, a position he held until his death on Aug. 20, 1867. His removal to Heidelberg and the publication of his *Die Anfänge der christlichen Kirche und ihrer Verfassung* (1837), coincide with the attainment of the principal theological positions with which his name is associated.

Rothe's most important work is his *Theologische Ethik* (3 vols., 1845–1848; 2nd ed., 5 vols. 1867–71). The *Theologische Ethik* begins with a general sketch of the author's system of speculative theology in its two divisions, theology proper and cosmology, cosmology falling into the two subdivisions of *Physik* (the world of nature) and *Ethik* (the world of spirit). It is the last subdivision with which the body of the work is occupied. After an analysis of the religious consciousness, which yields the doctrine of an absolute personal and spiritual God, Rothe proceeds to deduce from his idea of God the process and history of creative development, which is eternally proceeding and bringing forth, as its unending purpose, worlds of spirits, partially self-creative and sharing the absolute personality of the Creator. The third section of his work —the *Pflichtenlehre*—is generally most highly valued; there full strength as an ethical thinker is displayed, without any mixture of theosophic speculation.

See F. Nippold, *Richard Rothe, ein christliches Lebensbild* (2 vols., Wittenberg, 1873–74); W. Hönig, *Richard Rothe, sein Charakter, Leben und Denken* (1898); Adolf Hausrath, *Richard Rothe und seine Freunde* (1902).

ROTHENBURG-OB-DER-TAUBER, a town of Germany, in the republic of Bavaria, 49 m. by rail W. of Nuremberg. Pop. (1925) 8,700. Rothenburg-ob-der-Tauber, mentioned in the chronicles in 804 as *Rotinbure*, first appears as a town in 942 and in 1108 passed to the family of Hohenstaufen. In 1172 it became a free imperial city and it attained the zenith of its prosperity under the famous burgomaster Heinrich Toppler (1350–1408). It is probably the finest surviving example of a mediaeval town, flanked by mediaeval walls, towers and gates. Perhaps the most interesting building is the town hall, one part of which dates from 1240 and the other from 1572. The latter is a beautiful Renaissance structure and contains a grand hall in which every Whit Monday a play, *Der Meistertrunk*, which commemorates the capture of the town by Tilly in 1631, is performed. Other buildings are the Gothic church of St. James, with curiously carved altars and beautiful stained-glass windows and the 15th century church of St. Wolfgang. The town possesses a library with some interesting archives. It has manufactures of toys, soap and agricultural machinery, and breweries, linen weaving establishments, sandstone and limestone quarries.

ROTHENSTEIN, WILLIAM (1872–), English artist, was born at Bradford, Yorks, on Jan. 29, 1872, and educated at Bradford. In 1888 he studied in the Slade school under Legros, and afterwards worked in Paris. In 1893 he began exhibiting at the New English Art Club. He was in 1917 elected professor of civic art at the University of Sheffield, and in 1920 principal of the Royal College of Art. His paintings include "The Browning Readers" (1900), "The Dolls' House" (1900) and "Jews Mourning" (1905), Tate gallery; "Aliens at Prayer" (1904), Melbourne art gallery; "Carrying the Law" (1910), "Morning at Benares" (1911), "Bourlon Church" (1919) and "The Last Phase: on the Rhine" (1919). Among his portraits may be mentioned those of Augustus John, Walker art gallery, Liverpool; Sir Francis Darwin (1905), Mr. Charles Booth (1908), Liverpool university; Prof. Alfred Marshall (1908), Cambridge; Mr. Bernhard Berenson (1910) and Sir Rabindranath Tagore (1912), besides a portrait of himself (1900), now in the Metropolitan museum, New York. His portrait drawings of distinguished men are notable for their sound draughtsmanship. He is one of the group of artists who decorated St. Stephen's hall, Westminster.

His published works include *Oxford Characters* (1896); *English Portraits* (1898); *The French Set, and Portraits of Verlaine* (1898); *Manchester Portraits* (1899); *Liber Juniorum* (1899); a *Life of Goya* (1900); *Plea for a Wider Use of Artists and Craftsmen* (1918); *Twenty-four Portraits* (first series 1920, second series 1923); *Ancient India* (1925).

ROTHERHAM, THOMAS (1423–1500), archbishop of York, also called THOMAS SCOT, was born at Rotherham on Aug. 24, 1423; he was educated in his native town and seems to have been connected with both the universities of Oxford and Cambridge. After holding various preferments Rotherham became, through the influence of Elizabeth Woodville, queen of Edward IV., keeper of the privy seal, bishop of Worcester, then bishop of Lincoln and in 1475 chancellor of England. In 1480 he was chosen archbishop of York. When Edward IV. died in April 1483 the archbishop remained true to his widow Elizabeth, and consequently lost the chancellorship and was put into prison by Richard III. He was soon set at liberty, and he died in 1500 at Cawood, near York. At Oxford Rotherham built part of Lincoln college and increased its endowment; at Cambridge, where he was chancellor and master of Pembroke hall, he helped to build the University Library. He founded a college at Rotherham, which was suppressed under Edward VI., and he was re-

sponsible for the building of part of the church of All Saints there.

ROTHERHAM, a county and parliamentary borough in the West Riding of Yorkshire, England, 5 m. N.E. of Sheffield, on the L.M.S. and L.N.E. railways. Pop. (1921) of county borough, 68,022. It lies at the confluence of the Don with its tributary the Rother, which affords a notable north-to-south route on the east side of the Pennine upland, and for more than 40 years a branch from Rotherham along the Don valley was Sheffield's only link with the main railway line. Rotherham is connected by the Don canal with Goole and the Humber and is an important railway and road junction. It is a small counterpart of Sheffield, possessing iron, steel and brass works, railway wagon works, potteries, glass works, breweries, saw-mills and rope-yards. Ironworks were established at Masborough on the opposite bank of the Don in 1746. At Templeborough, south-west of Rotherham, was a Roman fort, which has been identified as that of Morbium; its traces are now effaced. Rotherham came into some prominence as a city of mediaeval life and education. The 15th-century church on the site of Anglo-Saxon and Norman buildings is of Perpendicular style, though preserving some Norman work. One other mediaeval building survives in the Chantry chapel built upon the middle of the Chantry bridge, which spans the Don. It was desecrated at the Reformation, but was restored and reconsecrated in 1924. During the Civil War, Rotherham was taken by the royalists in 1643, but after the battle of Marston moor, it was surrendered to a detachment of parliamentary forces. It was incorporated as a municipal borough in 1871 and became a county borough in 1902.

ROTHERMERE, HAROLD SIDNEY HARMSWORTH, 1ST VISCOUNT (1868–), British newspaper proprietor, was the second son of Alfred Harmsworth, and brother of Viscount Northcliffe. He was born on April 26, 1868, London, was created a baronet in 1910, Baron Rothermere in 1914 and Viscount Rothermere of Hemsted, after his services as air minister, in 1918. He married in 1893 Mary Lilian, daughter of George Wade Share.

At the age of 21 he entered the publishing firm of which his brother, Alfred, was the principal, soon after the date when *Answers* was launched. He assisted in developing the business on sound and economic lines, and for the next 20 years was the close associate of his brother in all his great undertakings. He took an important part in the reorganisation of *The Evening News,* London, was one of the three principals in the establishment of *The Daily Mail* (1896) and was largely responsible for developing its methods of distribution. He founded *The Daily Record* (1895), bought *The Leeds Mercury* and shared in the purchase of *The Times* (1908). He became known also as a most generous benefactor of charities. By the gift of a large sum he enabled the Union Jack Club to provide worthy accommodation for sailors and soldiers in London; and he gave £10,000 to the Territorial Force County of London Association. In 1910 he founded the King Edward Chair of English literature at Cambridge, and in 1910 he ceased his connection with *The Times, The Daily Mail* and *The Evening News.* In 1914 he acquired *The Daily Mirror* from Lord Northcliffe and in 1915 he founded *The Sunday Pictorial,* the first fully illustrated Sunday newspaper in London. On the death of Lord Northcliffe, in Aug. 1922, Lord Rothermere by purchase acquired control of *The Daily Mail* and Associated Newspapers Ltd., the company which owns that newspaper among others; and subsequently bought large newspaper properties owned by Messrs. E. Hulton & Co., Ltd. In 1917 Rothermere became air minister. He at once declared himself "whole-heartedly in favour of reprisals," which were the best means of carrying the war into Germany and protecting British towns against air attacks. Suffering from precarious health and bereavements in the World War, he resigned April 25, 1918, after he had carried out the fusion of the air service into the Royal Air Force. (H. W. W.)

ROTHES, EARLS OF. The first earl of Rothes was George Leslie, son of Norman Leslie of Rothes in Moray and of Ballinbreich in Fife. In 1445 he was created Baron Leslie of Leven, and about 1458 earl of Rothes in the peerage of Scotland. His grandson GEORGE, the 4th earl (d. 1558), whose father, William, the 3rd earl, was killed at Flodden, was accused, but acquitted in 1546, of complicity in the murder of Cardinal Beaton, in which his brother and his two sons were undoubtedly implicated; he was one of the Scottish commissioners who witnessed the marriage of Mary queen of Scots with Francis, the dauphin of France.

His son ANDREW, 5th earl of Rothes (d. 1611), took an active part with the lords of the congregation, first against the queen-mother, Mary of Guise, when regent of Scotland, and afterwards against Mary queen of Scots in opposing her marriage with Darnley, and in devising the murder of Rizzio. He was, however, one of the peers who acquitted Bothwell of Darnley's murder; and going over to the side of the queen, he fought for her at Langside. He continued to occupy a position of some prominence in Scottish affairs until his death in 1611.

His great-grandson, JOHN, 7th earl of Rothes (1630–1681), held a command in the Royalist army at the battle of Worcester in 1651, and accompanied Charles II. to England at the Restoration, when he became lord president of the council in Scotland. He was lord treasurer of Scotland from 1663 till 1667, when he was made lord chancellor of Scotland for life. His estates having been sequestrated by the parliament in 1651, he received a re-grant in 1663 of the earldom of Rothes.

See Sir R. Douglas, *The Peerage of Scotland,* ed. Sir J. B. Paul; and G. E. C., *Complete Peerage.*

ROTHESAY, royal, municipal and police burgh, and the chief town of the county and island of Bute, Scotland. Pop. (1921) 15,218. It is situated on a beautiful bay, 40 m. S.W. of Glasgow, with which there is regular communication by steamers from Wemyss Bay, Gourock, Greenock, Craigendoran, Adrishaig, Inveraray, Glasgow, etc. It is a popular watering-place. The sheltered bay affords excellent anchorage, and is the headquarters of the Royal Northern Yacht Club. Rothesay is a centre for the herring fisheries, and the head of a fishery district. The town is under the jurisdiction of a provost and council. Owing to its mild and equable climate it is a resort of invalids. There is a tramway to Port Bannatyne, on the east horn of Kames Bay (now practically part of Rothesay), and to Ettrick Bay; and Craigmore, about 1 m. west of Rothesay, is a suburb. Ardbeg Point, Loch Fad, Loch Ascog and Barone Hill (530 ft.) are all within a mile and a half of the town, and the Kyles of Bute within a short sail.

In the centre of the town are the ruins of a castle erected in 1098 either by Magnus Barefoot, king of Norway, or by the Scots as a defence against the Norwegians, with whom during the 13th century, and earlier, there was constant strife. The village which grew up round the castle was made a royal burgh by Robert III., who, in 1398, created his eldest son David duke of Rothesay, a title which became the highest Scottish title of the heir-apparent to the crown of the United Kingdom. During the Commonwealth the castle was garrisoned by Cromwell's troops. It was burned by the followers of Argyll in 1685, and remained neglected till the rubbish was cleared away by the second marquess of Bute in 1816. It was repaired by the third marquess.

ROTHSCHILD, the name of a Jewish family which has acquired an unexampled position from the magnitude of its financial transactions. The original name was Bauer, the founder of the house being Mayer Anselm (1743–1812), the son of Anselm Moses Bauer, a Jewish merchant of Frankfort-on-the-Main. He set up as a money-lender at the sign of the "Red Shield" (*Rothschild*) in the Frankfort Judengasse, became agent to William, ninth landgrave, afterwards elector of Hesse Cassel, in 1801, and in the following year negotiated his first government loan for the Danish government. When the landgrave was compelled to flee from his capital on the entry of the French, he placed his treasure in the hands of Rothschild, who buried it, it is said, in a corner of his garden, whence he dug it up as opportunity arose for disposing of it. This he did to such advantage as to be able to return its value to the elector at 5% interest. He died at Frankfort on Sept. 19, 1812, leaving ten children, five sons and five daughters. Branches of the business were established at Vienna, London, Paris and Naples, each being

in charge of one of the sons, who received the privilege of hereditary landowners from Austria in 1815, and were created barons in 1822.

The charge of the Frankfort house devolved on the eldest, Anselm Mayer (1773–1855), born on June 12, 1773, who was a member of the royal Prussian privy council of commerce, and, in 1820, Bavarian consul and court banker. The Vienna branch was undertaken by Solomon (1774–1826), born on Dec. 9, 1774, whose intimate relations with Metternich contributed to bring about the connection of the firm with the allied powers.

The third brother, Nathan Mayer (1777–1836), born on Sept. 16, 1777, has, however, generally been regarded as the financial genius of the family, and the chief originator of the transactions which have created for the house its unexampled position in the financial world. He went to Manchester about 1800 to act as a purchaser for his father of manufactured goods; but at the end of five years he removed to London. The boldness and skill of his financial transactions, which caused him at first to be regarded as unsafe by the leading banking firms and financial merchants, later awakened their admiration. By the employment of carrier-pigeons and of fast-sailing boats of his own, he was able to utilize to the best advantage his special sources of information, while no one was a greater adept in the art of promoting the rise and fall of the stocks. The great influence of the house dates from his successful negotiation of some drafts made by Wellington on the English government, which the latter was unable to meet. From this time the allied powers negotiated loans chiefly through the house of Rothschild, who never lost faith in the ultimate overthrow of Napoleon on which he staked his all.

Rothschild was the first to popularize foreign loans in Britain by fixing the rate in sterling money and making the dividends payable in London and not in foreign capitals. Latterly he became the financial agent of nearly every civilized government, although persistently declining contracts for Spain or the American States. He did not confine himself to operations on a large scale, but took every opportunity of transacting business in all quarters of the globe. He died on July 28, 1836, and was succeeded in the management of the London house by his son Lionel (1808–1879), born on Nov. 22, 1808, whose name is associated with the removal of the civil disabilities of the Jews. He was elected a member for the City of London in 1847, and again in 1849 and 1852, but it was not till 1858 that the joint operation of an act of parliament and a resolution of the House of Commons, allowing the omission from the oath of the words objectionable to Jews, rendered it possible for him to take his seat. He continued to represent the City of London till 1874.

His eldest son, Nathan (b. 1840), was created a peer as Baron Rothschild in 1885. Jacob (1792–1868), the youngest of the original brothers, started business in Paris after the restoration of the Bourbons, for whom he negotiated large loans. At the Revolution of 1848 he was a heavy loser, and had to be protected for a time by a special guard. It was by his capital that the earliest railways were constructed in France; the profits he obtained from the speculation were very large. He died on Nov. 15, 1868. The Naples branch was superintended by another of the brothers, Karl (1780–1855). It was always the least important of the five, and after the annexation of Naples to Italy in 1860 it was discontinued.

ROTHSCHILD, NATHANIEL MAYER, 1ST BARON (1840–1915), Jewish financier, was born in London on Nov. 8, 1840, the son of Lionel Nathan de Rothschild, Austrian baron, head of the English branch of the famous financial family. He was educated at Trinity college, Cambridge, and in 1879 succeeded his father as Austrian baron. He was Liberal M.P. for Aylesbury from 1865 to 1885, when he was created a peer by Mr. Gladstone, the first of his race and religion to be raised to the House of Lords. He was known as an agriculturist as well as a financier, and was renowned for his charities. He died in London on March 31, 1915.

His brother, LEOPOLD DE ROTHSCHILD (1845–1917), who was associated with him in the management of the financial house, succeeded him as its head, and also took over most of his public offices, besides interesting himself especially in the Jewish community and becoming president of the United Synagogue. He was an art collector and owner of race-horses. He died at Ascott, Leighton Buzzard, on May 29, 1917.

ROTHWELL, an urban district in the West Riding of Yorkshire, England, 4 m. S.E. of Leeds. Pop. (1921) 15,240. Soon after the Conquest, Rothwell was a dependency of the castle of Pontefract, and a baronial residence, of which there are slight remains, was erected here. Coal and stone are obtained in the neighbourhood and the town possesses match-works and rope and twine factories in which the majority of the large industrial population is employed.

ROTIFERA (or Rotatoria), a well-defined class of aquatic animals of microscopic size, remarkable for the astonishing diversity of their forms, the vivacity and intelligence of their movements and the high level of their structural development. Being extremely transparent, the largest can hardly be detected by the unaided eye. In length they rarely exceed 1·7 mm. or $\frac{1}{15}$ in., ranging downwards to ·08 mm., and they probably average under ·25 mm., with breadth and thickness very considerably less. In general rotifers are compact in body and symmetrical in structure. They are plentiful in most weedy ponds and boggy pools, and are also to be found in lakes and reservoirs, canals and rivers, ditches and runnels,—in short, in any collection of water containing suitable food. The great majority live in fresh-water, yet many are seldom met with except in water either brackish or alkaline, and some are restricted to sea-water. Many flourish in places only intermittently wet, such as among the stems of land-growing mosses and liverworts. Some are parasitic within the cells of water-plants, or the bodies of other larger water-animals, living even in the gill-chambers of fresh-water crabs and crayfish. Others are literally "hangers-on" to the leaves and stems of water-weeds for the sake of a favourable position, or to the exteriors of water animals for the benefit of constant change of surroundings as their hosts move about. While they mostly live in waters of moderate temperature, they have been found established in hot springs. They can endure intense cold, being capable of reviving after being frozen in thick ice. Some appear only in the spring and summer, others carry on through the winter as well.

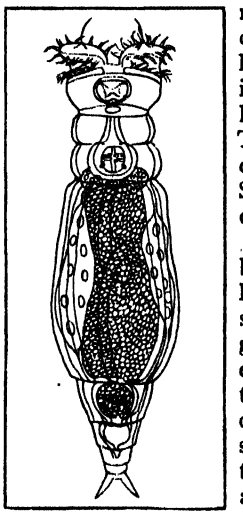

FIG. 1.—A BDELLOID ROTIFER (PHILODINA ACUTICORNIS)

The duration of their individual lives has been little studied, but some species are known to live a few days only, while others survive for at least three months. They are greatly dependent upon their immediate environment and the quality, no less than the quantity, of the water inhabited. Sudden changes of temperature, or in the density of the water, or, perhaps, a decrease in the proportion of oxygen held in solution, are quickly fatal to them.

Whatever the variations of their outward form, an arched back and a flattened ventral surface, two similar sides and a division of the body into head, trunk and foot, by shallow constrictions, can in general be readily distinguished, though the head is often merged into the trunk, and there is frequently no foot. The whole may be maggot-shaped, slender or elongate, ovoid or squat. Especially diversified in form are those species in which the skin is hardened to become an armour-like covering (lorica) which may be much flattened or laterally compressed. While mostly smooth and hyaline, the surface may be shagreened, faceted, grooved or otherwise obscured. It may carry defensive spines, supplemented by numerous prickles. It may consist of one or of several pieces connected by yielding skin. In species without a lorica, the skin is

ROTIFER GROUP SEEN THROUGH A MICROSCOPE

General view of the marine inhabitants found in one-half inch of pond-bottom. Rotifers are invisible to the human eye and the group represented is magnified one hundred diameters, or, cubically one million times. In the centre of the group is a spray of the bladder-wort (*Utricularia vulgaris*), a flesh-eating water plant which ensnares tiny rotifers and other creatures by means of its bladder-shaped traps spread diagonally across the field of vision

ROTIFERA

BY COURTESY OF THE AMERICAN MUSEUM OF NATURAL HISTORY

ROTIFER GROUP SHOWING MINUTE INHABITANTS OF A POND

Detail of microscopic life found in ½ in. of pond-bottom. The bladderwort (*Utricularia vulgaris*), a water plant, is seen on the right, showing a single "utricle" about the size of a pin head in the living plant. At its upper right margin is a trap door, with a captured rotifer visible inside. The stem is covered with tiny algae. At the top, approximately in the centre, is shown a spherical colony of rotifers (*Conochilus hippocrepis*) which cling together by their stems, and below it, centre bottom, is a crescent-shaped desmid (*Closterium*)

generally smooth and flexible, but is sometimes tough and leathery, and may carry spines. The head, trunk and foot are often subdivided into smaller areas, segments or joints, by annular infoldings of the skin, frequently permitting the telescoping of one segment into that next to it.

Corona.—The collection of food and the swimming and gliding movements of rotifers are effected by the lashing action of numerous cilia crowded upon a particular area of delicate skin close to or encircling the mouth, or fringing several fleshy lobes or discs protrusible from it. The whole area, including the mouth itself, as seen when the cilia are active, is called the corona, and there are many varieties of the organ, differing widely in the arrangement of the cilia, etc. All these may be assigned to two leading types, the external and the evertile. In the main, the external type is characteristic of the hunting rotifers, which go about, swimming or gliding, in search of their food. The mouth is generally a little below the centre of the convex front of the head and the ciliated area, sometimes extending over various prominences, may be mainly before or mostly behind it. In certain species which only swim feebly by their ordinary cilia, these are often supplemented by auricles, small evertile pouches, one on each side of the head, lined with more powerful cilia. When the pouches are everted, these stronger cilia drive the rotifer along at greatly augmented speed. Other species rely almost entirely on their auricles. Certain footless species possess, besides the corona, from two to twelve leaping spines, attached to the "shoulders," which enable them, in emergencies, suddenly to spring several times their own length. In *Pedalia*, these spines are replaced by six limbs, having flattened ends fringed with stiff bristles.

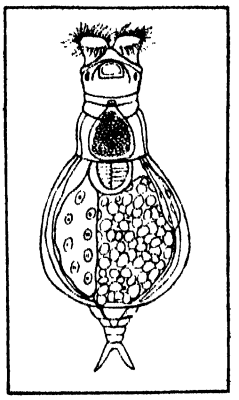

FIG. 2.—A PELLET MAKING BDELLOID ROTIFER (HABROTROCHA LATA)

The corona is much more complicated in the evertile type, characteristic of the stationary or sessile, and of the bdelloid rotifers, two groups very different otherwise, but alike in that they do not sally forth to seek their food, but wait for it to be brought to them by external currents or by those set up by themselves.

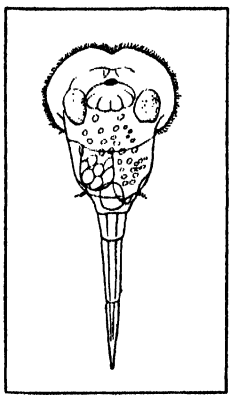

FIG. 3.—A HUNTING ROTIFER (MICROCODON CLAVUS)

The sessile rotifers are unique among the class in having an immature stage, lasting some days. When hatched, the young animals, little resembling their parents, and having a very simple corona, swim about for a while. Having chosen a position they affix themselves (for life) by the foot, and as they grow, develop the evertile corona proper to the adult. They are mostly independent, but certain of them form communities by affixing themselves, when young, close to others. Sometimes such communities are attached to plant-stems, sometimes they are free, the animals radiating from a common centre, and the community swimming through the water as a revolving sphere.

The ciliated area is mostly disposed as a band fringing a shallow disc-like expansion, rounded, elliptic, heart-shaped, or two-, four-, or eight-lobed, into which the head opens as the corona unfolds. In one family the whole head opens out as a cup whose rim is drawn out into lobes beset with long hair-like setae arranged to form a living net, wherein the animals can draw their prey by the influence of cilia hidden in the depth of the cup. In one of the most beautiful of such forms, the "crown animalcule" (*Stephanoceros fimbriatus*), the rim is drawn out into erect arms with approximating tips and furnished with regularly placed tufts of cilia, closing the gaps between the arms and so forming a trap.

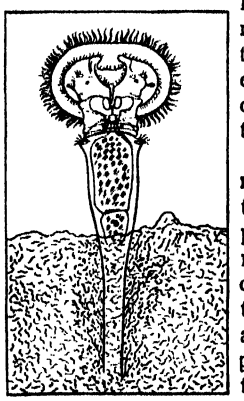
Among the bdelloids the corona consists mainly of two discs usually distinct, surmounting short pedicels arising from the back of the gaping mouth. The discs can be employed for swimming and for feeding while swimming, but most species feed when anchored by the foot, and when they desire to travel usually creep in leech-like manner; some exceptional species however, swim continuously, and some cannot swim at all.

In the typical form of the evertile corona, the cilia of the band fringing the upper surface of the lobes or discs are conspicuous and constitute the *trochus*. Almost parallel with it is another band, of much shorter cilia, the *cingulum*. Among the sessile species it passes round the under edge of the lobes or discs, and in the Bdelloida, round the bases of the pedicels and so to and around the lower lip on the inside, merging into the cilia of the mouth. Particles floating within reach of the trochus-cilia are struck by them within range of those of the cingulum, which in turn impel them to the mouth to be swallowed.

A curious illusory appearance of cogged wheels in rapid revolution, which greatly puzzled the early microscopists, is caused by the trochus-cilia. It happened that species showing this appearance were among the first rotifers discovered and that a long period elapsed before it was satisfactorily explained. Meanwhile it had led to all the known species being called "wheel animalcules" and thus to the later name of Rotifera (wheel-bearers) here employed. It is now believed that a succession of nerve-impulses, following each other at short and regular intervals, travel along the protoplasmic bases of the cilia, causing each of them, when reached, to lash violently downwards.

Among the many-segmented bdelloids, the first two segments form the rostrum, a structure peculiar to the group; the rostral tip, specially adapted, is employed to affix the body when creeping, the mouth, on the third or oral segment, being then closed with the corona hidden within. When it is desired to feed or to swim, the mouth is opened, the corona pushed forth, and the rostrum, in a collapsed condition, is thrust to the back and kept there while the corona continues active.

Mastax.—The food of rotifers consists in most cases of floating particles, excessively minute fragments of plant or animal tissues, bacteria, etc., but there are numerous exceptions. Many of the hunting rotifers will pounce upon weaker forms and gulp them down, tear them to shreds or suck out the soft interiors. Others successfully attack small Cladocera, such as *Chydorus*, and test-dwelling rhizopods are sometimes invaded and eaten. The contents of a water-snail's egg or of confervoid cells are obtained by piercing the investing shell or cell-wall. Diatoms, swallowed whole, are a favourite food of many forms and the smaller flagellates are also in request. Among the sessile rotifers the trap-making species prey upon the lesser animalcules and also upon flagellates. When secured, the food is passed down a short, distensible gullet to the mastax, or jaws.



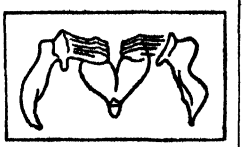


FIG. 4.—A SESSILE ROTIFER (PTYGURA STYGIS)

Important as are the functions of the mastax, they are by no means identical throughout the Rotifera, and the general plan of the organ has been very greatly modified in the various series of species according to the requirements of their respective habits of life. In itself the mastax is a complicated arrangement of seven principal hardened parts (adapted for biting, cutting, holding and crushing), of powerful muscles, of controlling nerves and tiny glands, all enclosed in a stout-walled chamber, into whose upper cavity the food is carried. Each hardened part varies greatly in size, shape and relative prominence in the combination, and the parts that are dominant in the mastaces of one series of species may be of secondary importance or even suppressed, in those of another series. The different forms of the mastax have been grouped under six leading types.

In the malleate type, figured in ventral aspect (fig. 5), the seven hardened parts are all present and of average development. In the centre is the *incus*, or anvil, comprising the *fulcrum*, or base (now viewed edgewise), to whose upper portion are hinged two

rami, or branches, flattened parts whose free ends, mostly directed upwards, open and shut like shears. In lateral view, the fulcrum appears as a moderately wide plate. It is secured strongly to the mastax wall and has no independent motion. Outside the rami, to right and left and further dorsalwards, are two *mallei*, or hammers, each comprising a *manubrium*, or handle, nearly perpendicular, and an *uncus*, or striker, bent sharply inwards towards its fellow, and often ending in finger-like teeth. The two rami move in unison, as do also the two mallei, but generally independently of the rami. Only the two unci and the two rami come in contact with the food. This type of mastax obtains among numerous species of the hunting rotifers.

FROM HUDSON IN THE "QUARTERLY JOURNAL OF MICROSCOPICAL SCIENCE"

FIG. 5.—MALLEATE JAWS OF HUNTING ROTIFERA (BRACHIONUS SP.)

The other types can only be briefly indicated. In the virgate type, adapted for pumping, the manubria and the fulcrum are both elongate; the canal being distended, and its wall being supported by the hardened parts, a piston is supplied by a muscle. In the incudate, or seizing type, the whole incus (but especially the rami), is extremely developed; in the ramate, or bruising type, the unci are divided into several teeth and the fulcrum is reduced. The uncinate, or tearing type, has both manubria and fulcrum greatly reduced, whilst in the forcipate type, having somewhat elongate jaws, the mastax can be thrust forth from the mouth for at least half its length.

Stomach.—From the mastax the food passes next by a usually short oesophagus to the stomach, a fairly capacious organ, occupying in general a large part of the body cavity. It has a stout wall lined with cuticle, mostly ciliated, and on the outside a strong elastic covering. Between these is a dense layer of granular tissue, often divided into conspicuous cells and containing many oil globules. The interior of the stomach is mostly bag-like, but in the bdelloid group it is generally narrowly tubular with a very thick wall and is bag-like only in certain species, known as pellet-makers, because, in their case, while the food passes through the oesophagus, it is agglutinated into small pellets before entry into the stomach. Though fairly numerous, such species are mostly small and dwell in mosses.

In one small group of hunting rotifers the stomach is blind and the undigested residue of food is returned to the mouth for ejectment. In others the stomach is divided into two portions, the lower of which functions as intestine, but usually that organ is a separate dilation of the food canal, following closely behind the stomach, and much smaller, with thinner walls. Thence the residue passes through a short cloaca to the dorsally placed anus, whose position marks generally the hinder limit of the trunk. A pair, or more, of small glands, which secrete digestive juices, are linked to the food canal near its entrance into the stomach.

Foot.—The foot has mostly a secondary rôle and many species get on very well without one. In others it is highly important and is frequently longer than the remainder of the body, serving for some as a rudder, for others as a balancer, or as a highly contractile stalk. In loricated species and in some others, its cuticle is mostly hardened and divided off into several segments, sometimes telescopically retractile. In certain species the skin covering the muscular and very flexible core of the foot falls into numerous annular wrinkles.

Among the sessile group the foot commonly ends in a blunt point by which the rotifer can attach itself in any selected position. Among other forms the extremity most frequently carries one, two, or more processes, known as toes, having great variety of form and diversity of function. There are two distinct types, one having a single piece, the other having two, the lower retractile within the upper. The latter type is normal among bdelloid species, which have two, three or four toes, but in some they are replaced by a kind of sucking-disc. Among the hunting rotifers, the toes are always of one piece, sometimes furnished with somewhat claw-like tips. While many have but one, there are generally two, which may be alike in size and form, or very dissimilar. They may be straight, decurved or recurved, short or exceedingly long, slender or stout. Both types are hollow, with perforate tips, from which exudes a viscid secretion brought by tiny ducts from two glands in the upper foot, or lower trunk. By this secretion, the toes, or the sucking-disc, or the blunt point of the sessile foot, are attached to any surface touched, but can be freed at will. Among the bdelloids, the second last segment has two dorsal processes resembling the toes of the hunting rotifers and called spurs to distinguish them. They are mostly short yet vary much in shape and pose.

Nervous System.—A nervous system is well developed. Within the head lies a large ganglion, or brain, which is mostly of flattened form. From thence nerve-threads pass down each side and to the eyes, the antennae and other sense-organs. The bdelloids and many of the hunting rotifers have a single antenna behind the head, sometimes of conspicuous length, but frequently very minute. Others of the latter group and many of the sessile forms have two antennae on the head, and certain loricated species have one antenna on the head, and two more to right and left further to the rear. Finally, several largish species are furnished with four distinct antennae. There are often two eyes, either in front of the head or behind the brain, but a single eye is more usual, and while there are occasionally three, very many species have none. When examined the eyes show mostly a crystalline particle backed by ruby-red pigment. Among secondary sense-organs frequently present may be mentioned the trochal setae of the bdelloids, and the tactile setae of the Synchaetidae and allied forms. In many species, notably in the great family Notommatidae, there is conspicuous in close contact with the brain, the so-called retro-cerebral organ, of three principal parts, *viz.*—a central pendulous sac stretching some way behind the ganglion, having its interior filled with coarsely granular matter usually somewhat opaque, and flanked by two glands, sometimes larger, sometimes smaller, than the central sac. In many of the swimming species the organ has not been detected, and its function is not yet certain.

Excretion and Secretion.—An excretory system is represented by a very slender, much convoluted tube, which passes down each side of the body from the head rearwards. To the tubes are attached at intervals by short stalks a series of minute "flame-cells," tag-like in form, hollow and closed at the free end and enclosing a pulsating cilium. The tags, which usually number five to each tube, but in certain Asplauchnae are greatly in excess of this, are believed to draw out from the body the effete fluids, which are carried either to the cloaca or to a collapsible bladder near, whence they are discharged at short intervals.

Besides the special muscles, which operate the motions of the mastax, there are very numerous sinews, which pass freely through the body, each having its own course and office, and operate the movements of the several parts of the rotifer, apart altogether from those arising from ciliary action. The illoricated species, bdelloids and others, have also an exceptionally interesting system of muscles, nestling close under the skin, and somewhat difficult to see, but controlling the skin tension.

When there is no lorica, the skin-pores of the trunk exude a secretion, frequently so viscid that debris, etc., readily adhere to it. Sometimes this becomes a close-fitting coat, but it may be made into a loose case, often of flask-like shape, enclosing the rotifer, which can protrude its head from the open end and feed when it pleases. Among the sessile forms slightly conical cases are made, often of gelatinous substance, sometimes hardened. In one well-known species the skin secretion is not employed, but by a special organ connected with the corona, the rotifer prepares small pellets of unswallowed particles, and with these builds, brick by brick, a more permanent dwelling.

This same pore-secretion has been said to be the means employed by most bdelloid rotifers, when fearing desiccation, to encase their bodies, which they have retracted to the smallest possible compass, but doubt has again been cast on the accuracy of the usually accepted explanation, which in its day put an end to many long-winded discussions on the revivification of rotifers, etc. It seems more important to ascertain which species have the power of so avoiding sudden death, and it is certain that it is almost limited to bdelloid forms and is probably by no means universal among them.

Reproductive Organs.—More than four-fifths of the known species of Rotifera are represented only by females. The males of the others are in most cases extremely rare, much smaller and somewhat unlike their own females. They attract attention by their restless, rapid and seemingly aimless swimming. If one be examined, it will generally be found minus jaws, alimentary canal or bladder, but having a very simplified corona of rather long cilia, and as sex organs, a great sperm-sac, occupying much of the body, a seminal duct and mostly a protrusible penis. They survive a very few days. No male has yet been found among Bdelloida. As sex organs the females have only the two-fold ovary, usually conspicuous in the trunk. The larger part, the yolk-mass, contains generally eight large cells, which produce yolk material; the smaller and separated part, the germ-mass, containing germ-cells. Among the bdelloids and a small series of marine parasitic forms, there are two such ovaries; in all others one only. The combined organ is usually of ovoid shape, rarely elongate and band-like. From the ovary a long, collapsible tube leads to the cloaca.

Reproduction is in general oviparous, sometimes ovoviviparous, the eggs being retained until the embryos are well advanced. Three kinds of eggs are produced, always by different females, (1) Unfertilized or parthenogenetic, hatching in few days, having a thin shell, and producing females (*see* PARTHENOGENESIS); (2) Male, much smaller, also thin-shelled and parthenogenetic, hatching promptly and producing males; (3) Resting, as large as the unfertilized eggs but having a stouter shell, requiring fertilization and not hatching for a protracted period and then producing females, which later develop the ordinary unfertilized eggs. By means of the resting eggs, the species is carried over a danger period. Fertilization is internal; the males of certain species possess intromittent organs, but in other cases, the body-wall of the female is penetrated. The spermatozoa may be very large and in some species superficially resemble trypanosomes.

Ecology and Distribution.—Rotifers are doubtless food for fish and other inhabitants of the waters wherein they mostly live, but they are also attacked by various internal parasites, as Sporozoa and Bacteria, which grow within their bodies and in a few days cause their death.

With regard to their geographical distribution, they have been thought to be potentially cosmopolitan, and it is true that a relatively small number of species seem to occur in every country whose fauna has been investigated with respect to them. But for the overwhelming majority of known species there exist only isolated or few records, and while this is the case, such views seem lacking in foundation. Even in those countries which have been most carefully searched, a mere fraction of the possible investigation has yet been carried through. After discarding a host of imperfectly described and unrecognizable forms, there are over 1,000 reliable species known to present-day microscopists.

BIBLIOGRAPHY.—The literature relating to the Rotifera is somewhat voluminous and deals with them from every conceivable view-point, from that of the possessor of a microscope of moderate capacities to that of the highly trained zoologist equipped with the most modern instrument and the newest and most powerful lenses. A remarkably complete and useful bibliography of the subject, as at the end of 1912, is included in H. K. Harring's *Synopsis of the Rotatoria* (United States Nat. Museum, Washington, 1913) and comprises over 1400 titles of works of minor or major importance, mainly by European authors. In view of the vast improvement in lenses, instruments and technique, few works more than fifty years old have other than historical value or as the home of the original descriptions of particular genera or species. Of those of more recent date the following may be indicated as having greatly influenced current thought on structure and consequently on classification: C. Zelinka, *Studien ueber Raederthiere*, three papers (Leipzig, 1886, 1888, 1891); C. Wesemberg-Lund, *Danmarks Rotifera* (Copenhagen, 1899); P. D. Beauchamp, *Recherches sur les Rotifères, les formations tégumentaires et l'appareil digestif* (Paris, 1909).

On the faunistic side may be noted as outstanding: C. Wesenberg-Lund, *Contributions to the Biology of the Rotifera I: The Males of the Rotifera* (Copenhagen, 1923); and, in course of publication, in instalments, H. K. Harring and F. J. Myers, *The Rotifer Fauna of Wisconsin* (Madison, 1922 onwards). The latter, with a scope much wider than is implied in the title and embodying the very latest ideas as to classification, promises to be the standard work of its kind for a long period to come. (D. L. B.)

SYSTEMATIC AFFINITIES

The systematic affinities of the Rotifera have been much discussed without any general measure of agreement being arrived at. Since Ehrenberg in 1838 distinguished them from the ciliate Protozoa they have been approximated in turn to nearly every one of the major divisions of the animal kingdom except the Chordata. In 1851 Huxley compared them with the free-swimming ciliated larvae of Annelids and, more particularly, of Echinoderms. In 1858, Semper's discovery of *Trochosphaera* gave fresh support to the comparison with the larvae of Annelids and for a long time the view that the Rotifera were persistent trochophores may be said to have held the field. In 1871 *Pedalion* was described by Hudson, and this remarkable form with its three pairs of hollow limbs moved by muscles, giving it a superficial resemblance to a crustacean Nauplius larva, revived an older view that the Rotifera were in some way related to the Arthropoda. Lankester included them with the Annelida and Arthropoda in his phylum Appendiculata. But the resemblances between *Trochosphaera* and the trochophore larva break down when examined in detail until little more is left than the common possession of a preoral ciliary wreath which they share with the Peritrichous Infusoria; and on the other hand the fact that two of the appendages of *Pedalion* are median and unpaired seems to preclude any close comparison with the other "Appendiculata." More recently Wesenberg-Lund and de Beauchamp have argued that the ciliary wreath is a secondary development and that the most primitive Rotifers are those like *Notommata* in which there is a ventral uniformly ciliated field surrounding the mouth. From these it is easy to pass to the ventrally ciliated Gastrotricha and to imagine the derivation of both from a uniformly ciliated Turbellarian-like stock.

With organisms like the Rotifera, however, where palaeontology can give no help, phylogeny must remain a matter of speculation. All that we can be sure of is that they are unsegmented Metazoa without definite mesoderm or coelom, with branching excretory canals furnished with flame-cells, and having a single pre-oral nerve-ganglion. They are, therefore, on the same grade of organization as the Platyhelminths and the early larvae of several groups of higher Metazoa. It is likely that the exact arrangement of the locomotive appendages, whether ciliary or appendicular, is without any important phylogenetic significance.

(W. T. C.)

ROTOGRAVURE: *see* PHOTOGRAVURE (MACHINE).

ROTOR SHIP. Wind propulsion for navigational purposes, in the commonly accepted sense, although suited for some particular trades, is practically obsolete for cargo carrying; and the sailing ship, pure and simple, cannot be said to have a definite future. Many sailing vessels are fitted with auxiliary propelling machinery, but, excluding fishing craft, these vessels have not proved an unqualified success.

Anton Flettner, the inventor of the rotor ship, originally intended to construct ships with metal sails, being convinced that the effect of metal sails is much greater than that of canvas sails. The idea was to build the metal sails with sections similar to those used in the construction of aircraft planes. It was intended that the sails should revolve freely around a pivot mast, and then be put by a special rudder blade in such a position that the wind would drive the ship ahead.

Experiments were carried out at the University of Göttingen with canvas sails, metal sails and model ships. The result of these experiments showed that the effect of metal sails could be made approximately double that of canvas sails, a necessary condition being, however, that a third part of the sail area should be turnable. Designs were got out, but the plans did not materialize.

In the case of the rotor ship the inventor states that it is not intended to drive ships solely by wind rotors, but that they shall serve as an auxiliary power upon steam and motor vessels. In the vessel under discussion, the power of the wind is not made use of by sails, but by means of large metal cylinders.

Revolving Cylinders.—In 1922 experiments were carried out at Göttingen with revolving cylinders, and it was then discovered that the pressure exerted upon a cylinder revolving in an

air current was considerably greater than had been supposed. Actually, the power exerted on a normal cylinder was about four or five times as large as that on a normal sail. When, however, discs of a larger diameter were provided at the ends of the cylinders, it was found possible to increase the effect to nine or ten times the amount of wind effect in the normal sail. One condition for this, however, is that the revolving speed of the cylinders is about 3 to 4½ times as great as that of the wind. An ordinary sailing vessel requires to take down all her canvas in a hurricane, but the rotor ship could continue sailing, with more stability for manoeuvring.

The vessel selected for the first tests was the three-masted schooner "Buckau." She had a displacement of 960 tons, and was fitted with an auxiliary motor of some 200 horse-power. The canvas rig of the vessel was dismantled, and in place of the fore and third masts, two very strong masts were erected. The new masts were shorter, being 42ft. in height. These masts were provided with bearings at the upper and lower ends to allow for the free rotation of the cylinders, which were placed over the masts. The cylinders were fitted with discs at either end, the discs being of greater diameter than the cylinders, but built as a part of them. In this particular case the cylinders are of sheet steel of 0·04in. thickness.

Naturally, the whole structure is suitably stiffened. The cylinders are rotated by means of electromotors, which will give the towers a speed of 125rev. per minute. Circumferential speed is approximately 60ft. per sec., and the power required to rotate the towers is nine horse-power. For working the plant one man only at the switch-board is required. By altering the circumferential speed of one or other of the cylinders the operator can correspondingly change the pressure exerted by the wind upon this, and so alter the vessel's course. When cruising, changing the wind side can be effected solely by the towers, when the ship can be stopped and driven astern.

The Magnus-effect.—The explanation of the phenomenon of the rotor ship may be traced to the so-called *Magnus-effect,* explained in 1853 by Prof. Magnus of Berlin, who found that a special power is exerted by an air current upon a revolving cylinder. The explanation of the reason for this effect was found, after more than 20 years of investigation, to be briefly as follows: When a cylinder revolves, the nearest stratum of air revolves with the cylinder, owing to the friction of the cylinder being much greater than the friction of the air molecules against each other. The nearest stratum induces the next one also to revolve, but, naturally, this is done at a much slower speed. In the same manner the strata lying more distantly from the cylinder are moved more and more slowly, until at a certain distance the influence stops. If such a rotating cylinder is impinged upon by an air current, the speed of which is slower than the circumferential speed of the cylinder, the streamlines are directed, so that at one side the air is rarefied by the frictional effect of the cylinder, and at the other side it is compressed. These changes of pressure are the causes of the *Magnus-effect,* and they create a power in a direction away from the side of the rarefied air, and through the centre of the densest air patch, or side in which the streamlines are compressed. Actually the real direction of the power is not always at right angles to the wind direction, but diverges in a measure which is dependent on the speed ratio of the wind current to that of the circumferential speed of the cylinder.

The sea-going trial of the rotor ship "Buckau," from Germany to the Forth, was claimed to be successful, but little has since been heard of the subject.

See *Marine Engineer Officers' Magazine* (Jan. 1925).

(F. J. D.)

ROTORUA, a town of Rotorua county, North Island, New Zealand. It lies in the midst of a remarkable volcanic district generally known as the Hot Spring district, which covers an area of 660 sq.m. and extends 160 m. from north-east to south-west from White Island, an active volcanic cone in the Bay of Plenty to the mountains of Tongariro, Ngaruhoe and Ruapehu in the interior of the island, S.W. of lake Taupo. Rotorua attracts many visitors on account of the beauty and scientific interest of the locality and the bathing in its various medicinal springs. It is a scattered township lying on the south-western shore of lake Rotorua, amid hills reaching 2,600 ft. in the immediate neighbourhood, with a rich growth of forest.

The springs are principally alkaline, alkaline and siliceous, acidic, or acidic and hepatic (sulphurous). The township includes the Maori village of Ohinemutu, an interesting collection of native dwellings. In the vicinity, on the lake-shore, is the government sanatorium. One mile south of the Rotorua is another native village, Whakarewarewa, where there are geysers as well as hot springs. Four miles from Rotorua, near the centre of the lake, the island of Mokoia rises to 1,518 ft. A short channel connects lake Rotorua with lake Rotoiti to the N.E. Both this lake and the smaller ones to the east, Rotoehu and Rotoma, have deeply indented shores, and are set in exquisite scenery. The waters of Rotoma are of a particularly vivid blue. To the south of Rotoiti is Tikitere, a sombre valley abounding in mud volcanoes, springs and other active volcanic phenomena. Mount Tarawera (16 m. S.E. of Rotorua) is noted for the eruption of June 1886, which changed the outline of several lakes, destroyed the famous Pink and White terraces on the adjoining lake Rotomahana.

ROTROU, JEAN DE (1609–1650), French tragic poet, born at Dreux on Aug. 19 or 20, 1609, became in 1632 playwright to the Hôtel de Bourgogne company. He was three years younger than Corneille, but began writing plays earlier than his great contemporary, for his first play *L'Hypochondriaque,* was printed in 1631. Most of his earlier plays were adaptations from the Spanish of Lope de Vega and by 1634 he is said to have produced 34 pieces. The importance of Rotrou in French dramatic literature lies in the fact that he sought to naturalize the romantic English and Spanish comedy in France, where the tragedies of Seneca and the comedies of Terence were still the only accepted models. *Diane* (acted 1630; pr. 1633), *Les Occasions perdues* (acted 1631; pr. 1635), praised by Richelieu; and *L'Heureuse Constance* (acted 1631; pr. 1635); praised by Anne of Austria, were all in the Spanish manner, but in *Les Menechines* (pr. 1636), and in *Hercule Mourant* (pr. 1636) he followed the Latin authors Plautus and Seneca. In 1639 Rotrou bought the post of *lieutenant particulier au bailliage* at Dreux, where he married and settled. His four masterpieces were written after that date; they are: *Le Véritable Saint Genest* (acted 1646; pr. 1648), a story of Christian martyrdom containing some amusing by-play, one noble speech and a good deal of dignified action; *Don Bertrand de Cabrère* (1647), a tragi-comedy; *Venceslas* (1647; pr. 1648); *Cosroès* (1649), a play with an oriental setting, claimed as the only absolutely original piece of Rotrou. He died of the plague and was buried at Dreux on June 28, 1650.

A complete edition of Rotrou was edited in five volumes by Viollet le Duc in 1822. In 1882 M. de Ronchaud published a handsome edition of six plays—*Saint Genest, Venceslas, Don Bertrand de Cabrère Antigone, Hercule Mourant* and *Cosroès. See* further J. Jarry, *Essai sur les oeuvres dramatiques de Jean Rotrou* (Paris and Lille, 1868); Léonce Person, *Hist. du Venceslas de Rotrou, suivie de notes critiques et biographiques* (1882), in which many legends about Rotrou are discredited; *Hist. du véritable Saint Genest de Rotrou* (1882), *Les Papiers de Pierre Rotrou de Saudreville* (1883); Henri Chardon, *La Vie de Rotrou mieux connue* (1884); and Georg Steffens, *Jean de Rotrou als Nachahmer Lope de Vega's* (1891).

ROTTERDAM, a city of Holland in the province of South Holland, on both banks of the New Maas, at the confluence of the canalized Rotte, and a junction station 14½ m. by rail S.S.E. of The Hague. The population of the city, which is the principal Dutch port, was about 20,000 in 1632; 53,212 in 1796; 105,858 in 1860; 379,017 in 1905 and 562,991 in 1927.

Rotterdam probably owes its existence to two castles, which existed in feudal times. In 1299 John I., count of Holland, granted to the people of Rotterdam the same rights as were enjoyed by the burghers of Beverwijk, which were identical with those of Haarlem (K. Hegel, *Städte und Gilden,* 1891, Bd. ii.). This privilege marks the origin of the town. It continued to increase in size, various extensions of its boundaries being made, and its trading importance is to a large extent the result of its commercial intercourse with England. Its shipping facilities have made it the first commercial city of Holland, and the third largest port on

the continent. By means of the New Waterway (1869–90) to the Hook of Holland it is accessible for the largest ships. Ships drawing 24 ft. can come up at any time, and those drawing 24 to 32 ft. at high water. The length of the quays is about 16 m. The principal quay is the Boompjes ("little trees"), forming the river-front on the north side. The river is spanned by a road bridge (1878) and a railway bridge (1877) passing from the Boompjes to the North Island, whence they are continued to the farther shore by swing-bridges through which the largest ships can pass to the upper river. These bridges prove useful in breaking up the ice which forms above them in winter. On the south side of the river are numerous large docks and wharves, which have been enlarged since the World War, while the city proper on the north side consists of a labyrinth of basins and canals with tree-bordered quays.

In the centre of the town is the Beursplein or Exchange Square. Behind the exchange is the great market-place, built on vaulting over a canal, and containing a bronze statue of Erasmus, who was born in Rotterdam in 1467. The statue is the work of Hendrik de Keyser, and was erected in 1622 to replace an older one. Beyond the market-place is the High Street, which runs along the top of the Maas Dyke. On the west of the city a pretty road leads from the Zoological Gardens (1857), on the north to a small park, which contains a statue of the popular poet Hendrik Tollens (d. 1856), a native of the city. Among the churches of Rotterdam is an English church, originally built by the 1st duke of Marlborough, whose arms may be seen with the royal arms over the entrance. The Groote Kerk, or Laurens Kerk (end of the 15th century), contains a fine brass screen (1715), a celebrated organ with nearly 5,000 pipes, and the monuments of Admiral Witte de Witte (d. 1658), and other Dutch naval heroes. In the New Market adjoining is a fountain adorned with sculptures erected in 1874 to commemorate the jubilee of the restoration of Dutch independence (1813). The museums of the city comprise an ethnographical museum, the maritime museum established by the Yacht Club in 1874, and the Boyman's Museum (1867) containing pictures, drawings and engravings, as well as the town library. Of the original collection of pictures bequeathed by F. J. O. Boyman in 1847, more than half was destroyed by fire in 1864; but the collection has been enlarged since and is representative of both ancient and modern artists. Close to the museum is a statue of the statesman Gysbert Karel van Hogendorp (1762–1834), a native of the city. Among the remaining buildings must be mentioned the old town hall (17th century; restored 1823), the new town hall, the concert-hall of the "Harmonic" club, the record office (1900), the *leeskabuiet*, or subscription library and reading-rooms, and the ten-storeyed *Witte Huis* (1897), which is used for offices and is one of the highest private buildings on the Continent.

The industries comprise the manufacture of tobacco, cigars, margarine, rope, leather, etc., and there are breweries, distilleries and sugar refineries. Shipbuilding yards extend above and below the city, one of the earliest being that of the Netherlands Steamboat Company (1825). It is, however, as a commercial rather than as a manufacturing city that Rotterdam is distinguished, its progress in this respect having been very striking. Between 1850 and 1902 the area of the port was increased from 96 to more than 300 acres. Rotterdam has a great transit trade of goods in bulk, and, besides its maritime trade, it has an extensive river traffic, not only with Holland, but also with Belgium and Germany. Its overseas trade is principally with the Dutch colonies, New York, La Plata and the east and west coasts of Africa. The great harbour works on the south side of the river required to accommodate this growing trade were planned by Stieltjes (d. 1878). Besides being easily accessible from the river and connected with the railways, the docks are provided with every facility for coaling and loading or discharging cargoes. The larger passenger steamers of the Rotterdamsche Lloyd to Netherlands India and of the Holland-American Steamship Company (the two principal passenger and cargo steamship companies at Rotterdam) have their berths on the south side of the river in the centre of which are mooring buoys for 30 vessels.

ROTTWEIL, a town of Germany, in the republic of Württemberg, on the Neckar, 46 m. S.W. of Tübingen by rail. Pop. (1925) 10,556. In the 13th century Rottweil became a free imperial city and was subsequently the seat of an imperial court of law, the jurisdiction of which extended over Swabia, the Rhineland and Alsace. The functions of this tribunal came to an end in 1784. In 1803 Rottweil passed into the possession of Württemberg. It is partly surrounded by walls, and has a mediaeval town hall. The Gothic Heilige-Kreuz-kirche, built in the 14th century, was restored in 1840, and the Capellen-kirche has a Gothic spire.

ROTUMAH: *see* PACIFIC ISLANDS.

ROUBAIX, a manufacturing town of northern France, in the department of Nord, 6 m. N.E. of Lille on the railway to Ghent. Pop. (1926) 113,952. Roubaix is situated about a mile from the Belgian frontier on the Roubaix canal, which connects the lower Deule with the Scheldt by way of the Marcq and the Espierre. It unites with Wattrelos (pop. 26,987) to form a great industrial centre. The prosperity of Roubaix had its origin in the first factory franchise granted in 1469 by Charles the Bold, duke of Burgundy, to Peter, lord of Roubaix, a descendant of the royal house of Brittany. In the 18th century Roubaix suffered from the jealousy of Lille of which it was a dependency, and not till the 19th century did its industries acquire real importance. During the war of 1914–18 Roubaix was in the hands of the Germans, and the factories were emptied. As the mills were largely spared, work was started again, with Government help and bank credits, in 1919, and the town is again a prosperous centre.

The chief business of Roubaix is the woollen manufacture, but cotton, silk and other materials are also produced. The chief of these are fancy and figured stuffs for garments, velvet and upholstering fabrics. There are wool-combing and wool-dressing works, spinning and weaving mills, dye-houses and printing works, rubber-works, metal foundries and machinery-works in the town.

ROUBILIAC (more correctly ROUBILLAC), **LOUIS FRANÇOIS** (1695–1762), French sculptor, was born at Lyons and became a pupil of Balthasar of Dresden and of N. Coustou. It is generally stated that he settled in London about 1720, but as he took the second grand prize for sculpture in 1730, while still a pupil of Coustou, it is unlikely that he visited England at an earlier date. The date 1744, as given by Dussieux, is incorrect. He was at once patronized by Walpole and soon became the most popular sculptor in England, superseding the success of the Fleming Rysbraeck and even of Scheemakers. He died on the 11th of January 1762, and was buried in the church of St. Martin-in-the-Fields. Roubiliac was largely employed for portrait statues and busts, and especially for sepulchral monuments. His chief works in Westminster Abbey are the monuments of Handel, Admiral Warren, Marshal Wade, Mrs. Nightingale and notably that of the duke of Argyll, which established his fame. He possessed skill in portraiture and was technically a master, but lived at a time when his art had sunk to a low ebb. His figures are frequently uneasy, devoid of dignity and sculpturesque breadth, and his draperies treated in a manner more suited to painting than sculpture. There are, however, noteworthy exceptions, his bust of Pope, for example, reaching a high standard.

His most celebrated work, the Nightingale monument, in Westminster Abbey, a marvel of technical skill, is saved from being ludicrous by its ghastly and even impressive hideousness. The celebrated bust of Shakespeare, known as the Davenant bust, in the possession of the Garrick Club, London, is his.

See Le Roy de Sainte-Croix, *Vie et ouvrages de L. F. Roubillac, sculpteur lyonnais (1695–1762)* (Paris, 1882). (An extremely rare work, of which a copy is in the National Art Library, Victoria and Albert Museum, South Kensington, London.) ROUBLE. The rouble is the monetary unit of Russia (U.S.S.R.), and before the World War it was divided into 100 kopeks. The par of exchange with sterling is R. 10=21*s.* 2*d.*, while, since 1922, a new unit called the tchervonetz has been created equivalent to ten roubles.

The main currency in circulation before the war were "credit

notes" issued by the State bank. Originally circulating at par with the rouble, they fell during the latter part of the 19th century to a heavy discount. By the law of 1899, this depreciation was legally recognized. Under that law, the ten and five rouble gold pieces were made legal tender for fifteen and seven and a half roubles respectively, thus being written up 50% in nominal value. As their gold content remained unaltered, this was equivalent to establishing a ratio of three to two between paper and gold.

The credit notes were successfully maintained at this ratio until 1914. In fact, at the outbreak of war, the "credit notes" had a gold backing of over 100%, as the State bank held 1,743 million paper roubles worth of gold against a note-issue of 1,630 roubles. Rather over 500 million roubles in gold and 230 millions in silver, too, were in circulation. Thus, the rouble was well protected against any ordinary shocks. Unfortunately, Russia, like many other countries, made little or no attempt to finance its war expenditure either by taxation or by long-term borrowing. Inflation was the chief method employed, and under inflation the gold standard was abandoned and the rouble steadily depreciated. This depreciation began prior to the revolutions of 1917, and by Jan. 1 of that year, the note issue had expanded to over 9,000 million roubles.

With the advent of the Bolsheviks to power, the final collapse of the old rouble took place. For a time the only use of the rouble was to enable the Government nominally to pay its way by continually issuing fresh notes. By Jan. 1, 1921, the total issue reached the astronomical figure of 1,168,000 million roubles. As a result the internal purchasing power of the rouble was exceedingly small and varied greatly from place to place.

The Tchervonetz, 1922.—One of the first points of the "New Economic Policy" of 1922 was the establishment of a new currency, the tchervonetz, created in Oct. 1922, and equal to ten pre-war gold roubles. The law creating it laid down that it should have a 25% cover of gold, platinum or stable foreign exchange, and that the remaining 75% cover should consist of marketable goods, short-term securities and approved bills of exchange. It was to be issued by the new State bank, itself also the offspring of the new economic policy.

Paper roubles were not withdrawn from circulation, and for a time the two currencies circulated side by side. The relation between the two was continually changing in favour of the tchervonetz, for although the old paper roubles had been replaced, at the ratio of one million to one, by "Soviet" or 1923 roubles, in themselves a paper currency, these in turn were sacrificed to balance the budget and to maintain the stability and value of the tchervonetz. By early 1924, the volume of Soviet roubles amounted to 178,000,000,000 millions, and their value had fallen to a point at which it took 200,000,000,000 of them to equal one tchervonetz.

New Roubles, 1924.—In Feb. 1924, the next step in monetary reform was taken. The commissariat of finance was authorized to issue currency rouble notes, which were made legal tender. Their volume was limited to half the number of tchervontsi in circulation, less those owed to the State bank by the Treasury. Apart from their limitation, no definite cover was provided, and no fixed ratio between "new roubles" and tchervontsi was laid down. The withdrawal of Soviet or 1923 roubles was then ordered at the ratio of 50,000 Soviet roubles to one new rouble.

Towards the end of 1924, a ratio of ten new roubles to the tchervonetz had been established, and on Oct. 1 the currency circulation amounted to 49 million roubles in silver coin, 202 million roubles in Treasury notes and 346 millions of tchervontsi —making, with various small coinage, a total circulation of roubles and tchervontsi combined of 622 millions. This was too small for the needs of the country, and during 1925 it expanded rapidly to 1,270 millions, or by rather more than 100 per cent. This increase was largely a natural one, due to trade demands and not to budget deficits, which, by then, had been reduced to manageable proportions. Nevertheless, the increase was too rapid, and during the next three months, the volume was reduced to 1,204 millions, only to rise again under demands for crop financing to 1,490 millions at the beginning of 1927. During that year, the position improved, as an increase in production led to a fall in prices and so to an improvement in the purchasing power of the currency. Up to a point, the new currency had, by early 1928, been re-established upon a gold basis. It must be remembered that foreign trade, and the import and export of currency, are rigidly controlled, and that if the tchervonetz is quoted at par against the pound or dollar in Moscow, unofficial rates in neighbouring foreign centres at times do not of necessity agree.

ROUEN, a city of France, capital of the department of Seine-Inférieure and the ancient capital of the province of Normandy, on the Seine, 87 m. N.W. of Paris by rail. Pop. (1926) 115,849.

History.—*Ratuma* or *Ratumacos,* the Celtic name of Rouen, was modified by the Romans into *Rotomagus,* and by the writers of mediaeval Latin into *Rodomum,* of which the present name is a corruption. Under Caesar and the early emperors the town was the capital of the Veliocasses, and it did not attain to any eminence till it was made the centre of Lugdunensis Secunda at the close of the 3rd century, and a little later the seat of an archbishop. Rouen owed much to its first bishops—from St. Mello, the apostle of the region, who flourished about 260, to St. Remigius, who died in 772.

Under Louis le Débonnaire and his successors, the Normans several times sacked the city, but after the treaty of St. Clair-sur-Epte in 912, Rouen became the capital of Normandy and the principal residence of the dukes. In 1087 William the Conqueror, mortally wounded at Mantes, died at Rouen. The succeeding Norman kings of England tended to neglect Rouen in favour of Caen and afterwards of Poitiers, Le Mans and Angers; but it maintained an importance during the 12th century indicated by the building of churches, notably that of St. Ouen. In 1203 Rouen was the scene of the murder of Arthur of Brittany at the hands of King John of England. Ostensibly to avenge the crime, Philip Augustus invaded Normandy and entered the capital unopposed. Philip confirmed its communal privileges and built a new castle.

A convention between the merchants of Rouen and those of Paris relating to the navigation of the Seine was followed by treaties with London, with the Hanseatic towns and with Flanders and Champagne. In 1302 the seat of the exchequer or sovereign court, afterwards the parlement, of Normandy was definitely fixed at Rouen. A stubborn resistance was offered to Henry V. of England who, after a long siege, occupied the town in 1419. The prosperity of Rouen continued under the English domination, and during this period the greater part of the church of St. Ouen was constructed. In 1431 Joan of Arc was tried and burnt in the city. From that year the French began attempts to recapture the town, which they did in 1449.

During the close of the 15th century and the first half of the 16th, Rouen was a metropolis of art and taste. In 1562 the town was sacked by the Protestants. This did not prevent the League from gaining so firm a footing there that Henry IV. besieged it unsuccessfully and only obtained entrance after his abjuration. The revocation of the edict of Nantes in 1685 greatly affected Rouen. During the Franco-German War the city was occupied by the invaders from December 1870 till July 1871. During the World War Rouen played a great part in the supporting organization of the British army in France.

Monuments.—The old city lies on the north bank of the river in an amphitheatre formed by the hills which border the Seine valley. It is surrounded by the suburbs of Martainville, St. Hilaire, Beauvoisine, Bouvreuil and Cauchoise; 2½ m. to the east is the industrial town of Darnétal (pop. 7,393), and on the opposite bank of the Seine is the manufacturing suburb of St. Sever with the industrial towns of Sotteville (pop. 22,476) and Petit Quevilly (pop. 17,839) in its immediate neighbourhood. Finally in the centre of the river, north-east of St. Sever, is the Ile Lacroix, which also forms part of Rouen. Communication across the Seine is maintained by three bridges, including a *pont transbordeur,* or moving platform, slung between two lofty columns and propelled by electricity. The central point of the old town is the *Place de l'Hôtel de Ville,* occupied by the church of St. Ouen and the *hôtel de ville.*

The cathedral was built on the site of a previous cathedral,

burnt in 1200, and its construction lasted from the beginning of the 13th century (lateral doors of the west portal), to the beginning of the 16th century (Tour de Beurre). The western façade belongs, as a whole, to the Flamboyant style. But the northern tower, the Tour St. Romain, is in the main of the 12th century, its upper stage having been added later. The southern tower, the Tour de Beurre, so named because funds for its building were given in return for the permission to eat butter in Lent, is of a type essentially Norman, and consists of a square tower pierced by high mullioned windows and surmounted by a low, octagonal structure, with a balustrade and pinnacles. These contrasted towers are the most striking feature of the wide façade. The portals of the transept are each flanked by two towers. The most remarkable part of the interior is the Lady Chapel (1302–20) behind the choir with the tombs (1518–25) of Cardinal Georges d'Amboise and his nephew, the statuary of which is of the finest Renaissance workmanship. Behind the cathedral is the archiepiscopal palace, a building of the 14th and 15th centuries.

St. Ouen was formerly the church of an abbey dating to the Roman period and reorganized by Archbishop St. Ouen in the 7th century. It was founded in 1318 in place of a Romanesque church which previously occupied the site and of which the only relic is the chapel in the south transept. The choir alone was built in the 14th century. The nave of the church belongs to the 15th century, by the end of which the central tower with its octagonal lantern and four flanking turrets had been erected. The western façade dates from 1846. The large stained glass windows are of the 14th, 15th and 16th centuries. The Portail des Marmousets, the entrance to the south transept, has a projecting porch, behind and above which rises a magnificent rose window. The north façade has no entrance.

The church of St. Maclou, behind the cathedral, begun in 1437 and finished early in the 16th century, is a rich example of the Flamboyant style, and has a rich portal with five arched openings. It is celebrated for carving attributed to Jean Goujon.

The church of St. Vincent, near the Seine, is a building of the 16th century and contains very fine stained-glass windows at the end of the north aisle, by Engrand and Jean le Prince, artists of Beauvais. The stained glass in the churches of St. Patrice (16th century) and St. Godar (late 15th century) is inferior only to that of St. Vincent.

The most important secular building in Rouen is the Palais de Justice, once the seat of the exchequer and, later, of the *parlement* of Normandy. It is in the late Gothic style and consists of a main building flanked by two wings. The left wing, known as the Salle des Procureurs, was built in 1493 and has a lofty barrel-roof of timber. South of the Palais de Justice is the Porte de la Grosse Horloge, an arcade spanning the street and surmounted by a large clock of the 15th century with two dials. The Tour de la Grosse Horloge, which rises beside the arcade, was built in 1389. The tower known as the Tour de Jeanne d'Arc was the scene of her trial, and is all that remains of the castle built by Philip Augustus early in the 13th century. The Porte Guillaume-Lion, opening on to the Quai de Paris, is a handsome gateway built in 1749.

Rouen is the seat of an archbishop, a prefect, a court of appeal and a court of assizes, and headquarters of the III. army corps. Its public institutions also include a tribunal of first instance, tribunals of commerce and of maritime commerce, a board of trade-arbitrators and a chamber of commerce. All the more important nations have consulates in the city.

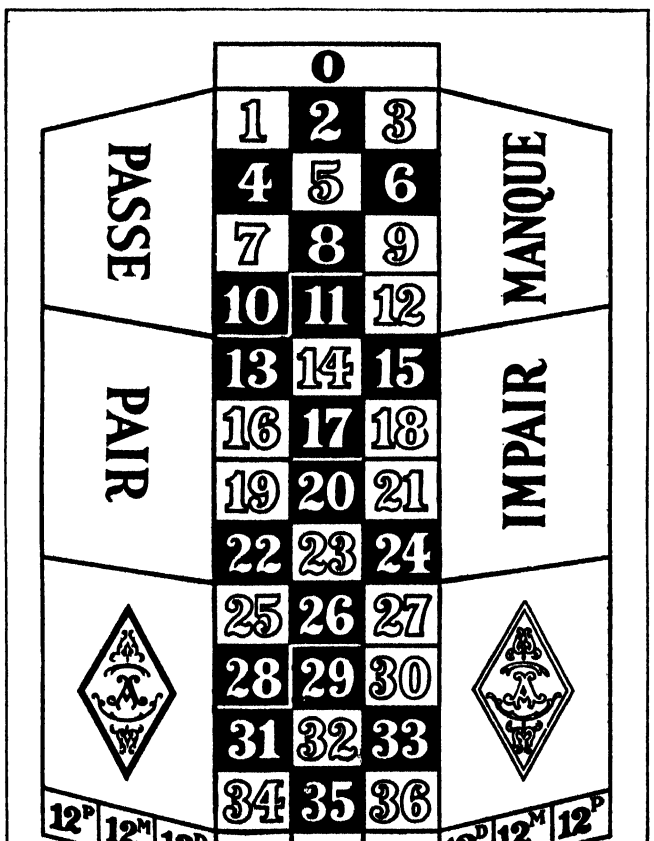
Rouen is an important centre for trade in wines, spirits, grain and cattle. Grain, wine, coal, timber and petroleum are leading imports. Besides its manufactures it exports plaster and sand. The principal industries of Rouen and its district are the spinning and weaving of cotton, notably the manufacture of *rouenneries* (cotton fabric woven with dyed yarn), the printing and dyeing of the manufactured material and the spinning of other fibres; shipbuilding and the making of various articles of clothing are also carried on, and there are distilleries, petroleum-refineries and manufactories of chemicals, soap, machinery, carding-combs and brushes. The port of Rouen comprises the marine docks below the Boïeldieu bridge, and the river dock, the timber dock and the petroleum dock above it. There is also a repairing dock. The Seine is tidal beyond Rouen. The port is accessible for ships drawing 19½ to 25 ft. of water, and its quays have a superficial area of about 194 acres. It is served by the lines of the Orléans, the Ouest-État and the Northern railways and these, in addition to the waterways connected with the Seine, make Rouen a convenient centre for the distribution of merchandise.

See A. Chervel, *Histoire de Rouen pendant l'époque communale* (Rouen, 1843); *id., Sous la domination anglaise* (Rouen, 1840); C. Enlart, *Rouen* (Paris, 1904); J. Levainville, *Rouen*.

ROUERGUE, formerly a French province, derives its name from the Gallic tribe of the *Rutheni*. It was bounded on the north by Auvergne, on the south and south-west by Languedoc, on the east by Gévaudan and the Cévennes and on the west by Quercy. It included (1) the county of Rodez, (2) Haute and Basse Marche; and it was divided between the dioceses of Rodez and Vabres (province d'Alby after this province had been separated from that of Bourges in 1678). Administratively it formed first a *sénéchaussée*, dependent on Languedoc (capital Villefranche, in the Basse Marche), and later it was attached to the military governments of Guienne and Gascony. It was then part of the departments of Aveyron and of Tarn-et-Garonne.

ROUGE, a French name applied to various colouring substances of a brilliant carmine tint, especially when used as cosmetics. The best of these preparations are such as have for their basis carthamine, obtained from the safflower (*q.v.*), *Carthamus tinctorius*. (*See* PAINTS, CHEMISTRY OF and COSMETICS.)

ROUGET DE LISLE, CLAUDE JOSEPH (1760–1836), French author, was born on May 10, 1760, at Lons-le-Saunier (Jura). He entered the army as an engineer, and attained the rank of captain. The song which has immortalized him, the *Marseillaise*, was composed at Strasbourg, where Rouget de Lisle was quartered in April 1792. He wrote both words and music in a fit of patriotic excitement after a public dinner. The piece was at first called *Chant de guerre de l'armée du Rhin*, and only received its name of *Marseillaise* from its adoption by the Provençal volunteers whom Barbaroux introduced into Paris, and who were prominent in the storming of the Tuileries. The author was a moderate republican, and was cashiered and thrown into prison; but the counter-revolution set him at liberty. He died at Choisy-le-Roi (Seine et Oise) on June 26, 1836. Rouget de Lisle published *Chants français* (1825), in which he set to music fifty songs by various authors. His *Essais en vers et en prose* (1797) contains the *Marseillaise*, a prose tale of the sentimental kind called *Adélaïde et Monville*, and some occasional poems.



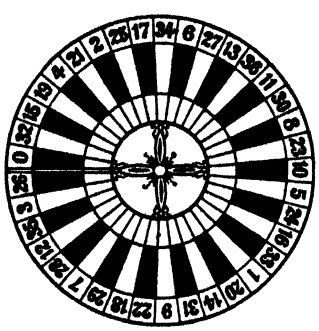
See J. Tiersot, *Histoire de la Marseillaise: oeuvres musicales de Rouget de Lisle* (1915).

ROUGH CAST, in architecture, a term used in England for any stucco or mortar combined with gravel and sand, employed as the finishing coat of covering plaster over a rough structure of masonry, and frequently decorated by the addition of pebbles of different colours, or even small pieces of glass. In American usage the term is limited to the rougher textures of a stucco surface, obtained either by throwing on the finished coat in unequal masses or by sprinkling over the finished surface, while still wet, a coating of coloured pebbles, tile or brick fragments, marble chips, etc.

ROUHER, EUGÈNE (1814–1884), French statesman, was born at Riom (Puy-de-Dôme) on Nov. 30, 1814. He entered the Chamber in his native department in 1848, and held office from 1849, with short intervals, until 1852. Napoleon entrusted him (1851) with the redaction of the new Constitution, and made him (1852) vice-president of the Council of State. As minister of agriculture, commerce and public works, from 1855 onwards, he greatly improved the economic situation of France, and in 1863 became minister president. He resigned in 1867, but shortly afterwards resumed office as finance minister. After the fall of the Empire he fled to England, but returned to France in 1872 to work for the interests of the Prince Imperial. He returned to the Chamber as deputy of Ajaccio, and, later, sat for Riom. After the death of the Prince Imperial, Rouher supported the claims of Prince Napoleon, son of the ex-king Jerome. He died on Feb. 3, 1884. (*See* the references under NAPOLEON III.)

ROULERS, a town in the province of West Flanders, Belgium, 13 m. N.W. of Courtrai, on the Mandel. Its Flemish name is Roeselaere. Pop. (1925) 26,657. Its weavers were already famous in the 11th–12th centuries and the neighbourhood cultivates flax. Lace, carpets and linen are manufactured.

ROULETTE, a gambling game, of French origin. It is one of the two games played in the gambling-rooms at Monte Carlo, and the description here given, and the maximum and minimum stakes mentioned, are to be understood as applying to the game as it is there conducted. It is solely a game of chance, though so-called "systems" are innumerable, and some of them for a short period often appear to give the player an advantage. There is no possible system, however, which will assure success in the long-run, and it is herein that the ingenuity of the game consists. Every systematic method of play must depend upon increased stakes to retrieve past losses; and though a player with an unlimited capital might be practically certain to achieve his end in the course of time, the circumstance that there is always a maximum renders the bank invincible. The roulette table, covered with a green cloth, is made up of precisely corresponding halves with a circular space let into the middle holding the wheel, on either side of which the



ROULETTE TABLE, SHOWING DIVISIONS

There are many methods of staking, e.g., even chances may be taken on the winning number being red or black, odd or even, etc.; 2 to 1 chances may be taken on dozens, i.e., numbers falling between 1–12, 13–24, 25–36; while varying odds are given on combinations covering two or more numbers

cloth is divided into spaces marked *passe, pair, manque, impair,* and the black and red diamonds. The wheel at Monte Carlo is divided into 37 compartments, coloured alternately black and red, numbered from one to thirty-six, the 37th being zero. At many other places there are 38 compartments with a single and double o. This is largely the rule in America. *Pair* indicates even numbers, *impair* odd numbers, *manque* includes the numbers from 1 to 18; *passe,* from 19 to 36. The methods of staking are innumerable. The minimum stake is ten francs. *Rouge, noir, pair, impair, manque* and *passe* are even chances; *i.e.,* a stake put upon any of them is paid in corresponding coin should the player win, the exception being when the little ball which is spun around the wheel falls into zero, in which case the even money chances are put "in prison"—that is to say, laid aside until another spin, when if the bank wins they are lost, if the player wins he is allowed to retrieve his money. The maximum in the case of these chances is 6,000 francs. Any one who desires to play *en plein* puts his stake on one of the 37 numbers. If the ball falls into the corresponding number on the wheel, the stake is paid 35 times; and as there are 37 numbers on the board, with the advantage already described of imprisoning the even-money chances when zero comes up, it will be seen that there is a steady percentage in favour of the tables and consequently against the player. This percentage is of course greatly increased when, as is often the case, a second zero, called *double zéro,* is used. In some gambling-houses there is even a third one, called Eagle Bird. The maximum stake allowed *en plein* is 180 francs. The next most daring selection is *à cheval,* when the stake is placed on the line separating any two numbers, and if either of them wins the player is paid 17 times, the highest stake permissible being 360 francs. *Transversale pleine* covers any three numbers in a line, the coin or note being placed on the line dividing any one of the numbers from the neighbouring even-money chance, as, for instance, between 4 and *passe,* or 6 and *manque.* A *transversale simple* covers six numbers, as, for example, where the line between 4 and 7 joins *passe,* or between 6 and 9 joins *manque;* and if any one of these numbers wins, five times the value of the stake is paid, the maximum here being 1,200 francs. *En carré* includes four numbers, the coin being placed, for instance, on the cross between 1, 2, 4, 5 or 28, 29, 31, 32; eight times the value of the stake is paid, and the maximum is 760 francs. The dozens and the columns are also indicated on the board, the first dozen, of course, including 1 to 12. In each of the columns are twelve numbers in different order. A stake placed on either a dozen or a column is paid twice its value, the maximum here being 3,000 francs. A stake constantly played is called the *quatre premiers,* which includes zero, 1, 2 and 3, the stake being placed on the line where zero and 1 join *passe* or where zero and 3 join *manque.* If any one of these four numbers, including zero, wins, the stake is paid eight times; and four times eight being 32, there is a greater advantage to the table than when it loses *en plein* or on certain other chances. Zero can also be played in combination with any one or two of its neighbours; if with one of them the stake is paid 17 times, if with two of them 11 times. A croupier sits on either side of the wheel; there is also one at each end of the table, their business being to assist the players in staking and recovering their winnings. Behind each of the former pair an official on a high chair supervises the table. The croupier whose duty it is to spin the wheel waits for a time till stakes have been made, and then, exclaiming, *"Messieurs, faites votre jeu!"* sets the cylinder in motion, throwing the ball in the direction contrary to that in which the wheel revolves. When it is seen that the ball will soon fall at rest in one of the compartments of the cylinder the croupier gives the notice, *"Rien ne va plus,"* after which no stakes can be placed. When the ball finally rests in the compartment, the croupier announces the number and the even-money chances that win, as *rouge, impair* and *manque.*

See "Scrutator," *The Odds at Monte Carlo* (1925).

ROULETTE WHEEL, SHOWING ARRANGEMENT OF NUMBERED, COLOURED DIVISIONS, INCLUDING THE ZERO

ROUNDERS, an English ball game, probably dating from the 18th century, but not attaining to any popularity before 1800. It was the immediate ancestor of Baseball (*q.v.*). Up to 1889 no code of rules existed, but two governing bodies were formed, the National Rounders Association of Liverpool and Vicinity and the Scottish Rounders Association. These, with the later Gloucester

Rounders Association, drew up the rules now recognized.

A hard ball similar to that used in baseball was adopted, and the rule by which a runner could be put out by hitting him with a thrown ball abandoned. The bat must not exceed 3½in. in diameter nor 35in. in length. The game is similar to baseball, but there are several important differences, the most radical being that the ball may be hit in any direction, as at cricket. The original pentagon has been discarded in favour of an elongated diamond, the home-base being at one end and 1st, 2nd and 3rd bases at the other points, while the 4th base is situated on the line of 3rd base towards home and 17yd. from the former, the sides of the diamond being 22yd. in length. The bowler stands in a space marked off in the centre of the diamond and tosses the ball to the batsman, who must hit at every "good" ball, *i.e.*, one that is straight over the home-base and between head and knee. Two bad balls score one for the batsman. If the latter hits the ball he must run to 1st base and then 2nd, and so on round to home again, resting at any base; but he may be put out if the batted ball be caught on the fly or first bounce or the backstop (wicket-keeper in cricket) catch a ball struck at but not hit, or the batsman be touched with a ball while running between bases. Ten players constitute a side and three innings apiece are played, every player batting once in each innings. Each base made counts one. The *backstop* is placed directly behind the batsman, and behind the backstop are placed *1st cover* (right), *longstop* (middle), and *4th cover* (left). The *1st, 2nd* and *3rd* basemen are stationed at the bases, while behind them in the field are placed the *2nd cover* (right), *centre cover and 3rd cover* (left). The bases are designated by light wooden posts. An umpire presides over the game.

ROUNDHEAD, a term applied to the adherents of the parliamentary party in England during the great Civil War. Some of the Puritans, but by no means all, wore the hair closely cropped round the head, and there was thus an obvious contrast between them and the men of fashion with their long ringlets. "Roundhead" appears to have been first used as a term of derision towards the end of 1641 when the debates in parliament on the Bishops Exclusion Bill were causing riots at Westminster. John Rushworth (*Historical Collections*) is more precise. According to him the word was first used on Dec. 27, 1641, by a disbanded officer named David Hide, who during a riot is reported to have drawn his sword and said he would "cut the throats of those round-headed dogs that bawled against bishops." Baxter ascribes the origin of the term to a remark made by Queen Henrietta Maria at the trial of Strafford; referring to Pym, she asked who the round-headed man was. The name remained in use until after the revolution of 1688.

ROUNDSMAN SYSTEM (sometimes termed the billet, or ticket, or item system), in the English poor law, a plan by which the parish paid the occupiers of property to employ the applicants for relief at a rate of wages fixed by the parish. It depended not on the services, but on the wants of the applicants, the employer being repaid out of the poor rate all that he advanced in wages beyond a certain sum. According to this plan the parish in general made some agreement with a farmer to sell to him the labour of one or more paupers at a certain price, paying to the pauper out of the parish funds the difference between that price and the allowance which the scale, according to the price of bread and the number of his family, awarded to him. It received the local name of billet or ticket system, from the ticket signed by the overseer which the pauper in general carried to the farmer as a warrant for his being employed, and afterwards took back to the overseer, signed by the farmer, as a proof that he had fulfilled the conditions of relief. In other cases the parish contracted with a person to have some work performed for him by the paupers at a given price, the parish paying the paupers. The system disappeared in 1834.

ROUND TABLE, the celebrated board of King Arthur (*q.v.*) around which he and his knights sat. The origin of the myth is obscure, and certainly cannot be said to have been yet settled; it has been traced by various scholars to Welsh, Irish, or Breton sources.

The story was at first independent of the Arthurian saga. The first known trace of it in an Arthurian connection is in the *Brut* of Wace (*q.v.*) in the reign of Henry II. Here the allusion is brief. Arthur made a round table at which, because of its shape, none of the "barons" could claim precedence over others. The size is left indefinite. Wace adds that the "Bretons" told many stories about the table; and this seems to indicate that there was a mass of Breton (or British) tradition about it known to Wace—a probability strengthened by the fact that elsewhere Wace shows signs of knowing many stories unknown to his main authority, Geoffrey of Monmouth (*q.v.*).

Half a century later, Layamon adds considerably to our information, and it would seem almost certain that he was drawing on Welsh tradition. There had been a great slaughter of the knights through disputes as to who should be greatest; and a Cornish carpenter, hearing of it, told Arthur he would make him a table at which more than 1,600 men could sit, so that there would be no more quarrels for the place of honour. Yet Arthur would be able to carry it about with him. It was finished in four weeks. "This," added Layamon, repeating Wace's words, "was the table about which the Britons told many tales." There is no reason to think that the poet was inventing; he makes over 30 additions to Wace, some of which are certainly not original; nor does he show anywhere a trace of inventive capacity.

Addition to the Legend.—Later romancists added many details. For example, the "Diot" *Perceval* (*see* PERCEVAL), tells us that just after Arthur's coronation Merlin related past history. A round table, said the seer, had been made for Joseph of Arimathea (*q.v.*) and a new one for Arthur's father, Uther Pendragon; let the king use it for his knights; without it the Romans could not be overcome. The table was also brought into connection with the Holy Grail (*q.v.*) and with the "Siege Perilous" which is so prominent a feature in the Percival legend; and became ultimately an inseparable adjunct of the Arthurian cycle.

Whether the tale reached Wace and Layamon directly from Wales or from Brittany, it is certainly of ancient Celtic origin: a round table seems to have been a feature of primitive Celtic life; a circular form was the rule in primitive Irish architecture, and the primitive Celtic watch house, both in Gaul and in Ireland, was circular. To what this in its turn is to be traced is more doubtful: it is not unlikely that it arose from sun-worship, or possibly (*cf.* the "four weeks") from the moon. The magical character of the table seems, again, to be of a peculiarly Celtic cast; it resembles that of the enchanted bowls, bushels and horns so often found in Irish and Welsh saga; and it was inevitable that when the attractive force of the Arthurian legend was felt, such a magical table should be assigned to the king along with his enchanted sword, boat, lance and shield.

The Table at Winchester.—The famous round table fixed in the wall of the great hall at Winchester is certainly of considerable antiquity. It is a table-top 18 ft. in diameter, divided into 25 sectors, one for the king and one for each of the knights (whose number had long been reduced from the 1,600 of Layamon). The present colouring of the sections (green and white successively is due to Henry VIII. Hardying, in his *Chronicle* (*c.* 1436), differing slightly from *Perceval*, says that it is the very table made by Joseph of Arimathea for the brethren of the Grail, which was transferred to Winchester by Uther to comfort Ygerne. He speaks in a manner that implies a great age for this table.

A good summary of the story is given by A. C. L. Brown in *Harvard Studies in Philology and Literature*, vol. vii., where other authorities are referred to. Incidental references will be found in the various works on different aspects of the Arthurian saga. (E. E. K.)

ROUNDWORM, the common name for the parasitic worms of the genus *Ascaris*, and especially for *A. lumbricoides*, which occurs in the intestine of man. Closely allied species inhabit the pig and the horse. The name roundworm is often extended to include all members of the class Nematoda (*q.v.*).

ROUS, FRANCIS (1579–1659), English Puritan, was born at Dittisham, in Devon in 1579, and educated at Oxford (Broadgates Hall, afterwards Pembroke College) and at Leyden. For some years he lived in seclusion in Cornwall and occupied himself with theological studies, producing among other books *The Arte of*

Happines (1619) and *Testis Veritatis*, a reply to Richard Montagu's *Appello Caesarem*. He entered parliament in 1625 as member for Truro, and continued to represent that or some neighbouring west country constituency in such parliaments as were summoned till his death. He obtained many offices under the Commonwealth, among them that of provost of Eton College. At first a Presbyterian, he afterwards joined the Independents. In 1657 he was made a lord of parliament. He died at Acton in January 1658–59. The subjective cast of his piety is reflected in his *Mystical Marriage . . . betweene a Soule and her Saviour* (1635), but he is best known by his metrical version of the Psalms (1643), which was approved by the Westminster Assembly and (in a revised form) is still used in the Scottish Presbyterian churches.

ROUSE, WILLIAM HENRY DENHAM (1863–), English educationist and classical scholar, was born at Calcutta, on May 30, 1863, and educated at the Grammar school, Haverfordwest, at Doveton college, Calcutta, and at Christ college, Cambridge, of which he was elected a fellow in 1888. After five years at Cheltenham college (1890–95) he obtained a travelling scholarship, and in the following year was appointed a master at Rugby. He held this post until 1901, when he became head-master of the Perse school, at Cambridge. In 1903 he was also appointed teacher of Sanskrit to Cambridge university. In 1912 he went to New York as acting Latin professor at the Columbia summer school, and demonstrated the direct method of teaching Latin.

His publications include *Greek Votive Offerings* (1902); *Latin on the Direct Method* (1925); translations from the Pali and various editions of the classics.

ROUSSEAU, JEAN BAPTISTE (1671–1741), French poet, was born at Paris on April 6, 1671. His earlier comedies, *Le Café* (1694), *Le Flatteur* (1696), and *Le Capricieux*, and the opera of *Venus et Adonis* (1697) were not successful. He was turned out of the Café Laurent, which was much frequented by literary men, on account of the libellous verse written by or attributed to him, but in 1701 he was made a member of the Académie des inscriptions, and in 1710 he presented himself as a candidate for the Académie française. But in 1712 he was prosecuted for defamation of character and, on his non-appearance in court, was condemned to perpetual exile. He spent the rest of his life abroad, refusing to accept permission to return in 1716, because it was not accompanied by complete rehabilitation. He died at Brussels on March 17, 1741.

ROUSSEAU, JEAN JACQUES (1712–1778), French philosopher, was born at Geneva on June 28, 1712. His family had established themselves in that city at the time of the religious wars, but they were of pure French origin. Rousseau's father Isaac was a watchmaker; his mother, Suzanne Bernard, was the daughter of a minister; she died in childbirth, and Rousseau, who was the second son, was brought up in a haphazard fashion. When the boy was ten years old his father got entangled in a dispute with a fellow-citizen, and being condemned to a short term of imprisonment abandoned Geneva and took refuge at Lyons. Rousseau was taken charge of by his mother's relations and was committed to the tutorship of M. Lambercier, pastor at Boissy. In 1724 he was taken into the house of his uncle Bernard, by whom he was shortly afterwards apprenticed to a notary. His master, however, found or thought him incapable and sent him back. After a short time (April 25, 1725) he was apprenticed afresh, this time to an engraver. He did not dislike the work, but was or thought himself cruelly treated, and in 1728 he ran away. Then began an extraordinary series of wanderings and adventures, for much of which there is no authority but his own *Confessions*. He first fell in with some proselytizers of the Roman faith at Confignon in Savoy, and by them he was sent to Madame de Warens (or Vuarrens) at Annecy, a young and pretty widow who was herself a convert. Her influence, however, was not immediately exercised, and he was passed on to Turin, where there was an institution specially devoted to the reception of neophytes. His experiences here were unsatisfactory, but he abjured duly and was rewarded by being presented with 20 francs and sent about his business. He wandered about in Turin for some time, and at last established himself as footman to a Madame de Vercellis. Here occurred the famous incident of the theft of a ribbon, of which he accused a girl fellow-servant. Madame de Vercellis died not long afterwards, but he found another place with the Comte de Gouvon. This he soon lost; he then resolved to return to Madame de Warens at Annecy. The chronology of all these events, as narrated by himself, is somewhat obscure, but they seem to have occupied about three years.

Even then Rousseau did not settle at once in the anomalous position of domestic lover to this lady, who, nominally a converted Protestant, was in reality a kind of deist, with a theory of noble sentiment and a practice of libertinism tempered by good nature. She thought it necessary to complete his education, and he was sent to the seminarists of St. Lazare to be improved in classics, and also to a music master. In one of his incomprehensible freaks he set off for Lyons, and, after abandoning his companion in an epileptic fit, returned to Annecy to find Madame de Warens gone. Then for some months he relapsed into the life of vagabondage, varied by improbable adventures, which (according to his own statement) he so often pursued. Hardly knowing anything of music, he attempted to give lessons and a concert at Lausanne; and he actually taught at Neuchâtel. Then he became, or says he became, secretary to a Greek archimandrite who was travelling in Switzerland to collect subscriptions for the rebuilding of the Holy Sepulchre; then he went to Paris, and, with recommendations from the French ambassador at Soleure, saw something of good society; then he returned on foot through Lyons to Savoy, hearing that Madame de Warens was at Chambéry. This was in 1732, and Rousseau, who for a time had unimportant employments in the service of the Sardinian Crown, was shortly installed by Madame de Warens, whom he still called Maman, as *amant en titre* in her singular household, wherein she diverted herself with him, with music and with chemistry. In 1736 Madame de Warens, partly for Rousseau's health, took a country house, Les Charmettes, a short distance from Chambéry. Here in summer, and in the town during winter, Rousseau led a delightful life, which he has delightfully described. In a desultory way he did a good deal of reading, but in 1738 his health again became bad, and he was recommended to go to Montpellier. By his own account this journey to Montpellier was in reality a *voyage à Cythère* in company with a certain Madame de Larnage. This being so, he could hardly complain when on returning he found that his official position in Madame de Waren's household had been taken by a person named Vintzenried. In 1740 he became tutor at Lyons to the children of M. de Mably, not the well-known writer of that name, but his and Condillac's elder brother. But Rousseau did not like teaching and was a bad teacher, and after a visit to Les Charmettes, finding that his place there was finally occupied, he once more went to Paris in 1741. He was not without recommendations. But a new system of musical notation which he thought he had discovered was unfavourably received by the Académie des sciences, where it was read in Aug. 1742, and he was unable to obtain pupils, though the paper was published in 1743 under the title of *Dissertation sur la musique moderne*. Madame Dupin, however, to whose house he had obtained the entry, procured him the honourable if not very lucrative post of secretary to M. de Montaigu, ambassador at Venice. With him he stayed for about 18 months, and had as usual infinite complaints to make of his employer and some strange stories to tell. At length he threw up his situation and returned to Paris (1745).

His Literary Triumphs.—Up to this time—that is to say, till his 33rd year—Rousseau's life, though continuously described by himself, was of the kind called subterranean, and the account of it must be taken with considerable allowances. From this time, however, his general history can be checked and followed with reasonable confidence. On his return to Paris he renewed his relations with the Dupin family and with the literary group of Diderot, to which he had already been introduced by M. de Mably's letters. He had an opera, *Les Muses galantes*, privately represented; he copied music for money, and received from Madame Dupin and her son-in-law M. de Francueil a small but regular salary as secretary. He lived at the Hotel St. Quentin

for a time, and once more arranged for himself an equivocal domestic establishment. His mistress, whom towards the close of his life he married after a fashion, was Thérèse le Vasseur, a servant at the inn, whom he first met in 1743. She had little beauty, no education or understanding, and few charms that his friends could discover, besides which she had a detestable mother, who was the bane of Rousseau's life. But he made himself happy with her, and (according to Rousseau's account, the accuracy of which has been questioned [*see* F. Macdonald, *J. J. Rousseau*, 1906]) five children were born to them, who were all consigned to the foundling hospital. This disregard of responsibility was partly punished by the use his critics made of it when he became celebrated as a writer on education and a preacher of the domestic affections. Diderot, with whom from 1741 onwards he became more and more familiar, admitted him as a contributor to the *Encyclopédie*, for which he wrote the articles on music and political economy. He formed new musical projects, and he was introduced by degrees to many people of rank and influence, among them Madame d'Epinay, to whom in 1747 he was introduced by her lover M. de Francueil.

It was not, however, till 1749 that Rousseau made his mark as a writer. The academy of Dijon offered a prize for an essay on the effect of the progress of civilization on morals. Rousseau took up the subject, developed his famous paradox of the superiority of the savage state, won the prize, and, publishing his essay (*Discours sur les arts et sciences*) next year, became famous. The anecdotage as to the origin of this famous essay is voluminous. It is agreed that the idea was suggested when Rousseau went to pay a visit to Diderot, who was in prison at Vincennes for his *Lettre sur les aveugles*. Rousseau says he thought of the paradox on his way down; Morellet and others say that he thought of treating the subject in the ordinary fashion and was laughed at by Diderot, who showed him the advantages of the less obvious treatment. Diderot himself, who in such matters is trustworthy, does not claim the suggestion, but uses words which imply that it was at least partly his. It is very like him. The essay, however, took the artificial and crotchety society of the day by storm. Francueil gave Rousseau a valuable post as cashier in the receiver-general's office. But he resigned it either from conscientiousness, or crotchet, or nervousness at responsibility, or indolence, or more probably from a mixture of all four. He went back to his music-copying, but the salons of the day were determined to have his society, and for a time they had it. In 1752 he brought out at Fontainebleau an operetta, the *Devin du village*, which was successful. He received 100 louis for it, and he was ordered to come to court next day. This meant the certainty of a pension. But Rousseau's shyness or his perversity (as before, probably both) made him disobey the command. His comedy, *Narcisse*, written long before, was also acted, but unsuccessfully. In the same year, however, a letter *Sur la musique française*, in which he indulged in a violent tirade against French music, again had a great vogue. Finally, for this was an important year with him, the Dijon academy, which had founded his fame, announced the subject of "The Origin of Inequality," on which he wrote a discourse which was unsuccessful, but at least equal to the former in merit. During a visit to Geneva in 1754 he abjured his abjuration of Protestantism and was enabled to take up his freedom as citizen, to which his birth entitled him and of which he was proud. Shortly afterwards, returning to Paris, he accepted a cottage near Montmorency (the celebrated Hermitage) which Madame d'Epinay had fitted up for him, and established himself there in April 1756. Here he wrote *La Nouvelle Héloïse;* here he indulged in the passion which that novel partly represents, his love for Madame d'Houdetot, sister-in-law of Madame d'Epinay. Here too arose the obscure triangular quarrel between Diderot, Rousseau and Frederick Melchior Grimm, which ended Rousseau's sojourn at the Hermitage. The supposition least favourable to Rousseau is that it was due to one of his numerous fits of half-insane petulance and indignation at the obligations which he was nevertheless always ready to incur. That most favourable to him is that he was expected to lend himself in a more or less complaisant manner to assist and cover Madame d'Epinay's passion for Grimm. At any rate, Rousseau quitted the Hermitage in the winter of 1757–58, and established himself at Montlouis in the neighbourhood.

Hitherto Rousseau's behaviour had frequently made him enemies, but his writings had for the most part made him friends. The quarrel with Madame d'Epinay, with Diderot, and through them with the *philosophe* party reversed this. In 1758 appeared his *Lettre à d'Alembert contre les spectacles*, written in the winter of the previous year at Montlouis. This was at once an attack on Voltaire, who was giving theatrical representations at Les Délices, on D'Alembert, who had condemned the prejudice against the stage in the *Encyclopédie*, and on one of the favourite amusements of the society of the day, and Rousseau was henceforward as obnoxious to the *philosophe* coterie as to the orthodox party. He still, however, had no lack of patrons—he never had—though his perversity made him quarrel with all in turn. The duke and duchess of Luxembourg made his acquaintance, and he was industrious in his literary work—indeed, most of his best books were produced during his stay in the neighbourhood of Montmorency. A letter to Voltaire on his poem about the Lisbon earthquake embittered the dislike between the two, being surreptitiously published. *La Nouvelle Héloïse* appeared in the same year (1760), and it was immensely popular. In 1762 appeared the *Contrat social* at Amsterdam, and *Émile*, which was published both in the Low Countries and at Paris. For the latter the author received 6,000 livres, for the *Contrat* 1,000.

Julie, ou La Nouvelle Héloïse, is a novel written in letters describing the loves of a man of low position and a girl of rank, her subsequent marriage to a respectable freethinker of her own station, the mental agonies of her lover, and the partial appeasing of the distresses of the lovers by the influence of noble sentiment and the good offices of a philanthropic Englishman. It is too long, the sentiment is overstrained; but it is full of pathos and knowledge of the human heart. The *Contrat social*, as its title implies, endeavours to base all government on the consent, direct or implied, of the governed, and indulges in much ingenious argument to get rid of the practical inconveniences of the theory. *Émile*, the second title of which is *De l'Éducation*, is much more of a treatise than of a novel.

Exile from France.—Rousseau's reputation was now higher than ever, but the term of the comparative prosperity which he had enjoyed for nearly ten years was at hand. The *Contrat social* was obviously anti-monarchic; the *Nouvelle Héloïse* was said to be immoral; the sentimental deism of the "Profession du vicaire Savoyard" in *Émile* irritated equally the *philosophe* party and the church. On June 11, 1762, *Émile* was condemned by the parlement of Paris, and two days previously Madame de Luxembourg and the prince de Conti gave the author information that he would be arrested if he did not fly. They also furnished him with means of flight, and he made for Yverdon in the territory of Berne, whence he transferred himself to Motiers in Neuchâtel, which then belonged to Prussia. Frederick II. was not indisposed to protect the persecuted when it cost him nothing and might bring him fame, and in Marshal Keith, the governor of Neuchâtel, Rousseau found a true and firm friend. He was, however, unable to be quiet or to practise any of those more or less pious frauds which were customary at the time with the unorthodox. The archbishop of Paris had published a pastoral against him, and Rousseau did not let the year pass without a *Lettre à M. de Beaumont*. The council of Geneva had joined in the condemnation of *Émile*, and Rousseau first solemnly renounced his citizenship, and then, in the *Lettres de la montagne* (1763), attacked the council and the Genevan constitution unsparingly. All this excited public opinion against him, and his unpopularity is said, on uncertain authority, to have culminated in a nocturnal attack on his house. At any rate he thought he was menaced if he was not, and migrated to the Île St. Pierre in the Lake of Bienne, where he once more for a short, and the last, time enjoyed that idyllic existence which he loved. But the Bernese Government ordered him to quit its territory.

David Hume offered him, late in 1765, an asylum in England, and he accepted. He passed through Paris, where his presence

was tolerated for a time, and landed in England on Jan. 13, 1766. Thérèse travelled separately, and was entrusted to the charge of James Boswell, who had already made Rousseau's acquaintance. Here he had once more a chance of settling peaceably. Severe English moralists like Johnson thought but ill of him, but the public generally was not unwilling to testify against French intolerance, and regarded his sentimentalism with favour. He was lionized in London to his heart's content and discontent, for it may truly be said of Rousseau that he was equally indignant at neglect and intolerant of attention. When, after not a few displays of his strange humour, he professed himself tired of the capital, Hume procured him a country abode in the house of Mr. Davenport at Wootton in Derbyshire. Here, though the place was bleak and lonely, he might have been happy enough, and he actually employed himself in writing the greater part of his *Confessions*. But his habit of self-tormenting and tormenting others never left him. His own caprices interposed some delay in the conferring of a pension which George III. was induced to grant him, and he took this as a crime of Hume's. The publication of a spiteful letter (really by Horace Walpole) in the name of the king of Prussia made Rousseau believe that plots of the most terrible kind were on foot against him. Finally he quarrelled with Hume because the latter would not acknowledge all his own friends and Rousseau's supposed enemies of the *philosophe* circle to be rascals. He remained, however, at Wootton during the year and through the winter. In May 1767 he fled to France, addressing letters to the lord chancellor and to General Conway, which show an unbalanced mind. He was received in France by the marquis de Mirabeau (father of the great Mirabeau), of whom he soon had enough, then by the prince de Conti at Trye. From this place he again fled and wandered about for some time in a wretched fashion, still writing the *Confessions*, constantly receiving generous help, and always quarrelling with, or at least suspecting, the helpers. In the summer of 1770 he returned to Paris, resumed music-copying, and was on the whole happier than he had been since he had to leave Montlouis.

Many of the best-known stories of Rousseau's life date from this last time, when he was tolerably accessible to visitors. He finished his *Confessions*, wrote his *Dialogues* (the interest of which is not quite equal to the promise of their curious sub-title, *Rousseau juge de Jean Jacques*), and began his *Rêveries du promeneur solitaire*, intended as a sequel and complement to the *Confessions*, and one of the best of all his books. It should be said that besides these, which complete the list of his principal works, he has left a very large number of minor works, the fragments of another opera, *Daphnis et Chloé* (printed in 1780), and a considerable correspondence. During this time he lived in the Rue Platière, which is now named after him. But his suspicions of secret enemies grew stronger, and at the beginning of 1778 he was glad to accept the offer of M. de Girardin, a rich financier, and occupy a cottage at Ermenonville. The country was beautiful; but his old terrors revived, and his woes were complicated by the alleged inclination of Thérèse for one of M. de Girardin's stable-boys. On July 2 he died in a manner which has been much discussed, suspicions of suicide being circulated at the time by Grimm and others, though there is no reason to doubt the original verdict of apoplexy.

His Character and Influence.—There is little doubt that for the last 10 or 15 years of his life Rousseau was not wholly sane —the combined influence of late and unexpected literary fame and of constant solitude and discomfort acting upon his excitable temperament so as to overthrow the balance, never very stable, of his fine and acute but unrobust intellect. His moral character was undoubtedly weak, but it is fair to remember that but for his astounding *Confessions* the more disgusting parts of it would not have been known, and that these *Confessions* were written, if not under hallucination, at any rate in circumstances entitling the self-condemned criminal to the benefit of considerable doubt. If Rousseau had held his tongue, he might have stood lower as a man of letters; he would pretty certainly have stood higher as a man. He was, moreover, really sinned against, if still more sinning. Like other men of letters of his time he had to submit to something like persecution. The conduct of Grimm to him was certainly bad; and, though Walpole was not his personal friend, a worse action than his famous letter, considering the well-known idiosyncrasy of the subject, would be difficult to find. Only excuses can be made for him; but the excuses for a man born, as Hume after the quarrel said of him, "without a skin" are numerous and strong.

His peculiar reputation increased after his death, when the paradox of Rousseauism, the belief in the superiority of "the noble savage" to civilized man, became more and more fashionable. The men of the Revolution regarded him with something like idolatry, and his literary merits conciliated many who were far from idolizing him as a revolutionist. His style was taken up by Bernardin de Saint Pierre and by Chateaubriand. Byron's fervid panegyric enlisted on his side all who admired Byron—that is to say, the majority of the younger men and women of Europe between 1820 and 1850—and thus different sides of his tradition were continued for a full century after the publication of his chief books. His religious unorthodoxy was condoned because he never scoffed; his political heresies, after their first effect was over, seemed harmless from the very want of logic and practical spirit in them, while part at least of his literary secret was the common property of almost every one who attempted literature.

In religion Rousseau was undoubtedly what he has been called above—a sentimental deist; but sentimentalism was the essence, deism the accident of his creed. In his time orthodoxy at once generous and intelligent hardly existed in France. There were ignorant persons who were sincerely orthodox; there were intelligent persons who pretended to be so. But between the time of Massillon and D'Aguesseau and the time of Lamennais and Joseph de Maistre the class of men of whom in England Berkeley, Butler and Johnson were representatives did not exist in France. Little inclined by nature to any but the emotional side of religion, and utterly undisciplined in any other by education, course of life, or the general tendency of public opinion, Rousseau took refuge in the nebulous kind of natural religion which was at once fashionable and convenient.

In politics Rousseau was a sincere and, as far as in him lay, a convinced republican. He had no great tincture of learning, he was by no means a profound logician, and he was impulsive and emotional in the extreme—characteristics which in political matters predispose the subject to the preference of equality above all political requisites. He saw that under the French monarchy the actual result was the greatest misery of the greatest number, and he did not look much further. The *Contrat social* is for the political student one of the most curious and interesting books existing. Historically it is null; logically it is full of gaping flaws, practically its manipulations of the *volonté de tous* and the *volonté générale* are clearly insufficient to obviate anarchy. But its mixture of real eloquence and apparent cogency is exactly what always carries a multitude with it, if only for a time. Moreover, in some minor branches of politics and economics Rousseau was a real reformer. Visionary as his educational schemes (chiefly promulgated in *Émile*) are in parts, they are admirable in others, and his protest against mothers refusing to nurse their children hit a blot in French life which is not removed yet, and has always been a source of weakness to the nation.

But it is as a literary man pure and simple—that is to say, as an exponent rather than as an originator of ideas—that Rousseau is most noteworthy, and that he has exercised most influence. The first thing noticeable about him is that he defies all customary and mechanical classification. He is not a dramatist—his work as such is insignificant—nor a novelist, for, though his two chief works except the *Confessions* are called novels, *Émile* is one only in name, and *La Nouvelle Héloïse* is as a story diffuse, prosy and awkward to a degree. He was without command of poetic form, and he could only be called a philosopher in an age when the term was used with such meaningless laxity as was customary in the 18th century. If he must be classed, he was before all things a describer—a describer of the passions of the human heart and of the beauties of nature. In the first part of his vocation the novelists of his own youth, such as Marivaux, Richardson and Prévost,

may be said to have shown him the way; in the second he was almost a creator. In combining the two and expressing the effect of nature on the feelings and of the feelings on the aspect of nature he was absolutely without a forerunner or a model. And, as literature since his time has been chiefly differentiated from literature before it by the colour and tone resulting from this combination, Rousseau may be said to hold, as an influence, a place almost unrivalled in literary history. The defects of all sentimental writing are noticeable in him, but they are palliated by his wonderful feeling, and by the passionate sincerity even of his insincere passages.

BIBLIOGRAPHY.—The first complete edition of Rousseau's works appeared at Geneva in 1782–83 in 47 small volumes. There have been many since, the most important of them being that of Musset-Pathay (1823). Some unpublished works, chiefly letters, were added by Bosscha (1858) and Streckeisen Moulton (1861). *See* also the latter's *Rousseau et ses amis* (1865), and the edition of Rousseau's *Correspondance Générale* by Dufour and Plan (1924 *et seq.*). The chief biographies are: in French that of Saint Marc Girardin (1874), in English the *Life* by Viscount Morley (1873; new ed. 1915). But the materials for his biography are so controversial and so personal that the correct historical view can hardly be said yet to be standardized. Mrs. Frederika Macdonald, in her *Jean Jacques Rousseau* (1906), makes out a good case for regarding Mme. d'Epinay's *Memoirs* as coloured, if not actually dictated, by the malevolent attitude of Grimm and Diderot; and her study of the documents undoubtedly qualifies a good many of the assumptions that had previously been made. *See* also E. Ritter, *Famille et jeunesse de Rousseau* (1896); A. Houssaye, *Les Charmettes* (2nd ed., 1864); J. Grand-Carteret, *Rousseau jugé par les Français d'aujourd'hui* (1890); L. Ducros, *J. J. Rousseau de Genève à l'Hermitage, 1712–57* (1908). The *Annales de la Société J. J. Rousseau* began to appear in 1905.

ROUSSEAU, PIERRE ÉTIENNE THÉODORE (1812–1867), French painter of the Barbizon school, was born in Paris on April 15, 1812, the son of a tailor. At the age of 15 he began his artistic education under the landscapist Charles Rémond and then under Guillon-Lethière. But his style was formed chiefly by his own efforts in working direct from nature in various parts of France. Théodore Rousseau shared the difficulties of the romantic painters of 1830 in securing for their pictures a place in the annual Paris exhibition. The influence of the classically trained artists was against them. He exhibited one or two unimportant works in the Salon of 1831 and 1834, but in 1836 his great work "La Descente des vaches" was rejected; and from then until 1848 he was persistently refused. He was not without champions in the press, and under the title of "le grand refusé" he became known through the writings of Thoré, the critic who afterwards resided in England and wrote under the name of Bürger. During these years of artistic exile Rousseau produced some of his finest pictures: "The Chestnut Avenue," "The Marsh in the Landes" (Louvre), "Hoar-Frost" (now in America); and in 1851, after the reorganization of the Salon in 1848, he exhibited his masterpiece, "The Edge of the Forest" (Louvre), a picture similar in treatment to the composition called "A Glade in the Forest of Fontainebleau," in the Wallace collection.

Up to this period Rousseau had lived only occasionally at Barbizon, but in 1848 he took up his residence in the forest village. At the Exposition Universelle of 1855, where all Rousseau's rejected pictures of the previous 20 years were gathered together, his works were acknowledged to form one of the finest groups. However, his struggles continued and his health began to give way. He was elected president of the fine art jury for the 1867 Exposition. Finally he began to sink, and he died, in the presence of his friend, J. F. Millet, on Dec. 22, 1867.

Rousseau's pictures are always grave in character, with an air of exquisite melancholy. He left a number of sketches and water-colour drawings. His pen work is rare; it is particularly searching in quality, he also executed four etchings and two heliogravures. There are a number of fine pictures by him in the Louvre, and the Wallace collection contains one of his most important Barbizon pictures. There is also an example in the Ionides collection at the Victoria and Albert museum.

ROUSSEAU, VICTOR (1865–), Belgian sculptor, born at Feluy-Arquennes (Hainaut) on Dec. 16, 1865, became a member of the Belgian Royal Academy of Arts, and director and professor of the Brussels City Academy. He began to exhibit about 1890. Among his works are "Les Soeurs de l'Illusion" and "Démeter" (both in the Brussels Museum), the decorative figures on the Fragnée Bridge at Liége, the "Maturité" monument in the Place de la Chancellerie, Brussels, and the Max Waller memorial in the same city. Rousseau, who lived in London during the War, designed the monument, signifying Belgian gratitude to England, which stands on the Thames Embankment, London, close to Cleopatra's Needle. He also designed the War memorial at Forest, near Brussels.

ROUSSEAU DE LA ROTTIÈRE, JEAN SIMÉON (b. 1747), French decorative painter, was the youngest son of Jules Antoine Rousseau, "sculpteur du Roi." He studied at the Académie Royale in 1768 winning the medal given to the best painter of the quarter. He appears with his brother Jules Hugues to have been employed by his father for the decorative work executed by the family at Versailles. Many of the attributions are fairly determined by dates, Jules Antoine Rousseau having been at work at Versailles for years before the birth of his famous son. There can be little doubt that the "Bains du Roi," the "Salon de la Méridienne," part of the bedchamber of Madame Adelaïde, and the "Garde-robe of Louis XVI." were shared in by Rousseau de la Rottière. His most individual and most famous undertaking was, however, the decoration of the lovely "Boudoir de Madame de Sévilly," purchased for the Victoria and Albert Museum in 1869. There is no information as to Rousseau's later life. The last known mention of him is in 1792.

ROUSSEL, ALBERT (1869–), French composer, was born at Tourcoing on April 5, 1869. He left the navy in 1884 to study music in Paris, and in 1902 became professor at the Schola Cantorum. The delightful *Rustiques* (1904–06), the first symphony *Le Poème de la Forêt* (1904–06) and the charming ballet *Le Festin de l'Araignée* (1912) were all manifestly the work of a gifted composer. The *Divertissement* (piano and wind instruments, 1906), *Evocations*, three symphonic poems, one with chorus (1910–11), the orchestral prelude *Pour une Fête de Printemps* (1920), the second symphony (op. 23, 1919–20) and the opera-ballet *Padmâvati* (1923) are among his other works.

ROUSSILLON, formerly a French province, now comprised in the department of Pyrénées Orientales (*q.v.*). It was bounded S. by the Pyrénées, W. by the county of Foix, N. by Languedoc and E. by the Mediterranean. The province derived its name from a small place near Perpignan, the capital, called Ruscino (Rosceliona, Castel Rossello). It formed part of the Roman province of Gallia Narbonensis until in the 5th century it was ceded with the rest of Septimania to Theodoric II., king of the Visigoths. It has little distinctive history until the appearance of a line of hereditary counts late in the 9th century. The district does not seem to have formed a single lordship before the 12th century, when it passed under the rule of the counts of Barcelona and their successors, the kings of Aragon. Under the Aragonese monarchs the province was prosperous, and Collioure, the port of Perpignan, became a centre of Mediterranean trade. By the treaty of Corbeil (1258) Louis IX. surrendered the sovereignty of Roussillon and the ancient countship of Barcelona to Aragon, and from that time until the 17th century the province ceased to belong to France. In the first half of the 17th century the decay of Spain was France's opportunity, and on the revolt of the Catalans against the Castilians in 1641, Louis XIII. supported the former, and the treaty of the Pyrénées in 1659 secured Roussillon to the French crown.

ROUTH, EDWARD JOHN (1831–1907), English mathematician, was born at Quebec on Jan. 20, 1831. At the age of 11 he came to England, and after studying under A. de Morgan at University college, London, entered Peterhouse, Cambridge, in 1851. In the mathematical tripos three years later he was senior wrangler, J. Clerk Maxwell, who tied with him for the Smith's prize, being second. Elected a fellow of his college, he devoted himself to teaching. Routh also found time to make contributions to mathematics, and to write his classic works on dynamics and statics. He was elected F.R.A.S. in 1866 and F.R.S. in 1872. He died at Cambridge on June 7, 1907.

His works include: papers in *Proceedings of London Mathematical Society* and *Proceedings of the Royal Society; An Analytical View of Newton's Principia,* with Lord Brougham (1855); *Essay on the Stability of a Given State of Motion,* which won the Adams prize, 1877, and in which he used his modified Lagrangian function; *Dynamics of a Particle* (Cambridge, 1896); *Dynamics of Rigid Bodies, Elementary,* vol. i., *Advanced,* vol. ii. (1860, 6th enlarged ed. 1905); *Analytical Statics,* vol i. (1891, 2nd ed. 1896), vol ii. (1892, 2nd ed. 1902).

ROUTLEDGE, GEORGE (1812–1888), English publisher, was born at Brampton in Cumberland on Sept. 23, 1812. He started in business for himself as a bookseller in London in 1836, and as a publisher in 1843. He was a pioneer of cheap classics; the shilling volumes called the "Railway Library" were an immense success, including as it did *Uncle Tom's Cabin.* He also published in popular form writings of Washington Irving, Fenimore Cooper, Bulwer Lytton and Benjamin Disraeli. A branch of Routledge's publishing business was established in New York in 1854. Routledge died in London on Dec. 13, 1888.

ROUVIER, MAURICE (1842–1911), French statesman, was born at Aix on April 17, 1842. He supported Gambetta's candidature at Marseilles in 1867, and in 1870 he founded an anti-imperial journal, *L'Égalité.* In July 1871 he was returned to the National Assembly for Marseilles at a by-election. He became a recognized authority on finance, and repeatedly served on the Budget Commission as reporter or president. In 1881 he joined Gambetta's cabinet as minister of commerce and the colonies, and in the 1883–85 cabinet of Jules Ferry he held the same office. He became premier and minister of finance on May 31, 1887, with the support of the moderate republican groups, the Radicals holding aloof in support of General Boulanger, who began a violent agitation against the government. Then came the scandal of the decorations in which President Grévy's son-in-law Daniel Wilson figured, and the Rouvier cabinet fell. Rouvier was minister of finance in a succession of ministries between 1889 and 1893. He was driven out of office by the Panama scandals; in 1902, after nearly ten years of exclusion from office, he joined the Radical cabinet of M. Combes; and on the fall of the Combes ministry in January 1905 he became premier, with Delcassé at the head of the foreign office. Delcassé, reproached with imprudence in the Morocco affair (*see* EUROPE: *History*), resigned, and the prime minister took over foreign affairs, and came to an agreement with the German government. His ministry fell in 1906 over questions connected with the Separation Law. Rouvier died at Neuilly on June 7, 1911.

ROUX, PIERRE PAUL EMILE (1853–), French bacteriologist, was born at Confolens, Charente, on Dec. 17, 1853. He studied medicine, and obtained an appointment to the Faculty of Medicine in Paris, which he held from 1874 to 1878. He then worked for ten years in Pasteur's laboratory, before being appointed to a post in the Pasteur institute. He was director of the Institute from 1904 to 1918. Roux did a great deal of research in collaboration with Pasteur, and studied the treatment of infectious diseases, including hydrophobia. He studied anthrax in conjunction with Pasteur and Chamberland, and produced vaccines against this disease. He was associated with Yersin in the study of the diphtheria bacillus and its toxins. With Behring he introduced the use of an antitoxin in diphtheria, and with him was awarded the Nobel prize for their work on serum therapeutics.

ROUYN, a new mining camp in north-western Quebec, Canada, east of the Porcupine district, and on the Canadian National and Nipissing Central railways, the centre of an area which promises to become one of the largest of the world's copper and gold fields.

In 1925 Rouyn was practically virgin bush, with a few scattered prospectors testing promising surface indications. Since the Canadian National railway completed its branch line to Rouyn in 1927 the town has grown rapidly.

Rouyn is in the centre of a mineral bearing area of approximately 10,000 sq.m., a continuation of the rocks which make up the Porcupine gold district and the Cobalt silver district of Ontario. The Noranda mine is still by far the most important in this field; over $50,000,000 worth of copper-gold ore is said to have been blocked out there.

ROVERETO, a town of the province of Trento, Italy, 15 m. by rail S.W. of the town of that name. Pop. (1921) 14,356 (town); 15,983 (commune). Built on the left bank of the Adige, in the widest portion of the valley, it is divided into two parts by the Leno torrent. Save in the newer quarter of the town, the streets are narrow and crooked, one being named after the most distinguished native of the place, Antonio Rosmini-Serbati (*q.v.*). The finest church is that of Santa Maria del Carmine, the old 14th-century church now serving as a sacristy to that built from 1678 to 1750. The church of San Marco dates from the 15th century, and so do the Municipal Palace and the Savings Bank. The town is dominated by the castle (now containing a war museum), which was reconstructed in 1492 by the Venetians, after it had been burnt in 1487 by the count of Tirol. It was very much damaged in the Great War, but its industries (silk, cotton, gloves, paper, metals, etc.) have begun to revive.

In 1132 the emperor Lothair found the passage of the gorge above the site of the town barred by a castle, which he took and gave to one of his Teutonic followers, the ancestor of the Castelbarco family. The first record of the town dates from 1154. In 1411 it was taken by the Venetians. In 1509 the town gave itself voluntarily to the emperor Maximilian, to whom it was ceded formally by Venice in 1517, and next year incorporated with Tirol.

ROVIGNO, a seaport of Italy, in Istria, 23 m. N.N.W. of Pola by rail. Pop. (1921) 10,863. It is situated on the west coast of Istria, and possesses a cathedral, built on the summit of the promontory Monte di Sant' Eufemia. Its campanile, built after the model of the famous campanile in Venice, is crowned with a bronze statue of St. Eufemia, the patron saint of the town, whose remains are preserved in the church. In the neighbourhood are vineyards, and olive gardens. Rovigno is the principal centre of the local sardine fishery and cannery. Rovigno is the ancient *Arupenum* or *Rubinum.* It became Venetian in 1283.

ROVIGO, a town of Venetia, Italy, capital of the province of Rovigo. It stands in the low ground between the lower Adige and the lower Po, 50 m. S.W. of Venice by rail and 27 m. S.S.W. of Padua, and on the Adigetto canal, 17 ft. above sea-level. Pop. (1926) 15,704. It is a station on the line between Bologna and Padua, with branches to Legnago and Chioggia. The architecture of the town bears the stamp both of Venetian and of Ferrarese influence. The finest church is the Madonna del Soccorso, an octagon with a lofty campanile, begun in 1594 by Francesco Zamberlan of Bassano, a pupil of Palladio. The town hall contains a library including some rare early editions and a fair picture gallery. The Palazzo Roncale is a fine Renaissance building by Sanmicheli (1555). Two towers of the mediaeval castle remain (920). Rovigo (Neo-Latin *Rhodigium*) is mentioned as Rodigo in 838.

ROVUMA, a river, about 500 m. long, forming the boundary between Tanganyika territory and Portuguese East Africa. The lower Rovuma is formed by the junction of two branches of nearly equal importance, the longer, the Lujenda, coming from the south-west; the other, the Rovuma, from the west. Its source lies on a plateau of Archaean rocks 3,000 ft. high, east of Lake Nyasa. In its eastward course the Rovuma flows near the base of the escarpment of an arid plateau to the north, from

which direction the streams, which have cut themselves deep channels in the plateau edge, have almost all short courses. On the opposite bank the Rovuma receives, besides the Lujenda, the Msenga and Luchulingo, flowing in broad valleys running from south to north. The Lujenda rises near Lake Chilwa, in the small Lake Chiuta (1,700 ft.), the swamps to the south of this being separated from Chilwa only by a narrow wooded ridge. The river, at its mouth about 1 m. wide, is fordable in many places in the dry season.

ROWE, NICHOLAS (1674–1718), English dramatist and miscellaneous writer, son of John Rowe (d. 1692), barrister and serjeant-at-law, was baptized at Little Barford in Bedfordshire on June 30, 1674. Nicholas Rowe was educated at Westminster school under Dr. Busby. He became in 1688 a King's scholar, and entered the Middle Temple in 1691. On his father's death he became the master of an independent fortune. His first play, *The Ambitious Stepmother,* the scene of which is laid in Persepolis, was produced in 1700, and was followed in 1702 by *Tamerlane.* In this play the conqueror represented William III., and Louis XIV. is denounced as Bajazet. It was for many years regularly acted on the anniversary of William's landing at Torbay. In *The Fair Penitent* (1703), an adaptation of Massinger and Field's *Fatal Dowry,* occurs the character of Lothario, whose name passed into current use as the equivalent of a rake. Calista is said to have suggested to Samuel Richardson the character of Clarissa Harlowe, as Lothario suggested Lovelace. Other plays are: *The Biter* (1704), *Ulysses* (1706), *The Royal Convert* (1707), *The Tragedy of Jane Shore* (1714) and *The Tragedy of Lady Jane Grey* (1715).

In 1715 Rowe succeeded Nahum Tate as poet laureate. He died on Dec. 6, 1718, and was buried in Westminster Abbey.

Rowe was the first modern editor of Shakespeare. It is unfortunate that he based his text (6 vols., 1709) on the corrupt Fourth Folio, a course in which he was followed by later editors. We owe to him the preservation of a number of Shakespearian traditions, collected for him at Stratford by Thomas Betterton. These materials he used with considerable judgment in the memoir prefixed to the *Works.* He divided the play into acts and scenes on a reasonable method, noted the entrances and exits of the players, and prefixed a list of the *dramatis personae* to each play.

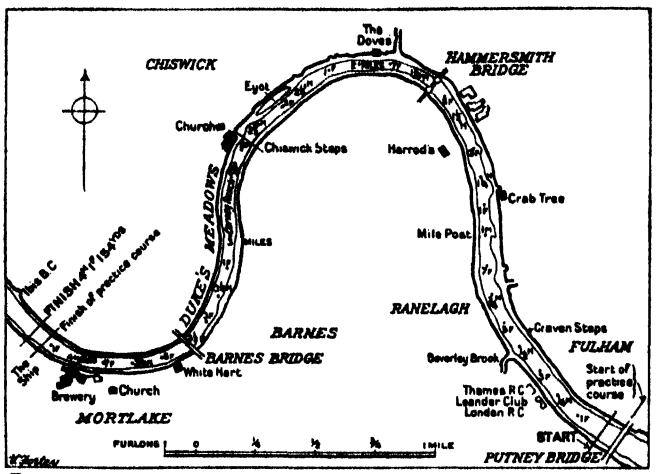
Rowe's *Works* were printed in 1727, and in 1736, 1747, 1756, 1766 and 1792; his occasional poems are included in Anderson's and other collections of the British poets.

ROWELL, NEWTON WESLEY (1867–), Canadian politician, was born on Nov. 1, 1867, in Middlesex county, Ontario. He was called to the Bar in 1891, and became head of a law firm in Toronto. He was elected to the Ontario legislative assembly for North Oxford in 1911, and from that year to 1917 was leader of the liberal opposition in the Ontario legislature. In Oct. 1917 he entered the Federal Government as president of the council and vice-chairman of the war committee of the cabinet, and was elected to the Dominion lower house in 1917. He was a member of the Imperial war cabinet and Imperial War Conference, 1918; Canadian representative at the International Labour Conference at Washington, 1919; and a Canadian delegate to the first assembly of the League of Nations at Geneva, 1920, subsequently becoming vice-president of the League of Nations Society in Canada. He resigned his seat in parliament in May 1921. He wrote *The British Empire and World Peace* (1922), and *Canada, a Nation* (1923).

ROWING, the act of propelling a boat (*q.v.*) by two or more persons by means of a succession of strokes of oars.

An oar is a long shaft of wood with a blade, or thin enlarged surface, at one end, and a handle at the other, and is, in theory, a lever of the second order. With the blade immersed the water forms the fulcrum, and the resultant pressure against the handle applied at some intermediate point of the shaft to a rowlock, or fixed pin in the side of the boat, drives the boat forward. From the earliest days until the Spanish Armada it wielded a vast influence on the seas as an instrument both of war and of commerce. In the days of Queen Anne the river was still the highway of London. There were no fewer than 10,000 licensed watermen on the tidal reaches of the Thames above London Bridge.

The oldest race of which there are records, save the Chester Cup, is the sculling-race known to this day as "Doggett's Coat and Badge." Thomas Doggett, the famous comedian of the early 18th century, caused the following placard to be posted on London Bridge on the eve of August 1, 1715: "This being the day of his Majesty's happy accession to the Throne, there will be given by



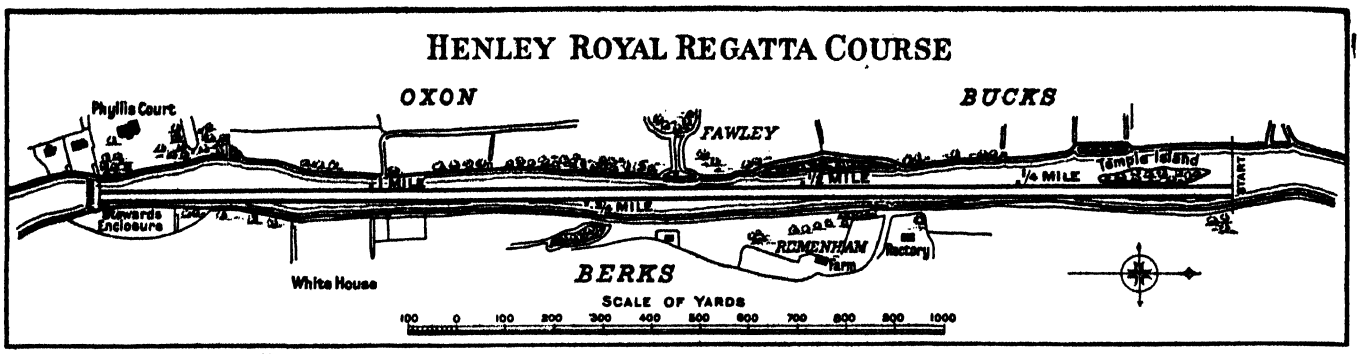


FIG. 1.—CHAMPIONSHIP COURSE ON THE RIVER THAMES FROM PUTNEY TO MORTLAKE

Mr. Doggett an orange livery, with a badge representing Liberty, to be rowed for by six watermen that are out of their time within the year past. They are to row from London Bridge to Chelsea. It will be continued annually on the same day for ever." True to his word Thomas Doggett left in his will, on his death in 1721, a sum of money in trust, and, with the exception of the years 1915–18 inclusive, the race has been rowed ever since under the administration of the Fishmongers' Company, and the list of winners is almost complete. In 1919 those who had not raced during the World War were then matched against each other, so there is really no break in continuity.

The first English regatta (*Ital. regata,* an entertainment introduced, as the Annual Register records, from Venice) of which we have evidence, took place on the Thames off Ranelagh Gardens in 1775. It attracted a great deal of public interest but no records of the races are preserved. Though there are numerous instances of professional matches at the beginning of the 19th century, it was not until the Napoleonic Wars were over that the "gentleman amateur" began to practise the sport to any extent. Westminster school *Water Ledger* is the first contemporary record of boat-racing. It commences in 1813 with the names of the crew of the six-oared "Fly," but it is only reasonable to suppose that the school-boys had manned craft and raced much earlier than that. Eton had a 10-oared boat "The Monarch" and three eight-oars as early as 1811, but no record exists of any racing until 1817. Eton challenged Westminster to row from Westminster to Kew against the tide in 1818, but the authorities refused to allow the race. This year is generally taken as the date of the foundation of the Leander club, which at once became the premier rowing club.

The records of college races at Oxford begin in 1815, but the very nature of the bumping races shows that evolution must have been gradual. It was apparently the custom for crews in eight-oared boats to row down to Sandford in company to supper. On the way home all would collect in Iffley lock. The broad, in-rigged wherries had a gang plank running from the bows to the stroke thwart. As soon as the lock gates were opened the stroke of the leading boat ran down the gang plank shoving the boat out of the lock with a boat-hook, and then, clear of the lock, dropped into his seat and raced away, followed as quickly as possible by the second boat and so on. If a crew were good enough to keep their lead, they kept their place, but if bumped they gave their position up to the boat that caught them on the next night's racing.

The year 1829 is the first great date in rowing history, for it saw the first University boat race and the first match between

HENLEY ROYAL REGATTA COURSE, ALTERED IN 1927, NOW MEASURING 1 MILE AND 555 YARDS

Eton and Westminster. Cambridge had founded a university boat club in 1827 but Oxford did not follow suit until 1839. The first race was, in all probability, suggested by Charles Wordsworth of Christ Church, whose father was the Master of Trinity, and who therefore knew personally the oarsmen on both Isis and Cam. A meeting of the C.U.B.C. was held in Mr. Gisbourne's rooms on Feb. 20, 1829, at which it was resolved: "That Mr. Snow, of St. John's, be requested to write immediately to Mr. Staniforth, Christ Church, Oxford, proposing to make up a University match" and on March 12 a formal challenge was issued as follows:—"That the University of Cambridge hereby challenge the University of Oxford to row a match at or near London, each in an eight-oared boat, during the ensuing Easter vacation." In the end the race was decided at Henley on June 10 over a course from Hambleden Lock to Henley Bridge against the stream, about 2m. distance. Oxford won easily in a time given as 14 minutes.

No other race could be arranged until 1836, when the course agreed upon was from Westminster to Putney. Cambridge won as easily as Oxford had done on the previous occasion. In 1837 and 1838 Oxford could not raise a crew and Cambridge met and defeated Leander club in both years. In '39, following the foundation of the O.U.B.C., and the three subsequent years races were rowed between Westminster and Putney, Oxford losing all save the last one. They were much assisted in turning the tide of defeat by the migration from Cambridge to Oxford of A. T. W. Shadwell, who helped F. N. Menzies, the O.U.B.C. president of 1842, to reorganize Oxford rowing. These two oarsmen with T. S. Egan, the Cambridge coxswain of 1836, '39 and '40 were largely responsible for laying the foundations of style and for the complete emancipation of the amateur from the toils of the professional.

There was still, however, the question of the professional coach. In 1849, Cambridge, in spite of the fact that they had a tried coach in T. S. Egan, decided to engage the celebrated professional sculler Robert Coombes. This year was famous in the annals of the race for the fact that there were two races and that in the second occurred the only foul. This foul has always been attributed to the instruction given to the coxswain by Coombes. From that date the universities avoided professional assistance.

From the year 1856, with the exception of the years 1915–1919 inclusive, owing to the World War, the University boat race has been an annual affair and is rowed a week or ten days before Easter. Since 1845 it has always been rowed on the Championship course from Putney to Mortlake, on the flood tide, with the exception of the years 1846, '56 and '63, when it was rowed on the ebb from Mortlake to Putney. Of the 81 races up to and including that of 1929, Oxford won 40 and Cambridge 40 races, whilst there was, in 1877, one dead heat. The course is just under 4¼m., to be exact 4m., 1fur. 154yds. Oxford has twice had a sequence of nine victories, 1861–69, and 1890–98, and in each case the balance was restored by Cambridge with the assistance of Oxford coaches. Cambridge has won nine times since 1920.

As it was in 1829, so to-day the University boat race is a match and is rowed under no rules. It is subject to conditions agreed on by the two presidents for the year, who also appoint the umpire. From the moment that the spin of the coin has decided which president shall have the choice of station, the race is put into the hands of the umpire and his decision has always been regarded as final and without appeal. The university boat clubs are composed of all the oarsmen who row in the inter-college races, that is to say that no oarsmen can represent his college unless he is first a member of the university club.

HENLEY ROYAL REGATTA

The reaches of the Thames at Henley are not only the most beautiful on the whole river but are the best adapted for boat-racing. From the earliest days, many important matches have been rowed there. In 1839 a meeting of "the landed gentry of the neighbourhood and the principal townspeople of Henley-on-Thames" was called in the town hall to establish an annual regatta. Subscriptions were raised and a cup of the value of 100 guineas, to be called the Grand Challenge Cup, was purchased, to be raced for annually by amateur crews in eight-oared boats. Another cup, called the Town Challenge Cup, for four-oared crews, the members of which resided within five miles of the town, was also to be competed for. The Grand Challenge Cup was won for the first time by Trinity college, Cambridge, who defeated Wadham college, Oxford, in their first heat, and the Oxford Etonian club (who had disposed of Brasenose college, Oxford) in the final. The Town Cup was won by a club called "The Wave" whilst there was also a pair-oared race for London watermen for a purse put up by "the Leander gentlemen," which was won by H. Campbell and J. Phelps, whose name is still famous on the tideway.

In 1841 "The Stewards Cup" was presented for four-oared boats under similar qualifications as the Grand Challenge Cup. The Ladies Challenge Plate was instituted in 1845 (though not so named until 1846), for eight-oared crews, but the qualification for entry was somewhat difficult of interpretation and led to several controversies. In 1857 the qualification was amended. There are now eight races and besides the Grand, the Stewards and the Ladies' Plate there are:—The Thames Cup for eight-oars, originally instituted in 1868, for which the qualification now is the same as for the Grand Challenge Cup, but previous winners of the latter or the Stewards Cup races, or those entered for these races in the same regatta are barred; the Visitors Challenge Cup for fours (given by the Stewards in 1847) with a similar qualification to that of the Ladies' Plate; the Wyfold Challenge Cup (presented by Mr. Donkin of Wyfold Court also in 1847) for fours, with a qualification as for the Thames Challenge Cup. The Silver Goblets and Nickalls Challenge Cup, instituted as the Silver Wherries in 1845, for pair-oars, and the Diamond Sculls founded in 1844, both of which are open to amateurs of the world, complete the programme.

The original regatta course started from "just above Temple Island and finished at the Bridge." In 1840 it was dropped down stream a little and started level with the Temple in the Bucks channel and finished some 50 or 60yds. below the bridge, a distance of about 1m. 550yds. The long bend some 200yds. from the finish in favour of the Berkshire station made this course very unfair, for a boat on the Bucks side had to have a very commanding lead at "the Point" if it was to make certain of winning. In 1884 a proposal to cut away "the Point" was dropped, but in 1886 the whole course was shifted down stream so that it started below the tail of the island and finished at the Point, or, as is more commonly said, at the top of Phyllis Court wall. The distance remained about 1m.

550yds. It was also decided in that year that only two boats should contend in each heat. The course was piled and the regatta became a three-days' meeting.

Although there was agitation for a change in order to equalize the stations in the years immediately before the war, it was not until 1923 that the experiment of a straight course, starting on the Berkshire side of the island, was made. The narrowness of the river at this point necessitated the shortening of the course in this year to 1m. 440yds. So great was the success of the experiment that the Stewards, with the assistance of the Thames Conservancy and the landowners on both banks, decided to cut away the tow-path bank and part of the island to enable a straight course of the old length and of a width of 75ft. to be made. This course was used in the 1924 and ensuing regattas, and met with complete approval.

In the long history of the regatta there have been many memorable races. The most famous of these is perhaps the "seven-oar" victory of Oxford university over the Cambridge Subscription Rooms club in 1843. F. N. Menzies, the Oxford stroke, was taken so ill just before the final that it was impossible for him to row. Their opponents were asked to allow a substitute to row in his place, but the stringent rule passed after the previous regatta made it impossible for this privilege to be granted. Oxford re-organized their crew, putting G. E. Hughes stroke, and, rowing without a bow oar, led away from the start and won by a length. The year 1853 saw a marvellous race between Oxford and Cambridge in the Grand Challenge Cup. Cambridge led nearly all the way and at the Point had ½ of a length in hand. From this point, however, Oxford had the bend in their favour and, creeping up gradually, won by 18in. In 1862 W. B. Woodgate sculled a dead heat with E. D. Brickwood, the wind being against the latter and the station against the former, but in the "row off" Brickwood won with considerable ease. W. B. Woodgate's name is, however, more famous in connection with the regatta by his introduction of the art of coxswainless four-oared rowing. Rowing in the Brasenose college four, in 1868, he made it known that he intended to race without a coxswain. The Stewards passed a rule that no boat should compete without a coxswain and that no steering apparatus would be allowed. The crew, therefore, embarked a coxswain, but directly the word was given, he jumped overboard. Relieved of his weight the Brasenose crew went ahead fast and came in first, only to be disqualified. But the direct consequence was the establishment in 1869 of an extra race for coxswainless fours in addition to the Stewards Cup, and in 1873, although there had been no further contest without coxswains, the Stewards Cup was made a coxswainless race.

The splendid Leander crew of 1891 marked the definite re-establishment of the club at the head of the rowing world, but now a club with a university qualification, rather than a metropolitan one as in the old days. In the first round they rowed a dead-heat with Thames who led almost to the winning post, but next day in the re-row they won easily under faster conditions and in the final made the record which, though equalled, still stands. During the next 15 years they won the Cup 12 times, their failure on one occasion, 1895, being due to the fact that in their heat against Cornell they never started, owing to a misunderstanding with the umpire, and Cornell rowed over. It was satisfactory to British prestige, however, that Cornell met their superior in Trinity Hall on the following day. In 1897, Leander lost to New College by 2ft. in equal record time. They were beaten by a very fine Third Trinity crew in 1902, but for all the other years from 1891 to 1905 they were invincible. In 1906, however, it was found impossible to put on a Leander crew, and many trace the acceleration of the decline of English rowing to this fact. In that year the Grand Challenge Cup for the first time left England, being taken away by the Sport Nautique de Gand to Belgium. The Belgians again took the Cup in 1907, defeating Leander by ½ of a length after a very fine race in the second round. In 1908, owing to the Olympic games being held in England, the Royal regatta was closed to foreign crews, but in the Olympic regatta, which was held later on in the month on the Henley course, lengthened to 1½m., a very fine Leander crew, composed mainly of veterans, after serious training, defeated the Belgians by two lengths.

In 1912 both the Grand and the Thames Cups were lost by England, the former being won by a very fine Australian crew from Sydney, N.S.W., whilst a French club took the latter. Leander, however, after further training, gained their revenge over the Australians at the subsequent Olympic regatta, held at Stockholm, where they beat all nations. In 1913 Leander once more won the Grand, but in 1914, a few weeks before the World War commenced, England had the humiliation of seeing two crews from America fight out the final. In 1919 a special "Peace regatta" with Navy and Army qualifications was held, in which the Australians carried off the chief prize. The Henley regatta itself was held again in 1920, since when the gradual revival of rowing on metropolitan waters has been the most marked feature of the regatta. Thames R.C. won the Grand Challenge Cup in 1923, and again in 1927, fighting out the final with the London R.C. crew, a thing which had not been seen for exactly 50 years, when metropolitan rowing was at its height. Up to and including 1927 there have been 84 meetings, and the Grand Challenge Cup has been won by university and college crews 37 times, Leander 20, metropolitan clubs 21 (London R.C. 12, Thames R.C. 7 and Kingston R.C. 2), Royal Chester once. On five occasions it has gone abroad, three times to Belgium, once to Australia, and once to the United States with a Boston crew of old Harvard oarsmen.

The Henley Stewards are the senior body of the sport in England but in 1882 the Amateur Rowing Association was formed to control the sport throughout the country. Its objects are defined as follows:—(1) To maintain the standard of amateur oarsmanship as recognized by the universities and principal boat clubs of the United Kingdom. (2) To promote the interests of boat racing generally. The Association consists of clubs which adopt the following definitions of an amateur, viz.:—No person shall be considered an amateur oarsman, sculler or coxswain:—(1) Who has ever rowed or steered in any race for a stake, money or entrance fee. (2) Who has ever knowingly rowed or steered with or against a professional for any prize. (3) Who has ever taught, pursued or assisted in the practice of athletic exercises of any kind for profit. (4) Who has ever been employed in or about boats, or in manual labour, for money or wages. (5) Who is or has been by trade or employment for wages a mechanic, artisan or labourer, or engaged in any menial duty. (6) Who is disqualified as an amateur in any other branch of sport.

The A.R.A. also laid down "The Laws of Boat Racing" and "Rules for Regattas," under which a large number of annual regattas are held on the Thames and provincial rivers. There was also established, in 1890, the National Amateur Rowing Association with an amateur definition in many ways as strict as the foregoing but omitting clauses 5 and 6. The N.A.R.A. has three main branches—the Lea, the Thames and the Midland—to which a large number of clubs are affiliated. The A.R.A. does not concern itself with the amateur status of foreign crews, who may wish to compete in this country, but the Henley Stewards have strict rules on the subject.

ROWING IN AUSTRALIA

Rowing, as a sport, began in Tasmania about 1830, when races were held in "short" (25ft.) fixed-seat fours. A race, of historical interest only, is still held annually in similar boats. On the mainland rowing became popular in the sixties and by 1880 eight-oared races between crews representing the various States had become annual fixtures. Limited at first to Tasmania, New South Wales and Victoria, this contest is now the most important event in the oarsman's almanac. Regularly attracting a crew from each State it is held alternately in the six capital cities.

Inter-university rowing originated in 1870 when a four-oared race was held between Melbourne and Sydney. It was repeated in the next year, but subsequently lapsed until 1888 when the first eight-oared race between Melbourne, Sydney and Adelaide took place. Omitting the war period this race has been held each year since that date. In 1893 university rowing received a great impetus when a number of Old Blues from Oxford and Cambridge presented the magnificent "Oxford and Cambridge Cup," to be con-

tested for annually by the three original universities, and others which may enter later. Queensland (1920), Tasmania (1924) and Western Australia (1927), have since joined in, and like the inter-state contest, the inter-university race is now between six crews and is rowed in each capital city in rotation. In the inter-state and inter-university races the crews row abreast over a three-mile course. Public school rowing flourishes chiefly in Melbourne and Sydney, where six and eight crews, respectively, race annually for the "Headship" of the river.

The great distances involved in travelling, to a large extent, kept Australia out of International contests. A Sydney Rowing club crew won the Grand at Henley-on-Thames in 1912, and was defeated in the final at the Olympic games in the same year, the Australian Army crew won the King's Cup at the Peace regatta (Henley, 1919) and this cup now constitutes the trophy for the annual inter-state race. In sculling, Australia has produced many world's champions. (G. C. D.)

THE UNITED STATES

The first race held in the United States was in 1811 between two barges, the "Knickerbocker" of New York and the "Invincible" of Long Island. The "Knickerbocker" proved to be the winner. It was from this humble start that rowing, after passing through many changes, reached its present magnitude. The interest in this race, presumably due to many side bets, was so great that it was not long before there were several rowing clubs formed in and around New York city. Finding the barge type of boat inadequate, shells were built. In 1834 a great number of these clubs amalgamated and became known as The Castle Garden Boat Club Association. The first race sponsored by this group was held at Poughkeepsie, N.Y., in 1837 and was for "six-oared" boats.

It was not long before the universities recognized the importance of rowing as a sport and in 1844 Yale purchased a "six-oar." Harvard followed suit the next spring but bought an "eight." In 1852 the first race between college crews was held on Lake Winnepesaukee, N.H. Yale entered three crews and Harvard one. This race resulted in a victory for Harvard. The next regatta, which took place in 1859, was for "six oars," Harvard again defeating Yale. The following day they both raced again and for a prize. This race was at the Worcester city regatta, and Yale turned the tables. Yale again prevailed over Harvard in 1864, but in 1866 Harvard came back and with a very fine crew won easily. Rowing at Harvard had progressed to such a degree that in 1869 she sent a challenge to Oxford and Cambridge to row a four-oared race on the Thames from Putney to Mortlake. Oxford accepted and on Aug. 27 the two crews matched blades. The thoughts of an American crew invading the sanctuary of British rowing caused much excitement, and the banks of the river were crowded with enthusiastic devotees. Harvard got away to a fine start and things began to look rather dark for the Oxonians; however, with their fine rowing background and superior knowledge, the Dark Blues overcame Harvard's lead and finished three lengths ahead.

This trip to England of Harvard's crew undoubtedly gave further impetus to rowing in the United States, Cornell, Princeton, Columbia and Pennsylvania adding it to their athletic activities. The first race in which a number of universities met and which possibly presaged the Poughkeepsie regatta was held in 1875 and included not less than 13 college crews. Cornell finished first, Columbia second and Harvard third. The first record of a college eight-oared race in the United States dates back to 1876 when Yale and Harvard tested their strength for a distance of four miles. In 1878 Columbia sent a four to England and won the race at Henley, bringing the Visitors' Challenge Cup to America. From 1878 to 1881 there were several inter-collegiate races and in 1881 Cornell sent a four-oared crew to Henley, but they were beaten.

At this time in the rowing history of the United States, Cornell forged to the front as the outstanding crew. Winning most of her races in America she decided to make another try for laurels at Henley and in 1895 put a crew on the Thames. In the first heat Leander was left at the post, due to a misunderstanding; the next day, however, Cornell suffered defeat at the hands of Trinity hall. Bob Cook, the grand old man of Yale rowing, was the next to invade Henley; but Yale lost to Leander. In 1895 an inter-collegiate rowing association was formed by Cornell, Columbia and Pennsylvania. This was the beginning of the Poughkeepsie regatta.

Rowing was established on the Pacific coast in 1899. The first race was held on Lake Washington in 1903 with California as Washington's opponent. The crews were fours and California won by about three lengths. California followed this victory with another over the James Bay Rowing club of Victoria, B.C. The next inter-collegiate regatta was to be a triangular affair held on the Oakland estuary, California. Three crews were entered, Washington, Stanford and California. For some reason Washington withdrew and the California four defeated Stanford; then a few days later raced Washington, adding another victory. The following year the race was repeated. Washington lost to California, but a few days later defeated Stanford. These four-oared races continued until 1906, the Golden Bears (California) winning without a challenge. In 1906 the San Francisco earthquake caused a cessation of rowing in the State, but in 1907 eight-oared crews appeared on the water at Lake Washington. The race was with California but the water was so rough that both shells swamped in the middle of the course. In 1910 Washington raced Wisconsin on Lake Mendota but was defeated. From 1912 until 1921 the Huskies (Washington) won all their races excepting in 1915 when Stanford was the victor. Washington went to Poughkeepsie in 1913 and 1914, finishing third and fifth respectively.

Rowing soon found its way to the preparatory and high schools which were fortunate enough to have a good body of water on which to row. St. Paul's, Exeter, Groton, St. Mark's, Kent, Choate and New Rochelle are among the better known schools which have added rowing to their athletic curriculum. St. Paul's followed the example of Oxford and Cambridge in that the school has been divided into several sections and each one has its own crew. In 1927 Kent defeated all comers, including the Columbia freshmen, and then went over to England to participate in the Henley for school crews. Their first two races were practice races with a crew from Brasenose college and the Leander club eight. Kent won the first by five lengths but lost to Leander by the matter of a few feet. This last race was remarkable in that Leander has always been known as one of the leading crews of England. Kent then went to the mark for the Thames Challenge Cup, a race in which there were 28 crews entered. The second crew of the Thames Rowing club was selected to race with Kent in the first heat. After a gruelling race, Thames triumphed by a quarter of a length. Kent's last race was with Radley, Kent winning by about five lengths.

The desire of college athletes to keep on with rowing after graduation has been met by rowing clubs all over the United States. Philadelphia has become the Henley of America and one can find the Schuylkill river lined with well equipped boat-houses where all manner of rowing is practised, from the eight down to the single-sculls A duplicate of the English Henley, called the American Henley, is held there every year in the latter part of May. Another famous centre of rowing in the United States is Duluth, Minn. Out on the Pacific coast there are two well-established rowing clubs, the Olympic club of San Francisco and the Portland Rowing club of Portland. At Philadelphia some of these clubs are old and consequently rich in rowing tradition and history.

The United States reached the pinnacle of the rowing world when the crew from the Naval academy went over to the Olympic Games (1920) and defeated a fine Leander crew by a narrow margin to win the Olympic championship. The following year Princeton sprang a surprise by winning against this crew in a short race. The year 1922 heralded the Pacific coast as a factor in American rowing. The University of Washington, after defeating the University of California by over 12 lengths, accepted the invitation of the Inter-collegiate Rowing Association to row in the Poughkeepsie regatta. On their way East they stopped off at the University of Wisconsin and defeated the crew of that institution by eight lengths. At Poughkeepsie the University of Washington finished second, forcing the Navy to smash the course record to

win. This race is still talked of as the most exciting one that has ever been witnessed on the Hudson. The following year the Navy finished second to Washington. In 1924 Washington won again and in 1925 Navy took first, these last two races being four miles. In 1926 Washington was the victor and in 1927 Columbia, with a crew made up mostly of sophomores, was the winner.

The great showing of the Washington crew of 1922 caused E. O. Leader, its coach, to become the head coach of Yale. This started the exodus of oarsmen from the University of Washington to other colleges as their coaches. Mr. Leader brought Yale up from a perpetual last place entry to a straight winner for the next four years. Yale represented the United States at the Olympic Games and won the championship. In 1927 Princeton was again destined to furnish a surprise by winning over Yale on Lake Carnegie. Harvard also defeated Yale on the Thames, thus breaking a six-year winning streak. (E. O. Le.)

SCULLING

A scull is a lever of the same nature as the oar, but smaller in all dimensions, enabling the user to hold one in each hand and so apply his power on both sides of the boat at one and the same time. "Sculling" is, therefore, the propulsion of a boat by one person with a pair of sculls.

In the early days of the 19th century sculling was a popular form of racing. In 1830 the Wingfield Sculls were founded. They carry the title of Amateur Champion of the Thames and are open to any amateur sculler of the United Kingdom of Great Britain and Ireland. They have their own constitution and are managed by a committee of past winners of the race. The first winner was J. H. Bayford, over the original course from Westminster to Putney. From 1849 to 1861 the course was from Putney to Kew, since when the race has been rowed on the Championship course from Putney to Mortlake.

The first professional championship was rowed in 1831 from Westminster to Hammersmith, C. Campbell defeating J. Williams. The Championship left England in 1876 when E. Trickett, of New South Wales, beat J. H. Sadler, and did not return until R. Arnst of New Zealand, in order to get a match, consented to race Ernest Barry on the Thames in 1912 and was beaten by him. Barry lost in 1919 to A. Felton, the Australian, but defeated him on the Parramatta river in 1920, and then resigned his title, since when it has been held by scullers from the Antipodes. In 1928 Major Goodsell, N.S.W., the holder was beaten by H. A. Barry.

The Diamond Sculls, instituted at Henley regatta in 1844, are the chief prize open to amateurs, and were first won by T. B. Bumpsted. Since 1872 many foreign aspirants have entered and England has lost them on seven occasions. In 1892, J. J. K. Ooms, of Amsterdam, won them, at his first and only attempt, with considerable ease. In 1897 Ten Eyck, of Worcester, U.S.A. won them, but in the following year his entry was refused owing to the fact that he had lost his amateur status. In 1904, L. F. Scholes of Toronto won them, beating, among others, F. S. Kelly, an Australian by birth, the greatest sculler who has yet been seen on the Henley course. Kelly was, however, also rowing in the Leander crew which won the Grand Challenge Cup and it was doubtless owing to this fact that he was beaten. In 1905, confining himself to sculling, he made the record for the course of 8min. 10sec., which still stands. In 1913 and '14, 1921 and '22, the trophy was won by C. McVilly, of Tasmania, G. Sinigaglia, of Italy, F. E. Eyken, of Delft university and W. M. Hoover, of the U.S.A. respectively. In the year 1927, the Diamond Sculls nearly fell to J. Wright, a young Canadian, of the Argonaut club of Toronto. He defeated T. D. A. Collett, the best English sculler of the year after a very hard race in the first heat, and was leading R. T. Lee, of Worcester college, Oxford, a few lengths from the finish, when he hit the booms, and before he was clear Lee had won the race. J. Wright, Canada won in 1928.

See the volumes on *Rowing* in the Badminton and Isthmian libraries; W. E. Sherwood, *Oxford Rowing* (1900); W. B. Woodgate, *Oars and Sculls* (1889); H. T. Steward, *Henley Royal Regatta* (1903); Sir Theodore Cook, *Racing at Henley* (1911); G. C. Bourne, *A Textbook on Oarsmanship* (1925); S. Fairbairn, *Notes on Rowing* (1926). (G. C. D.)

ROWLAND, HENRY AUGUSTUS (1848–1901), American physicist, was born at Honesdale, Pa., on Nov. 27, 1848. He graduated as a civil engineer at Rensselaer Polytechnic institute at Troy in 1870, and two years later returned there as instructor in physics, becoming assistant professor in 1877. While at Troy he made investigations on magnetic induction, permeability and distribution, which established fundamental results. In 1875 he was chosen to occupy the chair of physics in the newly-founded Johns Hopkins university, a position which he held until his death, at Baltimore, on April 16, 1901. Before beginning his work at Johns Hopkins he went to Europe, to visit the various physics research centres of the Continent, and to purchase laboratory apparatus. He studied under Helmholtz in Berlin, where he carried out experiments proving that an electrostatic charge carried at a high rate of speed had the same magnetic action as an electric current. At Johns Hopkins he carried on a long series of experiments in which he computed the accepted value of the mechanical equivalent of heat, experiments which necessitated more careful thermometric and calorimetric methods than had ever been used before. Similar refined apparatus and technique enabled him to make a more nearly accurate determination of the value of the ohm, than had been calculated before. Becoming interested in the study of spectrum analysis, he realized the importance of securing more accurate diffraction gratings, and to this end constructed a dividing engine which allowed from 14,000 to 20,000 grating lines to be ruled to the inch on a plane surface of either glass or speculum metal. He next investigated the action of a grating ruled on a spherical concave surface, and, discovering the advantages, proceeded to rule them. These gratings came to be used in physics laboratories the world over, and the modern study of spectroscopy as an exact science dates from this work. With these gratings Rowland studied and photographically mapped the solar spectrum for the first time. He then undertook the systematic study of the arc-spectra of all the elements so far as possible, and published his results between 1895 and 1900. In his last years he became interested in alternating currents and their practical application to motors, measuring instruments, etc. He devised a system of multiplex telegraphy depending upon synchronous motors which received a grand medal at the Paris Exposition of 1900. He was the recipient of many honours, including the Rumford and Draper medals.

See H. A. Rowland, *Physical Papers* (1902), which contains a bibliography of his writings.

ROWLANDSON, THOMAS (1756–1827), English caricaturist, was born in Old Jewry, London, in July 1756, the son of a tradesman or city merchant. On leaving school he became a student in the Royal Academy, but at the age of 16 he went to study in Paris, and afterwards made frequent tours on the Continent. In 1775 he exhibited at the Royal Academy a drawing of "Delilah visiting Samson in Prison." He took to drawing caricatures as a means of livelihood. His Academy drawing of Vauxhall (1784) had been engraved by Pollard, and the print was a success. Rowlandson was largely employed by Rudolph Ackermann, the art publisher, who in 1809–11 issued in his *Poetical Magazine* "The Schoolmaster's Tour"—a series of plates with verses by Dr. William Coombe which became very popular. Again engraved by Rowlandson himself in 1812, and issued under the title of the "Tour of Dr. Syntax in Search of the Picturesque," they had reached a fifth edition by 1813, and were followed (1820) by "Dr. Syntax in Search of Consolation," and (1821) by the "Third Tour of Dr. Syntax in Search of a Wife." The same collaboration of designer, author and publisher resulted in the English "Dance of Death" (1814–16), and the "Dance of Life" (1822). Rowlandson also illustrated Smollett, Goldsmith and Sterne. Other designs are in *The Spirit of the Public Journals* (1825), *The English Spy* (1825), and *The Humourist* (1831). He died in London on April 22, 1827.

Rowlandson's designs were usually executed in outline with the reed-pen, and delicately washed with colour. They were then etched by the artist on the copper, and afterwards aqua-tinted—usually by a professional engraver, the impressions being finally coloured by hand. As a designer the quality of his work suffered from haste and over-production.

See J. Grego, *Rowlandson the Caricaturist, a Selection from his Works*, etc. (2 vols., 1880).

ROWLEY, WILLIAM (*c.* 1585–*c.* 1642), English actor and dramatist, collaborator with several of the dramatists of the Elizabethan period, especially with Thomas Middleton (*q.v.*). He is not to be identified with the "Master Rowley," whom Francis Meres described in his *Palladis Tamia*. William Rowley is described as the chief comedian in the Prince of Wales's company. He joined the King's Servants in 1623, and retired from the stage about four years later. He is supposed to have died about 1642. The following plays attributed to his sole authorship are extant: *A new Wonder, A Woman never Vext* (printed, 1632); *A Match at Midnight* (1633); and a *Shoomaker a Gentleman with the Life and Death of the Cripple that stole the Weathercock at Paules* (1637). They are distinguished by effectiveness of situation and ingenuity of plot. It is recorded by Langbaine that he "was beloved of those great men Shakespeare, Fletcher and Jonson." With George Wilkins and John Day he wrote *The Travailes of the Three English Brothers* (1607); with Thomas Heywood he produced *Fortune by Land and Sea* (printed, 1655); he was associated with Thomas Dekker and John Ford in *The Witch of Edmonton* (printed, 1658); *A Cure for a Cuckold* (printed, 1661) and *The Thracian Wonder* (printed, 1661) are assigned to the joint authorship of Webster and Rowley; while Shakespeare's name was unjustifiably coupled with his on the title-page of *The Birth of Merlin: or, The Childe hath found his Father* (1662). Rowley also wrote an elegy on Hugh Attwell, the actor, and a satirical pamphlet describing contemporary London, entitled *A Search for Money* (1609).

SAMUEL ROWLEY, the dramatist, described without apparent reason by J. P. Collier as William Rowley's brother, was employed by Henslowe as a reader of plays. He wrote some scriptural plays now lost, with William Borne (or Bird, or Boyle) and Edward Juby. His only extant pieces are: *When you see me, You know me, Or the famous Chronicle Historie of King Henry the eighth, with the birth and vertuous life of Edward Prince of Wales* (1605), of interest because of its possible connection with the Shakespearian play of *Henry VIII.*, and *The Noble Souldier, Or, A Contract Broken, justly reveng'd* (1634), which was entered, however, in the Stationers' Register as the work of Thomas Dekker, to whom the major share is probably assignable.

ROWLEY REGIS, urban district, Kingswinford parliamentary division, Staffordshire, England, on the G.W. railway, 7 m. W. of Birmingham. Pop. (1921) 40,025. It lies in a hilly district rich in coal and iron, while a hard basaltic intrusion known as Rowley rag is largely quarried for road metal.

ROWLOCK (pronounced *rullock* or *rollock*), a device, on the gunwale of a boat, in or on which an oar rests, forming a fulcrum for the oar in rowing. The word is a corruption due to "row" of the earlier "oar-lock," O.E. *ārlōc*, a lock or enclosed place for an oar. The simplest form of rowlock is a notch, square or rounded, on the gunwale, in which the oar rests; other kinds are formed by two pins or pegs, "thole pins" (thole being ultimately the same word as Norw. *toll*, a young fir-tree), and by a swivel with two horns of metal, pivoted in the gunwale or on an outrigger. (*See* OAR.)

ROWNO, a town of Poland, in the province of Volhynia, situated on a tributary of the Goryn. Pop. (1921), 30,400. Though it never had the political importance of Luck or Ostrog, Rowno has grown to be a larger town than either of these. It is an important railway junction, the centre of an agricultural district, near the Volhynian forests and in a region famous for its horses and cattle. It is on the famous route west from Kiev along which many Russian conquerors, Tatar raiders and foreign armies have passed. It is first mentioned in 1282, and formerly possessed a royal palace. It has a large Jewish population.

ROWTON, MONTAGUE WILLIAM LOWRY-CORRY, BARON (1838–1903), son of the Right Hon. Henry Corry and Harriet, daughter of the 6th earl of Shaftesbury, was born in London on Oct. 8, 1838, educated at Harrow and at Trinity college, Cambridge, and called to the bar in 1863. His father, a son of the 2nd earl of Belmore, represented County Tyrone in parliament continuously from 1826–1873, and was a member of Lord Derby's cabinet (1866–68) as vice-president of the council and afterwards as first lord of the Admiralty. In 1866 he became private secretary to Disraeli, with whom he maintained intimate relations until the statesman's death in 1881. When Disraeli resigned office in 1868 Corry declined various offers of public employment in order to be free to continue his services, now given gratuitously, to the Conservative leader; and when the latter returned to power in 1874, Corry resumed his position as official private secretary to the prime minister. He accompanied Disraeli (then earl of Beaconsfield) to the congress of Berlin in 1878, where he acted as one of the secretaries of the special embassy of Great Britain. On the defeat of the Conservatives in 1880, Corry was raised to the peerage with the title of Baron Rowton, of Rowton Castle, Shropshire. After Beaconsfield's removal to the House of Lords, Rowton assisted him in keeping in touch with the rank and file of the party, and on Beaconsfield's death he was put in charge of his correspondence and papers.

Lord Rowton will long be remembered as the originator of the scheme known as the Rowton houses. Consulted by Sir Edward Guinness (afterwards Lord Iveagh) with regard to the latter's projected gift of £200,000 for endowment of a trust for the improvement of the dwellings of the working classes, Rowton made himself personally familiar with the conditions of the poorest inhabitants of London; and determined to establish "a poor man's hotel," which should offer better accommodation than the common lodging-houses, at similar prices. The first Rowton House was opened at Vauxhall in Dec. 1892, the cost (£30,000) being defrayed by Lord Rowton and it proved so successful that in 1894 a company, Rowton Houses (Limited), was incorporated to extend the scheme which was subsequently imitated throughout Great Britain, Europe and America. (*See* HOUSING.) Lord Rowton also devoted himself to the business of the Guinness Trust, of which he was a trustee. As he was unmarried the title became extinct on Lord Rowton's death on Nov. 9, 1903, at London.

See *Reports of the Rowton Houses, Ltd.*, 1895–1903; E. R. Dewsnup, *The Housing Problem in England* (1907); R. H. Vebch, *General Sir Andrew Clarke* (1905).

ROXANA or **ROXANE,** daughter of the Bactrian king Oxyartes, and wife of Alexander the Great. After the latter's death she gave birth at Babylon to a son (Alexander IV.), who was accepted by the generals as joint-king with Arrhidaeus. Having crossed over to Macedonia, and thrown in her lot with Olympias, mother of Alexander the Great, she was imprisoned by Cassander in the fortress of Amphipolis and put to death (310 or 309 B.C.). The marriage of Alexander and Roxana was the subject of a famous painting by Aëtion.

See Plutarch, *Alexander*, 47, 77; Arrian, *Anab.* iv. 18, vii. 27; Diod. Sic. xviii. 3, 38, xix. 11, 52, 105; Strabo xi. p. 517, xvii. p. 794.

ROXBURGHE, EARLS AND DUKES OF. ROBERT KER, 1st earl of Roxburghe (*c.* 1570–1650), was the eldest son of William Ker of Cessford (d. 1606) and the grandson of Sir Walter Ker (d. *c.* 1584), who fought against Mary queen of Scots both at Carberry Hill and at Langside. He was descended from Sir Andrew Ker of Cessford (d. 1526) who fought at Flodden and was killed near Melrose in Jan. 1526 by the Scotts of Buccleuch. After a turbulent life on the border Robert Ker became a Scottish privy councillor in 1599 and was made Lord Roxburghe about the same time; he accompanied King James to London in 1603, and was created earl of Roxburghe in 1616. He was lord privy seal for Scotland from 1637 to 1649, and in the Scottish parliament he showed his sympathy with Charles I.; but he took no part in the Civil War, although he signed the "engagement" for the king's release in 1648. His titles and estates passed by special arrangement to his grandson, WILLIAM DRUMMOND (d. 1675), the youngest son of his daughter Jean and her husband John Drummond, 2nd earl of Perth. William took the name of Ker, became 2nd earl of Roxburghe, and married his cousin Lord Ker's daughter Jean.

JOHN, 5th earl and 1st duke of Roxburghe (*c.* 1680–1741), received the dukedom in 1707 for his services in connection with the Union. This was the last creation in the Scottish peerage.

The duke was a representative peer for Scotland in four parliaments; George I. made him a privy councillor and keeper of the privy seal of Scotland, and he was loyal to the king during the Jacobite rising in 1715. He was again a secretary of State from 1716 to 1725.

His grandson JOHN, 3rd duke of Roxburghe (1740–1804), was a famous bibliophile. The duke's library, including a unique collection of books from Caxton's press, and three rare volumes of broadside ballads, was sold in 1812, when the Roxburghe Club was founded to commemorate the sale of Valdarfer's edition of Boccaccio. Roxburghe's cousin William, 7th Lord Bellenden (*c.* 1728–1805), who succeeded to the Scottish titles and estates, died childless in October 1805, and for seven years the titles were dormant.

Then in 1812 SIR JAMES INNES, Bart. (1736–1823), a descendant of the 1st earl, established his claim to them, and taking the name of Innes-Ker, became 5th duke of Roxburghe. In his family the dukedom remained. Its holder has a seat in the House of Lords as Earl Innes in the peerage of the United Kingdom.

ROXBURGHSHIRE, border county, Scotland, bounded west by Berwickshire, east and south-east by Northumberland, south by Cumberland, south-west by Dumfriesshire and north-west by Selkirkshire and Midlothian. It has an area of 426,028 ac. (excluding water). The only low ground is in the north and in the valleys of the larger rivers, and the whole of the south is markedly hilly, though the Cheviots, forming for a considerable distance the natural boundary with England, mostly belong to Northumberland. The Tweed flows through the north of the shire for 26 out of its total run of 97 m., though for about 2 m. (near Abbotsford) it is the boundary stream with Selkirkshire, and for 10 m. lower down with Berwickshire. On the right its affluents are the Bowden and the Teviot, and on the left the Allan and the Eden. The Teviot is the principal river entirely in Roxburghshire. From its source near Causeway Grain Head on the Dumfriesshire border, it follows mainly a north-easterly direction of 37 m. to its confluence with the Tweed at Kelso. The Liddel is the main stream in the S. Rising near Peel Fell in the Cheviots it flows south-west to the Esk after a course of 27 m., receiving on the right Hermitage Water, on the left Kershope Burn. The Kershope and Liddel, during part of their run, serve as boundaries with Cumberland. Excepting the Liddel, which drains to the Esk, much the greater portion of the surface is drained, by the Tweed, to the North Sea. Teviotdale, Liddesdale, Tweedside and Jedvale are the principal valleys. The county contains a considerable range of sedimentary rocks from the Ordovician to the Carboniferous systems, and with these are associated large tracts of volcanic rocks. The Ordovician and Silurian rocks occupy the N.W. and W. part of the county. Two divisions of the Old Red Sandstone occur; the lower is confined to the Cheviots; the strata are unconformable upon the upturned Silurian beds. The upper division, which in its turn is unconformable upon the lower, occupies about one-third of the county, being well developed in the north, where volcanic rocks come in. Carboniferous rocks are represented by the Calciferous sandstone series in the south-west in Liddesdale and on the uplands of Carter Fell, etc. An interesting series of volcanic "necks" belonging to the Carboniferous period is exemplified in Dunain Law, Black Law, Maiden Paps, Ruberslaw and other hills. Glacial deposits are represented by boulder clay and beds of sand and gravel.

Agriculture and Industries.—The soil is chiefly loam in the level tracts along the banks of the larger streams, where it is also very fertile. In other districts a mixture of clay and gravel is mostly found, but there is besides a considerable extent of mossy land. Of the area under grain about three-quarters are occupied by oats, the remainder being principally barley. Among green crops turnips and swedes are most generally cultivated, potatoes covering a comparatively small acreage. In different parts of Tweedside and Jedvale several kinds of fruit are successfully grown. Both in the pastoral and arable localities agriculture is in an advanced condition. The hill country is everywhere covered with a thick green pasturage admirably suited for sheep, which occupy the walks in large quantities. The herds of cattle are also heavy, horses are kept mostly for farming operations, and pigs are raised in moderate numbers. About ⅓ of the holdings are large, the average being 150 acres. Many districts on the Tweed and Teviot are beautifully wooded.

The county is a principal seat of the tweed and hosiery manufactures in Scotland. Ironfounding and dyeing are also carried on at Hawick and tanning at Jedburgh, and agricultural implements, chemical manures and fishing tackle are made at Kelso. The salmon fisheries on the Tweed are of considerable value.

The Waverley route of the L.N.E. railway runs through the county from near Melrose in the north to Kershopefoot in the south. At St. Boswells branches are sent off to Duns and Reston, and to Jedburgh and Kelso via Roxburgh. There is also a line from Berwick to Kelso, via Coldstream and Carham.

Population and Administration.—The population in 1921 was 44,989, and there were 95 persons who spoke Gaelic and English, but none Gaelic only. The principal towns are Hawick (pop. 16,353), Kelso (3,527), Jedburgh (2,426), Melrose (2,155). The county returns a member to parliament with Selkirkshire. Jedburgh, the county town, is a royal burgh, and Hawick, Kelso and Melrose are police burghs. The shires of Roxburgh, Berwick and Selkirk form a sheriffdom, and a resident sheriff-substitute sits at Jedburgh and Hawick. The county is under school-board jurisdiction, and there are secondary schools at Hawick and Jedburgh.

History and Antiquities.—Among the more important remains of the original inhabitants are the standing stones and circles at Plenderleath between the Kale and Oxnam; on Hownam Steeple, a few miles to the north-west; and at Midshiels on the Teviot. The stones on Ninestane Rig, near Hermitage Castle, and on Whisgill are supposed to commemorate the Britons of Strathclyde who, under Aidan, were defeated with great slaughter by Ethelfrith, king of Bernicia, at the battle of Degsanstane or Dawstane in 603. There are hill forts in Liddesdale on the Allan, in the parish of Oxnam, and on the most easterly of the three Eildons. This last is said to be the largest example of its kind in Scotland. One of the most important and most mysterious of British remains is the Catrail, or Picts' Work Dyke. In its original condition it is supposed to have consisted of a line of double mounds or ramparts, with an intervening ditch 6 ft. broad. It is now far from perfect and in places has disappeared for miles. Beginning at Torwoodlee, north-west of Galashiels, it ran south-west to Yarrow church, whence it turned first south and then south-east, following a meandering course to Peel Fell in the Cheviots, a distance of 48 miles.

Roman remains are also of interest. Dere Street crossed the border north of Brownhart Law in the Cheviots, then took a mainly north-western direction across the Kale, Oxnam, Jed and Teviot to Newstead, near Melrose, where it is conjectured to have crossed the Tweed and run up Lauderdale into Haddingtonshire. Another so-called Roman road is the Wheel Causeway or Causey, a supposed continuation of the Maiden Way which ran from Overburgh in Lancashire to Bewcastle in Cumberland, and so to the Border. It entered Roxburghshire north of Deadwater and went (roughly) north as far as Wolflee, whence its direction becomes a matter of surmise. Of Roman camps the principal appear to have been situated at Cappuck, to the south-east of Jedburgh, and near Newstead, at the base of the Eildons, the alleged site of *Trimontium*. After the retreat of the Romans the country was occupied by the Britons of Strathclyde in the west and the Bernicians in the east. It was then annexed to Northumbria for over four centuries until it was ceded, along with Lothian, to Scotland in 1018.

David I. constituted it a shire, its ancient county town of Roxburgh (*see* KELSO) forming one of the Court of Four Burghs. The castle of Roxburgh, after changing hands more than once, was captured from the English in 1460 and dismantled. Other towns were repeatedly burned down, and the abbeys of Dryburgh, Jedburgh, Kelso and Melrose ultimately ruined in the expedition of the earl of Hertford (the Protector Somerset) in 1544–45. The Border freebooters—of whom the Armstrongs and Elliots were the chief—conducted bloody frays on their own account.

On the union of the crowns the county gradually settled into what was comparatively a state of repose, disturbed to some extent during the Covenanting troubles and, to a much slighter degree, by the Jacobite rebellions.

ROXBURY, formerly a city of Norfolk county, Massachusetts, U.S.A., situated between Boston and Dorchester, but since 1868 a part of Boston. It is primarily a residential district. The town of Roxbury (at first usually spelled Rocksbury) was founded in 1630 by some of the Puritan immigrants who came with Governor John Winthrop; the settlers were led by William Pynchon, who in 1636 led a party from here and founded Springfield, Mass. At the home of Thomas Welde (d. 1662), the first minister, Anne Hutchinson (*q.v.*) was held in custody during the winter of 1637–38. Associated as teacher with Welde and his successors, Samuel Danforth and Nehemiah Walter, was John Eliot, the apostle to the Indians, who removed to Roxbury in 1632 and died here in 1690. Roxbury was the home also of Thomas Dudley, of his son Joseph and of his grandson Paul; of Robert Calef (d. 1719), the leader of the opposition to the witchcraft craze; of Gen. Joseph Warren, and of William Eustis (1753–1825), who was U.S. secretary of war (1809–12), and governor of Massachusetts (1823–25); and from 1837 to 1845 Theodore Parker was the pastor of the Unitarian church of West Roxbury. Of special interest in the old Roxbury burial-ground is the "Minister's Tomb," containing the remains of John Eliot, and the tomb of the Dudleys. West Roxbury was the scene of the Brook Farm experiment (*see* BROOK FARM).

See F. S. Drake, *The Town of Roxbury, its Memorable Persons and Places* (Boston, 1878 and 1905).

ROYAL AGRICULTURAL SOCIETY: *see* AGRICULTURAL SOCIETIES AND SHOWS.

ROYAL DUTCH OIL COMPANY. The Company was established in 1890 at The Hague (Netherlands) with a share capital of 1,300,000 guilders. Though the first years were difficult ones for the Royal Dutch Company it succeeded in keeping its footing, managed by Mr. J. B. Aug. Kessler who in December 1900 died, and was succeeded by Mr. H. W. A. Deterding, since 1920 Sir Henri W. A. Deterding, who has been managing the Company ever since.

With the new oil companies set up in the Netherlands Indies the Royal Dutch established relations.

In 1903 a selling company, the Asiatic Petroleum Company, was formed by the Royal Dutch and the companies with whom they had contracted, also in conjunction with the Mocara Enim, the Moesi Ilir, and the Nederlandsche Industrie and Handel Maatschappij, in co-operation with the Shell Transport and Trading Company, the Dordtsche Petroleum Maatschappij, and the principal Russian producers-exporters headed by the Soc. Comm. et Ind. de Naphte Caspienne et de la Mer Noire.

In 1907 an amalgamation was effected with the Shell Transport and Trading Company. Two new companies were formed, a Dutch one, De Bataafsche Petroleum Maatschappij, The Hague, for the winning and refining of oil and preparation of its products, and an English Company, The Anglo Saxon Petroleum Company, London, to attend to transport and storage. The "Royal Dutch" and "Shell" still retained their separate existence, but the possessions of both companies were combined under the two newly formed companies. The Royal Dutch and Shell shares in these concerns were 60% and 40% respectively.

The expansion of the Royal Dutch-Shell group was no longer confined to the Indies but it gradually succeeded in acquiring interests in nearly all producing centres of the world.

The statutory capital of the Royal Dutch was (1929) 600,000,000 guilders, the issued capital 527,123,600 guilders.

The crude oil production of the Royal Dutch-Shell group in 1928 amounted to 22,108,972 metric tons. (J. E. F. DE K.)

ROYAL FERN, in botany, the common name for the fern *Osmunda regalis*, native to Asia, Europe, including Great Britain, North America and Mexico, growing usually in bogs and marshy woods. It is a handsome plant with bi-pinnate fronds 2 to 6 ft. long and 1 ft. or more broad; the tops of the fronds are fertile, the fertile pinnae being cylindrical and densely covered with the spore-cases, giving the appearance of a dense panicle of flowers, whence the plant is known as the flowering fern. There are various cultivated forms—*O. cristata* has the ends of the fronds and the pinnae finely crested, and *O. corymbifera* has curiously forked and crested fronds. Several related species, among them *O. cinnamomea* and *O. Claytoniana*, natives of North America, are known in Great Britain as handsome greenhouse ferns.

ROYAL MAIL STEAM PACKET COMPANY. This British shipping company was incorporated in 1839, at a time when energetic efforts were being made to reform the postal services. (*See* HILL, SIR ROWLAND.) Representations were made from the West Indian colonies to the government, and in September, 1839, a charter of incorporation was granted to the Royal Mail Steam Packet company, which was formed, with a capital of £1,500,000. Fourteen "steam packets" were laid down, these being paddle steamers, fully equipped with sails, and on Jan. 1, 1842, the first vessel, named "Thames," left on her maiden voyage for the West Indies. The opening of 1846 found this service fully established; indeed, it proved so successful that an extension to the port of Colon was provided by steamers running once a month. In the same year, the company undertook further pioneer work by the establishment of a regular service of mules and canoes across the 50 miles of land that separated Colon from the Pacific side of the Isthmus of Panama. This proving inadequate, a railroad across the isthmus was completed in 1855 by the Panama Railroad company, to which the Royal Mail Steam Packet company lent considerable pecuniary assistance.

In 1850, a contract was concluded with the British government for the conveyance of the mails from the United Kingdom to Brazil. After the new Brazil service had been in operation for 19 years, the expansion of trade with South America necessitated the extension of the main service to the Argentine republic.

Since then the story of the company's South American service has been one of steady progress. The fleet has rapidly grown, each vessel constructed being larger than its predecessor, until in 1928 "Asturias" and "Alcantara" were Great Britain's largest motor liners. In the World War, 56 of the company's ships were requisitioned and 13 of them were sunk. The 29,237 tons owned by the company in 1839 had grown in 1928 to 373,527 tons, which figure includes the tonnage of the fleet of R.M.S.P. Meat Transports, Ltd. The fleets of the other companies affiliated with the Royal Mail Steam Packet company aggregated in 1928 2,328,426 gross registered tons, making a total of 2,701,953 tons. (L.C.M.)

ROYAL OAK, a residential village of Oakland county, Michigan, U.S.A., on Federal highway 10 and the Grand Trunk railway, 12 m. N.W. of Detroit. The population was 6,007 in 1920 (85% native white).

ROYAL PALM (*Oreodoxa regia*), a tropical American palm, extending northward to southern Florida, much planted as an ornamental, especially in avenues. (*See* PALM.)

ROYAL SOCIETY, THE, the oldest scientific society in Great Britain, and one of the oldest in Europe. The Royal Society (more fully, The Royal Society of London for Improving Natural Knowledge) is usually considered to have been founded in the year 1660, but a nucleus had in fact been in existence for some years before that date. As early as the year 1645 weekly meetings were held in London of "divers worthy persons, inquisitive into natural philosophy and other parts of human learning, and particularly of what hath been called the *New Philosophy* or *Experimental Philosophy*," and there can be little doubt that this gathering of philosophers is identical with the "Invisible College" of which Boyle speaks in sundry letters written in 1646 and 1647.

Some of these "Philosophers," resident in Oxford about 1648, formed an association there under the title of the Philosophical Society of Oxford, and used to meet, most usually in the rooms of Dr. Wilkins, warden of Wadham College. A close intercommunication was maintained between the Oxford and London Philosophers; but ultimately the activity of the society was concentrated in the London meetings, which were held principally at Gresham College.

On Nov. 28, 1660, the first journal book of the society was

opened with a "memorandum," from which the following is an extract: "Memorandum that Novemb. 28, 1660, These persons following, according to the usuall custom of most of them, mett together at Gresham Colledge to heare Mr. Wren's lecture, viz., The Lord Brouncker, Mr. Boyle, Mr. Bruce, Sir Robert Moray, Sir Paul Neile, Dr. Wilkins, Dr. Goddard, Dr. Petty, Mr. Ball, Mr. Rooke, Mr. Wren, Mr. Hill. And after the lecture was ended, they did, according to the usuall manner, withdrawe for mutuall converse. Where amongst other matters that were discoursed of, something was offered about a designe of founding a Colledge for the promoting of Physico-Mathematicall Experimentall Learning." It was agreed at this meeting that the company should continue to assemble on Wednesdays at three o'clock; an admission fee of ten schillings with a subscription of one schilling a week was instituted; Dr. Wilkins was appointed chairman; and a list of forty-one persons judged likely and fit to join the design was drawn up. On the following Wednesday Sir Robert Moray brought word that the king (Charles II.) approved the design of the meetings; a form of obligation was framed, and was signed by all the persons enumerated in the memorandum of Nov. 28 and by seventy-three others. On December 12, another meeting was held at which fifty-five was fixed as the number of the society—persons of the degree of baron, Fellows of the College of Physicians, and public professors of mathematics, physics and natural philosophy of both universities being supernumeraries.

Gresham College was now appointed to be the regular meeting-place of the society. Sir Robert Moray (or Murray) was chosen president (March 6, 1661), and continued from time to time to occupy the chair until the incorporation of the society, when Lord Brouncker was appointed the first president under the charter. In Oct. 1661 the king offered to be entered one of the society, and next year the society was incorporated under its present title. The name "Royal Society" appears to have been first applied to the Philosophers by John Evelyn, in the dedication of his translation of a book by Gabriel Naudé, published in 1661.

The charter of incorporation passed the Great Seal on July 15, 1662, to be modified, however, by a second charter in the following year, repeating the incorporating clauses of the first charter, but conferring further privileges on the society. The second charter passed the Great Seal on April 22, 1663, and was followed in 1669 by a third, confirming the powers granted by the second charter, with some modifications of detail, and granting certain lands in Chelsea to the society. The council of the Royal Society met for the first time on May 13, 1663.

At this early stage of its history the "correspondence" which was actively maintained with continental philosophers formed an important part of the society's labours, and selections from this correspondence furnished the beginnings of the *Philosophical Transactions* (a publication now of world-wide celebrity). At first the publication of the *Transactions* was entirely "the act of the respective secretaries." The first number, consisting of 16 quarto pages, appeared on Monday, March 6, 1664–65, under the title of *Philosophical Transactions: giving some Accompt of the present undertakings, studies and labours of the Ingenious in many considerable parts of the world,* with a dedication to the Royal Society signed by Henry Oldenburg, the first secretary of the Royal Society. The society also from its earliest years published, or directed the publication of, separate treatises and books on matters of philosophy; most notable among these being the *Philosophiae naturalis principia mathematica Autore Is. Newton. Imprimatur: S. Pepys, Reg. Soc. Praeses. Julii 5, 1686, 4to Londini 1687.*

In 1887 the *Philosophical Transactions* were divided into two series, labelled A and B respectively, the former containing papers of a mathematical or physical character, and the latter papers of a biological character. More than 225 quarto volumes have been published. In 1832 appeared the first volume of *Abstracts of papers, printed in the Philosophical Transactions from the year 1800.* This publication developed in the course of a few years into the *Proceedings of the Royal Society,* which has been continued up to the present time.

It is, however, certain that one of the most important functions of the society from the beginning was the performance of experiments before the members. In the royal warrant of 1663 ordering the mace which the king presented to the society, it is described as "The Royal Society for the improving of Natural Knowledge by experiments"; and during its earlier years the time of the meetings was principally occupied by the performance and discussion of experiments. The society early exercised the power granted by charter to appoint two "curators of experiments," the first holder of that office being Robert Hooke, who was afterwards elected a secretary of the society.

Another matter to which the society gave attention was the formation of a museum, the nucleus being "the collection of rarities formerly belonging to Mr. Hubbard," which, by a resolution of council passed in 1666, was purchased for the sum of £100. This museum, at one time the most famous in London, was presented to the trustees of the British Museum in 1781, upon the removal of the society to Somerset House. A certain number, however, of instruments and models of historical interest have remained in the possession of the society, and some of them, more peculiarly associated with its earlier years, are still preserved at Burlington House. The remainder have been deposited in the Victoria and Albert Museum, South Kensington.

After the Great Fire of London in September 1666 the apartments of the Royal Society in Gresham College were required for the use of the city authorities, and the society was invited by Henry Howard (later duke of Norfolk) to meet in Arundel House. At the same time he presented them with the library purchased by his grandfather, Thomas earl of Arundel, and thus the foundation was laid of the important collection of scientific works, now exceeding 60,000 volumes, which the society possesses. Of the Arundel mss. the bulk was sold to the trustees of the British Museum in 1830 for the sum of £3,559, the proceeds being devoted to the purchase of scientific books. These mss. are still kept in the British Museum as a separate collection. The society, however, still possesses a valuable collection of scientific correspondence, official records and other manuscripts, including the original manuscript, with Newton's autograph corrections, from which the first edition of the *Principia* was printed.

Under date December 21, 1671, the journal-book records that "the lord bishop of Sarum proposed for candidate Mr. Isaac Newton, professor of the mathematicks at Cambridge." Newton was elected a Fellow Jan. 11, 1671–72, and in 1703 he was appointed president, a post which he held till his death in 1727. During his presidency the society moved to Crane Court, their first meeting in the new quarters being held Nov. 8, 1710. In the same year they were appointed visitors and directors of the Royal Observatory at Greenwich, a function which they continued to perform until the accession of William IV., when by the new warrant then issued the president and six of the Fellows of the Royal Astronomical Society were added to the list of visitors.

In 1780, under the presidency of Sir Joseph Banks, the Royal Society removed from Crane Court to the apartments assigned to them by the government in the new Somerset House, where they remained until they removed to Burlington House in 1857. The policy of Sir Joseph Banks was to render the Fellowship more difficult of attainment. A step in pursuance of the same policy was taken in the year 1847, when the number of candidates recommended for election by the council was limited to fifteen, and the election was made annual. This limitation has remained in force up to the present time. Concurrent with the gradual restriction of the Fellowship was the successive establishment of other scientific bodies. The founding of the Linnean Society in 1788 under the auspices of several Fellows of the Royal Society was the first instance of the establishment of a distinct scientific association under royal charter; and this has been followed by the formation of the large number of societies now active in the promotion of special branches of science.

From the time of its royal founder onwards the Royal Society has constantly been appealed to by the government for advice in connection with scientific undertakings of national importance. The following are some of the principal matters of this character upon which the society has been consulted by, or which it has

successfully urged upon the attention of, the government: the improvement and equipment of the Royal Observatory, Greenwich, in 1710, when it was placed in the sole charge of the society; the change of the calendar in 1752; ventilation of prisons; protection of buildings and ships from lightning; measurement of a degree of latitude; determination of the length of a pendulum vibrating seconds; comparison of the British and French standards of length; the Geodetic Survey in 1784, and the General Trigonometrical Survey begun in 1791; expeditions to observe the transits of Venus in 1761, 1769 (commanded by Captain Cook), 1877 and 1882; the Antarctic expeditions of 1772 (under Captain Cook, whose voyage extended to the circumnavigation of the globe), of 1839 (under Ross), and 1900; help with the reports of the British Antarctic Expedition of 1910–13; observations for determining the density of the earth; Arctic expeditions of 1817 (in search of the North-West Passage), of 1819 (under Parry), of 1827 (Parry and Ross), of 1845 (Franklin) of 1874 (under Nares); numerous expeditions for observing eclipses of the sun; 1822, use of coal-tar in vessels of war; best manner of measuring tonnage of ships; 1823, corrosion of copper sheathing by sea-water; Babbage's calculating machine; lightning-conductors for vessels of war; 1825, supervision of gas-works; 1832, tidal observations; 1835, instruments and tables for testing the strength of spirits; magnetic observatories in the colonies; 1862, the great Melbourne telegraph; 1865, pendulum observations in India; 1866, reorganization of the meteorological department; 1868, deep-sea research; 1872, "Challenger" expedition; 1879, prevention of accidents in mines; 1881, pendulum observations; cruise of the "Triton" in Faroe Channel; 1883, borings in delta of Nile; 1884, Bureau des Poids et Mesures; international conference on a prime meridian; 1888, inquiry into lighthouse illuminants; 1890, the investigation of colour-blindness; 1895, examination of the structure of a coral reef by boring; 1896, inquiry into cylinders for compressed gases; the establishment of an International Geodetic Bureau; 1897, determination of the relations between the metric and imperial units of weights and measures; and, more recently, an inquiry into the volcanic eruptions in the West Indies; international seismological investigation; international exploration of the upper atmosphere; measurement of an arc of the meridian across Africa. During 1913–17 the society completed a magnetic survey of the British Isles. In 1920 it sent two expeditions to observe the total solar eclipse of May 29th, and to note any deflection of rays of light by the sun's gravitational field, as required by Einstein's general theory of relativity. In recent years also the society, acting at the request of the government, has taken the leading part in investigations, in the course of which important discoveries have been made, in relation to various tropical diseases, beginning with the tsetse-fly disease of cattle in Africa, followed by investigations into malaria, Mediterranean fever and sleeping-sickness. In 1924 the society received a bequest of £10,000 for medical research on tropical diseases, etc., and sent an expedition to Kala Azar in North China. The society has also shown an active interest in problems of respiration and circulation in high altitudes (Peru expedition, 1921), and in investigations into glass workers' cataract. The society has standing committees which advise the Indian government on matters connected with scientific inquiry in India and on the observatories of India. The society has taken a leading part in the promotion of the *International Catalogue of Scientific Literature*, and of the International Association of Academies.

In addition to the occasional services enumerated above, the Royal Society has exercised, and still exercises, a variety of important public functions of a more permanent nature. It still provides seven of the board of visitors of the Royal Observatory at Greenwich, has eleven representatives on the Joint Permanent Eclipse committee, and has a Solar Research committee of its own. From 1877 until the reconstitution of the Meteorological Office in 1906 the society nominated the meteorological council, which had the control of that office. The Gassiot and other committees of the society continued to co-operate with the Meteorological Office. Since 1919, when the Meteorological Office was attached to the Air Ministry, the society has two representatives on the Meteorological Committee. The society has the custody of standard copies of the imperial standard yard and pound. The president and council have the scientific control of the National Physical Laboratory, an institution established in 1899 in pursuance of the recommendations of a treasury committee appointed by H.M. government in response to representations from the Royal Society (the financial control was transferred to the Department of Scientific and Industrial Research in 1918). It also appoints the British delegates to the meetings of the International Research Council.

One of the most important duties which the Royal Society performs on behalf of the government is the administration of the annual grant of £6,000 for the promotion of scientific research. This grant originated in a proposal by Lord John Russell in 1849 that at the close of the year the president and council should point out to the first lord of the treasury a limited number of persons to whom the grant of a reward or of a sum to defray the cost of experiments might be of essential service. This grant of £1,000 afterwards became annual, and was continued until 1876. In that year an additional sum of £4,000 for similar purposes was granted, and the two funds of £1,000 and £4,000 were administered concurrently until 1881, in which year the two were combined in a single annual grant of £4,000 under new regulations. In 1920 the annual grant was increased to £6,000. Since 1896 parliament has also voted annually a grant of £1,000 to be administered by the Royal Society in aid of scientific publications, not only those issued by itself, but also scientific matter published through other channels. This grant was raised to £2,500 in 1925. One of the most useful of the society's publications is the great catalogue of scientific papers—an index now in twelve quarto volumes, under authors' names, of all the memoirs of importance in the chief English and foreign scientific serials from the year 1800 to the year 1883.

A statement of the trust funds administered by the Royal Society will be found in the *Year Book* published annually, and the origin and history of these funds will be found in the *Record of the Royal Society*.

Five medals (the Copley medal, two Royal, the Davy and the Hughes) are awarded by the society every year; the Rumford and the Darwin medals biennially, the Sylvester triennially and the Buchanan quinquennially. The first of these originated in a bequest by Sir Godfrey Copley (1709), and is awarded "to the living author of such philosophical research, either published or communicated to the society, as may appear to the council to be deserving of that honour"; the author may be an Englishman or a foreigner. The Rumford medal originated in a gift from Count Rumford in 1796 of £1,000 3% consols, for the most important discoveries in heat or light made during the preceding two years. The Royal medals were instituted by George IV., and are awarded annually for the two most important contributions to science published in the British dominions not more than ten years nor less than one year before the date of the award. The Davy medal was founded by the will of Mr. John Davy, F.R.S., the brother of Sir Humphry Davy, and is given annually for the most important discovery in chemistry made in Europe or Anglo-America. An enumeration of the awards of each of the medals and the conditions of the awards are published in the *Year Book*.

Under the existing statutes of the Royal Society every candidate for election into the society must be recommended by a certificate in writing signed by six or more Fellows, of whom three at least must sign from personal knowledge. From the candidates so recommended the council annually select fifteen by ballot, and the names so selected are submitted to the society for election by ballot. Princes of the blood, however, and not more than two persons selected by the council on special grounds once in two years, may be elected by a more summary procedure. Foreign members, not exceeding fifty, may be selected by the council from among men of the greatest scientific eminence abroad, and proposed to the society for election.

The anniversary meeting for the election of the council and officers is held on St. Andrew's Day. The council for the ensuing year, out of which are chosen the president, treasurer, principal

secretaries, and foreign secretary, must consist of eleven members of the existing council and ten Fellows who are not members of the existing council. These are nominated by the president and council previously to the anniversary meeting. The session of the society is from November to June; the ordinary meetings are held on Thursdays during the session, at 4.30 P.M. The selection for publication from the papers read before the society is made by the "Committee of Papers," which consists of the members of the council for the time being aided by committees appointed for the purpose. The papers so selected are published either in the Society's *Philosophical Transactions* (4to) or *Proceedings* (8vo).

(R. W. F. H.; A. Wo.)

ROYALTIES. Payment by royalties based on a percentage of the published price has now become the customary method of sharing receipts between publisher and author from sales of a book. The amount of royalty agreed upon depends on the cost (including advertising) and the estimated sale of the book, as well as on the respective bargaining powers of publisher and author. British publishers are accustomed to contracts calling for payment to the author of 10% of the original published price —usually 7/6d.—of a novel by a new author, with provision that the royalty shall rise by agreed-upon stages to 15 or 20%. The successful British author whose sales are already established ordinarily gets a percentage beginning at 15 or 20, and rising to 25 after a sale of from 10,000 to 20,000 at the original price. The royalties on non-fiction books published at higher prices are as a rule somewhat higher than the royalties on novels.

Most British contracts for fiction now contain a provision for publication in cheaper form after the sales at the original published price have ceased. Royalties on these cheap editions range from a farthing a copy on sixpenny editions to 10% on 2/6d. editions.

Another phase of royalties is the advance. When it became apparent that the royalty system was fairer to publisher and author than the old system of payment outright for all rights, the author was prompt to point out that he might starve while waiting for his money—hence the publishers' custom of paying an advance on account of royalties on the day of publication. Authors whose previous sales had been large commanded proportionately large advances.

In the United States, where costs of distribution and advertising are greater than in the British Isles, royalties are lower. Whereas 20% was not uncommon for a successful writer, 15% is now the rule, though 20% after a sale of 10,000 at the original price in America is not unknown, despite the declaration of most of the American publishers that they cannot now go above 15%. The tendency is to begin at 10% of the advertised price, rising to 12½% or 15% after a sale of 5,000 copies at the original price.

When advances are paid to the author before any royalties are earned they are customarily made (a) upon the signing of the agreement, (b) upon delivery of the complete manuscript ready for publication and (c) on the publication date.

It is not the general custom of American publishers to bring out cheap editions of their own novels, though more publishers are bringing out these cheaper editions than ever before. The more usual practice is to sell the cheap edition rights, when possible, to firms who specialize in such editions, the original publisher providing the plates and giving the author half of the royalties, which usually yields to the author a royalty of 5% of the published price of the cheap edition.

As regards royalties on the Continent, it is only within recent years that this system of payment has been generally adopted, and even yet in some of the central European countries and in Holland it is only for particularly important books that royalties can be obtained. As a rule the percentages are lower than those prevailing in England. In Germany and Austria the royalty is not paid on the retail published price but on the "Broschiert," that is to say, on the retail price to the bookseller of the stitched and unbound copy.

A compromise between the percentage royalty on the retail price of every copy sold and the outright payment for the copyright has now been extensively adopted by foreign publishers; the system being the payment of an outright sum for every 1,000 copies printed. The advance on such payment usually covers the number of copies printed in the first edition.

Recent Developments.—The royalty system has undergone a notable change since the beginning of the twentieth century. It was formerly customary for the publisher to contract for the world rights of his author, reselling on a basis of half receipts to himself and half to the author such rights as he could not use—*e.g.*, foreign rights, serial rights, dramatic rights and, at first, moving-picture rights. But such contracts are now rare, the author selling each right separately.

The same tendency is observable in play sales. Here the normal royalty in England and America has become fixed at approximately 5% of the gross weekly receipts up to £500 or $2,500; 7½% on the next £200 (or $1,000) and 10% on all gross weekly receipts above £1,000 or $5,000, with an advance on account of these royalties, payable on the signing of the contract, of from £100 to £200. If the play is sold first in England, the English manager claims a share in the American rights and the film rights —and vice versa if the play is sold in America. If the author is in a strong position he claims and gets a separate royalty in each country for each right, with somewhat lower royalties for translation rights on account of the cost of translation and possibly adaptation. He even reserves the royalties obtainable on his amateur rights, broadcasting rights, and book publication rights.

When moving pictures first presented themselves to the authors as a possible source of suddenly augmented income, an attempt was made to apply the royalty system to payment per foot of film for what soon came to be known as "film rights"; but the difficulties of collection and checking became such that the system has been practically abandoned for outright payment. However, the preference for profit-sharing has brought forth a new form of royalty payment that may presently prevail—*i.e.*, payment on signature of contract of an advance on account of a royalty of usually from 5 to 10% on the "bookings," *i.e.*, the purchases of exhibitors of the rights to show the film for varying periods.

A normal agreement for publication of music is 10% per copy of the retail selling price; half royalty on copies sold for export; half of any broadcasting fees, and half of the moneys received by the publishers as royalties on mechanical reproduction rights. These royalties on mechanical contrivances for the performance of musical works were altered in Great Britain in 1928 by order of the Board of Trade from 5% to 6¼%.

Earlier Systems.—The royalty system became general only in the last century, although before that authors were occasionally paid a stipulated sum for the first impression of a book, and a further sum if a further impression were called for. Samuel Simmonds paid Milton £5 for *Paradise Lost* and agreed to pay a further £5 at the end of the sale of each of the first three impressions. Richard Baxter records that he arranged with Thomas Underhill and Francis Tyton to publish his *Saints' Everlasting Rest*, a quarto of nearly 1,000 pages, for a payment of £10 for the first impression and £20 for every subsequent impression up to 1665.

Sidney Lee records that the highest price known to be paid before 1599 to an author for a play by the manager of an acting company was £11. "A small additional gratuity, rarely exceeding 10s., was bestowed on a dramatist whose piece on its first production was especially well received, and the author was customarily awarded, by way of benefit, a certain proportion of the receipts of the theatre on the production of a play for the second time. The 19 plays which may be set to Shakespeare's credit between 1591 and 1599 combined with such revising work as fell to his lot during those nine years cannot consequently have

brought him less than £200 or some £20 a year. Between 1599 and 1611 his remuneration as both actor and dramatist was on the upward grade. The fees paid dramatists rose rapidly. The exceptional popularity of Shakespeare's work after 1599 gave him the full advantage of the higher rates of pecuniary reward in all directions. The 17 plays that were produced by him between that time and the close of his professional career could not have brought him less on an average than £25 each, or some £400 in all." But the pound of that day had over five times its present value. Later on prices improved and Fielding, for example, received £1,000 from Andrew Miller for *Amelia*, while Gibbon received two-thirds of the proceeds on his history.

Edward Chapman, of Chapman and Hall, in a letter to Forster (1837) said: "There was no agreement about *Pickwick* except a verbal one. Each number was to consist of a sheet and a half, for which we were to pay 15 guineas, and we paid him for the first two numbers at once, as he required the money to go and get married with. We were also to pay more according to the sale, and I think *Pickwick* cost us altogether £3,000." Forster adds: "I had always pressed so strongly the importance to him of some share in the copyright that this at last was conceded in the deed above mentioned (though five years were to elapse before the rights should accrue) and it was only yielded as part consideration for a further agreement entered into on the same date (Nov. 19, 1837) whereby Dickens engaged to write a new work (*Nickleby*) the first number of which was to be delivered on the 15th of the following March and each of the numbers on the same day of each of the successive 19 months, which was also to be the date of the payment to him by Chapman and Hall, and 20 several sums of £150 each for five years' use of the copyright, the entire ownership in which was then to revert to Dickens."

On July 2, 1840, Dickens wrote to Chapman and Hall: "Your purchase of *Barnaby Rudge* is made upon the following terms: It is to consist of matter sufficient for ten monthly numbers of the size of *Pickwick* and *Nickleby*, which you are, however, at liberty to divide and publish in 15 smaller numbers if you think fit. The terms for the purchase of this edition in numbers and for the copyright of the whole book for six months after the publication of the last number are £3,000. At the expiration of six months, the whole copyright reverts to me." (C. BN.)

See Copinger's *Law of Copyright* (6th ed., 1927); Michael Joseph, *The Commercial Side of Literature* (1925); Stanley Unwin, *The Truth about Publishing* (1926).

ROYALTY, kingly state or personality, hence a royal person, or number of persons of royal birth collectively, a member of a royal family (O. Fr. *realte, reialte, royaulté*, from Med. Lat. *regalitas*, the substantive of regalis, of or belonging to a king, *rex*). More particularly "royalty" is used of the rights and attributes of a sovereign, and especially of dues paid to the Crown, which belong to the sovereign *iure coronae*.

ROYALTY, IN MINING. In some countries the ownership of the minerals is vested in the State who may grant concessions (*e.g.*, France) to private individuals or corporations to work them. In others (*e.g.*, Great Britain) the ownership of minerals is different, for the owner of land is deemed to own everything over, on, or under the surface down to the centre of the earth, the only exception (apart from special custom) being in respect of mines of gold and silver, which are the property of the Crown, *i.e.*, "royal" metals (hence the term "royalty"). It would appear that in or about the year 1568, the respective adverse rights of the Crown and of private landowners became the subject of contention, and called for definition by the Courts of Justice, which, in the great case of the *Queen* v. *Northumberland*, was to the effect that only the so-called royal mines of gold or silver belonged to the Crown and that all the baser minerals belonged to the individual landowners.

There may be two ownerships in respect of a given property by reason of severance, for an owner may have transferred the surface and excepted the mines or minerals or *vice versa*. There may also be different severances in respect of strata, *e.g.*, one person may own one seam of coal and another person another seam, but the latter is a rather uncommon occurrence.

Though the gold and silver mines are vested in the Crown, the gold or silver may occur—frequently does, especially in the case of the latter mineral—in ores of lead, copper, etc., in which case the property in the mine is not in the Crown, though the Crown has the right of pre-emption over the gold and silver on paying for the value of the lead, copper, etc., ores which accompany it.

Sometimes the landowner works the minerals himself, but usually he leases them to others for a term of years who engage to work and sell them. In the case of coal, it is common practice to designate the latter as "coal owners," or "colliery owners" and the former as the royalty owner, for the owner of the coal, *i.e.*, the lessor, receives from the colliery owner or lessee, a rent or "royalty" for the mineral leased to and worked by the latter.

Dead Rents.—In regard to coal, which is the substance worked to the greatest extent in Great Britain (*see* COAL AND COAL MINING), the leases of coal seams are granted for various periods ranging from 21 to 60 years or even (recently) up to 100 years, the right to work being conceded in return for a "fixed," "certain" or "dead" rent per annum, which merges into the royalty rent, an arrangement which is found to have existed in leases at least as far back as the middle of the 18th century.

The certain rent is commonly determined by the capacity of working an agreed minimum number of tons per annum at an agreed tonnage or royalty rent. When in any year the number of tons worked at this rent exceeds in value the certain rent, the surplus is paid as "overworkings" or "overs." When it falls short, the deficiency is carried forward as "short working" to next year's account.

The royalty rent may be payable—

(1) as a tonnage rate pure and simple.
(2) as a sum per acre per foot thick of seam.
(3) as simply a sum per acre.
(4) as a proportion of the value of the mineral raised.
(5) by way of a sliding scale.

Most commonly the payment is made under (1), (2) or (3).

The average of the royalties, in terms of so much per ton, inclusive of way-leaves (the right of passage over or through another's land is termed a way-leave), of coal raised over the United Kingdom was estimated to be in 1889 (Report of Royal Commission) 5·4d. per ton of coal worked, and as way-leaves may be taken as averaging about ¼d. per ton, the actual royalty would then be 5¼d. per ton. The tendency has, however, been for rents to rise somewhat since then and probably 6d. per ton would be closer to actuality now.

Royalties are also payable in respect of china clay, ganister, other "clays," oil shale, stratified and unstratified ironstone, slate and building stones, limestone, chalk, and metalliferous ores.

See J. H. Cockburn, *The Law of Coal and Minerals* (1902); R. A. S. Redmayne and G. Stone, *The Ownership and Valuation of Mineral Property* (1920). (R. R.)

ROYAN, a town of W. France, in the department of Charente Inférieure, on the right bank of the Gironde, at its mouth 63 m. below and N.N.W. of Bordeaux. Pop. (1926) 8,657.

Royan belonged to the family of la Trémoille, in whose favour it was made first a marquisate and then a duchy. During the first half of the 15th century it was held by the English. During the wars of religion it was a centre of Calvinism and in 1622 was besieged by Louis XIII. At the end of the 18th century it was a "bourg" of about 1,000 inhabitants, noticeable only for its priory. Its prosperity dates from the Restoration, when steamboat communication was established with Bordeaux.

ROYCE, JOSIAH (1855–1916), American philosopher and teacher, was born at Grass Valley, a California mining town, on Nov. 20, 1855. At 16 he entered the newly-opened University of California, inclined to the study of engineering. But the teaching of Joseph LeConte, the geologist, and of Edward Rowland Sill, the poet, roused his extraordinary speculative power; and on receiving his baccalaureate degree, 1875, he gave himself to the study of philosophy, first in Leipzig and Göttingen (under Lotze) and then, as one of the first fellows of Johns Hopkins university, with William James and Charles Peirce. Here he received the degree of Ph.D., 1878. After teaching English for four years in

the University of California he was called to Harvard university as lecturer in philosophy, becoming assistant professor in 1885, professor in 1892 and succeeding George Herbert Palmer as Alford professor in 1914. He received various honorary degrees and was made in 1916 Honorary Fellow of the British Academy. He died at Cambridge, Mass., Sept. 14, 1916.

His effect as teacher and writer was profound: no previous American thinker had so united moral energy with wide historical learning, command of scientific method and intense interest in logical technique. His versatile mind concerned itself effectively with a wide range of subjects; he contributed to mathematical logic, psychology, social ethics, literary criticism and history as well as to metaphysics. His thought was massive and intimately human; yet it was sustained with a dialectical skill of such evident virtuosity as, on the one hand, to excite the critical opposition first of pragmatic and then of realistic schools, and, on the other hand, to set a new standard in the systematic treatment of philosophy. In this latter respect, Royce did for American philosophy what his older contemporary, F. H. Bradley, did for British philosophy: in many ways the views of these thinkers are akin. Like Bradley, Royce teaches a monistic idealism. Scientific laws he describes—anticipating certain developments of recent physics—as statistical formulae of average behaviour. His absolute idealism is supplemented, not corrected, by the ethical and social teachings of his later years and, in particular, by the conception of the world of human selves as the Great Community, the literally personal object of moral loyalty.

BIBLIOGRAPHY.—Among his more important publications (selected from a far greater number) are: *The Religious Aspect of Philosophy* (1885); *The Spirit of Modern Philosophy* (1892); *The Conception of God* (1895), with Supplementary Essay (1897); *Studies of Good and Evil* (1898); *The World and the Individual* (Gifford Lectures), vols. i., ii. (1900–01); *The Conception of Immortality* (1900); *Outlines of Psychology* (1908); "The Relation of the Principles of Logic to the Foundations of Geometry," in *Transactions of the American Mathematical Soc.*, vi., 3 (1905); *The Philosophy of Loyalty* (1908); *The Sources of Religious Insight* (1912); "Prinzipien der Logik," *Enzyklopädie der Philosophischen Wissenschaften*, Bd. i. (1912), English translation in *Encyclopaedia of the Philosophical Sciences*, vol. i. (1913); *The Problem of Christianity* (lectures delivered at the Lowell Institute, Boston, and at Manchester college, Oxford), vols. i., ii. (1913); "The Mechanical, the Historical and the Statistical," *Science*, n.s. xxxix. (1914); *Lectures on Modern Idealism* (1919). For a bibliography (exclusive of posthumous publications) *see* B. Rand, *Philosophical Rev.*, xxv. (1916). (M. W. C.; W. E. H.)

ROYDEN, AGNES MAUDE (1876–), British social worker and preacher, youngest daughter of Sir Thomas Royden, 1st Bart. of Frankby Hall, Cheshire, was educated at Cheltenham and Lady Margaret Hall, Oxford. Until 1914 edited *The Common Cause*, the organ of the National Union of Women's Suffrage Societies. In 1917 she became assistant preacher at the City Temple, London, and thus became the first woman in Great Britain to occupy the pulpit of a regular place of worship.

Miss Royden's numerous books and pamphlets include *Women and the Sovereign State* (1917); *Sex and Commonsense* (1922); *Prayer as a Force* (1922); *Political Christianity* (1922); *The Church and Woman* (1924) and *Modern Sex Ideals* (1926).

ROYER-COLLARD, PIERRE PAUL (1763–1845), French statesman and philosopher, was born on June 21, 1763, at Sompuis, near Vitry le Français (Marne), the son of Antoine Royer, a small proprietor. He was sent to the college of Chaumont of which his uncle, Father Paul Collard, was director. He followed his uncle to Saint-Omer, where he studied mathematics. At the outbreak of the Revolution he was practising at the Parisian bar. He was returned by the Island of Saint Louis to the Commune, of which he was secretary from 1790 to 1792. After the revolution of Aug. 10, 1792, he was replaced by J. L. Tallien. His sympathies were now with the Gironde, and after the insurrection of the 12th Prairial (May 31, 1793) he was in danger of his life. He returned to Sompuis, and was saved from arrest possibly by the protection of Danton. In 1797 he was returned by his department (Marne) to the Council of the Five Hundred. He made one great speech in the council in defence of the principles of religious liberty, but retired into private life at the *coup d'état* of Fructidor (Sept. 4, 1797).

From that time until the Restoration Royer-Collard devoted himself to the study of philosophy. His opposition to the philosophy of Condillac arose from the study of Descartes and his followers, and from his early veneration for the fathers of Port-Royal. He desired to establish a system which should provide a moral and political education consonant with his view of the needs of France. From 1811 to 1814 he lectured at the Sorbonne.

Royer-Collard was the moving spirit of the "Doctrinaires," led by Guizot, P. F. H. Serre, Camille Jordan and Charles de Rémusat, who met at the house of the comte de Ste. Aulaire and in the salon of the duchesse de Broglie. In 1820 Royer-Collard was excluded from the council of State by a decree signed by his former ally Serre. In 1827 he was again elected; in 1828 he became president of the chamber, and fought against the reactionary policy which precipitated the Revolution of July. In March 1830 he presented the address of the 221. From that time he took no active part in politics, although he retained his seat in the chamber until 1839. He died at his estate of Châteauvieux, near Vitry, on Sept. 2, 1845. He had been a member of the Academy since 1827.

Fragments of Royer-Collard's philosophical work are included in Jouffroy's translation of the works of Thomas Reid. The standard life of Royer-Collard is by his friend Prosper de Barante, *Vie politique de M. Royer Collard, ses discours et ses écrits* (2 vols., 1861). There are also biographies by M. A. Philippe (1857), L. Vingtain (1858), E. Spuller (1895), in *Grands écrivains français. See* E. Faguet, *Politique et morale du xixe siècle* (1891); H. Taine, *Les Philosophes français du xixe siècle* (1857); L. Séché, *Les Derniers Jansénistes* (1891); and Lady Blennerhasset, "The Doctrinaires" in the *Cambridge Modern History* (vol. x. chap. ii., 1907).

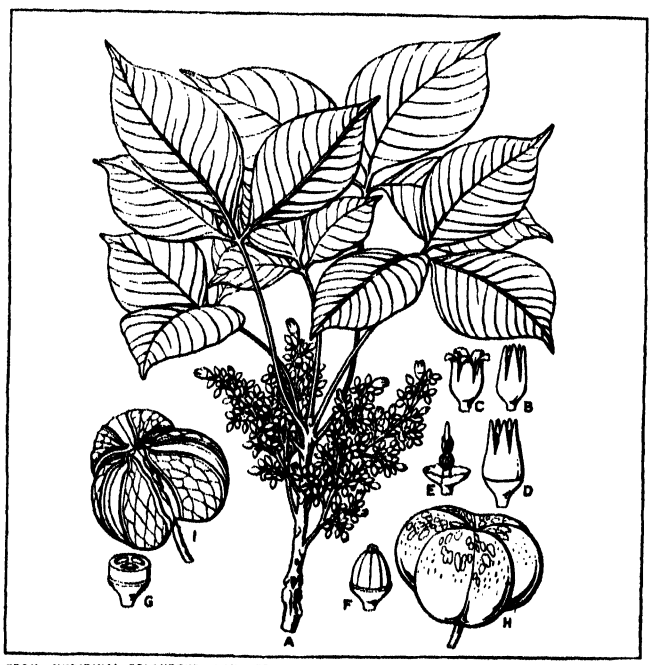
ROYSTON, a town in Hertfordshire, England, near the border of Cambridgeshire, 48 m. N. of London. Pop. (1921) 3,826. The town lies on the Roman Ermine Street. Roman relics have been found, and several barrows and earth-mounds occur on the neighbouring hills. A monastery of Augustinian canons was founded here towards the close of the 12th century. The church of St. John the Baptist is mainly Early English.

ROYTON, urban district, Royton parliamentary district, Lancashire, England, on L.M.S. railway. Pop. (1921) 17,194.

ROZAS, JUAN MARTÍNEZ DE (1759–1813), the earliest leader in the Chilean struggle for independence, was born at Mendoza in 1759. In early life he was a professor of law, and of theology and philosophy at Santiago. He held the post of acting governor of Concepción at one time, and was also colonel in a militia regiment. In 1808 he became secretary to the last Spanish governor, Francisco Antonio Carrasco, and used his position to prepare the nationalist movement that began in 1809. After resigning his position as secretary, Rozas was mainly responsible for the resignation of the Spanish governor, and the formation of a national Junta on Sept. 18, 1810, of which he was the real leader. Under his influence many reforms were initiated, freedom of trade was established, an army was organized and a national congress was called together in July 1811. He died at Mendoza on March 3, 1813.

RUANDA-URUNDI is a mandated territory in East Africa lying between the first and fourth degrees of south latitude and 29° to 31° east longitude. It is bounded on the north by Uganda, on the east and south by Tanganyika Territory, and on the west by the Belgian Congo. It comprises that portion of the former German colony of East Africa which was assigned under mandate to Belgium after the World War, an area of about 22,000 sq. miles. There was much delay in issuing the mandate—for which the concurrence of the United States had to be obtained—and this was further prolonged by the readjustment of the frontier. It was not therefore until Oct. 1924, that the mandate was formally accepted by the Belgian parliament. A law was then passed by which the territory should be administered as an integral part of the Congo colony but with a separate budget.

The country is divided into two distinct units—Ruanda and Urundi. Each is supervised by a resident with headquarters at Kigali and Kiteja respectively, the capital being at first at Usumbura on Tanganyika lake. The site for a new capital, in a healthy part of the highlands, was selected in 1927 and was named Astrida after the Duchess of Brabant. It is the declared policy of Belgium to support the authority of the native chiefs and to rule through



them. Early in 1928 there was a revolt against Musinga, the king of Ruanda. The movement was also anti-white and spread across the border into the south-west corner of Uganda. Belgian and British forces restored order. The European population in 1927 was: Ruanda 164; Urundi, 192.

The greater part of the country is mountainous and lies at a high altitude. Lakes Tanganyika and Kivu form part of its frontiers and there are numerous other small lakes—one, Karago, at an altitude of 6,000 feet. The population is estimated at 5,000,000, the density in some areas being upwards of 300 to the sq. mile. The bulk of the people are of Bantu stock, but the ruling caste are of the pastoral Wahima race, as in Uganda, Bunyoro and Ankole. The wealth of the country consists in its flocks and herds. A movement of large numbers of natives into the Belgian Congo was noted in 1928.

The local revenue, derived in part from a direct tax on the natives, is supplemented by a grant from Belgium. Owing to its distance from the sea and the lack of cheap transport, the trade of the country developed but slowly. A quantity of foodstuffs with livestock and hides is exported. The trade figures for 1927 were, exports 19,500,000 francs; imports 30,087,000 francs (*see* MANDATES). (LU.)

RUBATAH: *see* ARABS.

RUBBER: BOTANY, CULTIVATION AND CHEMISTRY. During his second visit to South America, Columbus was astonished to see the native Indians amusing themselves with a black, heavy ball made from a vegetable gum. Later explorers were equally impressed by these balls, and an historian of the time remarked that they rebounded so much that they appeared alive. Three centuries elapsed before the material was brought into commercial use in Europe, and it was then marketed not for its elastic properties but to rub out lead pencil marks—hence the name indiarubber or rubber. Since then the principal constituent (caoutchouc) of this material has been found as a vegetable product in many parts of the world, sometimes mixed with as little as one twentieth and sometimes with eight times its own weight of other substances. Some of these mixtures are strong and elastic, others are weak and brittle, but they are all classified as rubber. In addition, the term has been broadened by common use to include a wide range of vulcanised products derived from rubber by heating with sulphur, generally after mixing with large proportions of powders and plastic solids.

Although raw rubber is a coherent, elastic solid, it is obtained from a milky liquid known as *latex*, which occurs in special tubes in the roots, stem, branches, leaves and fruit of a wide variety of trees growing for the most part in the tropics. Rubber latex consists of a watery solution (serum), in which float small globules of rubber visible under a microscope. Although neither the rubber nor the serum is definitely opaque in thin layers, the many reflecting surfaces presented by these globules cause the latex to have the appearance of cows' milk, but whereas cows' milk contains only about 12% solid matter, rubber milk contains 30–40%. When rubber milk is suitably treated the globules unite (coagulate) and float in the serum as a soft, doughy mass (coagulum), which can be easily rolled to a sheet or other convenient form. On drying the coagulum loses its doughy character and becomes the firm, elastic solid known as raw or crude rubber.

Sources of Supply.—The numerous varieties of trees which contain rubber latex belong to many different botanical families, but nearly the whole of the world's rubber supply is obtained from a tree known as *Hevea brasiliensis* belonging to the family Euphorbiaceae. The rubber obtained from the latex of this tree usually contains over 90% caoutchouc of excellent quality. Few other trees furnish rubber of a purity and quality approaching this. In some cases the latex yields a product which consists chiefly of resin. Jelutong rubber, for example, obtained from *Dyera costulata*, a large tree growing in the East Indies, is very resinous, as also is the rubber produced from shrubby species of *Euphorbia* indigenous to South Africa.

Certain tropical African plants yield rubber of good quality, but the methods of preparation employed by the natives are crude and tend to degrade the product. The most important are *Funtumia elastica*, a tall and stately tree, and various species of *Landolphia*, which are big woody climbers.

A tree which is well known because it is cultivated in Europe as an ornamental plant under the name of the indiarubber tree is *Ficus elastica*, indigenous to Assam and Burma, where it grows to a considerable size. It yields moderately resinous rubber.

Guayule rubber from *Parthenium argentatum*—a silvery-leafed shrub found in north Mexico and is also moderately resinous.

The tropical American rubbers include Ceara rubber from *Manihot Glaziovii*, a tree of moderate size growing in Brazil, and Caucho rubber from *Castilloa elastica*, a large tree found in Central America and portions of Brazil. In both cases the rubber is of fairly good quality. The purest and best, however, is undoubtedly the Para rubber obtained chiefly from *Hevea brasiliensis* and to a lesser extent from *Hevea Benthamiana*. Both these trees are found in the Amazon valley, the former around the southern and the latter around the northern tributaries. *Hevea Benthamiana* is not so widely distributed as *Hevea brasiliensis*, but both yield rubber which is classed as "hard fine para"—the highest grade on the market.

Origin of Plantations.—In spite of huge natural resources the demand for Para rubber is far in excess of the quantity which the Amazon can supply. At one time there was no other source of *Hevea* rubber, but as long ago as 1834 Thomas Hancock, the English discoverer of vulcanisation and a rubber manufacturer, called attention to the high price of rubber and the possibility of growing it in the East. The requisite climate conditions appeared to be a heavy, well-distributed rainfall (about 100ins. per annum) and a temperature of 70°–90° F. These conditions are obtained over wide areas in the East. Eventually Sir Joseph Hooker, Director of the Royal Botanical Gardens, Kew, London, interested himself in the problem, and in 1873 2,000 Hevea seeds from the Amazon were delivered to Kew by a Mr. Farris. Only a dozen germinated, and six sent to the Royal Botanical Gardens, Calcutta, did not thrive. Arrangements were then made for further supplies of seeds. The most successful collector was H. A. Wickham (now Sir Henry Wickham) who displayed much enterprise and care in successfully bringing to Kew a consignment of 70,000 seeds of *Hevea brasiliensis*. Hot houses were summarily emptied, and within two weeks of the arrival of

the seeds in England there were over 2,000 young plants, nearly all of which were despatched to Ceylon, where they proved very successful.

After the establishment of Hevea trees in Ceylon steps were taken to distribute plants and seeds to other countries. Difficulties were experienced in exporting seeds in a sound condition, and the problem was studied by H. N. Ridley in the Botanical Gardens at Singapore. He found that seeds packed in moist, powdered charcoal retained their fertility for a long time, and when shortly after the beginning of the twentieth century planters began to take an increasing interest in rubber, large quantities of seeds were distributed by this means from Malaya.

The countries producing the largest quantities of plantation rubber are Malaya, the Dutch East Indies, and Ceylon. Smaller amounts are also obtained from India, Sarawak, Borneo, French Indo-China, Siam and various parts of Africa. Owing chiefly to the demands of the motor car industry the production of plantation rubber has made phenomenal progress. The first occasion on which a considerable amount of plantation rubber was offered on the market was in 1910, when the output reached 11,000 tons. By 1920 it was nearly 317,000 tons and in 1927 it amounted to 567,000 tons. In this period there were wide fluctuations in price, ranging from 12s. 0d. per lb. in 1910 to 7½d. per lb. in 1921.

While the production of plantation rubber has continued to increase that of wild rubber has decreased until in 1927 the world's production of all grades of wild rubber was only 6% of that produced on plantations. The reason for this is that not only is plantation rubber of good quality, comparable with that from the Amazon, but it is put on the market in a clean, dry condition.

Description of Principal Rubber Tree.—*Hevea brasiliensis* is a large tree which on occasions grows to a height of over 100ft. with a well developed trunk more than 12ft. in circumference. The usual height on plantations is from 60 to 80ft. The leaves are three-lobed, the segments being long and narrow and tapering at each end. The flowers are usually pale green and inconspicuous, separate male and female flowers being borne on the same tree. The fruit is a capsule containing three seeds which are oval and have a mottled brown, smooth coat. When ripe the

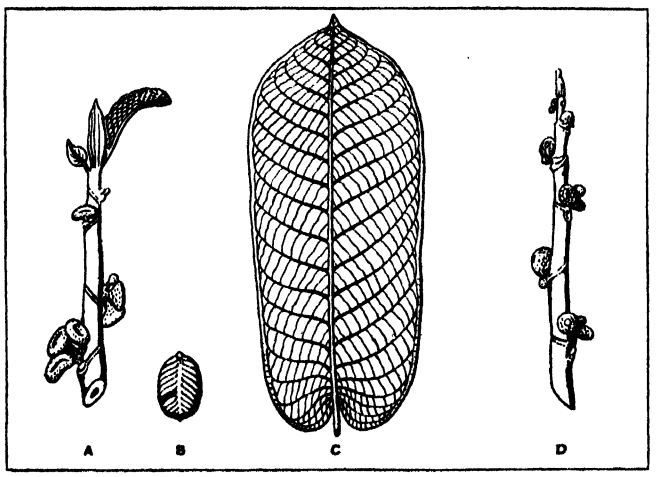

FIG. 2.—CASTILLOA ELASTICA
(A) Sprig bearing male flowers, (B) a seed, (C) a leaf, (D) twig bearing female flowers

capsules explode violently and eject the seeds to a distance of 20yd. or more, well beyond the shadow cast by the parent tree.

The structure of what is popularly known as the bark is of considerable importance in *Hevea brasiliensis*, because, as already indicated, the latex vessels in this part of the tree are the chief source of the world's rubber supply. The trunk of a tree may be divided roughly into an inner portion of wood and an outer portion of bark. At the junction of the bark and the wood is a layer of cells about the thickness of a sheet of paper, known as the cambium, which appears as a slimy layer when the bark is torn away from the tree. This layer is the seat of growth, on the one hand adding new cells to the wood and on the other new cells to the bark. Next to the cambium and in the soft portion of the bark are found the latex tubes. Outside the soft bark is a hard portion where there are comparatively few latex tubes. The whole is protected by an external layer of cork. The diameter of the latex tubes is considered to be about 0·0015 inch.

Cultivation.—*Hevea brasiliensis* is planted on many types of soil and thrives remarkably well as long as reasonable precautions are taken to avoid swampy, undrained or exposed lands. It is sometimes grown at an altitude of over 2,000ft., but the trees do not flourish so well at this altitude as at a lower level.

In opening up a new plantation the land is cleared of all growth as soon as possible not only to make room for the rubber trees but also to avoid the possibility of disease from rotting timber.

At one time it was the practice on rubber plantations to remove all weeds and leave bare the ground between the trees, but this is no longer regarded as an attribute of a well-kept estate. It is still the practice to remove the weeds, but heavy tropical rains have caused such loss of top-soil, particularly on sloping land, that many estates find it necessary to plant cover crops. Shrubby types of plants such as species of *Crotalaria* and *Tephrosia* which are periodically lopped and mulched into the soil, or herbaceous types such as *Centrosema pubescens* and *Vigna oligosperma* are among those used.

On sloping land cover crops are not sufficient to prevent the loss of valuable top-soil. In Ceylon for example stone walls are sometimes built across the hills. As a general rule however it is considered better to level the land in a series of contours about 15 to 20ft. apart, cutting into the side of the hill at a slight gradient to a depth of about six feet.

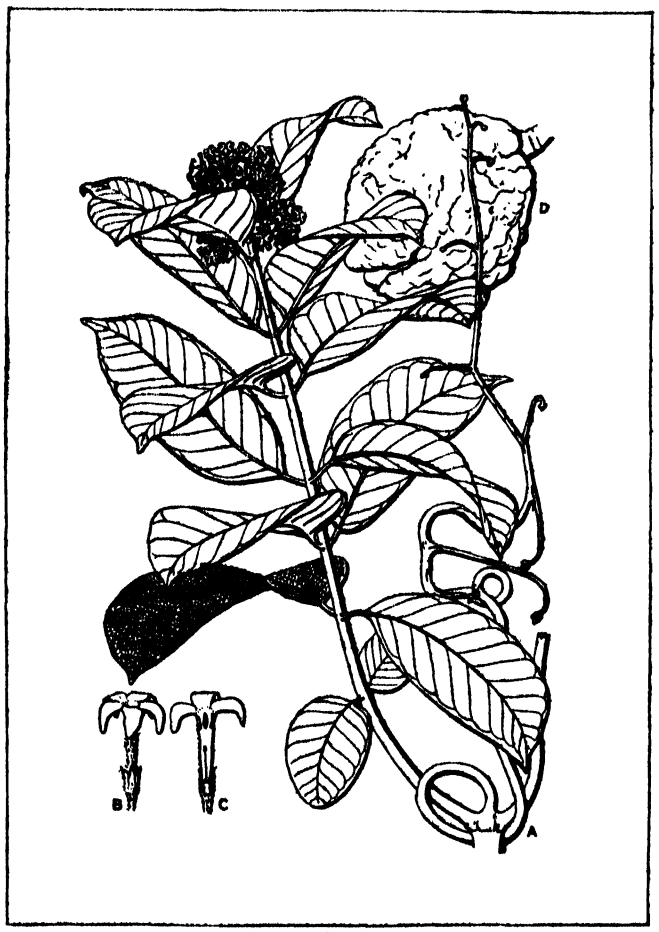
The loss of top-soil can also be reduced by drains which prevent the accumulation of a continuous stream of water during heavy rain. In Ceylon a series of lateral drains empty into main drains (herring-bone drains) which carry the water away, but in Malaya and Sumatra the water is trapped in blind drains (silt pits) from which it ultimately percolates into the soil.

Where considerable erosion has taken place or the soil has been impoverished by previous cultivation it is sometimes possible to effect great improvement in the health of the trees by the addition of manures, particularly those containing nitrogen and phosphorus. This increased health is reflected in a more vigorous canopy of leaves, better replacement of bark removed for collection of latex, and a greater yield of latex.

The number of trees planted per acre on estates is largely dictated by local conditions, such as the quality of the soil and the contour of the land. Most estates plant out more trees than will eventually be required and thin them out, removing weak ones or those which prove low yielders, leaving about 90 trees per acre.

The rubber tree is by no means free from disease but a careful watch is kept by scientific officers, and nowhere in the East have the diseases assumed serious proportions. The most troublesome are an abnormal leaf-fall (not to be confused with that which occurs while the trees are wintering) and a pathological condition of the bark often associated with heavy tapping. Measures have been devised to counteract both, but they still occur.

Selection of Planting Material.—Most trees on estates yield 4 to 5lb. of rubber per annum, but there are a few which yield as much as 30lb. growing by the side of others which yield only 2-lb. As yield capacity is partly hereditary, it seems probable that the yield per acre may be greatly increased by propagating from high-yielding trees only. For this purpose two methods of propagation have received considerable attention. In one the plants are raised from seeds from carefully selected high yielding mother-trees. In the other a bud from a high yielding mother-tree is grafted on to a vigorous young plant grown from seed. Unless special care is taken a high yielding mother tree is liable to be fertilised by pollen from neighbouring low yielders, so that the daughter trees grown from seed may not be particularly good yielders. On the other hand it is to be expected that the budded material will have the vegetative characteristics of the mother tree.



Tapping.—The trees are ready for tapping for latex when about five years old, but the yield of latex and the quality of rubber obtained are not so good as when the trees are a few years

older. Tapping is a very delicate and important operation, consisting in the removal of a shaving of bark with a sharp knife. The cut passes through the latex tubes and there is a flow of latex in consequence. If the cut is too deep, it penetrates into the cambium and bark renewal is hindered, but if it is not deep enough only a portion of the latex tubes are pierced and the yield of latex is reduced. For perfect tapping it is necessary to cut within $\frac{1}{25}$ in. of the wood, an operation requiring practice and skill.

The only tapping tools in general use on the plantations are a gouge (straight or bent) and the ordinary farrier's knife (or its modification).

It is the usual practice to make the first cut at between two and four feet from the ground. A shaving is then taken at definite intervals of time from the lower edge of the exposed bark. The thickness of the shaving removed is so arranged that the consumption of bark is between half an inch and one inch per month, some districts, such as Ceylon, preferring thin shavings while others, such as Malaya, prefer thicker shavings.

The length of the shaving varies from one-half to one-quarter of the circumference, some estates employing a single spiral cut at an angle of about 30° to the horizontal and some a V cut. In Ceylon it is the practice to change the tapping panel every six or twelve

BY COURTESY OF THE BRITISH MUSEUM (NATURAL HISTORY)

FIG. 3.—LANDOLPHIA COMORENSIS

(A) Sprig bearing leaves and inflorescence, (B) detached flower, (C) vertical section through flower, (D) fruit

months, but elsewhere it is customary to continue tapping on one panel down to the ground before commencing a fresh panel. Tapping is generally carried out every alternate day, one portion of an estate being rested while the other is tapped.

After the bark has been cut away, it is regenerated complete with latex vessels in a few years. With the most conservative system it is eventually necessary to tap on renewed bark. As the replacement of bark becomes more difficult each time a panel is tapped, there is a limit to the economic life of the tree, but the industry is too young for definite information on this point.

Tapping operations are always carried out in the early morning when the flow of latex is greatest. The latex from each tree is collected in a cup, transferred to a pail and taken to the factory as quickly as possible. Sometimes sodium sulphite is added to prevent premature coagulation. When the latex has ceased to drip there remains on the bark a thin film which dries in the sun leaving a strip of rubber. This is collected, washed in the factory and sold as "tree scrap"—an inferior grade.

Preparation.—The details of the methods employed in the preparation of plantation rubber depend upon the shape and appearance of the product to be put on the market, but in nearly all cases the outlines of the procedure adopted are the same. The sieved and diluted latex containing 15–25% rubber is treated with a coagulant such as acetic or formic acid or sodium silicofluoride. This causes the rubber to rise to the surface as a wet, white, doughy coagulum leaving in solution a small quantity of mineral and organic matter. The coagulum is then pressed between rollers until it is the required consistency, thickness and shape. After that it is hung to dry and eventually packed in wooden cases and shipped to its destination.

The two most important forms of plantation rubber are sheet and crêpe. Sheet is generally dark brown in colour because it is dried in smoke, whilst crêpe is a straw colour and is dried in air.

Sheet is obtained from latex coagulated in shallow tanks divided into compartments of suitable dimensions, each piece of coagulum being pressed by light machinery to the required thickness.

In the preparation of crêpe the coagulum is machined much more drastically, heavy rollers being necessary. During this process the coagulum is torn and pressed until it is sufficiently thin to dry in air without artificial heat. The rubber is dried by hanging on racks in well ventilated sheds for about a week.

Sheet is thicker than crêpe and requires artificial heat to dry it in a reasonable time. It is therefore exposed to the smoke of a wood fire for about 14 days. It was at one time presumed that smoking had a beneficial effect on quality because the highest grade rubber was obtained from the Amazon where the latex is coagulated with smoke, a wooden paddle being repeatedly dipped into the latex and exposed to the smoke of burning Urucuri nuts until a fairly large sized ball of rubber is built up. Experimental evidence does not support this view however and it is probable that as firewood becomes more difficult to obtain other means of drying sheet rubber will be developed on estates.

Both crêpe and sheet are sold largely on appearance. It is customary therefore to add sodium bisulphite to latex when preparing crêpe so that the rubber may be as pale as possible, and p-nitrophenol to latex in the preparation of sheet so that the development of mould may be prevented. Sheet rubber contains more mechanically enclosed serum substances than crêpe and is therefore a more suitable medium for the growth of mould. Not even drying in smoke entirely prevents this when conditions are favourable, but p-nitrophenol is an effective safeguard.

A considerable proportion of plantation rubber is prepared on native estates without machinery of any kind. In these cases the latex is coagulated with a convenient coagulant, not necessarily a suitable one. Sulphuric acid and alum have been used for this purpose although they affect adversely the behaviour of the rubber during manufacturing processes. The coagulum is lightly pressed by hand and whilst still wet is sent to a central factory where it is milled to crêpe and sold as an inferior grade of rubber.

Chemistry.—The microscope has been particularly useful in yielding information concerning the structure of rubber latex. The array of globules dancing here and there (Brownian movement) are easily seen at moderate magnifications, and it is possible to measure them and show that they vary in shape and size. In Hevea latex the globules are shaped like a pear and vary in length from 0·00002in. to six times that size. In spite of their minute size the expert has been able to ascertain that the globules in Hevea latex consist of an outer skin of non-rubber material, enclosing a viscous rubber shell surrounding semifluid rubber.

When Hevea latex is treated with any but very weak acids, the Brownian movement of the globules ceases, and they unite to form a coherent coagulum. Dehydrating agents such as alcohol and pro-

tein precipitants such as tannic acid also cause Hevea latex to coagulate.

In the presence of suitable proportions of an alkali such as ammonia or caustic soda, Hevea latex retains its liquid condition for many years, but in the absence of such additions bacterial action occurs, acids are developed and the latex quickly coagulates. Disinfectants also have a preserving effect on latex.

As already indicated, undiluted Hevea latex usually contains 30–40% of rubber. There are also present a number of other substances, amongst which by a remarkable chance are small quantities of compounds essential to the commercial applications of the product. When latex is coagulated with an acid only a portion of the accessory substances are coagulated with the rubber. The rest remains in the serum. The active non-rubber substances still mixed with the rubber are ample, however, to satisfy commercial requirements. For this reason methods of preparing rubber by evaporating latex have not met with general approval. In such cases the pure rubber may only amount to 85% of the solid material, whereas commercial crêpe and sheet prepared by acid coagulation may contain as much as 95%.

The following table shows the average percentage of the different non-rubber substances in dried Hevea latex in comparison with the amounts present in crêpe and sheet.

Non-rubber constituent	*Amount present in*	
	Dried latex per cent	*Crêpe and Sheet* per cent
Protein and nitrogenous matter	4–5	2
Constituents soluble in acetone	4–5	3
Mineral matter (ash)	1½	0·3
l-methyl inositol	1½	traces
Sugars	½	traces

Some of the constituents of the accessory substances are particularly active in accelerating vulcanisations and are therefore of great importance to the rubber manufacturer. A similar effect may also be produced by another of the accessory substances, viz., the ash which consists chiefly of potassium compounds.

Constituents soluble in acetone (a solvent which does not affect the rubber portion of the product) contain an appreciable amount of fatty acids such as oleic and stearic which dissolve and disperse some of the mineral powders mixed with rubber during commercial operations. The acetone-soluble material also contains a substance (allied in chemical composition to the sterols) which is particularly useful in preserving vulcanized rubber goods against the effects of atmospheric oxidation, so that they remain supple and elastic for a longer period than they otherwise would.

Pure rubber (caoutchouc) is a compound containing carbon and hydrogen only, in the proportion corresponding to five atoms of carbon and eight of hydrogen (C_5H_8). It belongs to the class of bodies known as terpenes and is related in chemical composition to the constituents of turpentine.

The specific gravity of rubber is a little less than that of water. It decreases regularly with increase of temperature except between 30 and 35° C when the decrease is greatly accelerated. At the temperature of liquid air rubber is transparent and brittle like glass. At 0–10° C it is hard and opaque, but quickly reverts to a soft and translucent condition above 20° C. As the temperature increases the rubber becomes softer, stickier, weaker and less elastic. These changes are greatly accelerated at temperatures of 50–60° C. At a little below 200° C rubber decomposes yielding liquid hydrocarbons of the terpene series.

When rubber is repeatedly pressed between rollers it becomes more plastic and sticky and less elastic. While in this condition large quantities of powders and plastic solids may be mixed with the rubber merely by repeatedly passing through rollers.

Rubber is insoluble in water and is unaffected by alkalis or moderately strong acids, but these substances may react with the non-rubber accessory substances present. Rubber is dissolved by benzol, petrol, carbon disulphide, chlorinated hydrocarbons, etc. It forms compounds with halogens, halogen acids, ozone, certain oxides of nitrogen, chromyl chloride and certain metallic halides. It is oxidised by nitric acid, potassium permanganate and hydrogen peroxide. It is also slowly affected by atmospheric oxygen, particularly in the presence of copper salts. It is reduced by hydrogen in the presence of a catalyst.

When rubber is heated at 120–160° C with sulphur it forms a product known as vulcanized rubber, which is stronger, more elastic and less affected by changes of temperature than the raw material. It is also insoluble in all the usual solvents. These changes are considerably modified by the amount of sulphur and heat applied and also (although to a lesser extent) by powders and other substances which may have been mixed with the rubber With suitable adjustments it is possible to obtain from the raw materials a product which is as soft and elastic as an inner tube or as hard and brittle as a piece of vulcanite.

RUBBER: PRODUCTION AND MANUFACTURE.

Between 1900 and 1911 the increase in the world's rubber production averaged only about 3,000 tons per year. Between 1911 and 1926, due mainly to the development of automotive transportation, the increase in crude rubber consumption increased enormously, averaging about 34,000 tons per year during the interval.

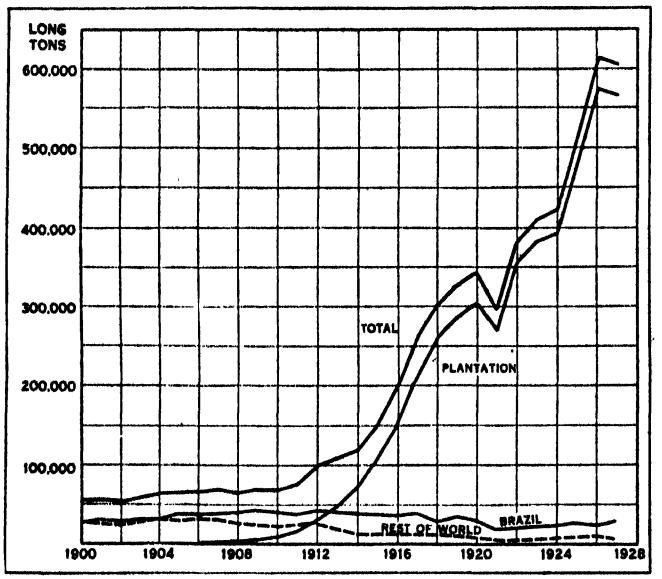
The 622,676 long tons of crude rubber produced in 1927 were distributed for use throughout the world as follows:—

TABLE I.

	Tons	Percentage
United States	397,278	63·8
*United Kingdom	60,248	9·7
France	36,000	5·8
Germany	40,000	6·4
Italy	11,000	1·8
Canada	26,000	4·2
Japan	20,169	3·2
Russia	12,000	1·9
Other countries	19,981	3·2
Total	622,676	100·0

*Actual consumption and in manufacturers' hands, 44,659 tons.

In 1925 about 74% of the total world's production of crude rubber, 387,629 long tons, was imported into the United States. During that year the value of rubber goods manufactured in the United States was $1,255,414,000 and the number of men and women employed in the industry was 164,230 in 498 different manufacturing establishments. The rubber industry is, therefore, among the largest in the United States.



The most important underlying development of the industry was the discovery of hot vulcanization of rubber made in 1839 by Charles Goodyear, of New Haven, Conn. The second important development was the art of compounding—the blending with crude rubber of various mineral powders, oils, waxes, tars, asphalts, fibres, etc., to secure in the finished goods special properties. The third great development was the art of combining rubber compositions with other structural materials, such as textile fabrics, metals and alloys, concrete, wood, glass, or asbestos, to secure in commercial articles the combined benefits of the rubber portion and the superior structural strength or rigidity of the auxiliary materials. The various processes of reclaiming scrap vulcanized rubber have resulted in supplying a plastic rubber material which can be processed with the equipment used for compositions of crude rubber, which will blend smoothly with crude rubber, and which makes economically possible the manufacture and sale of many articles that would not find a ready market at the higher prices of crude rubber compositions.

Since 1906 organic accelerators of vulcanization have constantly increased in use, saving millions of dollars annually to the indus-

try and to consumers through economies in manufacture and improvement in quality of goods. Within the last few years the latest development has been made—the retarding of deterioration of rubber compositions by admixture with them of small quantities of age-resisters.

MATERIALS USED IN THE INDUSTRY

Practically the only original source of rubber materials to-day is the latex of certain plants (*see* RUBBER: BOTANY, CULTIVATION AND CHEMISTRY). Preserved latex alone or compounded with other ingredients to cause vulcanization or to modify the characteristics of the rubber has been used for impregnating the cord fabric used in pneumatic tyres. Toy balloons and surgeons' gloves have been produced by dipping into latex compounded with water dispersions of pigments, sulphur and accelerator, porous forms which absorb water, leaving a thin film of vulcanizable stock on the form. The articles thus formed are then dried and vulcanized, giving a product of excellent quality. Philip Schidrowitz, of London, developed and patented in 1922 a process for vulcanizing the rubber while still dispersed in the form of latex, of forming articles from the vulcanized suspension and drying them. The anode process of electro-deposition of rubber compositions, invented independently by Paul Klein and S. E. Sheppard, utilizes latex also. Concentrated latices have been placed on the market in small quantities. That prepared by centrifuging according to the process of W. L. Utermark contains 60% to 65% of rubber; the product prepared by evaporation of some of the water according to the process of E. Hauser may contain as much as 85%.

BY COURTESY OF THE GOODRICH RUBBER CO.

GRAPH OF THE WORLD'S PRODUCTION OF CRUDE RUBBER

A successful method has been brought into practical use by Trumbull, Dickson and Pratt for the production of aqueous dispersions of crude rubber or of rubber compositions containing vulcanizing and compounding ingredients. These dispersions have found commercial applications in the manufacture of artificial leather and of rugs made of sisal fibre. They have also been used for impregnating fabric prior to the application of a thin rubber coating by the usual process of calendering (*see* below).

Materials Used in Dry Mixing.—The ordinary practice of blending rubber with other materials is carried out with dry materials—coagulated rubber, reclaimed rubber, mineral powders, softeners such as oils or tars and waxes, accelerators of vulcanization, age resisters and sulphur. Hundreds of materials are used in rubber compounding and thousands of combinations are in commercial use. They may be classified, however, into relatively few groups.

I. *Rubber Materials.*—*A.* Crude Rubber.—The sources and commercial forms are discussed in the article RUBBER: BOTANY, CULTIVATION AND CHEMISTRY.

B. Reclaimed Rubber.—Vulcanized rubber scraps may be plasticized and made available for reprocessing by the ordinary methods of rubber goods manufacture. The process of treatment is known as reclaiming and the product as reclaimed rubber, reclaim or shoddy. Many methods have been devised but the one most extensively used is that of heating ground scrap with a dilute solution of caustic soda at temperatures about 350° F for 12 to 20 hours. This is the alkali process of A. H. Marks, patented in 1889. During the past four years the use of reclaimed rubber in the United States has increased much more rapidly than the consumption of crude rubber. From 1924 to 1927 crude rubber consumption increased only 31% as compared with a 137% increase in the use of reclaimed rubber.

C. Scrap.—Unvulcanized trimmings containing no fabric or other materials are not waste. They may be blended with fresh stocks of the same composition and utilized with no loss of material value. Unvulcanized waste containing fabric may be treated to pulverize the fabric and utilized in rubber compositions with some reduction in value. Even vulcanized waste is incorporated in certain goods.

II. *Dry Pigments.*—*A.* Reinforcing and Filling Pigments.—Powdered materials are blended with rubber materials in order to modify the stiffness, strength, resistance to abrasion or chemical action of the vulcanized rubber compositions. These may be divided into "reinforcing" pigments and "fillers." Reinforcing pigments possess the property of stiffening and strengthening rubber compositions so that the total energy necessary to extend a strip of the compound to its breaking point is greater than that necessary to stretch a similar rubber-sulphur-accelerator mix to the breaking point. Fillers are characterized by the fact that, though they may stiffen the vulcanized compound, they do not increase the total energy necessary to extend a strip of the compound to the breaking point. Carbon black (gas black), zinc oxide, certain clays and magnesium carbonate are common reinforcing pigments. Whiting, barytes and ground slate are extensively used as fillers.

B. Colours.—Most of the colours for rubber goods are used in powdered form, and few colours soluble in rubber are used. For white goods, zinc oxide, lithopone, titanium oxide and zinc sulphide are used. Reds, blues, yellows and other colours and shades are secured with pigments such as ferric oxide, ultramarine blue and zinc chromate. The most recent development of special colours for the rubber industry is the utilization of metallic salts of organic azo- or other coloured compounds. These are produced in many beautiful shades, have high tinting values, and are not changed in colour by sulphur or heat during vulcanization.

III. *Other Compounding Ingredients.*—*A.* Softeners.—For modifying the characteristics of the vulcanized rubber mixtures and more especially for improving their properties for ease in processing, many kinds of softening materials are incorporated in rubber stocks. Petroleum products varying in consistency from oils to paraffin wax, tars, oxidized petroleum residues (mineral rubber), rosin, pine tar, stearic acid and many others are common to the industry.

B. Vulcanizing Agents.—By far the commonest vulcanizing agent is sulphur, used in the form of ground brimstone. The proportion used depends upon the character of the product required. Soft rubber goods carry from 2½% to 10% of sulphur, with the majority of compounds carrying from 3% to 5%. Hard rubber compositions carry 10% to 50% of sulphur. Some organic sulphur compounds which liberate sulphur at vulcanizing temperatures have been used in special cases without addition of sulphur itself. Selenium will produce vulcanization, also, and has been used to some extent, usually, however, with some sulphur.

C. Accelerators of Vulcanization.—Vulcanization of rubber by sulphur alone proceeds at a slow rate and almost invariably suitable materials, called accelerators, are added to the rubber mixes to hasten the process. From the time of Goodyear's experiment, in which he used white lead, until 1906, the only accelerators used were inorganic oxides or hydroxides—litharge, white lead, quick or slaked lime, magnesia. In 1906 George Oenslager, of Akron, O.,

PREPARING RUBBER FOR COMMERCIAL USES

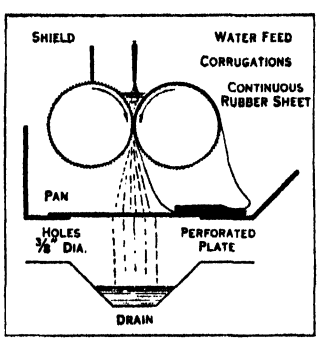
1. Latex, brought from the trees in containers resembling milk cans, is poured into large vats, as shown in the illustration
2. Machines used for washing rubber, to remove dirt, bark and other impurities
3. Sorting and folding sheets of crepe crude rubber, preparatory to packing
4. Grinding and washing mill, showing smoked Pará rubber going through the machine, before being made into sheet. Pará rubber is now produced in great quantities in the East as well as in the Amazon valley where it originated

discovered that organic amines shortened the time necessary to produce the changes due to vulcanization. Aniline was one of the first used. Later thiocarbanilid and para-amino-dimethyl aniline were used. The investigations in this field extended rapidly and in 1928 organic accelerators of vulcanization are essential ingredients of most rubber mixtures. They may be classified in various ways,—according to activity, to the range of temperatures at which they give the best results, or according to chemical composition. The activity of many accelerators is improved by the presence in the mix of secondary accelerators, such as zinc oxide, litharge, or magnesia. These are often further assisted by acid materials, such as oleic or stearic acids or pine tar. Pneumatic tyres, formerly requiring three hours for vulcanization without accelerators, are now vulcanized by the action of organic accelerators in less than an hour.

D. Anti-oxidants.—The natural deterioration of vulcanized rubber or its deterioration in service may be retarded by incorporating in the mixture, before vulcanization, ½% to 2% of certain materials which have no effect on the vulcanization rate but greatly retard the rate of oxidation or deterioration of the vulcanized product. Those already placed on the market are para-amino phenol, phenyl alpha naphthylamine, phenyl beta naphthylamine, symmetrical diphenylamino ethane and certain aldehydeamine reaction products. The development of these materials is relatively recent and other types of compounds may later be found to be serviceable. The anti-oxidants are added as ingredients of the rubber mixtures along with the pigments, accelerators, and sulphur. Commercial Pale Crêpe rubber contains about ½% of natural anti-oxidants.

E. Other Materials.—A few other materials are used which do not fall under any of the classifications mentioned. Probably the most important of these is "substitute" or "factice." Factice is made either by the action of sulphur chloride on vegetable oils,—white substitute,—or by the action of sulphur on these oils,—brown substitute. White substitute is used almost exclusively in cold vulcanized goods (*see* below), brown substitute in hot vulcanized goods. Skilful selection and blending of other materials with rubber is necessary to alter the characteristics of vulcanized rubber products to meet specific conditions of service. It is estimated that approximately 150,000 tons of non-rubber materials are used each year for this purpose in the United States alone.

Art of Compounding.—Study of the effect of different materials upon the physical characteristics of rubber mixtures has developed an art of compounding. Experienced compounders, by the selection of materials as to kinds and relative quantities, can secure vulcanized mixtures of specific properties to resist flexure, abrasion, steam, oil or acids. Rubber is modified by compounding with carbon black to resist the abrasive wear of roads upon vehicle tyres. Rubber, an excellent electric insulator, by incorporation of graphite and other carbon pigments may be modified to conduct an electric current.



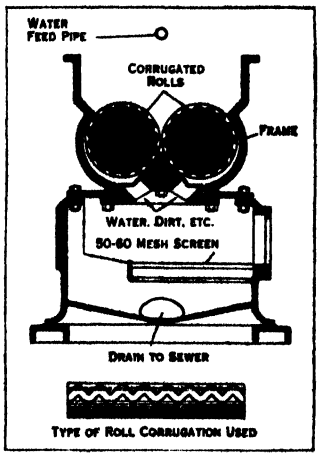
Auxiliary Materials in Rubber Manufacture.—Rubber compositions may be fabricated with other materials to secure the peculiar advantages of the rubber stocks, together with the mechanical strength or rigidity of other substances, or to secure serviceable articles at low cost. Cotton fabric, for example, lends strength to conveyor and transmission belting, to hose, and to pneumatic tyres. Wool or metal (in the form of wire or tape) is also used to secure improved strength or rigidity. Rubber may be used, moreover, as a coating inside steel tanks, to protect them from the action of various acids. Rubber compositions have been used for lining concrete tanks for the storage of corrosive solutions.

PROCESSING

The machinery for processing rubber is of various types. The rubber compositions must be mixed, formed, combined with other materials, fabricated into articles and vulcanized. By far the greatest quantity of materials is handled in the dry state. Some articles, however, utilize rubber materials in the form of rubber solutions (cements) or of water dispersions (latex mixtures or artificial dispersions). For making cements, churns up to 250 gal. capacity are used. They consist essentially of vertical cylinders with a centre, rotating shaft on which are fastened arms to stir the contents of the churn. Stationary arms are usually fastened either to the cylinder walls or top of the mixer. The rubber or rubber compound is placed in the churn with a small amount of solvent, benzene (benzol) or gasolene, and the centre shaft driven by power. A heavy dough of the rubber swelled with the solvent first forms. Additional quantities of the solvent are added in small increments, each blending with and thinning the mixture in the churn before the addition of the next, until a cement of the desired consistency is obtained. Considerable heat is generated in the early stages of the process and tight lids must be provided to avoid loss of solvent by evaporation. Tightly closed internal mixers which handle the rubber cement in the form of thick doughs have very recently come into use for making cements, with great economy in consumption of power and avoidance of solvent losses. The viscosity of a definite composition of cement of milled rubber decreases with the time of milling, up to a certain point. Conversely, when milled rubber is used more of it must be incorporated into a fixed quantity of solvent to obtain a cement of definite viscosity. Therefore, for spreading purposes, when it is desired to apply as much rubber as possible with a minimum quantity of solvent, milled rubber mixtures are used. When strong adhesion is required, on the other hand, the rubber is milled as little as possible.

Spreading.—The fabric is drawn over a roller under a spreader knife which can be set at varying distances from the roll carrying from a cement feed a thin layer of the cement, and then over steam heated pipes to evaporate the solvent. This process is repeated until the required thickness of rubber coating is built up. By this method the rubber surfacing is applied to nursery and hospital sheetings, printers' blankets for offset work, and similar products. Thin coatings similarly applied are used to improve the adhesion to fabric of rubber layers later applied on a calender. Cements applied by brushing are extensively used in the manufacture of rubber articles, notably footwear.

Washing.—Some grades of rubber—wild varieties and low-grade plantation rubber—must be washed to remove sand, bark, or other impurities, before they can be utilized in the manufacture of rubber goods. For this purpose mechanical washers are used. The ordinary two-roll washer is the commonest type (fig. 1). The rubber is first formed into a relatively thick sheet by passing through a "cracker," a small mill with coarsely corrugated rolls. No water is used on the rubber in this operation. It is then passed repeatedly between more finely corrugated rolls on a washer while a stream of cold water plays over it, loosening the dirt and washing it into the sewer. Finally the rubber is sheeted out thin on a similar washer with the rolls set close together,—the "finisher."



BY COURTESY OF THE GOODRICH RUBBER CO.

FIG. 1.—TWO-ROLL RUBBER WASHER

The rubber is ready for the drier after leaving the "finisher." Another type is the internal washer illustrated in fig. 2. In this machine the rubber is torn into numerous small chunks which are shredded between the rolls and the walls of the machine. It is said to be more rapid in its action than the two-roll washer.

Drying.—After washing, rubber must be dried before it is used in the mixing operation. Three methods of drying are in common use, forced drying, vacuum drying and humidified air drying. Forced drying consists in forcing air at 90° to 100° F through chambers in which sheets from the washers are suspended from wooden rods. The time of drying varies from 2 to 12 days, dependent upon the kind of rubber and the purpose for which it is to be used. Vacuum drying consists of heating the sheeted rubber laid in pans on steam plates in a vacuum chamber. Time and temperature of drying vary. High-grade plantation rubber

will dry in 2½ hr. under a vacuum of 27 in. with steam in plates at 281° F. Ordinary vacuum drying units will accommodate 2,500 lb. per charge. Humidified air drying is secured by circulating air at a relative humidity of 30% to 35% at 170° F through a chamber containing rubber in trays placed in racks. In a unit of 50,000 lb. capacity the rubber will dry in 12 to 14 hours under these conditions. Reclaimed rubber comes to the rubber goods manufacturer in dry condition. In rare cases it is dried in a vacuum drier at low temperature, 240° to 260° F. Damp pigments are easily dried by storage in a hot room at 160° to 170° F for 10 to 15 hours. Oils, waxes, tars and other fusible materials may be readily dried by holding them in the melted state at 250° to 270° F for a few hours. Fabric is dried by passing over a series of heated rolls or plates. These are known as "drum" ("can") driers or "shelf" driers. The fabric is passed through the driers at the rate of 35 yd. to 55 yd. per minute. Two passes through the drier are necessary for ordinary belt fabrics and in exceptional cases three or more passes are required.

FIG. 2.—INTERNAL RUBBER WASHER (16"X40")

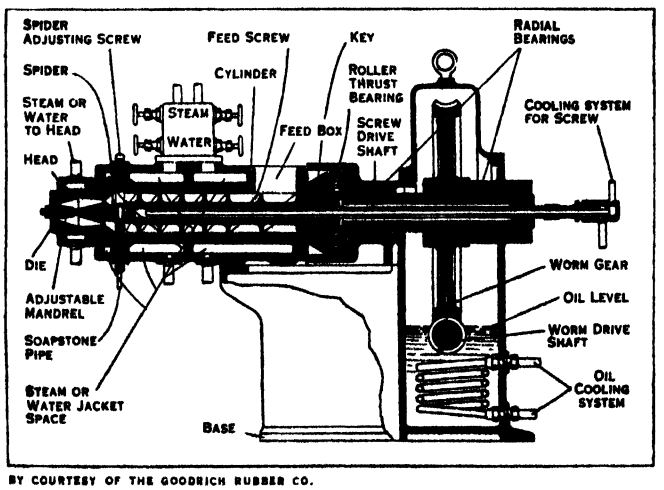
Cracking and Grinding.—Fairly large quantities of vulcanized rubber waste are used in cheap articles without treatment by any chemical reclaiming process. Preparation for incorporation in rubber mixtures is carried out on grinders consisting of two horizontal rolls of different diameters, the larger rotating with peripheral speed about three times as rapidly as the smaller. The rolls are set tight together and coarsely pulverized material fed into the machine. The small clearance between the rolls and the great difference in surface speed produce a powerful grinding action. The material is passed between the rolls repeatedly until sufficiently fine for use. To facilitate handling of the material, fluxes,—pine tar, pitches or rubber,—may be run through with the vulcanized scrap during the last few passes. This causes the material to form a sheet. A cracker, similar to that used in washing but having only one roll corrugated, is used for breaking up large masses of vulcanized rubber and similar waste rubber material in preparation for the grinders. Hard rubber dust is employed very extensively in the preparation of various ebonite mixtures.

Mastication of Rubber.—Rubber is softened permanently by repeated passages between cool mill rolls. In order to reduce labour cost, large quantities of rubber are milled in preparation for the mixing operations in which they are blended with other materials. Masticating is performed on mixing mills to be described later. In order to secure better dispersion of material or to prevent loss of ingredients used in small quantities in a mixture, master batches containing rubber or reclaimed rubber mixed with pigments,—especially colours,—or with accelerators are prepared ready for the regular mixing operation.

Mixing.—The mixing operation is the most important of all through which the rubber compositions pass in the fabrication of goods. In fact, proper running in all subsequent operations depends upon the mixing operation having been properly performed. Mixing mills vary in size from 24 in. to 84 in. in width. The 84 in. mills are the largest in common use. They consist of two parallel, horizontal rolls set close together side by side and revolving in opposite directions. The back roll is fixed in position and geared directly to a drive shaft; the front roll is floating. The clearance between the rolls is adjustable by means of set screws near the ends of the front roll. Rolls are made of cast iron with chilled surface. The rolls of 84 in. mills are 24 in. or 26 in. in diameter, cast hollow and fitted for service with internal perforated pipes for the introduction of cooling water. Large quantities of heat are generated in the milling of rubber materials and this must be rapidly carried off to prevent vulcanization during the mixing operation (scorching). Cooling water from 50° to 55° F is desirable. The safety device for stopping mills in emergencies consists of a magnetic clutch opened instantly with the breaking of the magnetizing circuit and a magnetic brake on the line shaft actuated by a weighted arm held in position by an electromagnet wound from the same circuit as the clutch.

The methods of mixing are complicated and dependent upon the materials to be blended. In general, the rubber materials are softened on the mill rolls first and the softeners and powdered ingredients added only after the rubber is plasticized to a smooth sheet on the roll. The procedure for batches containing crude rubber is somewhat different from those using reclaimed rubber only. It is essential, however, in all cases, that all parts of the batch be uniformly blended. This blending is secured by cutting the sheet on the mill roll with a sharp knife, beginning at one end and rolling it on itself until the sheet has been cut almost entirely across. The roll thus formed is permitted to sheet out again on the mill and the process repeated in the opposite direction. This is repeated six or seven times to secure uniform mixtures. Mills of 84 in. face will mix batches from 150 to 300 lb. in 25 to 40 minutes. Several types of internal mixers have been introduced as improvements over mills for mixing purposes. Machines of 600 to 1,000 lb. capacity are in common use. Batches mixed in internal mixers run hotter than on mills and it is often necessary to mix the sulphur separately on mills to avoid danger of scorching.

Calendering.—Calenders of various types and sizes are used in the rubber industry. The usual type is the three-roll calender, consisting of three rolls of equal diameter mounted vertically one above the other. The centre roll is direct-driven and the top and bottom rolls may be run at the same speed or at slower speeds than the middle roll. At one side of the calender the three rolls are geared together with pinions of the same diameter, at the opposite end of the rolls the pinion on the centre roll is smaller than those on the top or bottom rolls. Calender rolls are bored and ground true on their bearings to insure uniform wall thickness to resist the mechanical pressures and the heating and cooling to which they are subject in service. The middle roll is usually a true cylinder, the upper roll convex and the bottom roll either straight or concave. The "crown" of the upper roll varies from ·005 in. to ·008 in. depending upon the service, and the concavity of the lower roll from ·002 in. to ·004 inches. The distance between rolls is adjustable to suit various operating demands. Three kinds of operations are performed on calenders—sheeting, frictioning and coating.



Sheeting.—Rubber is sheeted on calenders by feeding between the upper two rolls material previously plasticized on a mill. The rubber sheet passes half-way round the middle roll and is removed and wound in rolls with cloth (liners) to prevent the layers from adhering. All but extremely thin sheets are ordinarily run in plies. One ply is sheeted and wrapped in a liner. To add a second ply the first ply with its liner passes between the lower two calender rolls, meeting and adhering to the second ply as it runs from the calender. This process may be repeated so that the final sheet consists of three, four or even more layers. The top roll may run at the same speed as the middle roll or slower, depending upon the quality of the rubber stock or the quality demanded of the product. Sheeting calenders are run from 10 to 30 yd. per minute, driven by variable speed, direct current motors. Calenders 100 in. wide with rolls 30 in. in diameter are the largest used in the industry. Sheets varying in thickness from point to point and sheets with specially embossed surfaces are also run on calenders. Treads for pneumatic tyres and soles and uppers for footwear are examples of such sheets. Footwear calenders are four-roll machines. The engraved or embossed rolls are mounted in such a manner that they are quickly removable and replaceable. As many as 50 rolls bearing different designs are used in a day's run of shoe stocks.

Frictioning.—Frictioning consists in squeezing rubber into cloth as it passes between the lower two calender rolls carefully

adjusted to permit the cloth to pass between them without additional clearance. The rubber is fed between the upper two rolls, passes in a thin sheet around the middle roll, meeting the fabric as it passes between the lower two. The rubber is thus forced into the meshes of the cloth, but, because of its high viscosity, little penetration into the threads around the fibres is secured. The frictioning process may be repeated on the opposite side of the fabric. In the frictioning operation the lower roll is always run slower than the middle roll. Before frictioning, the fabric is dried as described above and delivered hot to the calender. Frictioning speeds vary from 7 to 40 yd. per minute.

Coating.—Coating consists in laying a sheet of rubber composition on bare fabric or on fabric which has been previously frictioned or spread. As in the frictioning operation, the rubber stock is fed between the upper two rolls and the fabric passes between the lower two. For coating, however, the lower two rolls must run at the same speed. The rubber sheet passing around the centre roll is pressed firmly against the cloth as it passes through the calender but is not forced completely through the meshes of the fabric as in frictioning. Coating calenders run at speeds of 10 to 40 yd. per minute. Shoe linings and facing cloth are coated without previous frictioning. Combined operations of frictioning and coating are frequently applied to the same fabric; *i.e.*, frictioned two sides and coated one side, frictioned one side and coated two, etc.

Tubing Operations.—Tubing machines, or extruding machines, are devices for forcing continuous strips of rubber from a die. These strips may be tubular, rectangular, or any one of a great variety of irregular cross-sectional shapes. The tubing machine consists of a horizontal cylinder in which a power-driven screw rotates, forcing the rubber stock through a die inserted at the end of the machine. Fig. 3 shows the essential features of tubing machine design. They are used for the production of tubing, hose tubes, pneumatic tyre treads, solid tyre treads, inner tubes for pneumatic tyres, channel rubber slides for the windows of automobiles and many other articles. By special setting of the die and mandrel and regulation of the rate of extrusion, tubes may be made to leave the machine not in straight lengths but in curves. Specially designed tubing machines are used for extruding tubes of one colour striped with rubber compositions of another colour. Tubing machines are designed, also, to apply a tube directly on

BY COURTESY OF THE GOODRICH RUBBER CO.

FIG. 3.—TUBING MACHINE

poles fed through a hollow screw, or for covering hose run through the head at right angle to the axis of the screw.

Vulcanization (Curing).—Before vulcanization, rubber is weak, softened by moderate heat, rendered stiff by cold, soluble in gasolene or benzol, and easily plasticized and sheeted between warm rolls. After vulcanizing it is strong, not greatly softened by heat nor stiffened by cold, insoluble in gasolene, and will crumble if run between rolls. Unvulcanized rubber is easily deformed to assume new shapes permanently; vulcanized rubber returns to its original form after deformation. Hot vulcanization, the process most generally used, is brought about in a number of ways.

Mold Cures.—Many articles are given their final form and vulcanized at the same time by application of heat and pressure to the rubber material in metal molds. Pneumatic and solid tyres are placed in engraved molds which are then stacked one above the other in a vertical cylindrical heater fitted with an hydraulic ram. When the molds are all loaded on the plate at the top of the ram a cover is firmly fixed on the vulcanizer and the stack of molds pushed by hydraulic pressure against the cover. Steam is admitted into the vulcanizer around the molds. The heat softens the rubber compositions, which flow into the depressions in the molds to form the tyre with its special tread design and its lettering, and, as the temperature rises, causes vulcanization to occur. After vulcanization is complete the steam is blown off, the molds are cooled with water, the ram is lowered, the cover of the vulcanizer removed, and the ram again slowly raised as the molds are removed one by one. Pneumatic tyre vulcanizers 54 in. in diameter, 17 ft. high, with a 14 ft. ram stroke, take from 12 to 32 molds in each heat. Pneumatic tyres are cured from 50 min. to 225 min., depending upon size. Solid tyres are cured in much longer periods,—from three to eight hours.

Press Curing in Molds.—Presses consist of parallel-faced, steam-heated plates between which are placed metal molds in which the articles are formed. Pressure between the plates is secured, as in heater molding, by hydraulic pressure, but the article receives its heat only by transfer through the hollow metal plates and through the metal molds. Steam does not come into direct contact with the molds. The platens may be rectangular plates cast hollow or may be bored with a series of cylindrical channels through which the steam passes. Originally, presses contained but two steam-heated plates. More recently several plates one above the other, with molds between adjacent plates, are used. Hollow articles, such as syringe bulbs and tennis or toy balls, are vulcanized in molds. The rubber is forced against the metal mold by internal steam or air pressure or by nitrogen formed by heating pellets of a mixture of sodium nitrite and ammonium chloride inserted inside the article before vulcanization. Sheets of sponge rubber are vulcanized between plates separated to permit the composition to expand, as bicarbonate of soda or other blowing agent incorporated in it forms bubbles of gas on heating. Sponge rubber blown to twice the thickness of the unvulcanized sheet is said to have a "100% blow," to three times the thickness, a "200% blow," etc. Special presses are made for curing long belts, a section of 20 to 36 ft. being cured at one time, and the belt moved and another section vulcanized.

Lead Coating for Curing.—Garden hose made in long lengths, formerly cured in a manner similar to that used for belts, is now commonly cured by an entirely different method. The assembled hose is run through a lead press and covered with a lead sheath. A 500 ft. length thus covered is wound on a drum and water connections leading outside the heater are made at both ends. A number of the drums are placed side by side in a horizontal, cylindrical vulcanizer and hot water under pressure run through the hose, while steam is admitted to the vulcanizer. In this manner heat is applied simultaneously from both sides of the rubber structure and the internal water compacts the hose against the lead sheath. The lead covering is stripped, melted and used again for covering. The lead covering method may be also applied to other articles such as buggy tyres.

Open Steam Curing.—Articles which require no further forming than is produced in building operations may be vulcanized without enclosure in molds. Steam is permitted to come into contact either with the bare goods or with wet fabric wrappings around them. Tubes of stationers' band stock are hung on metal rods placed in a horizontal heater and vulcanized by steam coming into direct contact with the rubber. Air brake hose is built on mandrels, wrapped tightly with wet cloth and vulcanized by steam directly surrounding the wrapped hose. Pressure may be applied during vulcanization in open steam to articles built on hollow forms. Boots and shoes, for example, built on hollow, perforated lasts, each of which is connected in the vulcanizer with a vent to

the atmosphere, receive from the steam around them not only the heat necessary for vulcanization, but mechanical pressure which forces out the air between the shoes and the forms and between the separate pieces composing the goods.

Water Curing.—Some rubber goods are cured immersed in hot water under pressure. The pressure may be equal to or greater than that of saturated steam at the same temperature. In recent years inner tubes for pneumatic tyres have been extensively cured under water at 150 lb. pressure at 280° F. This treatment compacts the rubber against the forms on which the tubes are built and practically eliminates defects due to expansion of air trapped in the rubber structure. Rubber sheet to be cut into thread is wrapped with wet cloth on drums, covered with a vulcanized rubber sheet and cured under water.

Air Curing.—Varnished footwear and shoes containing wool fabrics have long been cured by heating in air. Originally the goods were heated simply by air at atmospheric pressure rising from steam pipes in the bottom of a large chamber holding several cars. Several hours were required for these cures. More recently, horizontal vulcanizers have been used of the same construction as open steam vulcanizers. The air is circulated under pressure by pumps and is heated before it enters the vulcanizer. This method not only shortens the time of vulcanization but improves the quality of the rubber compositions. By use of perforated lasts vented to the atmosphere outside the heater, or by connecting the vents with vacuum pumps, differential pressure outside and inside the lasts is secured, with a beneficial compacting of the goods against them. Litharge used in rather large proportions was once considered necessary to produce vulcanization of "dry heat" compositions. Nowadays organic accelerators have been found more effective and much cheaper. Auto topping, sheetings and other goods are also cured in air. Carbon dioxide has been used instead of air on the theory that it would prevent deterioration of the rubber caused by the action of oxygen in the air. It has not, however, found general commercial application.

Combination Air and Steam Curing.—Rubber goods which stain when vulcanized in open steam by the usual procedure have been cured by first warming in air and then introducing steam. This reduces or eliminates condensation of water on the surface of the goods and prevents staining.

Sulphur Chloride Curing.—Vulcanization by means of sulphur mono-chloride (S_2Cl_2) may be carried out as "cold vulcanization" in solutions of this agent or by passing the vapour around the goods in a vulcanizing chamber. Cold vulcanization is used for thin articles, such as surgeons' gloves and finger cots. The articles are made by repeated dipping of forms in a rubber cement, allowing the solvent of the cement to evaporate after each dip. When the desired thickness is attained, the vulcanization is secured by dipping the articles on the forms into a 2% to 3% solution of sulphur chloride. This process of vulcanization was discovered by Alexander Parker, of Birmingham, England, in 1846. Sulphur chloride is used also in vapour form for curing gloves, dental dam, or dress-shield stock. The goods are placed in a closed vulcanizing room and the sulphur chloride vapour, produced by warming the liquid, is allowed to act on them. To remove excess curing agent, ammonia gas is introduced into the room before the goods are removed.

Another special method of cold vulcanization is the Peachey process, devised and patented by Stanley J. Peachey, of London. This process consists in exposing the rubber goods to sulphur dioxide gas for a definite time, followed by exposure to hydrogen sulphide gas. Sulphur is liberated by the action of the hydrogen sulphide upon the sulphur dioxide held in the goods from the first treatment. This sulphur, liberated in a finely divided and extremely active condition, causes vulcanization to take place at ordinary temperatures. The commercial applications of this process are of necessity limited to thin rubber articles.

PROPERTIES OF VULCANIZED RUBBER

Relatively little rubber is used in the unvulcanized state. Rubber cements for adhesive purposes, sealing can ends, surgical adhesive tape, electrical insulating tape (either all rubber or rubberized fabric) and crepe-soled footwear are among the most important uses of unvulcanized rubber. By skilful compounding of rubber with other materials the properties of vulcanized rubber may be varied to meet a great diversity of conditions of service and the applications of vulcanized rubber compositions in promoting human comfort, health and pleasure. Economic processes now number many thousands. Probably the outstanding property which has been secured in vulcanized rubber compositions is resistance to abrasive wear. Their superiority for this purpose has long been utilized in vehicle tyres, heels and soles, and in conveyor belts for carrying ore, sand, gravel, coal and even broken glass trimmings (cullet) in glass works. More recently, gravel chutes, grinding mills and mixers for abrasive materials have been lined with rubber. Flexibility, combined with one or more of other desirable properties, renders rubber goods superior to metal or other materials under certain conditions of service for equipment to convey gases or liquids, for invalid or operation cushions, and for many other purposes. Pneumatic tyres, hose of various kinds, valve discs, paper machine rolls, clothes wringer rolls, rubber stoppers, insulated wire, universal joint parts, nursing nipples and milking machine parts may be mentioned as articles in which flexibility adds to the usefulness of the product.

Extensibility of rubber has been utilized as the dominantly valuable property in stationers' bands and in elastic webbing. Soft rubber compositions vary in extensibility to the breaking point, according to composition, up to 1,000% of the original length. Hard rubber compositions ordinarily stretch not over 20%. Absorption of shock is a valuable property in vehicle tyres, in shock-absorber cord for aeroplanes, in engine supports and shackles for automobiles, in heels, in matting and flooring and in steam hammer cushions. Resistance to diffusion of gases is utilized in air brake hose, balloons, vacuum hose, football bladders, tennis balls, jar rings for preserving foods, sealing of cans, gas masks for mines or chemical plants and in air mattresses and pillows. Waterproofness is one of the properties of rubber first recognized and adapted to human needs, even before vulcanization was discovered. Coats, capes, hats, footwear, gloves, aprons, diving clothing, bathing caps, hose, dental dam, etc., find their value in this property. On dry surfaces rubber exhibits an enormously high frictional resistance. Advantage is taken of this property in transmission belting, which transmits power satisfactorily under many conditions where leather belting can not be used, in pulley lagging for belt drives and for band saws, tyres, pencil erasers, non-slip footings for ladders and flooring. On wet surfaces, on the other hand, rubber compositions give rather low frictional resistance. This has led to the development of rubber bearings for propellor shafts and for deep well pumps where oil lubrication is difficult. Sealing rings in hydraulic pumps not only run with low frictional resistance but deliver water with greater operating efficiency. Rubber has replaced metal or lignum vitae for bearings in installations where silt in the water has caused rapid wear, rubber resisting the cutting action of the silt or sand far better than the other materials.

The electrical resistance of soft rubber insulation is well recognized. Gloves, rubber shoes of special construction and protective blankets for linemen are also serving useful purposes in the electrical industry. Hard rubber compositions are also used extensively for electrical purposes. Telephone receivers, many parts of telephone station equipment, insulators, plugs and sockets, storage battery containers, and many other articles are made of hard rubber. The heat conductivity of rubber is only about $\frac{1}{300}$ the conductivity of steel. Therefore, at temperatures not so high as to cause decomposition, it is a good heat insulator. Rubber-lined pipe for carrying hot distilled water has been used in preference to non-corrosive metal covered with heat insulating pipe lagging. Hard rubber sponge is an excellent heat insulator but its relatively high cost limits its use for this purpose. Resilience of rubber lends value in connection with some of the other properties already enumerated. Tyres, valve discs, universal joint equipment, nursing nipples, milking machine cups, golf balls, tennis balls, elastic webbing and aeroplane shock-

absorber cord, already mentioned, would be of little value if they were not resilient as well as possessing the other properties under which they are listed. Rubber compositions are used for resisting solvent or chemical action of many substances. Car-heating hose for railroad trains and steam hose for many industrial purposes, steam packing for flanged pipe joints or digestor heads exemplify the value of rubber in resisting the action of steam. Air hose, distillate (petroleum) hose and printing press rolls of rubber illustrate its use for resisting oil. Railroad and storage tanks lined with rubber are used for muriatic acid in any strength, for dilute sulphuric or phosphoric acids, and for aluminium sulphate solutions. Belts are used in canneries for carrying food products of various kinds and also in creameries where it is necessary to use rubber covers resistant to butter fat. Salt solutions of many kinds, which corrode metal, can safely be handled in rubber-lined equipment. Rubber-lined pipes and valves are now produced, permitting the installation of apparatus rubber-lined throughout. Hard rubber pumps, pipes and fittings, and metal apparatus lined with hard rubber serve the chemical industry for certain types of service where soft rubber is unsatisfactory. Hard rubber may be used at higher temperatures than soft rubber and will resist greater concentrations of corrosive materials. The tensile strength of soft rubber materials based on dimensions before stresses are applied will vary according to composition up to 4,500 lb. per square inch. Hard rubber compositions vary from 1,000 to 10,000 lb. per square inch. As already mentioned, however, rubber may be combined with other materials to secure articles of greater strength.

SYNTHETIC RUBBER

Synthetic rubber of properties and cost comparable with the natural product has long been sought. Laboratory studies produced rubber-like materials by polymerization of isoprene, dimethyl butadiene and other dienes, but it was not until 1916, when the Germans were unable to secure natural rubber, that a synthetic product was made for commercial use. Two varieties were made, methyl rubber *W* (*weich*) for soft rubber goods, and methyl rubber *H* (*hart*) for hard rubber compositions. Their method of production utilized lime and coke as the primary materials. These were heated in the electric furnace to form calcium carbide, which by the action of water yielded acetylene. Under proper conditions this reacted with water to form acetic acid. The other steps involved the formation in sequence of calcium acetate, acetone, pinacone and dimethyl butadiene by well-known chemical reactions. The dimethyl butadiene polymerized hot (five months at 70° C) yielded methyl rubber *W*, and polymerized cold (three months at 30° C) the methyl rubber *H*. Only about 2,400 tons were thus produced and manufacture of the products was discontinued as soon as natural rubber again became available. Synthetic rubbers deteriorate rapidly in air and must be preserved with antioxidants. The properties of the vulcanized mixtures lack the snap and resilience of those produced from natural rubber. There is no essential reason, from the commercial viewpoint, for demanding that synthetic rubber should have the same composition as the natural product. The production, at sufficiently low cost, of a product of proper *physical* properties is essential for ready adoption by the industry.

(J. W. Sc.)

RUBBER ACCELERATORS are substances which increase the rate or lower the temperature of the vulcanization of rubber (*see* RUBBER: PRODUCTION AND MANUFACTURE).

RUBBER SHOES. The manufacture of indiarubber galoshes, shoes, fishing boots, etc., forms an important branch of the indiarubber industry, especially in America, where rubber overshoes, colloquially known as "rubbers," are extensively worn, and where one factory alone produces fully 12,000 different styles and sizes. So far back as 1831 the Roxbury India Rubber Company was constituted to work the discovery that indiarubber dissolved in turpentine and mixed with lampblack formed a varnish which gave a hard waterproof surface when applied to leather, but the process failed because the varnish melted with heat and cracked with cold. This defect was remedied by Charles Goodyear (1800–60), who found that when sulphur was combined with the rubber by the aid of heat the product ("vulcanized rubber") was not only stronger but retained its elasticity through a wide range of temperature. His discovery, made in 1839, was the foundation of various American rubber industries including that of rubber boots and shoes. Guttapercha has also been used instead of leather for the outer soles of boots. Rubber footwear is manufactured from a combination of rubber and fabric parts. The U.S. census report for 1925 gives the following data for the industry in the United States: Rubber boots produced, 4,739,423 pairs; rubber shoes and overshoes, 52,338,782 pairs; rubber-soled canvas shoes, 24,999,932 pairs; with a total value of about $120,000,000.

RUBBER TYRE MANUFACTURE: *see* TYRE.

RUBBLE, broken stone, of irregular size and shape. This word is closely connected in derivation with "rubbish," which was formerly also applied to what we now call "rubble."

"Rubble-work" is a name applied to several species of masonry (*q.v.*). One kind, where the stones are loosely thrown together in a wall between boards and grouted with mortar almost like concrete, is called in Italian *muraglia di getto* and in French *bocage*.

RUBELLITE, a red variety of tourmaline (*q.v.*) used as a gem-stone. It generally occurs crystallized on the walls of cavities in coarse granitic rocks, where it is often associated with a pink lithia-mica (lepidolite). The most valued kinds are deep red; the colour being probably due to the presence of manganese. Some of the finest rubellite is found in Siberia. The mills at Ekaterinburg, where it is cut and polished, draw most of their supplies from the Urals—chiefly from Mursinka, Sarapulskaya and Shaitanka—but specimens are occasionally found at Nerchinsk in Transbaikalia. Burma is famous for rubellite; the pits which yield it are dug in alluvial deposits in the Mönglong valley, some miles to the S.E. of Mogok, the centre of the ruby country. Very fine rubellite is found in the United States, notably at Mount Mica, near Paris, Oxford Co., Maine, where the crystals are often red at one end and green at the other. Mount Rubellite, near Hebron, and Mount Apatite at Auburn, are other localities in the same State from which fine specimens are obtained. Chesterfield and Goshen, Mass., also yield red tourmaline, frequently associated with green in the same crystal. Pink tourmaline also occurs, with lepidolite and kunzite, in San Diego Co., California. In Europe rubellite occurs sparingly at a few localities, as at San Piero in Elba and at Penig in Saxony.

RUBENS, PETER PAUL (1577–1640), Flemish painter, was born at Siegen, in Westphalia, on June 29, 1577. His father, Johannes Rubens, a druggist, although of humble descent, was a man of learning, and councillor and alderman in his native town (1562). A Roman Catholic by birth, he adopted the Reformed faith, and we find him spoken of as *le plus docte Calviniste qui fust pour lors au Bas Pays*. After the plundering of the Antwerp churches in 1566, Johannes Rubens hastily quitted Spanish soil, ultimately settling at Cologne (October 1568) with his wife and four children.

Here he became legal adviser to Anne of Saxony, the second wife of the prince of Orange, William the Silent. Before long it was discovered that their relations were not purely of a business kind. Rubens was imprisoned at Dillenburg for two years, and after that he was confined to the small town of Siegen. Here he lived with his family from 1573 to 1578, and here Maria Pypelincx gave birth to Peter Paul. A year after (May 1578) he returned to Cologne, where he died on March 18, 1587.

Rubens went to Antwerp with his mother when he was scarcely ten years of age. He was an excellent Latin scholar. Part of his boyhood he spent as a page in the household of the countess of Lalaing at Audenarde but soon his mother allowed him to follow his proper vocation, choosing as his master Tobias Verhaecht, a landscape painter. From 1592–96 he worked under Adam Van Noort, whose aspect of energy is well known through Van Dyck's beautiful etching, the highly esteemed master of numerous painters —among them Jordaens, later his son-in-law. Rubens thereafter studied under Otto Vaenius of Van Veen, a gentleman by birth

and a court painter to archduke Albrecht, sovereign of the Spanish Netherlands. In 1598, Adam Van Noort acting as dean of the Antwerp gild of painters, Rubens was officially recognized as "master." His style at this early period may be judged from the "Annunciation" in the Vienna Museum.

Italian Period.—From 1600 to the latter part of 1608 Rubens belonged to the household of Vincenzo Gonzaga, duke of Mantua. The duke, who spent some time at Venice in July 1600, had his attention drawn by one of his courtiers to Rubens's genius, and induced him to enter his service. The influence of the master's stay at Mantua was of extreme importance to his artistic development. Sent to Rome in 1601, to take copies from Raphael for his master, he was also commissioned to paint several pictures for the church of Santa Croce, by archduke Albrecht. "St. Helena with the Cross," "The Crowning with Thorns" and "The Crucifixion" are to be found in the hospital at Grasse in Provence.

At the beginning of 1603, "The Fleming," as he was termed at Mantua, was sent to Spain with a variety of presents for Philip III. and his minister the duke of Lerma, and thus had opportunity to spend a whole year at Madrid and become acquainted with some of Titian's masterpieces. Among his own works, known to belong to the same period, in the Madrid Gallery, are "Heraclitus" and "Democritus." Of Rubens's abilities so far back as 1604 we get a more complete idea from an immense picture now in the Antwerp Gallery, the "Baptism of Our Lord," originally painted for the Jesuits at Mantua. Here may be seen the influence of Italian surroundings on the painter. Vigorous in design, he reminds us of Michelangelo, while in decorative skill he seems to be descended from Titian and in colouring from Giulio Romano. Executed simultaneously with this picture, were "The Transfiguration," now in the museum at Nancy, and the portraits of "Vincenzo and his Consort, kneeling before the Trinity," in the library at Mantua. To 1606 belong a large altar-piece of "The Circumcision" at St. Ambrogio at Genoa, the "Virgin in a Glory of Angels," and two groups of Saints, painted on the wall, at both sides of the high altar in the church of Santa Maria in Valicella in Rome.

Return to Antwerp.—While employed at Rome in 1608, Rubens received alarming news of his mother's health. He at once set out for the Netherlands. When he arrived in Antwerp, Maria Pypelincx was no more. His wish to return to Italy was overruled by the express desire of his sovereigns, Albrecht and Isabella, to see him take up a permanent residence in the Belgian provinces. On Sept. 23, 1609, Rubens was named painter in ordinary to their Highnesses, with a salary of 500 livres, and "the rights, honours, privileges, exemptions," etc., belonging to persons of the royal household, not to speak of the gift of a gold chain. Not least in importance for the painter was his complete exemption from all the regulations of the gild of St. Luke, entitling him to engage any pupils or fellow-workers without being obliged to have them enrolled—a favour which has been of considerable trouble to the historians of Flemish art. By order of the municipality he painted the first among the numerous repetitions of the "Adoration of the Magi," a picture in the Madrid Gallery, measuring 12 ft. by 17, and containing 28 life-size figures, many in gorgeous attire, warriors in armour, horsemen, slaves, camels, etc.

Apart from his success, another powerful motive had helped to detain the master in Antwerp—his marriage with Isabella Brant (Oct. 13, 1609). Many pictures have made us familiar with Isabella. We meet her at The Hague, Leningrad, Berlin, Florence, but more especially at Munich, where Rubens and his wife are depicted at full length on the same canvas. "His wife is very handsome," observes Sir Joshua Reynolds, "and has an agreeable countenance"; but the picture, he adds, "is rather hard in manner." This, it must be noted, is the case with all those pictures known to have immediately followed Rubens's return, when he was still dependent on the assistance of painters trained by others than himself. Even in the "Raising of the Cross," now in the Antwerp cathedral, and painted for the church of St. Walburga in 1610, the dryness in outline is striking. The picture is tripartite, but the wings only serve to develop the central composition, and add to the general effect. In Witdoeck's beautiful engraving the partitions disappear. Thus, from the first, we see Rubens quite determined upon having his own way, and it is recorded that, when he painted the "Descent from the Cross," "St. Christopher," the subject chosen by the Arquebusiers, was altered so as to bring the artistic expressions into better accordance with his views. Although the subject was frequently repeated by the great painter, this first "Descent from the Cross" has not ceased to be looked upon as his masterpiece. Begun in 1611, the celebrated work was placed in 1614. Rubens received 2,400 florins for this picture. In many respects, Italian influence remains conspicuous in the "Descent from the Cross." Rubens had seen Ricciarelli's fresco at the Trinità de' Monti, and was also acquainted with the grandiose picture of Baroccio in the cathedral of Perugia. But in Rubens strength of personality could not be overpowered by reminiscence; and the "Descent from the Cross" may be termed thoroughly Flemish.

If Sir Dudley Carleton could speak of Antwerp in 1616 as *Magna civitas, magna solitudo*, there was no place nevertheless which could give a wider scope to artistic enterprise. Spain and the United Provinces were for a time at peace; almost all the churches had been stripped of their adornments; monastic orders were powerful, and corporations eager to show the fervour of their Catholic faith, now that the "monster of heresy" seemed for ever quelled. Gothic churches began to be decorated according to the new fashion adopted in Italy. Altars magnified to monuments, sometimes reaching the full height of the vaulted roof, displayed, between their twisted columns, pictures of a size hitherto unknown. No master seemed better fitted to be associated with this kind of painting than Rubens. The church of St. Charles, erected by the reverend fathers in Antwerp, was almost entirely the painter's work, and if he did not, as we often find asserted, design the front, he certainly was the inspirer of the whole building. Hitherto no Fleming had undertaken to paint ceilings with foreshortened figures, and blend the religious with the decorative art after the style of those Italian buildings which owe their decorations to masters like Titian, Veronese and Tintoretto. Thirty-nine ceiling-panels were composed by Rubens, and painted under his direction in the space of two years. All were destroyed by fire in 1718.

Rubens delighted in undertakings of the vastest kind. "The large size of a picture," he writes to W. Trumbull in 1621, "gives us painters more courage to represent our ideas with the utmost freedom and semblance of reality. . . . I confess myself to be, by a natural instinct, better fitted to execute works of the largest size." The correctness of this appreciation he demonstrated by a series of twenty-four pictures, illustrating the life of Marie de' Medici, queen-mother of France. The gallery at the Luxembourg Palace, which these paintings once adorned, has long since disappeared, and the complete work is now exhibited in the Louvre. The sketches of all these paintings—now in the Munich Gallery—were painted in Antwerp, a numerous staff of distinguished collaborators being entrusted with the final execution. But the master himself spent much time in Paris, retouching the whole work, which was completed within less than four years. On May 13, 1625, Rubens writes from Paris to his friend Peiresc that both the queen and her son are highly satisfied with his paintings, and that Louis XIII. came on purpose to the Luxembourg, "where he never has set foot since the palace was begun sixteen or eighteen years ago." We also gather from this letter that the picture representing the "Felicity of the Regency" was painted to replace another, the "Departure of the Queen," which had caused some offence. Richelieu gave himself some trouble to get part of the work, intended to represent the life of Henry IV., bestowed upon Cavalier d'Arpina, but did not succeed. The queen's exile, however, prevented the undertaking from going beyond a few sketches, and two or three panels, one of which the "Triumph of Henry IV.," now in the Uffizi Gallery, is one of the noblest works of Rubens or of any master.

Rubens's comprehension of religious decorative art is disclosed in the "Assumption of the Virgin" at the high altar of Antwerp cathedral, finished in 1626. Every outline is bathed in light, so that the Virgin is elevated to dazzling glory. Rubens penetrates

into the spirit of his subjects more deeply than, at first sight, seems consistent with his prodigious facility in execution. The "Massacre of the Innocents," in the Munich Gallery, is a composition that can leave no one unmoved.

Diplomatic Activity.—In the midst of his activity as a painter, Rubens was now engaged on diplomatic business. The truce concluded between Spain and the Netherlands in 1609 ended in 1621; Archduke Albrecht died the same year. His widow wished to prolong the arrangement, still hoping to see the United Provinces return to the Spanish dominion, and in her eyes Rubens was the fittest person to bring about this conclusion. The French ambassador writes from Brussels in 1624—"Rubens is here to take the likeness of the prince of Poland, by order of the infanta. I am persuaded he will succeed better in this than in his negotiations for the truce." But, if Rubens failed to bring about an arrangement with the Netherlands, other events enabled him to render service to the state.

Rubens and Buckingham met in Paris in 1625; a correspondence of some importance had been going on between the painter and the Brussels court, and before long it was proposed that he should endeavour to bring about a final arrangement between the Crowns of England and Spain. The infanta willingly consented, and King Philip acceded on hearing that the negotiator on the English side, Sir Balthasar Gerbier—a Fleming by birth—was likewise a painter. Rubens and Gerbier met in Holland, and Rubens volunteered to go to Spain and lay before the council the result of his negotiations (1628). The nine months then spent at Madrid rank among the most important in Rubens's career. He had brought with him eight pictures as presents from the infanta, and he was also commissioned to paint several portraits of the king and royal family. Philip delighted to see Rubens at work in the studio prepared for him in the palace, where he not only left many original pictures, but copied for his own pleasure and profit the best of Titian's. In Spain Rubens and Velazquez met, to the delight and advantage of both.

The king now commissioned Rubens to go to London as bearer of his views to Charles I., and the painter, honoured with the title of secretary of the king's privy council in the Netherlands, arrived in London just as peace had been concluded with France. He induced Charles to engage in no undertakings against Spain so long as the negotiations remained unconcluded, and he remained immovable in this resolution. The tardiness of the Spanish court in sending a regular ambassador involved the unfortunate painter in distressing anxieties, and the tone of his despatches is very bitter. But he speaks with the greatest admiration of England. On September 23, 1629, the University of Cambridge conferred upon him the honorary degree of master of arts, and on February 21, 1630, he was knighted. During his stay in England Rubens, besides his sketches for the decoration of the Banqueting Hall at Whitehall, painted the admirable picture of "The Blessings of Peace" now in the National Gallery.

Rubens was now fifty-three years of age; he had been four years a widower, and in December 1630 he contracted a second marriage with a beautiful girl of sixteen, named Helena Fourment. She was an admirable model, and often appears in his works.

Later Works.—Rubens's return was followed by an almost incredible activity. Inspired more than ever by the glorious works of Titian, he now produced some of his best paintings. Brightness in colouring, breadth of touch and pictorial conception, are specially striking in these later works. Could anything give a higher idea of Rubens's genius than, for example, the "Feast of Venus," the portrait of "Helena Fourment ready to enter the Bath," or the "St. Ildefonso" in the Vienna gallery?

Isabella died in 1633, and we know that to the end Rubens remained in high favour with her, alike as an artist and as a political agent. The painter was one of the gentlemen she deputed to meet Marie de' Medici at the frontier in 1631, after her escape from France.

Ferdinand of Austria, the cardinal-infant of Spain, the new governor of the Netherlands, arrived at Antwerp in May 1635. The streets had been decorated with triumphal arches and "spectacula," arranged by Rubens. Several of the paintings detached from the arches were offered as presents to the new governor-general, which accounts for the presence of many of these works in public galleries (Vienna, Dresden, Brussels, etc.). The painter was confirmed in his official standing. The last years of his life, however, were employed in working much more for the king than for his brother. About a hundred and twenty paintings of considerable size left Antwerp for Madrid in 1637, 1638 and 1639; they were intended to decorate the pavilion erected at the Pardo, and known under the name of Torre de la Parada. Another series had been begun, when Ferdinand wrote to Madrid that the painter was no more, and Jordaens would finish the work. Rubens breathed his last on May 30, 1640.

Rubens left the world in the midst of his glory. Not the slightest failing of mind or skill can be detected even in his latest works, such as the "Martyrdom of St. Peter" at Cologne, the "Martyrdom of St. Thomas" at Prague, or the "Judgment of Paris" at Madrid, where his young wife appears for the last time.

Rubens was a Fleming throughout, notwithstanding his frequent recollections of those Italian masters whom he most admired. But it must be borne in mind how completely his predecessors were frozen into stiffness through italianization, and how necessary it was to bring back the Flemish school to life and nature. In no other school do we find these animated hunts of lions, tigers, and even the hippopotamus and the crocodile, in which life and nature are displayed with the utmost power. "His horses are perfect in their kind," says Reynolds; his dogs are of the strong Flemish breed, and his landscapes the most charming pictures of Brabantine scenery, in the midst of which lay his seat of Steen. As a portrait painter, he shows Van Dyck the way; and his pure fancy subjects, as the "Garden of Love" (Madrid and Dresden) and the "Village Feast" (Louvre), have never been equalled.

Paintings by Rubens are found in all the principal galleries in Europe.

In America, the Metropolitan Museum of Art contains his "Return of the Holy Family from Egypt," "The Holy Family," and others; the Frick Collection, also in New York City, has his "Ambrose Spinola." The Cleveland Museum of Art contains his "Triumph of the Holy Sacrament over Folly"; the Joseph Widener Collection, Philadelphia, his "Rape of the Sabine Women"; the Detroit Institute of Arts, his "Abigail Meeting David with Presents"; and the Gardner Museum, Boston, his "Thomas Howard, Earl of Arundel."

(H. Hy.; X.)

RUBIACEAE, in botany, a large family of seed plants, belonging to the series Rubiales of the subclass Sympetalae (Gamopetalae) of dicotyledons, and containing about 450 genera with about 5,500 species. It is mainly a tropical family of trees, shrubs and herbs, but some of the tribes, especially Galieae, to which the British representatives belong and which contains only herbs, are more strongly developed in temperate regions; some species of *Galium* reach the Arctic zone.

The most striking characteristic of the family are the opposite-decussate, generally entire, stipulate leaves. The stipules are very varied in form; they generally stand between the petioles of a pair of leaves (interpetiolar). The two stipules of adjacent leaves are usually united, and in the Galieae, as well shown in the British

species, are enlarged and leaf-like, forming with the two leaves an apparent whorl; by fusion or branching of the stipules the number of leaves in the whorl varies from four to eight or more. The flowers are mostly arranged in cymes or panicles or crowded into heads, and are frequently showy. The flowers are hermaphrodite and regular with parts in fours or fives; the four or five sepals, petals and stamens are placed above the ovary, which consists of two carpels and is crowned by a simple style usually ending in a head or in two lobes. The sepals are often small, sometimes reduced to a narrow ring encircling the top of the ovary or altogether absent. The united petals form a corolla which varies widely in form in the different genera; it is often funnel- or salver-shaped. The stamens are fixed to the corolla-tube and alternate in position with its segments; the flowers are often dimorphic (or heterostyled) with short-styled and long-styled forms.

The fruit also varies widely in form and is dry or fleshy. When dry it forms a capsule with septicidal or loculicidal dehiscence or is a schizocarp separating when dry into two one-seeded mericarps which, as in the British cleavers (*Galium Aparine*), sometimes bear hooked appendages which aid their dispersal.

The family is divided into a large number of tribes based on the number of ovules in each ovary-chamber, the character of the fruit seed and ovule, and the aestivation of the corolla. These may be arranged in two classes as follows:—

Cinchonoideae, often woody plants with scale-like stipules, and numerous ovules in each ovary-chamber; the fruit is generally a capsule. To this belong *Cinchona* (*q.v.*), a genus of large trees with handsome flowers containing about 40 species in the Andes of South America—it is well known as a source of quinine. An allied genus, *Bouvardia* (*q.v.*), is cultivated for its flowers.

Coffeoideae, often woody or shrubby plants with scale-like stipules; each ovary-chamber contains only a single ovule. *Coffea*, a genus of shrubs with about 45 species in the Old World tropics, includes the coffee plant (*C. arabica* and *C. liberica*); the fruit is a two-seeded drupe, the seed is the "coffee-bean." The thickened root of *Uragoga Ipecacuanha* yields ipecacuanha. In this class is the tribe *Stellateae*, herbaceous plants with leaf-like stipules; each ovary-chamber contains one ovule only. Includes the four British genera: *Rubia*, one species of which, *R. tinctorum*, is madder; *Galium*, including *G. verum* (lady's bedstraw), *G. Aparine* (goose-grass or cleavers), and other British species; *Asperula*, including *A. odorata* (woodruff) and *Sherardia*.

The most common representatives in eastern North America are *Galium* (cleavers, goose grass, wild licorice, etc.), *Houstonia* (bluets, innocence), and *Mitchella* (partridge berry). In western North America, in addition to a few species of *Galium*, the genus *Kelloggia* is very characteristic.

RUBICON, a small stream of ancient Italy, which flowed into the Adriatic between Ariminum and Caesena, and formed the boundary between Italy and the province of Cisalpine Gaul in Republican times, while Augustus adopted the Marecchia, a few miles farther south. Hence Caesar's crossing of it in 49 B.C. meant a declaration of war against Pompey and the Senate. The historic importance of this event gave rise to the phrase "crossing the Rubicon" for a step which definitely commits a person to a given course of action. Its upper course is represented by that of the Pisciatello (called Rubigone in the 11th or 12th century and now Rugone or Urgone), and its lower portion by the Fiumicino, which the Urgone once joined. The point was marked by a station on the Via Aemilia below their confluence, 12 m. N.W. of Ariminum, bearing the name *ad Confluentes;* and here is still preserved a three-arched bridge.

RUBIDIUM, a metallic element belonging to the group of the alkali metals (symbol Rb, atomic number 37, atomic weight 85·44). It is found in the minerals lepidolite, petalite and in various specimens of mica and of carnallite, and in some mineral waters. It also occurs in tea, cocoa, coffee, tobacco and in the ashes of beetroot. It was discovered by R. Bunsen and Kirchhoff (1860) in the spectroscopic examination of the residues obtained on evaporation of water from a mineral spring at Dürkheim, being characterized by two distinctive red lines. The best source of rubidium salts is the residue left after extracting lithium salts from lepidolite, the method of separation being based on the different solubilities of the platinichlorides of potassium, rubidium and caesium in water. A somewhat similar process based on the varying solubilities of the corresponding alums has also been devised by Redtenbacher (1865). The metal is prepared by distilling the carbonate with carbon (an explosive compound similar to that obtained from potassium and carbon monoxide is liable to be formed simultaneously); by reducing the hydroxide with aluminium: $4RbOH+2Al=Rb_2OAl_2O_3+2Rb+2H_2$; by reducing the carbonate or the hydroxide with magnesium; and by heating the fused chloride with calcium in an exhausted glass tube at 400–500° C. The metal was first obtained electrolytically in 1910 by electrolysing the fused hydroxide in a nickel vessel, with an iron wire cathode and iron cylinder anode; the product on cooling being opened under pyridine cooled by a freezing mixture (G. von Hevesy). It is a silvery white metal which melts at 39° C, boils at 696°, and has a specific gravity of 1·52. It oxidizes rapidly on exposure to air, and decomposes cold water very rapidly. It closely resembles caesium and potassium in its general properties. The rubidium salts are generally colourless, mostly soluble in water and crystallographically are similar to the corresponding potassium and ammonium salts, especially the latter. The acid tartrate is very sparingly soluble.

Rubidium hydride, RbH, was obtained in the form of colourless needles by H. Moissan from the direct combination of its constituent elements. It rapidly dissociates when heated *in vacuo* to 300° C. Several oxides have been described; the composition depends upon the conditions of oxidation and is doubtful in the case of Rb_2O and Rb_2O_3 but is well substantiated for Rb_2O_2 and Rb_2O_4. Rubidium hydroxide, RbOH, is a colourless solid which is formed by the action of rubidium on water, or by the addition of baryta water to a solution of rubidium sulphate. It is readily soluble in water, the solution being very alkaline and caustic. It melts at 301°. Evaporation of the aqueous solution at 15° C deposits a crystalline hydrated hydroxide of composition $RbOH·2H_2O$. Rubidium chloride, RbCl, is formed on burning rubidium in chlorine, or on dissolving the hydroxide in aqueous hydrochloric acid. It crystallizes in colourless cubes and volatilizes when heated very strongly. It is soluble in water and combines with many metallic chlorides to form double salts.

RUBINSTEIN, ANTON GRIGOROVICH (1829–1894), Russian pianist, born of Jewish parentage on Nov. 28, 1829 at Wechwotynetz, Podolia, was the son of a pencil manufacturer who migrated to Moscow. Besides his mother Anton had but one teacher, the piano master Alexander Villoing, of whom he declared at the end of his own career that he had never met a better. In July 1838 Rubinstein appeared in the theatre of the Petrowski Park at Moscow; and in the following years in the principal centres of Europe, including London. He then studied in Berlin and Vienna. The years 1848 to 1854 were spent in St. Petersburg in performing and composing. His opera *Dmitri Donskoi* was produced there in 1851, and *Toms der Narr* in 1853. *Die Sibirischen Jäger,* written about the same time, was not produced. In 1857 he paid his second visit to London where, at a Philharmonic concert he introduced his own concerto in G. In the following year he was in London again, having in the meantime been appointed Concert Director of the Royal Russian Musical Society. In 1862, in collaboration with Carl Schuberth, he founded the St. Petersburg Conservatorium, of which he was director until 1867, and again from 1887 to 1890. For twenty years from 1868 he made prolonged concert tours in Europe and America, enjoying prodigious success wherever he went and being accounted by some the superior even of Liszt. He died on Nov. 20, 1894. Rubinstein left compositions in almost every known form. But it is as one of the greatest of all pianists that he will be remembered.

His brother NICHOLAS RUBINSTEIN (1835–1881) was also a fine pianist. He founded the Moscow Conservatorium in 1864, and was its director until his death. There he founded a school of piano-playing which produced many great artists.

See Anton Rubinstein's own *Autobiography* (Eng. trans., 1890) and monographs by Bernhard Vogel, Alexander MacArthur, Eugen Zabel and Anton von Halten, W. Baskin and U. Lissowski.

RUBRUQUIS (or RUBROUCK), **WILLIAM OF** (*c.* 1215–1270; *fl.* 1253–55), Franciscan friar, one of the chief mediaeval travellers and travel-writers. Nothing is known of him save what can be gathered from his own narrative, and from Roger Bacon, his contemporary and brother Franciscan. The name of Rubruquis ("Fratris Willielmi de Rubruquis," probably meaning "of Rubrouck," Flanders) is found in the imperfect ms. printed by Hakluyt in his collection, and followed in his English translation, as well as in the completer issue of the English by Purchas. (*Itinerarium fratris Willielmi de Rubruquis de ordine fratrum Minorum*, Galli, *Anno gratiae* 1253, *ad partes Orientales.*)

Friar William went to Tartary under orders from Louis IX. (St. Louis). That king, at an earlier date, viz., December 1248, when in Cyprus, had been visited by alleged envoys from Elchigaday (Ilchikadai, Ilchikdai), who commanded the Mongol hosts in Armenia and Persia. The king then despatched a return mission consisting of Friar Andrew of Longjumeau or Lonjumel and other ecclesiastics, who carried presents and letters for both Ilchikadai and the Great Khan. They reached the court of the latter in the winter of 1249–50, when there was no actual khan on the throne; and they returned, along with Tatar envoys, bearing a letter to Louis from the Mongol regent-mother which was couched in terms so arrogant that the king repented sorely of having sent such a mission. The envoys reached the king at Caesarea, between March 1251 and May 1252. But not long after the king, hearing that the Tatar prince Sartak, son of Batu, was a "baptized Christian," felt moved to open communication with him, and for this purpose deputed Friar William of Rubrouck. The former rebuff had made the king chary of sending formal embassies, and Friar William on every occasion, beginning with a sermon delivered in St. Sophia's on Palm Sunday (*i.e.*, April 13) 1253, disclaimed that character.

Friar William apparently received his commission at Acre, but he travelled by way of Constantinople and there received letters to some of the Tatar chiefs from the emperor, Baldwin de Courtenay, the last of the Latin dynasty.

Rubrouck and his party landed at Soldaia, or Sudak, on the Crimean coast, then a centre of intercourse between the Mediterranean world and what is now S. Russia. Equipped with horses and carts for the steppe, they travelled successively to the courts (*i.e.*, the nomad camps) of Scacatai (Kadan?), Sartak and Batu, thus crossing the Don and arriving at the Volga: of both these rivers Friar William gives vivid and interesting sketches. Batu Khan (*q.v.*) kept the travellers for some time in suspense, and then referred them to the Great Khan himself, an order involving the enormous journey to Mongolia. The actual travelling of the party from the Crimea to the khan's court near Karakorum cannot have been, on a rough calculation, less than 5,000 m., and the return journey to Lajazzo in Cilicia would be longer by 500 to 700 m. The envoys embarked on the "Euxine" on May 7, 1253. They were at the camp of the Great Khan from Dec. 27, 1253, to about July 10, 1254. They reached Tripoli on the way home on Aug. 15, 1255.

Roger Bacon, in the geographical section of the *Opus Maius* (*c.* 1262), cites the traveller repeatedly and copiously, describing him as "frater Wilhelmus quem dominus rex Franciae misit ad Tartaros, Anno Domini 1253 . . . qui perlustravit regiones orientis et aquilonis et loca in medio his annexa, et scripsit haec praedicta illustri regi; quem librum diligenter vidi et cum eius auctore contuli." (See *Opus Maius*, Oxford edition of 1897, i. 353–66.) Add to this William's own incidental particulars as to his being—like his precursor, Friar John de Plano Carpini—a very heavy man (*ponderosus valde*), and we know no more of his personality, except the abundant indications of character afforded by the story itself. These paint for us an honest, pious, stout-hearted, acute and most intelligent observer, keen in the acquisition of knowledge, the author of one of the best narratives of travel in existence. His language indeed is dog-Latin of the most un-Ciceronian quality; but it is in his hands a pithy and transparent medium of expression. In spite of all the difficulties of communication, and of the badness of his *turgemannus* or dragoman, he gathered a mass of particulars, wonderfully true or near the truth, not only as to Asiatic nature, geography, ethnography and manners, but as to religion and language.

The narrative of Rubrouck, after Roger Bacon's copious use of it, seems to have dropped out of sight, though five mss. are still known to exist: the chief of these are (1) Corp. Chr. Coll., Cambridge, No. 66, fols. 67 v.–110 v. of about 1320; (2) No. 181 of the same library, fols. 321–98, of about 1270–90; (3) Leiden Univ. Libr., No. 77 (formerly 104), fols. 160 r.–190 r. of about 1290. It has no place in the famous collections of the 14th century. It first appeared imperfectly in Hakluyt (1598 and 1599), as we have mentioned. *See* the two editions in the Hakluyt Society's publications, (i.) *William of Rubrouck . . . John of Pian de Carpine*, trans. and edited by William W. Rockhill (London, 1900); (ii.) *Texts and Versions of . . . Carpini and . . . Rubruquis . . .*, edited by C. Raymond Beazley (London, 1903). *See* also Beazley, *Dawn of Modern Geography*, ii. 266, 278–79, 281, 298–99, 303, 320–82, 421, 449–52; iii. 17–18, 31–32, 46, 69, 84–85, 88, 98, 101, 105, 188, 336–37, 544.

RUBY, the most valued of all gem-stones, a red transparent variety of corundum, or crystallized alumina (Lat. *rubeus*, red). It is sometimes termed "oriental ruby" to distinguish it from the spinel ruby (*q.v.*), which is a stone of inferior hardness, density and value.

The ruby crystallizes in the rhombohedral system (*see* CORUNDUM); the crystals have no true cleavage, but tend to break along certain gliding planes. The colour varies from deep cochineal to pale rose-red, in some cases, with a tinge of purple, the most valued tint being that called by experts pigeon's-blood colour. The oriental ruby is a mineral of very limited distribution. Its most famous localities are in Upper Burma, principally in the neighbourhood of Mogok, 90 m. N.N.E. of Mandalay. It occurs in bands of a crystalline limestone, associated with granitic and gneissose rocks, some of which are highly basic; the limestone also contains spinel, garnet, graphite, wollastonite, scapolite, felspar, mica, pyrrhotite and other minerals. The ruby, like other kinds of corundum, suffers alteration under certain conditions, and passes by hydration into gibbsite and diaspore, which by further alteration and union with silica, etc., may yield margarite, vermiculite, chlorite and other hydrous silicates.

Rubies have been produced artificially (*see* GEMS, ARTIFICIAL) with much success. It was once the practice to make "reconstructed rubies" by fusing together small fragments of the natural stone; but this process has given way to Prof. A. Verneuil's method of forming artificial ruby from purified ammonia-alum with a certain proportion of chrome-alum. The finely powdered material is caused to fall periodically into an oxyhydrogen flame, the heat of which decomposes the alum, and the alumina thus set free forms liquid drops which collect and solidify as a pear-shaped mass. When of the characteristic pigeon's-blood colour, the synthetical ruby contains about 2·5% of chromic oxide. The manufactured ruby possesses the physical characters of corundum, but may generally be distinguished by microscopic bubbles and striae. The manufacture of synthetic rubies is carried out commercially.

RÜCKER, SIR ARTHUR (1848–1915), English physicist, was born at Clapham on Oct. 23, 1848, and educated at Clapham grammar school and Brasenose college, Oxford. He became professor of mathematics and physics at the Yorkshire college, Leeds, in 1874, and professor of physics at the Royal College of Science in 1886. In 1901 he was appointed principal of the University of London. He was a secretary of the Royal Society from 1896 to 1901, receiving its Royal medal in 1891, and was knighted in 1902. He died at Newbury, Berks., on Nov. 1, 1915. Rücker's most important work in physics was a magnetic survey of the British Isles carried out in conjunction with Professor T. E. Thorpe; the results were published in a series of papers between 1883 and 1890. In conjunction with Professor Reinold he carried out investigations on thin liquid films; their work was published between 1877 and 1893. Rücker also made contributions to the theory of direct current dynamos and motors.

RŪDAGĪ (d. 954). Farīd-eddīn Mohammed 'Abdallāh, the first great literary genius of modern Persia, was born in Rūdag, a village in Transoxiana, about 870–900. Most of his biographers assert that he was totally blind, but the accurate knowledge of colours shown in his poems makes this very doubtful. The fame

of his accomplishments reached the ear of the Sāmānid Nasr II. bin Ahmad, the ruler of Khurāsān and Transoxiana (913–42), who invited the poet to his court. Of the 1,300,000 verses attributed to Rūdagī, there remain only 52 kasīdas, ghazals and rabā'īs; of his epic masterpieces we have nothing beyond a few stray lines in native dictionaries. But the most serious loss is that of his translation of Ibn Mokaffa's Arabic version of the old Indian fable book *Kalilah and Dimnah*. Fragments are preserved in the Persian lexicon of Asadī of Tus (ed. P. Horn, Göttingen, 1897).

There is a complete edition of all the extant poems of Rūdagī, in Persian text and metrical German translation, together with a biographical account, based on forty-six Persian mss., in Dr. H. Ethé's "Rūdagī der Sāmānidendichter" (*Göttinger Nachrichten*, 1873, pp. 663–742); *see* also his "Neupersische Literatur" in Geiger's *Grundriss der iranischen Philologie* (ii.); P. Horn, *Gesch. der persischen Literatur* (1901), p. 73; E. G. Browne, *Literary History of Persia*, i. (1902); C. J. Pickering, "A Persian Chaucer" in *National Review* (May 1890).

RUDD (*Scardinius erythrophthalmus*), a Cyprinid fish of Europe and western and northern Asia, deep-bodied, with reddish fins, and with the dorsal fin farther back than in the roach. It reaches a length of 18 in. and a weight of 3½ pounds.

RUDDER, that part of the steering apparatus of a ship which is fastened to the stern outside, and on which the water acts directly (O.E. *Rother, i.e.*, rower). The word may be found to be used as if it were synonymous with "helm." But the helm (A.S. *Hillf*, a handle) is the handle by which the rudder is worked. The tiller, which is perhaps derived from a provincial English name for the handle of a spade, has the same meaning as the helm. In the earliest times a single oar, at the stern, was used to row the vessel round. In later times oars with large blades were fixed on the sides near the stern. In Greek and Roman vessels two sets were sometimes employed, so that if the pitching of the ship lifted the after pair out of the water, the foremost pair could still act. As these ancient ships were, at least in some cases, sharp at both ends and could sail either way, steer (or steering) oars were fixed both fore and aft. The steer oar in this form passed through a ring on the side and was supported on a crutch, and was turned by a helm, or tiller. Norse and mediaeval vessels had, as far as we can judge, one steer oar only placed on the right side near the stern—hence the name "starboard," *i.e.*, steerside, for the right side of the ship looking forward. In the case of small vessels the steer oar possesses an advantage over the rudder, for it can bring the stern round quickly. Therefore it is still used in whaling boats and rowing boats which have to work against wind and tide, and in surf when the rudder will not act. The side rudder was generally displaced by the stern rudder in the 14th century. (*See* SHIPBUILDING.)

RÜDESHEIM, a town in the Prussian province of Hesse-Nassau, on the Rhine, 19 m. S.W. of Wiesbaden. Pop. (1925) 4,394. It lies at the lower end of the vineyard district of the Rheingau, opposite Bingen and just above the gorge of the Rhine, and is a popular tourist centre. Rüdesheim has some interesting towers: the Brömserburg, or Niederburg (13th century), formerly belonging to the archbishops of Mainz; the Boosenburg, or Oberburg; the Adlerturm, a relic of the fortifications of the town; and the Vorderburg, the remains of an old castle.

RUDINÌ, ANTONIO STARABBA, MARQUIS DI (1839–1908), Italian statesman, born at Palermo on April 6, 1839, joined the revolutionary committee in 1859. After spending a short time at Turin as attaché to the Italian foreign office he was elected mayor of Palermo. In 1866 he quelled a separatist insurrection. He was then appointed prefect of Palermo, and put down brigandage throughout the province; in 1868 he was prefect of Naples. In October 1869 he became minister of the interior in the short-lived Menabrea cabinet. On the death of Minghetti in 1886, he became leader of the Right. Early in 1891 he succeeded Crispi as premier and minister of foreign affairs by forming a coalition cabinet with a part of the Left under Nicotera; his administration initiated the economies by which Italian finances were put on a sound basis, and also renewed the Triple Alliance. He was overthrown in May 1892 by a vote of the Chamber and succeeded by Giolitti. Upon the return of his rival, Crispi, to power in December 1893, he resumed political activity, allying himself with the Radical leader, Cavallotti. The crisis consequent upon the disaster of Adowa (March 1, 1896) brought Rudinì back to power as premier and minister of the interior in a cabinet formed by the veteran Conservative, General Ricotti. He concluded peace with Abyssinia, but endangered relations with Great Britain by the unauthorized publication of confidential diplomatic correspondence in a Green-book on Abyssinian affairs. To satisfy the anti-colonial party he ceded Kassala to Great Britain, provoking thereby much indignation in Italy. He was overthrown in June 1898. His conduct of affairs had gravely divided his party. He died on Aug. 6, 1908, leaving a son, Carlo, who married a daughter of Henry Labouchere.

RUDOLF (otherwise known as BASSO NOROK and GALLOP), a large lake of eastern equatorial Africa, forming the centre of an inland drainage system, occupying the south of the Abyssinian highlands and a portion of the great equatorial plateau. The lake itself lies towards the north of the great East African rift valley, between 2° 26′ and 5° N., while the meridian of 36° E. passes through the lake. The lake is in part in Uganda, in Kenya, in Abyssinia and in Anglo-Egyptian Sudan. The length along the curved axis is 185 m., the maximum width 37 m. Its altitude is 1,250 ft. Towards the south it is deep, but comparatively shallow in the north. Its water is brackish, but drinkable. The country bordering the lake on almost every side is composed of Archaean metamorphic rock and is sterile and forbidding. The southern end is shut in by high cliffs—the escarpments of a rugged lava-strewn country, which shows abundant signs of volcanic activity. In particular, the great Teleki volcano stands at the southern end of the lake. The highest point of the south-east side of the lake is Mt. Kulal, 7,812 ft., while the culminating height within the basin of the lake is Mt. Sil, 9,280 ft., which lies about 20 m. south of Lubburua. Farther north, on the west side, sandy plains alternate with lines of low hills. Lagoons cut off from the lake are the haunt of great numbers of water-birds. In 3° 8′ N. the dry bed of the Turkwell approaches the lake. Near the northern end mountains again approach the shores, the most prominent being Mt. Lubur (5,200 ft.), an extinct volcano with a well-preserved crater. At the extreme north-west a bay some 35 m. long (Sanderson gulf) is almost separated from the rest of the lake by two long points of land. On the east side, open arid plains, with few trees, occupy most of the north country. One hill, in 3° 20′ N., has a height of 3,470 ft., and at the north-east end, separating the lake from Lake Stefanie, is a hilly country, the highest point between the lakes being 3,524 ft. Immediately north of these hills rises the Hummurr range, with one peak exceeding 7,000 ft. Near the south end is the volcanic island of Elmolo, 10 m. long, and there are a few small islets. Just north of 4° N. is a small volcanic island with highest point 2,100 ft. At the north end of the lake a level swampy plain is traversed by various arms of the lake and by the Nianam river (identical with the Omo). Lake Rudolf was discovered in 1888 by Count Samuel Teleki and Lieutenant Ludwig von Höhnel.

RUDOLPH II. (1552–1612), Roman emperor, son of the emperor Maximilian II. by his wife Maria, daughter of the emperor Charles V., was born in Vienna on July 18, 1552. In 1563 he was sent to Spain, where he was educated. In 1572 he was crowned king of Hungary, in 1575 king of Bohemia; and in Oct. 1575 he was chosen German king, at Regensburg, becoming emperor on his father's death in Oct. 1576.

The more active part of the emperor's life was the period from his accession to about 1597. During that time he attended the infrequent imperial diets, and took an interest in the struggle in the Netherlands and the defence of the empire against the Turks. He was at times suspicious of the papal policy, while his relations with Spain were somewhat inharmonious. He forwarded the progress of the counter-reformation, and in general the tolerant

policy of Maximilian II. was reversed. Political as well as religious privileges were attacked; and discontent became very pronounced about the opening of the 17th century. Meanwhile Rudolph had become increasingly subject to attacks of depression, which bordered on insanity. In 1604, after a war with Turkey had been in progress since 1593, many of the Hungarians rebelled against Rudolph and chose Stephen Bocskay as their prince. In April 1606 the Habsburg family declared Rudolph incapable of ruling, and recognized one of his younger brothers, the archduke Matthias, afterwards emperor, as their head; and in the following June Matthias, having taken over the conduct of affairs, made peace by granting extensive concessions to the rebellious Hungarians, and concluded a treaty with the sultan in November of the same year. Then shaking off his lethargy Rudolph prepared to renew the war with the Turks, a move which Matthias met by throwing himself upon the support of the national party in Hungary. Matthias also found adherents in other parts of his brother's dominions, with the result that in June 1608 the emperor was compelled to cede to him the kingdom of Hungary together with the government of Austria and Moravia. Rudolph now sought the aid of the princes of the empire, and even of the Protestants; but he had met with no success in this direction when trouble arose in Bohemia. Having at first rejected the demand of the Bohemians for greater religious liberty, the emperor was soon obliged to yield to superior force, and in 1609 he acceded to the popular wishes by issuing the Letter of Majesty (*Majestätsbrief*), and then made similar concessions to his subjects in Silesia and elsewhere. A short reconciliation with Matthias was followed by further disorder in Bohemia, which was invaded by Rudolph's cousin, the archduke Leopold (1586–1632). The Bohemians invoked the aid of Matthias, who gathered an army; and in 1611 the emperor, practically a prisoner at Prague, was again forced to cede a kingdom to his brother. Rudolph died at Prague, his usual place of residence, on Jan. 20, 1612, and was succeeded as emperor by Matthias.

Rudolph was greatly interested in chemistry, alchemy, astronomy and astrology; he was a patron of Tycho Brahe and Kepler, and was himself something of a scholar and an artist. He was the greatest collector of his age, his agents ransacking Europe to fill his museums with rare works of art. His education at the Spanish court and an hereditary tendency to insanity, however, made him haughty, suspicious and consequently very unpopular.

The sources for the life and times of Rudolph II. are somewhat scanty, as many of the official documents of the reign, which were kept at Prague and not at Vienna, were destroyed, probably during the Thirty Years' War. The best authorities, however, are: *Rudolphi II. epistolae ineditute*, edited by B. Comte de Pace (Vienna, 1771); M. Ritter, *Quellenbeiträge zur Geschichte des Kaisers Rudolf II.* (Munich, 1872); and *Deutsche Geschichte im Zeitalter der Gegenreformation und des dreissigjährigen Krieges* (Stuttgart, 1887 fol.); L. von Ranke, *Zur deutschen Geschichte: Vom Religionsfrieden bis zum 30-jährigen Kriege* (Leipzig, 1868); A. Gindely, *Rudolf II. und seine Zeit* (Prague, 1862–68); F. Strieve, *Die Verhandlungen über die Nachfolge Kaiser Rudolfs II.* (Munich, 1880); in the *Allgemeine Deutsche Biographie*, Band xxix. (Leipzig, 1889); and *Der Ursprung des dreissigjährigen Krieges* (Munich, 1875); F. von Bezold, *Kaiser Rudolf II. und die heilige Liga* (Munich, 1886); J. Janssen, *Geschichte des Deutschen Volks seit dem Ausgang des Mittelalters* (Freiburg, 1878 fol.), of which there is an English translation by M. A. Mitchell and A. M. Christie (1896 fol.); and H. Moritz, *Die Wahl Rudolfs II.* (Marburg, 1895).

RUDOLPH or RAOUL (d. 936), king of the Franks and duke of Burgundy, was a son of Richard duke of Burgundy, and was probably a member of the Carolingian family. He succeeded his father in 921, married Emma, daughter of Robert duke of the Franks, and assisted his father-in-law to drive the Frankish king, Charles III. (the Simple), from his throne. Robert then became king of the Franks, but was killed in battle in June 923 and was succeeded by Rudolph. At Limoges Rudolph defeated the Normans, the Aquitanians and Herbert of Vermandois. Rudolph died at Auxerre, leaving no sons, on Jan. 14, 936.

See W. Lippert, *König Rudolf von Frankreich* (Leipzig, 1886).

RUDOLPH (d. 1080), German king, and duke of Swabia, was a son of Kuno, count of Rheinfelden, who possessed estates in both Burgundy and Swabia. He received the duchy of Swabia from Agnes, regent and mother of the young king, Henry IV., in 1057, and two years later married the king's sister Matilda, and was made administrator of the kingdom of Burgundy. When Henry was excommunicated and deposed by Pope Gregory VII., the princes met at Forchheim, and elected Rudolph as German king. He renounced the right of investiture, disclaimed any intention of making the crown hereditary in his family, and was crowned at Mainz, on March 27, 1077. He found no support in Swabia, but, uniting with the Saxons, won two victories over Henry's troops, and, in 1080, was recognized by the pope. On Oct. 15, 1080, Rudolph was severely wounded at Hohenmölsen, and died the next day. He was buried at Merseburg, where his beautiful bronze tomb is still to be seen.

See O. Grund, *Die Wahl Rudolfs von Rheinfelden zum Gegenkönig* (Leipzig, 1880).

RUDOLPH I. (1218–1291), German king, son of Albert IV. count of Habsburg, and Hedwig, daughter of Ulrich count of Kyburg, was born at Limburg, on May 1, 1218. At his father's death in 1239 Rudolph inherited the family estates in Alsace, and in 1245 married Gertrude, daughter of Burkhard III. count of Hohenberg. A partisan of the emperor Frederick II. and his son Conrad IV., he was richly rewarded by them, but in 1254 was excommunicated by Pope Innocent IV. In the general disorder after the fall of the Hohenstaufen, he increased his estates largely at the expense of his uncle, Hartmann of Kyburg, and the bishops of Strassburg and Basle, becoming the most powerful prince in south-western Germany. His election as German king at Frankfurt (Sept. 29, 1273) was largely due to the efforts of his brother-in-law, Frederick III. of Hohenzollern, burgrave of Nuremberg. The support of Albert duke of Saxe-Lauenburg, and of Louis II. count palatine of the Rhine and duke of upper Bavaria, had been purchased by betrothing them to two of Rudolph's daughters; so that Ottakar II. king of Bohemia, a candidate for the throne, was almost alone in his opposition. Rudolph was crowned at Aix-la-Chapelle on Oct. 24, 1273. To win the approbation of the pope Rudolph renounced all imperial rights in Rome, the papal territory and Sicily, and promised to lead a new crusade; and Pope Gregory X., in spite of Ottakar's protests, not only recognized Rudolph himself, but persuaded Alphonso X. king of Castile, who had been chosen German king in 1257, to do the same. From 1274–78 Rudolph was engaged in an intermittent struggle with Ottakar, which ended with the latter's death. (*See* AUSTRIA.) Rudolph then set about consolidating his authority in Austria and the adjacent countries, where he met much opposition. At length in Dec. 1282 Rudolph invested his sons Albert and Rudolph with the duchies of Austria and Styria at Augsburg, and so laid the foundations of the greatness of the house of Habsburg.

In 1281 Rudolph compelled Philip I. count of upper Burgundy to cede some districts to him, forced the citizens of Berne to pay tribute, and in 1289 marched against Philip's successor, Otto IV., and compelled him to do homage. He was much less successful, however, in maintaining order in Germany, although in 1289 he led an expedition into Thuringia and destroyed some robber castles. In 1281 his first wife died, and on Feb. 5, 1284 he married Isabella, daughter of Hugh IV. duke of Burgundy. In 1291 he attempted to secure the election of his son Albert as German king; but without success, although Albert, the only son who survived him, was crowned German king after Rudolph's death. Rudolph died at Spires on July 15, 1291 and was buried in the cathedral of that city. His reign is memorable rather for the house of Habsburg than for the kingdom of Germany.

Redlich, *Rudolf von Habsburg* (Innsbruck, 1903). *See* also GERMANY; AUSTRIA; HABSBURG.

RUDOLPH or RAOUL, known as RUDOLPH GLABER (Rudolph the Bald) (d. *c.* 1050), French chronicler, was born in Burgundy

about 985, and was in turn an inmate of the monasteries of St. Leger at Champeaux and St. Bénigne at Dijon, afterwards entering the abbey of Cluny, and becoming a monk at St. Germain at Auxerre before 1039. He also appears to have visited Italy. His *Historiarum sui temporis libri V.*, dedicated to St. Odilon, abbot of Cluny, purports to be a universal history from 900 to 1044; but is an irregular narration of events in France and Burgundy.

The *Historiarum* was first printed in 1596, and published by A. Duchesne in the *Historiae Francorum Scriptores*, tome iv. (1639–49). Extracts are printed in the *Monumenta Germaniae historica*, Band vii.; but perhaps the best edition of the work is the one edited by M. Prou in the *Collection de textes pour servir à l'étude et l'enseignement de l'histoire* (1886). Rudolph also wrote a *Vita S. Gulielmi, abbatis S. Benigni*, published by J. Mabillon in the *Acta Sanctorum*, tome vi. (1668).

See A. Molinier, *Les Sources de l'histoire de France*, tome ii. (Paris, 1902); and A. Potthast, *Bibliotheca historica* (Berlin, 1896).

RUDOLPH OF HABSBURG (1857–1889), crown prince of Austria, was born on Aug. 21, 1857, the only son of the emperor Francis Joseph of Austria (*q.v.*) and his wife Elizabeth. Great hopes centred on the boy, who possessed unusual talents. Although his father was chiefly intent on his military education, Rudolph's own chief interests were natural history and literature. The monumental description of the Austro-Hungarian monarchy, *Oesterreich-Ungarn in Wort und Bild*, was truly his conception and in part his work; he also wrote some minor works of his own. He early developed an interest in modern literature and thought; became known as a free-thinker, and even a revolutionary, and made no secret of his anti-clerical views. He thus drifted into increasing opposition to his father, which was accentuated by his notoriously easy morality. His marriage with Stephanie, daughter of the king of the Belgians, took place on May 10, 1881, and was at first happy, although its only fruit—unfortunately for the Austrian succession—was one daughter, Elizabeth (afterwards Princess Windischgrätz). Later he developed a deep passion for the young and beautiful Baroness Marie Vetser, and on Jan. 30, 1889, the sudden and appalling news reached Vienna that the bodies of the two lovers had been found in Rudolph's hunting lodge of Mayerling, near Vienna. It was at once officially announced that the pair had committed suicide. All persons in any way connected with the story were sworn to secrecy, and the official dossier was excluded from the State archives. Numerous extraordinary rumours naturally arose, connecting the death with the Jesuits, the Hungarian nobles, or an injured husband; but it is generally accepted that the crown prince actually shot his lover, and afterwards committed suicide in a fit of despair, partly due to his father's order to break off the liaison. (C. A. M.)

RUDOLSTADT, a town of Germany, in the republic of Thuringia, on the left bank of the Saale, 18 m. S.W. of Jena, by the railway to Saalfeld. Pop. (1925) 16,064. The name of Rudolstadt occurs in an inventory of the possessions of the abbey of Hersfeld in the year 800. After passing under various rulers, it came into the hands of the counts of Schwarzburg in 1335. Its civic rights were confirmed in 1404, and from 1599 it was the residence of the ruling house of Schwarzburg-Rudolstadt. The town is a favourite tourist resort. The former residence of the prince is the Heidecksburg, a palace which was rebuilt after a fire in 1735 on an eminence 200 ft. above the Saale. The Ludwigsburg is another palace in the town built in 1742. The town also has a hydropathic establishment. The industries of the place include the manufacture of porcelain, chemicals, machinery, dyestuffs and thermos flasks.

RUDRA, a minor god in Vedic India who doubtless personified lightning (the "red" one, probably), but also protected cattle against it. In the *Rig Veda* he is identified with Agni (*q.v.*), but in the later *Vedas* he is called an archer and his malevolence emphasized. Best known as father of the storm-gods (Maruts, *q.v.*), in the Epic period he becomes many Rudras and in modern Hinduism is identified with Siva (*q.v.*).

RUE, the name of a woody or bushy herb, belonging to the genus *Ruta* (family Rutaceae), especially *R. graveolens*, the "common rue," a plant with bluish green spotted leaves and greenish yellow flowers, native to Europe and sparingly naturalized in eastern North America. It has a strong pungent smell and the leaves have a bitter taste. The plant was much used in mediaeval and later medicine as a stimulative and irritant drug. It was commonly supposed to be much used by witches. From its association with "rue," sorrow, repentance, the plant was also known as "herb of grace," and was taken as the symbol of repentance.

RUEDA, LOPE DE (1510?–1565), Spanish dramatist, was born at Seville, where, according to Cervantes, he worked as a metal-beater. His name first occurs in 1554 as acting at Benavente, and between 1558 and 1561 he was manager of a strolling company. Rueda's more ambitious plays, such as *Eufemia, Armelina* and *Los Engañados*, are mostly adapted from the Italian. They follow the original so closely that they give no idea of his talent; but in his *pasos* or prose interludes he displays an abundance of riotous humour, great knowledge of low life, and a most happy gift of dialogue. Rueda, with his strollers, created a taste for the drama which he was able to gratify, and he is admitted both by Cervantes and Lope de Vega to be the true founder of the national theatre.

RUEIL, a town of north France, in the department of Seine-et-Oise, at the west foot of Mt. Valérien, 6 m. W. of Paris. Pop. (1926) 15,500. Rueil has a church rebuilt by Napoleon III. in the original Renaissance style, and containing the tombs of the Empress Josephine and her daughter Hortense de Beauharnais. Rueil has important photographic works and manufactures of lime and cement, etc. Close to the town is the 18th century château of Malmaison, the residence of the Empress Josephine.

RUFA'A: *see* ARABS.

RUFF, a limicoline bird, taking its name from the frill of elongated feathers round the neck of the breeding male, to which the name is properly confined; the female, a much smaller bird, is termed the reeve. The plumage of the male is extremely variable, but the same markings are reproduced after every moult in each individual bird. The ruff (*Machetes pugnax*) no longer breeds in Britain, but its range extends across the whole of N. Europe and Asia, and it migrates south to India, Ceylon and Africa in winter. Except for its remarkable frill and its polygamous habit, the ruff does not differ in any marked manner from the ordinary sandpipers. The extraordinary courtship antics of the cock bird (*see* plate in article COURTSHIP OF ANIMALS) are described in Montagu's *Ornithological Dictionary*, Stevenson's *Birds of Norfolk*, Selous' *Realities of Bird Life* (Constable & Co., London, 1926), and elsewhere. The nest is made on the ground and, as in almost all polygamous animals, the male takes no interest in his offspring.

RUFFO, FABRIZIO (1744–1827), Neapolitan cardinal and politician, was born at San Lucido, Calabria, on Sept. 16, 1744. His father, Litterio Ruffo, was duke of Baranello, and his mother, Giustiniana, was a Colonna. Ruffo was placed by pope Pius VI. among the *chierici di camera*—the clerks who formed the papal civil and financial service. He was later promoted to be treasurer-general, a post which carried with it the ministry of war. In 1791 he was removed from the treasurership, but was created cardinal on Sept. 29, though he was not in orders. He never became a priest. Ruffo went to Naples, and, when in December 1798 the French troops advanced on Naples, he accompanied the royal family to Palermo. He was chosen to head a royalist movement in Calabria, where his family exercised large feudal powers. He was named vicar-general on Jan. 25, 1799. On Feb. 8, he landed at La Cortona with a small following, and began to raise the so-called "army of the faith" in association with Fra Diavolo.

Ruffo had no difficulty in upsetting the republican government established by the French and by June had advanced to Naples. (*See* NAPLES and NELSON.) But he lost favour with the king by showing a tendency to spare the republicans. He resigned his vicar-generalship to the prince of Cassero, and during the second French conquest and the reigns of Joseph Bonaparte and Murat he lived quietly in Naples. During the revolutionary troubles of 1822 he was consulted by the king, and was even in office for a very short time as a "loyalist" minister. He died on Dec. 13, 1827.

The account of Ruffo given in Colletta's *History of Naples* (English trans., Edinburgh, 1860) is biased. *Cf.* the duca de Lauria, *Intorno alla storia del Reame di Napoli di Pietro Colletta* (Naples, 1877). Ruffo's own side of the question is stated in *Memorie Storiche sulla vita del Cardinale Fabrizio Ruffo*, by Domenico Sacchinelli (Naples, 1836). *See* also Baron von Helfert, *Fabrizio Ruffo: Revolution and Gegen-Revolution von Neapel* (Vienna, 1882).

RUFIJI, a large river of Tanganyika Territory, East Africa, entering the sea by a delta, between 7° 45′ and 8° 13′ S. Its upper basin is drained by three main branches, of which the two southern, the Luwegu and the Ulanga, though shorter than the northernmost (the Ruaha), carry more water, as they come from a more rainy region, and by their junction in 8" 35′ S., 37° 25′ E., the Rufiji proper may be said to be formed.

The Luwegu rises 10° 50′ S., 35° 50′ E., and flows in a narrow wooded valley and in its lower course it is 100 to 150 yd. wide. The Ulanga is formed by a number of streams descending from the escarpment which runs north-east from Lake Nyasa and in Uhehe becomes broken up in ranges of mountains. The most important head-stream is the Ruhuje. As a whole, the Ulanga valley is broad, level and swampy, the meandering river sending off many diverging arms. It is navigable throughout the greater part of its course, having in the dry season a general depth of 3 to 12 ft, with a width of 40 to 120 yd. In April and May nearly all the streams overflow their banks. Below the junction of the Luwegu and Ulanga, the Rufiji flows through a narrow pass by the Shugali falls, and continues to the junction of the Ruaha, in 7° 55′ S., 37° 52′ E. The most remote branches of the Ruaha rise in the Livingstone Mountains. The united stream sweeps round the N. of the Uhehe Mountains, finally flowing to the Rufiji. Below the junction the Rufiji is broken by the Pangani falls, but is thence navigable by small steamers to its delta, receiving no large tributaries but sending out divergent channels. The country on either side is a generally level plain, inundated, on the south, in the rains, and the river varies in width from 100 to 400 yd. The main mouth of the river is that known as Simba Uranga, the bar of which can be crossed by ocean vessels at high water, but all the branches are very shallow as the apex of the delta is approached. Much of the delta is suited for rice-growing. (For geology *see* TANGANYIKA TERRITORY.)

RUFINUS, TYRANNIUS, presbyter and theologian, was born at or near Aquileia at the head of the Adriatic, probably between 340 and 345. In early manhood he entered the cloister as a catechumen, receiving baptism about 370. About the same time a visit of Jerome to Aquileia led to a close friendship between the two, and shortly after Jerome's departure for the East Rufinus also was drawn thither (in 372 or 373) by his interest in its theology and monasticism. He first settled in Egypt. There, if not even before leaving Italy, he had become intimately acquainted with Melania, a wealthy and devout Roman widow; and when she removed to Palestine, taking with her a number of clergy and monks on whom the persecutions of the Arian Valens had borne heavily, Rufinus (about 378) followed her. While his patroness lived in a convent of her own in Jerusalem, Rufinus, at her expense, gathered together a number of monks in a monastery on the Mount of Olives, devoting himself at the same time to the study of Greek theology. When Jerome came to Bethlehem in 386, the friendship formed at Aquileia was renewed. Another of the intimates of Rufinus was John, bishop of Jerusalem, and formerly a Nitrian monk, by whom he was ordained to the priesthood in 390. In 394, in consequence of the attack upon the doctrines of Origen made by Epiphanius of Salamis during a visit to Jerusalem, a fierce quarrel broke out, which found Rufinus and Jerome on different sides; and, though three years afterwards Jerome and John were reconciled, the breach between Jerome and Rufinus remained unhealed.

In the autumn of 397 Rufinus embarked for Rome, where he published a Latin translation of the *Apology* of Pamphilus for Origen, and also (398–99) a somewhat free rendering of the *περὶ ἀρχῶν* (or *De Principiis*) of that author himself. In the preface to the latter work he referred to Jerome as an admirer of Origen, and as having already translated some of his works with modifications of ambiguous doctrinal expressions. This led to a bitter dispute between Jerome and Rufinus. At the instigation of Theophilus of Alexandria, Anastasius (pope 398–402) summoned Rufinus from Aquileia to Rome to vindicate his orthodoxy; but he excused himself from a personal attendance in a written *Apologia pro fide sua.* The pope in his reply expressly condemned Origen, but left the question of Rufinus's orthodoxy to his own conscience. He was, however, regarded with suspicion in orthodox circles (*cf.* the *Decretum Gelassii,* § 20) in spite of his services to Christian literature. In 408 we find Rufinus at the monastery of Pinetum (in the Campagna?); thence he was driven by the arrival of Alaric to Sicily, being accompanied by Melania in his flight. In Sicily he was engaged in translating the *Homilies* of Origen when he died in 410.

The original works of Rufinus are—(1) *De Adulteratione Librorum Origenis*—an appendix to his translation of the *Apology* of Pamphilus, and intended to show that many of the features in Origen's teaching which were then held to be objectionable arise from interpolations and falsifications of the genuine text; (2) *De Benedictionibus XII. Patriarcharum Libri II.*—an exposition of Gen. xlix.; (3) *Apologia s. Invectivarum in Hieronymum Libri II.*; (4) *Apologia pro Fide Sua ad Anastasium Pontificem;* (5) *Historia Eremitica*—consisting of the lives of thirty-three monks of the Nitrian desert[1]; (6) *Expositio Symboli,* a commentary on the creed of Aquileia comparing it with that of Rome, which is valuable for its evidence as to church teaching in the 4th century. The *Historiae Ecclesiasticae Libri XI.* of Rufinus consist partly of a free translation of Eusebius (10 books in 9) and partly of a continuation (bks. x. and xi.) down to the death of Theodosius the Great.

See W. H. Freemantle in *Dict. Chr. Biog.* iv. 555–60; A. Ebert, *Allg. Gesch. d. Litt. d. Mittelalters im Abendlande,* i. 321–27 (Leipzig, 1889); G. Krüger in Herzog-Hauck's *Realencyk. für prot. Theol.,* where there is a full bibliography.

RUFUS, LUCIUS VARIUS (*c.* 74–14 B.C.), Roman poet of the Augustan age. He was the friend of Virgil, after whose death he and Plotius Tucca prepared the *Aeneid* for publication, and of Horace, for whom he and Virgil obtained an introduction to Maecenas. Horace and Virgil speak highly of his epic poetry. From Macrobius (*Saturnalia,* vi. 1, 39; 2, 19) we learn that Varius composed an epic poem *De Morte,* some lines of which are quoted as having been imitated or appropriated by Virgil. But his most famous literary production was the tragedy *Thyestes,* which Quintilian (*Inst. Orat.* x. 1. 98) declares equal to any of the Greek tragedies. It was presented at the games of 29 B.C.

Fragments in E. Bährens, *Frag. Poetarum Romanorum* (1886); monographs by A. Weichert (1836) and R. Unger (1870, 1878, 1898); M. Schanz, *Geschichte der römischen Literatur* (1899), ii. 1; Teuffel, *Hist. of Roman Literature* (Eng. trans., 1900), 223.

RUGBY, a market town in Warwickshire, England, finely situated on a tableland rising from the south bank of the Avon, near the Oxford canal. Pop. of urban district (1921) 25,088. Rugby was originally a hamlet of the adjoining parish of Clifton-on-Dunsmore, and is separately treated of as such in Domesday Book. Ernaldus de Bosco (Ernald de Bois), lord of the manor of Clifton, erected the first chapel in Rugby, in the reign of Stephen, about 1140. It was afterwards granted by him, with certain lands, to endow the abbey of St. Mary, Leicester, which grant was confirmed by his successors and by royal charter of Henry II. In the second year of King John (1200) a suit took place between Henry de Rokeby, lord of the manor of Rugby, and Paul, abbot of St. Mary, Leicester, which resulted in the former obtaining possession of the advowson of Rugby, on condition of homage and service to the abbot of Leicester. Rugby is an important junction on the L.M.S. railway, by which it is 82½m. N.W. from London.

The boys' school, ranking as one of the first public schools in England, was founded and endowed under the will (1567) of Laurence Sheriff of Rugby. The endowment consisted of the parsonage of Brownsover, Sheriff's mansion house in Rugby and one-third (8 ac.) of his estate in Middlesex, which, being let on building leases, gradually increased to about £5,000 a year. The full endowment was obtained in 1653. The school originally stood opposite the parish church, and was removed to its present site on the south side of the town between 1740 and 1750. In 1809 it was rebuilt from designs by Henry Hakewill (1771–1830); the chapel, dedicated to St. Lawrence, was added in 1820. The

[1]On this work *see* Dom Butler in *Texts and Studies,* vi. i. pp. 10 ff.

chapel was rebuilt and reconsecrated in 1872, and additions were made in 1898. The Temple observatory, containing a fine equatorial refractor by Alvan Clark, was built in 1877, and the Temple reading-room with the art museum in 1878. The workshops underneath the gymnasium were opened in 1880, and a new big school and class-rooms were erected in 1885.

RUGE, ARNOLD (1802–1880), German philosopher and political writer, was born at Bergen, in the island of Rügen, on Sept. 13, 1802. As a student he joined the national movement, and was confined for five years in the fortress of Kolberg, where he studied Plato and the Greek poets. On his release in 1830 he published *Schill und die Seinen*, a tragedy, and a translation of *Oedipus at Colonus*. In 1837 with E. T. Echtermeyer he founded at Halle the *Hallesche Jahrbücher für deutsche Kunst und Wissenschaft*, in which he advocated the Hegelian philosophy. The *Jahrbücher* was detested by the orthodox party in Prussia; and was finally suppressed by the Saxon Government in 1843. In the 1848 revolution he organized the Extreme Left in the Frankfurt parliament, and for some time he edited *Die Reform* in Berlin. The Prussian Government intervened and Ruge soon afterwards left for Paris, and then for London. Here, with Ledru-Rollin and Mazzini, he formed a "European Democratic Committee." Ruge, however, soon withdrew. In 1866 and 1870 he vigorously supported Prussia against Austria, and Germany against France. In his last years he received a pension from the German Government. He died on Dec. 31, 1880. After the publication of his *Gesammelte Schriften* (10 vols., 1846–48) he wrote, among other books, *Unser System, Revolutionsnovellen, Die Loge des Humanismus*, and *Aus früherer Zeit* (his memoirs). His *Letters and Diary* (1825–80) were published by Paul Nerrlich (1885–87).

RUGELEY, market town, urban district, Lichfield parliamentary division of Staffordshire, England, in the Trent valley. Pop. (1921) 4,607. Rugeley is on the L.M.S. railway, 124½m. N.W. of London, and on the Grand Trunk canal. To the south-west is Cannock Chase. A grammar school was founded in 1611. There are ironfoundries, corn-mills and tanneries; and the parish includes several collieries.

RÜGEN, an island of Germany, in the Baltic, immediately opposite Stralsund, 1½ m. off the north-west coast of Pomerania in Prussia, from which it is separated by the narrow Strelasund, or Bodden. Its shape is exceedingly irregular, and its coast-line is broken by numerous bays and peninsulas, sometimes of considerable size. The general name is applied by the natives only to the roughly triangular main trunk of the island, while the larger peninsulas, the landward extremities of which taper to narrow necks of land, are considered to be as distinct from Rügen as the various adjacent smaller islands which are also included for statistical purposes under the name. The chief peninsulas are those of Jasmund and Wittow on the north, and Mönchgut, at one time the property of the monastery of Eldena, on the south-east; and the chief neighbouring islands are Ummanz and Hiddensöe, both off the north-west coast. Rügen is the largest island in Germany. Its greatest length from north to south is 32 m.; its greatest breadth is 25½ m.; and its area is 377 sq.m. The surface gradually rises towards the west to Rugard (335 ft.)—the "eye of Rügen"—near Bergen, but the highest point is the Hertaburg (505 ft.) in Jasmund. Erratic blocks are scattered throughout the island, and the roads are made with granite. The most beautiful and attractive part of the island is the peninsula of Jasmund, which terminates to the north in the Stubbenkammer (Slavonic for "rock steps"), a sheer chalk cliff, the summit of which, the Königsstuhl, is 420 ft. above the sea. The east of Jasmund is clothed with an extensive beech wood called the Stubbenitz, in which lies the Borg, or Herta Lake. Connected with Jasmund by the narrow isthmus of Schabe to the west is the peninsula of Wittow, the most fertile part of the island. At its north-west extremity rises the height of Arcona, with a lighthouse.

A ferry connects the island with Stralsund, and from the landing-stage at Altefähr a railway traverses the island, passing the capital Bergen to Sassnitz, on the north-east coast. The other chief places are Garz, Sagard, Gingst and Putbus, the last being the old capital of a barony of the princes of Putbus. Sassnitz, Göhren, Sellin and Lauterbach-Putbus are among the favourite bathing resorts. Schoritz was the birthplace of the patriot and poet, Ernst Moritz Arndt. The inhabitants of Rügen are distinguished from those of the mainland by peculiarities of dialect, costume and habits; and even the various peninsulas differ from each other in these particulars. The inhabitants raise some cattle, and Rügen has long been famous for its geese; but the chief industry is the herring-fishery. With the rest of Western Pomerania Rügen has belonged to Prussia since 1815.

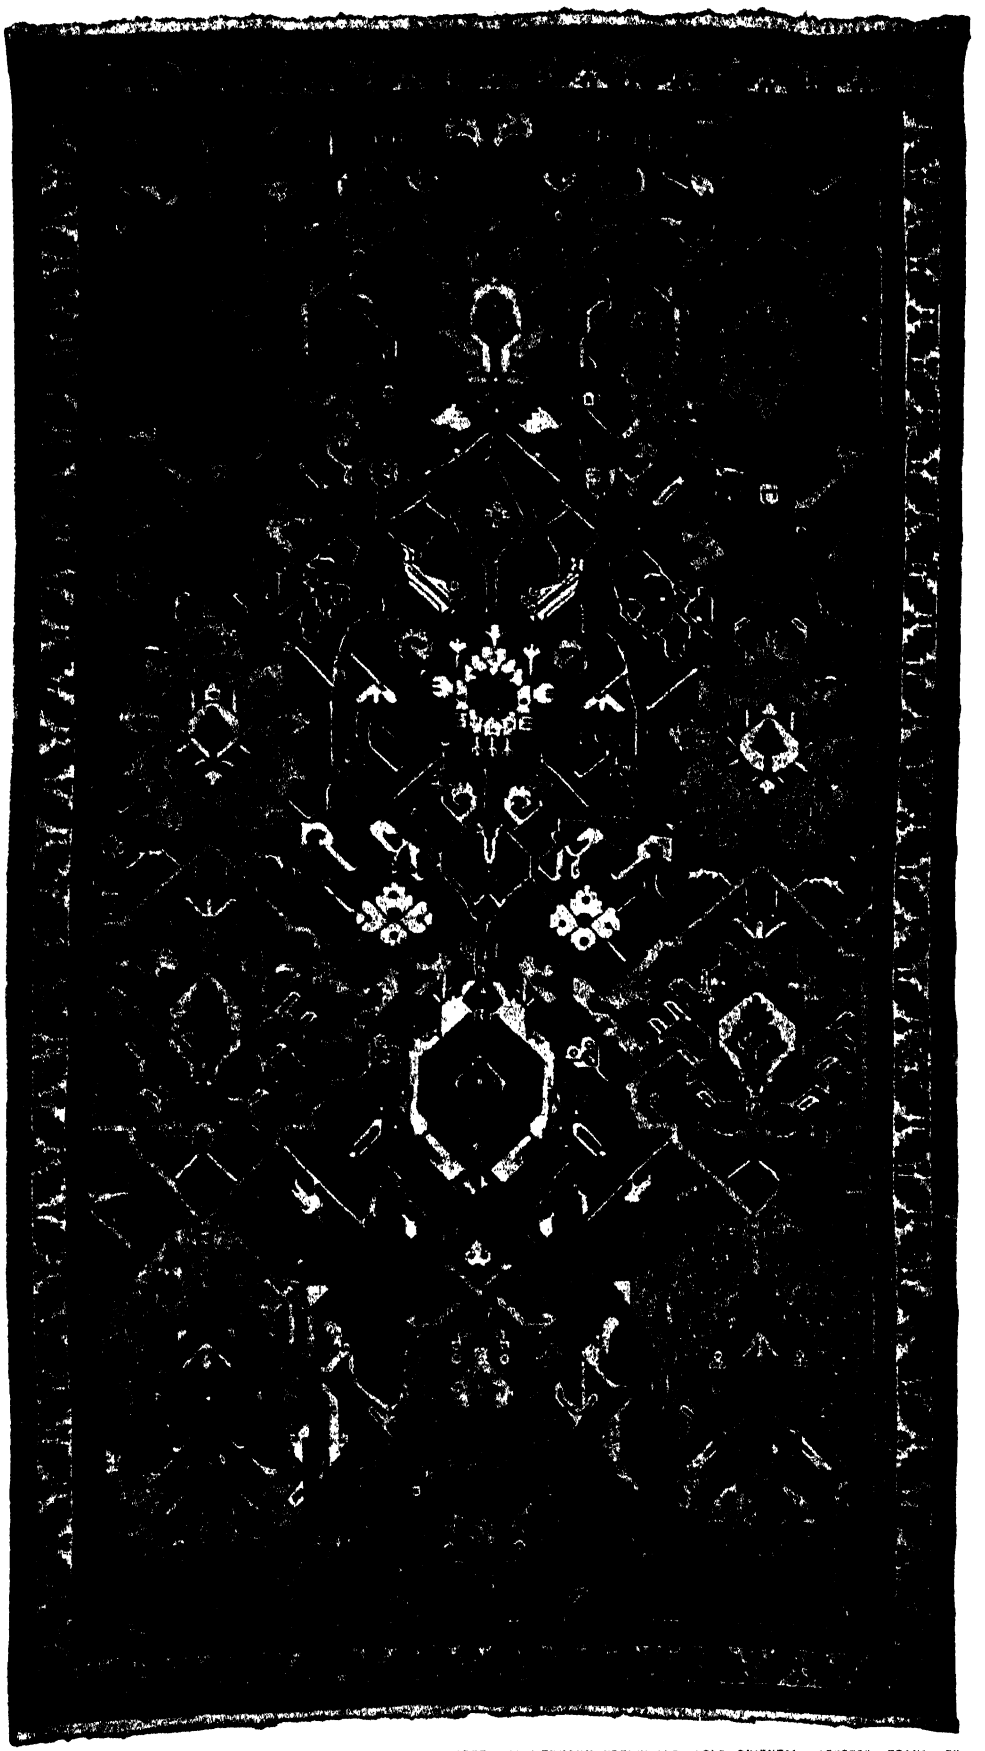
RUGS AND CARPETS. The term "carpet" is usually understood to mean a textile floor-covering and it is in this sense that the word is used here. The best fabric yet devised for use under foot is one in which a heavy woven foundation is fortified with extra threads forming a pile.



Early History.—The real home of the hand-woven carpet is to be found in the wide region of the East that stretches from Turkey to China, and the oriental carpet holds a most important place in the field of decorative art.

Nothing is definitely known about the origin or early history of carpet-weaving and a discussion of the basis of the most plausible theories on the subject cannot be entered into here. It seems however very possible that the art had its cradle among the nomadic peoples living to the north of India, that it was practised for centuries before the date of the oldest carpets still remaining, and that the knowledge of it spread outwards, but more especially in a westerly direction. On general grounds it is likely that smooth-faced carpets of tapestry-weaving preceded those with a pile, for the former is a much simpler and more obvious process. As actual specimens of tapestry-weaving (other than rugs) dating from at least 1500 B.C. are known, and pile fabrics of at least the 3rd century A.D., there is no reason on technical grounds for denying to carpets a very early origin.

Perhaps the oldest pieces of carpet are certain fragments excavated by Sir Aurel Stein in Turkestan. These are attributed to about the beginning of the Christian era but their exact date and significance are not established. A western wall-hanging resembling a carpet, made at Quedlinburg about the end of the 12th century, suggests strongly that oriental carpets were not unknown in Europe at that date and that the technique of one had been copied by the Quedlinburg weavers, but it is not quite out of the question that the art may have been independently invented, especially as a modified form of the oriental technique is adopted. Three carpets in the mosque of Ala-ed-Dîn at Konia are attributed with some certainty to the early 13th century, and the historical evidence is supported by the nature of their patterns which, while differing from those of any other known carpets, may well be primitive forms of later and better known ornament.

With the exception of these isolated pieces and perhaps a few others not as yet recognized as early, it is doubtful whether we still have carpets much earlier than the 16th century. By that date however it is certain not only that the art was well established, but that it had in fact already reached its highest level of achievement in both Persia and Turkey; and further it is known that carpets from the latter country had been exported to Spain, England and other European countries in the previous century and that their introduction had soon led to successful attempts at knotting in the western world. It is probable also, if not certain, that during the 16th century carpets were made in the Caucasus, India, Turkestan and China.

A brief outline of the later history of carpet-knotting can be given more conveniently when the carpets of particular countries are described.

BY COURTESY OF A. SCHROLL AND COMPANY FROM FRIEDRICH SARRE AND HERMANN TRENKWALD, "OLD ORIENTAL CARPETS" (TRANS. BY A. F. KENDRICK, 1926), ISSUED BY THE AUSTRIAN MUSEUM FOR ART AND INDUSTRY, VIENNA

ARMENIAN CARPET, 17TH CENTURY

So-called Armenian carpet, Caucasus region, end of 17th century. 298 cm. x 167 cm. The ten colours are strong in tone; the ground colours, deep-blue, white and red. The warp and weft are of white cotton, the knotting is of sheep's wool, with the pile slightly to the right. The pattern of large stems and cartouches includes floral motives angularly conventionalized. The border, narrow in relation to the field, shows leaf-motives and blossoms

TECHNIQUE

Pile Carpets.—A pile carpet is a woven fabric with extra threads attached to form the pile. A set of threads—the *warp*—is stretched between two beams or rollers, which with a supporting framework constitute the *loom*. The warp being supposed vertical, which is usually the case, a row of knots is tied on the warp-threads in a horizontal line, and then one or more other threads—the *weft*—are interlaced with the warp, each weft-thread passing alternately under and over consecutive warp-threads. Lines of knots alternate with lines of weft until the work is finished. The warp and weft are visible at the back of the carpet but not at the front, and the pattern is formed by the knots, which are of coloured yarn, individually at the choice of the weaver. Two kinds of knots only are used in oriental carpets—the Persian or Sehna—and the Turkish or Ghiordes (*see* figs. 1 and 2). A third kind, tied on one warp-thread instead of on two, is found in most Spanish carpets but rarely elsewhere (*see* fig. 3). After each line of knots is tied and the weft-threads are inserted, the work is consolidated by beating down with a heavy comb and the ends of the pile are rough-trimmed with shears. When the knotting is all finished the pile is with great care cut to an even surface. Should the required carpet be longer than the loom, then at intervals the finished part is rolled round the lower beam and more of the warp is unwound from the upper. The treatment of the sides or selvedge, where the weft doubles back on itself, and of the top and bottom, where the ends of the warp often form a fringe, is capable of more variation in detail than can now be described. A simple and easily constructed loom, with fixed beams instead of rollers (*see* fig. 4), exhibits most of the features of larger looms and is suitable for the use of those who wish to try practical carpet-knotting or weaving.

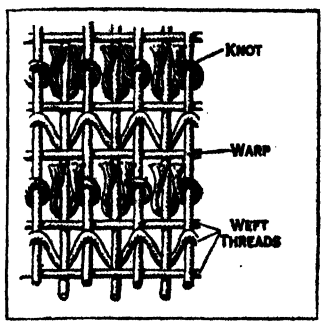


FIG. 1.—PERSIAN OR SEHNA KNOT, ONE OF THE TWO TYPES OF KNOTS USED IN ORIENTAL CARPETS

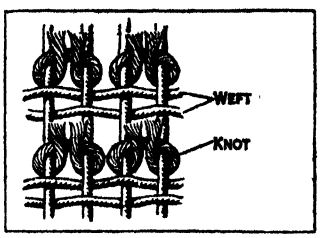

FIG. 2.—TURKISH OR GHIORDES KNOT, THE OTHER TYPE OF KNOT USED IN ORIENTAL CARPETS

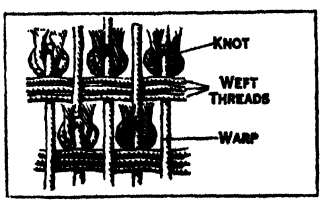

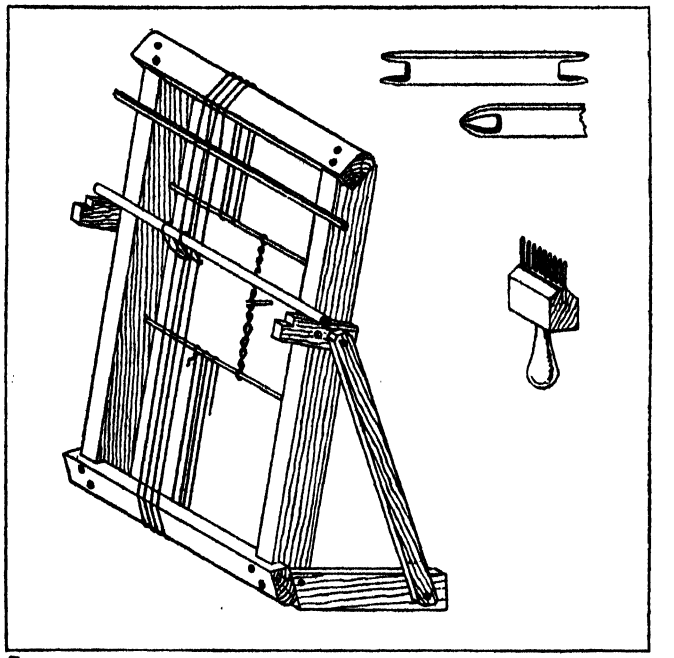

FIG. 3.—SPANISH OR SINGLE-WARP KNOT

Smooth-Faced Carpets.—The majority of these are made by the tapestry method, which is only a modified form of plain-cloth weaving. Each weft-thread is carried under and over consecutive warp-threads in the usual way, but the yarn for the weft is bulky and is inserted so loosely that when it is beaten down it completely hides the warp. By choosing a weft sufficiently strong and heavy, a very durable fabric may be obtained. The pattern is formed by varying the colour of the weft, and only carrying each colour as far as it is needed. It will be seen that a change of colour necessitates a discontinuity in the weft (*see* fig. 5); and where lines of the pattern lie parallel to the warp a slit will occur in the fabric. Either lines in this direction must be avoided by the designer—a condition that has much influence upon the patterns of *kilims*, as tapestry-woven rugs are called—or the slits must be sewn up afterwards. The back of a *kilim* is almost exactly like the front, though usually rather less tidy. To rugs woven by a modified form of the tapestry method the name *soumak* is applied. In these the weft is carried forward over four of the warp-threads and then backwards behind two (*see* fig. 6). This gives a kind of herring-bone texture at the front and a series of ribs at the back of the fabric. Because a weft looped round the warp-threads as described has much less than the usual binding effect, it is found necessary to insert in the ordinary way other weft-threads that remain hidden among the coloured threads forming the pattern.

Texture.—The technical feature which above all others indicates the amount of time and trouble spent by the weaver and therefore serves as the first criterion of technical merit, is the fineness of texture. This depends upon the closeness of the warp-threads and the size of the yarns used for weft and pile, and is measured by the number of knots in a specified area. Some idea of the wide variation possible in this respect is given by the fact that carpets are found with as few as 15 and as many as 1,000 knots to the square inch. Textures with from 40 to 80 may be considered of medium fineness.

FIG. 4.—LOOM WITH FIXED BEAMS; (UPPER RIGHT) SHUTTLES FOR WEFT, (LOWER RIGHT) COMB FOR BEATING DOWN WORK

Other technical points, not necessarily in themselves signs of merit, have to be taken into account in problems of classification and identification. The chief of these are:—the species of knot; the material (wool, cotton, silk, etc.) and nature of the yarns constituting warp, weft and pile; the colour of the warp, and whether it is arranged on one or two levels; the colour of the weft, and the number of times it passes after each row of knots; the length of the pile; the way in which the sides and ends are finished. These points, duly observed, will throw as much light upon the carpet as do the design and colour.

FIG. 5.—TAPESTRY WEAVING

Design.—In order to give a pleasing effect at distances from which the detail cannot be clearly seen, there is generally a definite scheme of composition upon which the masses of the pattern are based. In the first place there is almost invariably, running along every edge, a border, which may be divided into two or more parallel bands. Within the border is the field, either of fairly level tone (still neglecting the lesser detail) or containing various arrangements of shaped panels differing in tone from the rest. There is no definite limit to the number of such arrangements but a few are so common as to deserve mention.

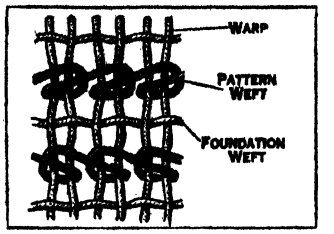

FIG. 6.—SOUMAK WEAVING, A MODIFIED FORM OF THE TAPESTRY METHOD

Very often there is a prominent central panel or medallion, which is sometimes associated with four quarter-panels, one in each corner of the field: or there may be a number of panels, perhaps of two different shapes, arranged on a symmetrical plan. Again, a succession of similar panels is often found set on the long axis of the carpet: or the whole field may be divided up into well-marked rectangular or lozenge-shaped compartments. Lastly may be mentioned the arched form cut off from the ends of the field, or from one end only as in most prayer-rugs.

Motives with symbolic meaning are undoubtedly often seen in carpet design, but it is very questionable (in spite of much that is alleged) whether in most cases the designer or weaver has adopted them with full consciousness of their significance. In this connection it must be remembered that the vast majority of oriental carpets have been copied with only slight modifications from others previously made.

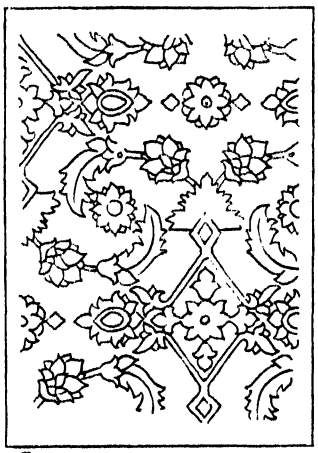

FIG. 7.—THE HERATI PATTERN

Little need be said about the ornament in detail. Flowers such as the rose, jasmin, hyacinth, or trees as the cypress or willow can often be identified but many of the floral forms are too indefinite for recognition. The inflorescence of the date palm —such an important object to the oriental—is rendered in many characteristic ways to which the term *palmette* is frequently applied. The well-known comma-shaped device common in the later Persian carpets may also be derived from the date-palm. It is most often called the *cone-device*, but many other names and origins are ascribed to it. The *cloud-band*, borrowed from Chinese art, is a ribbon or snake-like conventionalization of a cloud. Perhaps it is the origin of the S-form found in many of the more geometrical carpets. *Latch-hooks* are the angular appendages set round the edge of a panel to soften a too rigid contour. Apart from isolated motives there are several well-known all-over patterns, of which the *herati* and the *mina khani* are the most common (*see* figs. 7 and 8). With regard to border patterns it will soon be noticed that there are many almost standardized types, some of which are peculiar to particular groups of rugs. The basic idea is mostly either that of a wavy stem bearing flowers and leaves or else a succession of similar devices, floral or geometrical, set in a row.

Colouring.—A comparatively small number of dyestuffs, well proved by experience, are used. The tones are usually darker than appears at first sight to the eye, as may be readily proved by matching them, especially the lighter ones, against tinted paper. This association of great richness of colour with great depth of tone is undoubtedly due in great part to the effect of the pile surface, and in consequence it is not possible to get on paper a reproduction of a carpet that will give more than an indication of the beauty of the original.

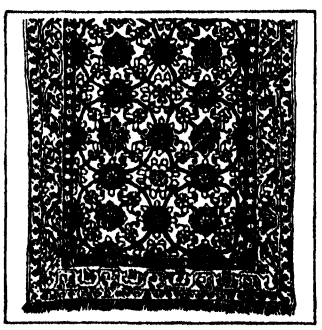

FIG. 8.—THE MINA KHANI PATTERN

Dyes.—There is little mystery about the actual dyestuffs used. Indigo and madder yield a range of most satisfactory and permanent blues and reds; kermes or some other form of cochineal will supplement the latter; and several good though less permanent yellow dyes are available. The secondary colours can be obtained by double dipping; and the more neutral colours—brown, white, black—are often supplied by undyed wool, but in any case present no technical difficulty.

Size and Shape.—Rugs—a term understood to include all carpets for use on the floor—are mostly rectangular, though occasionally pieces are seen made to fit into irregular spaces. The rectangle may vary from a square to a strip at least six times as long as it is wide. A very usual ratio is about three to two.

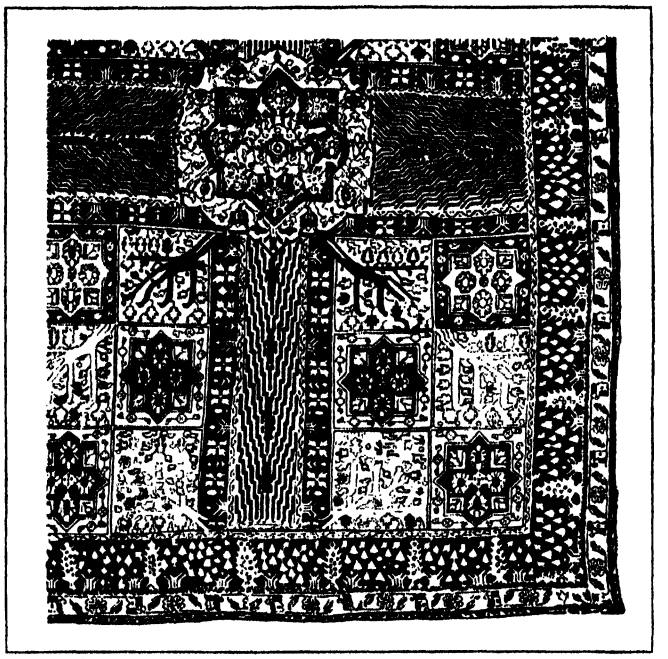

FIG. 9.—GARDEN PATTERN, RARE TYPE OF PERSIAN RUG

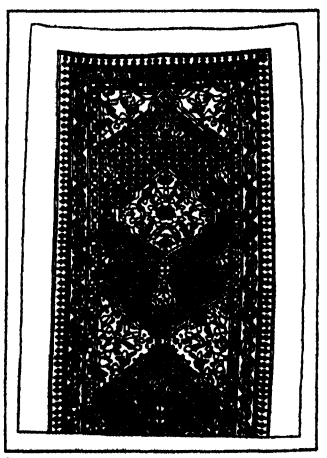
The strips, called runners or *kanara*, made in pairs to go along the sides of a Persian room, are very useful in corridors. A very common size for small rugs is about 6½ by 4½ ft., while large ones may reach 25 ft. in length or occasionally more. The large rugs are mostly now made with an eye to the western market, and there is a general tendency for the smaller rugs to be of better quality of design, workmanship and material.

CLASSIFICATION

The natural tendency of workers in a district to follow a fixed system of technique even though wide variations are available, and the conservatism which causes them to copy traditional patterns with only slight modifications, allow the origin and approximate date of most oriental carpets to be determined with fair certainty. Difficulties of attribution, of course, do frequently arise, especially in the case of the earlier carpets, but it is still often possible to form groups of like carpets even when their exact origin is not known. With regard to dating, much difference of opinion exists and there is a tendency for the assigned antiquity to err in excess. Positive evidence on the point is the exception. A close study, however, of the development of designs shows that their secular changes proceed along definite lines that are mostly in the direction of simplification and debasement. Also it is seen that new motives are occasionally introduced. Upon these observations a scheme of chronological sequence may be founded, and if certain carpets in the series can be definitely fixed in time either by the internal evidence of dated inscriptions, or because they are seen reproduced in pictures or mentioned in historical documents, then the whole scheme of dating may be



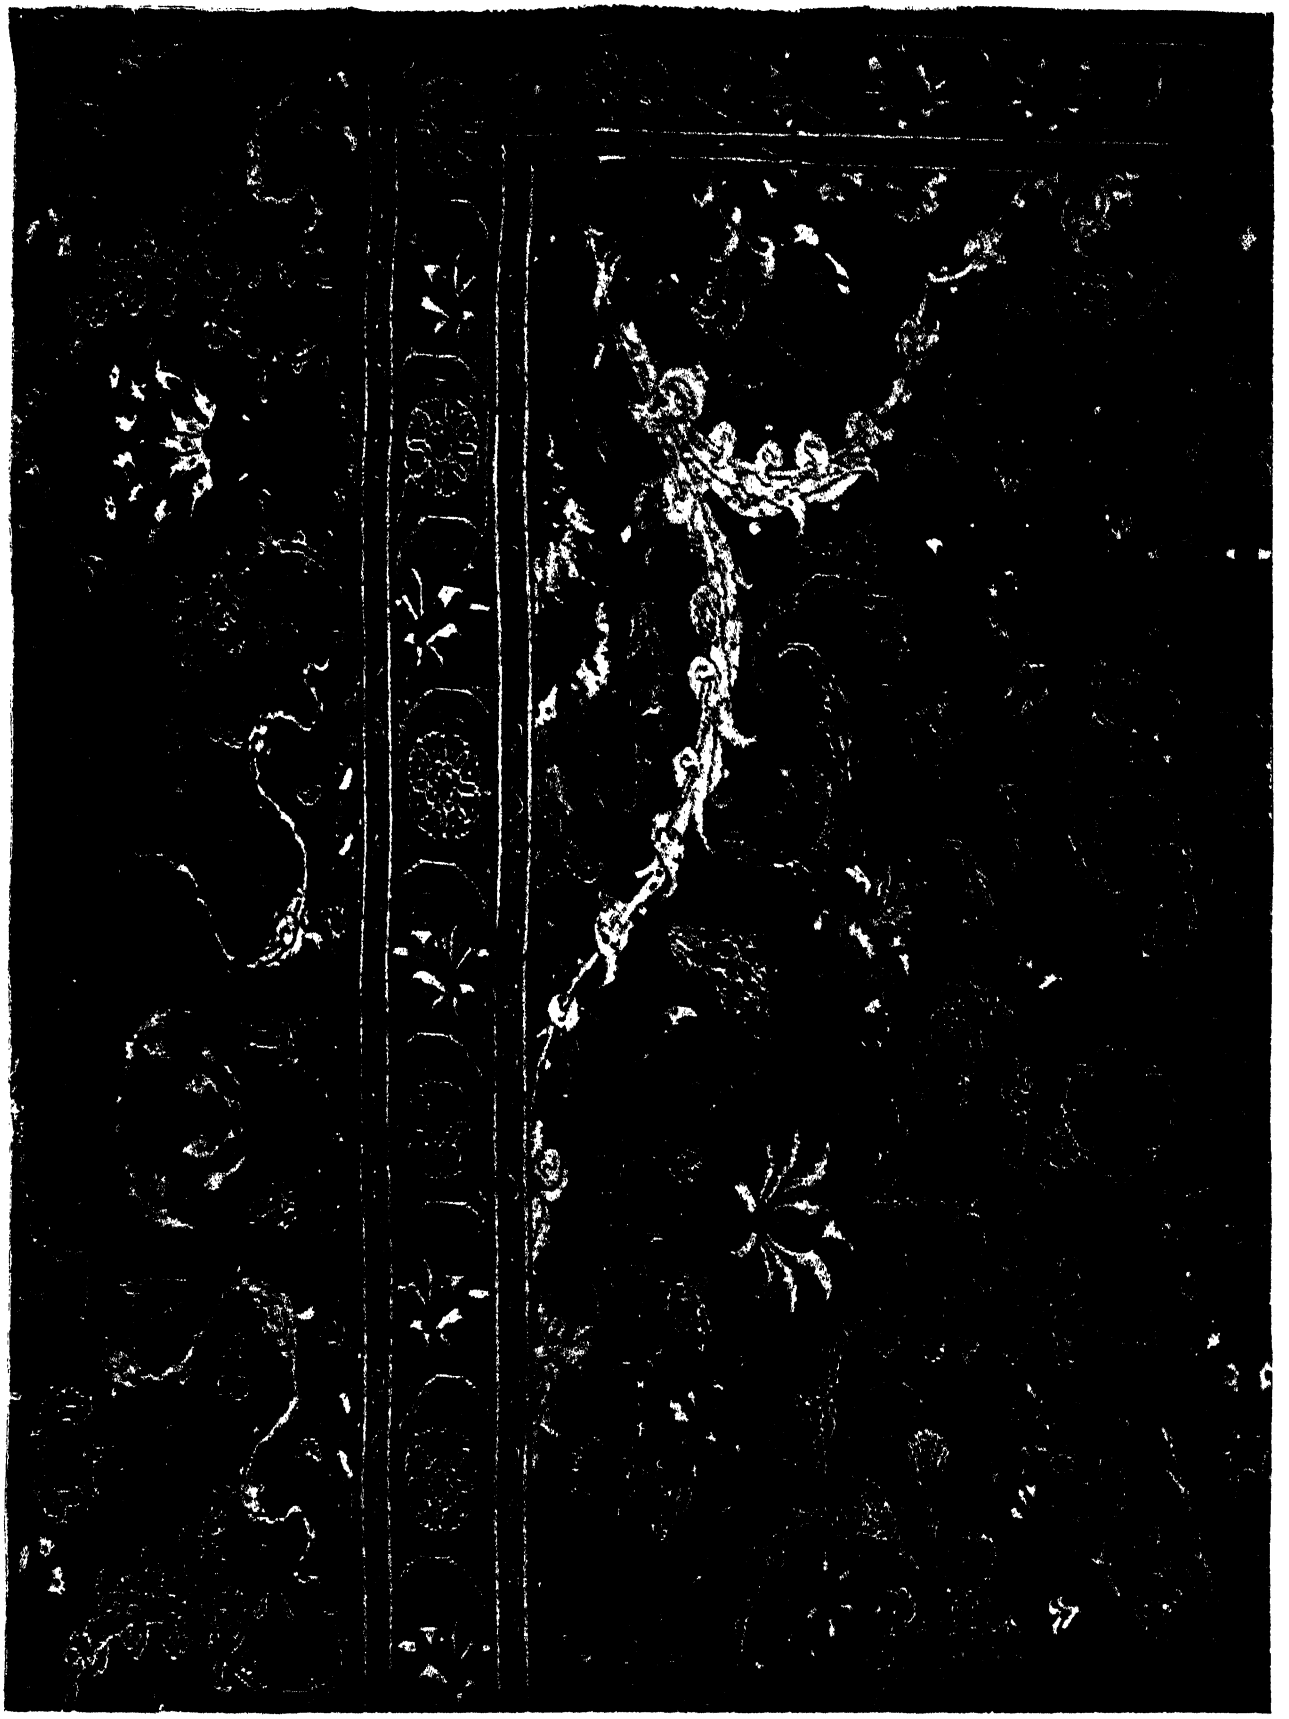


FIG. 10.—HAMADAN RUNNER WITH HEXAGONAL PANELS

BY COURTESY OF A. SCHROLL AND COMPANY FROM FRIEDRICH SARRE AND HERMANN TRENKWALD, "OLD ORIENTAL CARPETS" (TRANSLATED BY A. F. KENDRICK, 1926), ISSUED BY THE AUSTRIAN MUSEUM FOR ART AND INDUSTRY

TURKISH CARPET, 16TH CENTURY

Fragment of Turkish carpet, court manufactory, 16th century. Dimensions of whole, 456 cm. x 248 cm. The warp is of yellow silk, the weft of dyed red silk, the knotting of sheep's wool and cotton, in seven colours. The pattern, of cartouches and conventionalized flowers and leaves, gives the effect of movement, with half-panels forming the corner filling

considered to be established. The name commonly applied to a type is usually that of the town or district where it is made, though sometimes that of the tribe that makes it, or of the place where it is marketed.

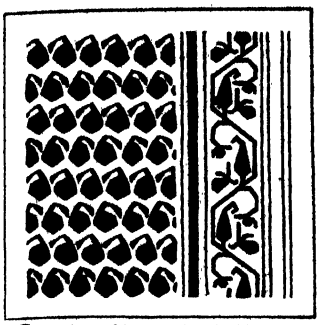

FIG. 11.—SARABEND PATTERN

Persia.—In the 16th and 17th centuries the Sehna knot is always used—at least in those carpets that have come down to us: the warp and weft are of silk or cotton and the pile mostly of wool. The texture is fine and there are usually three lines of weft after the knots. The patterns are based on floral motives and the treatment is often highly naturalistic: cloud-bands and other Chinese details are frequently introduced. The colours are rich but quiet and there are usually from ten to twenty different tints, of which crimson is most commonly used for the ground though blue is also seen. The term "Ispahan" is used in the trade to describe these early carpets, but it is not known certainly where the various groups were made, and the following classification is based chiefly upon the patterns.

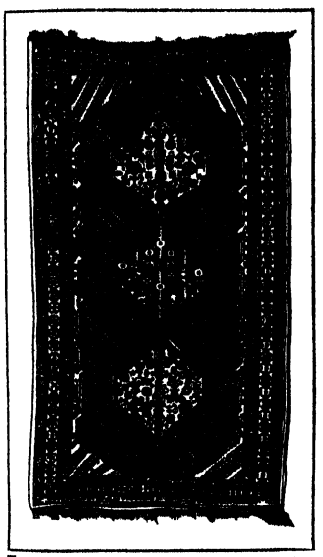

FIG. 12.—SHIRAZ RUG WITH PATTERN OF HEXAGONAL PANELS

Garden.—In this well marked but very rare type there is a map-like representation of a garden, with paths, flower-beds, trees and water-channels (*see* fig. 9).

Floral.—One type of floral carpet has a mass of trees and flowers forming almost a thicket, growing upwards from one end. More often however the ornament is arranged in a more ordered manner on a basis of scrolling stems curving about the field. The scheme may be associated with variously shaped panels as in the very famous "Ardabil" carpet in the Victoria and Albert Museum (*see* Plate VI.). In the rather later examples the floral forms—mostly palmettes—become larger and fewer and give the effect of a number of definite masses, sometimes almost touching, arranged more or less evenly throughout the field.

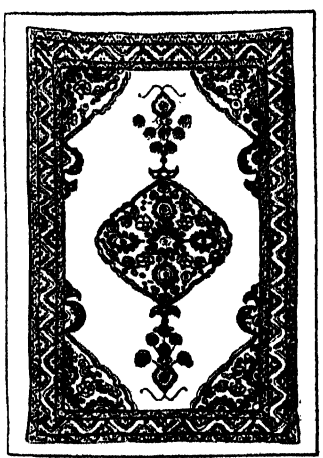

FIG. 13.—MESHED PATTERN FROM EAST PERSIA

Large Medallion.—These are floral carpets with a central lobed medallion, almost as wide as the field, having an appendage stretching towards each end of the carpet. To this device the name "pole-medallion" is often given. Carpets that are of this type probably come from north-west Persia.

Animal or Hunting.—An artificial division that includes floral carpets introducing hunting scenes or animals. Probably most of them come from south-east Persia.

Vase.—These are simply floral carpets with vases of flowers occurring in the pattern. The third type of floral carpet is very commonly so treated (*see* Plate IX.). It has been suggested that they were made in the neighbourhood of Joshaghan.

Diamond Diaper.—In these the field is divided up by long serrated leaves into diamond-shaped compartments, which are often filled with a group of four large palmettes, and sometimes contain vases.

Polonaise.—These are carpets with a silk pile often enriched with gold and silver thread inserted by the tapestry method. They appear to date from the 17th century but their place of origin is still uncertain. An abandoned theory is that they were made by Persian settlers in Poland. It is possible that they were all made in Persia and were mostly intended as gifts to European courts, but their patterns certainly differ from contemporary Persian carpets and an Indian or Turkish origin is not out of the question.

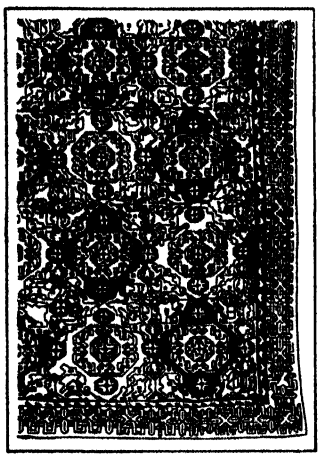

FIG. 14.—"HOLBEIN" TYPE, GROUND MOSTLY A CHEQUER OF TWO COLOURS DISGUISING THE TRUE NATURE OF THE PATTERN

Indo-Persian.—These are of the second and third floral types, but with a more set and angular arrangement of the basic stems, and with a much brighter colour scheme. The ground is crimson and among the other colours, brilliant greens and yellows predominate. It is thought that they may have come from the neighbourhood of Herat.

Tapestry.—A very few examples are known of carpets with the usual Persian patterns, woven by the tapestry method.

During the 17th and 18th centuries the patterns become more formal in character without undergoing any essential change: the more naturalistic forms tend to drop out and designs of the third floral and the diamond diaper type become more frequent. Silk is rarely used for the warp, but wool begins to be noticed though no doubt it had been used much earlier in carpets that have not been preserved. Towards the end of this period there begin to emerge certain groups of carpets that can be ascribed to definite districts, and these types mostly persist throughout the 19th century, when their numbers are augmented by the efforts of the manufacturer catering for the western market. The carpets of a locality rarely differ much in technique, and are mostly restricted to a few types of pattern, some of which are highly characteristic. There is a general tendency for carpets made towards the north-west of Persia to have a woollen warp, the Ghiordes knot and a rather coarse texture; and those from the south-east to have a cotton warp, the Sehna knot and a fine texture.

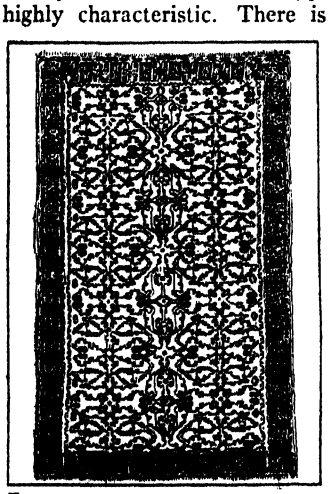

FIG. 15.—"YELLOW ARABESQUE" TYPE, YELLOW ON RED GROUND

Kurdistan.—Very thick and close pile: Ghiordes knot and woollen warp: mostly two lines of red woollen weft. The Mina Khani is a favourite pattern. Similar rugs not easily distinguishable from a description are called *Kara Dagh, Bijar,* and *Mosul.*

Hamadan.—Usually a cotton warp; the Ghiordes knot; and one line of weft after the knots. There is a wide outer band of plain camel hair which is very characteristic. Many are runners and have two or more large hexagonal panels along the field (*see* fig. 10). The colours are soft and harmonious.

Tabriz.—A type produced during the 19th century by an organized system chiefly for the western market. They are finely woven and well and accurately made but they lack the interest of the spontaneous product. The colours are light and delicate: the graceful pattern is evolved from traditional detail

by the modern designer. They have a cotton warp and the Sehna knot. Both large and small rugs are made; many with a silk pile.

Herez.—Mostly large carpets, coarser in texture and bolder in pattern than the Tabriz, but otherwise answering much the same description. To kindred products the names *Gorevan, Kermanshah* and *Serapi* are applied.

Feraghan.—A type much prized in the East. The best, usually small, are finely woven with a short pile. They have the Ghiordes knot, a cotton pile, and two lines of weft. The colouring is soft, and evenly toned patterns like the *herati* are common. Sometimes they have a well-marked diamond-shaped panel on a light ground. Many large and coarse rugs dating from the middle of the 19th century are found in English houses.

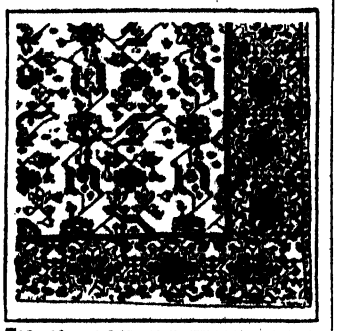

FIG. 16.—"BIRD" PATTERN, DIAPER PATTERN OF DEVICES ON A WHITE GROUND

Sarabend.—Like the Feraghan in technique, but they nearly always have the cone pattern in the field, and a wavy stem with dependent cones in the border. Many are runners (*see* fig. 11).

Sehna.—Very fine texture and short harsh pile: the Sehna knot; a cotton warp; and one line of weft. They are always small and have often the cone pattern or the *herati*. The field may have one or more concentric diamond-shaped panels but the sub-pattern runs through all with perhaps a change of colouring. The most expensive Persian rugs of their date.

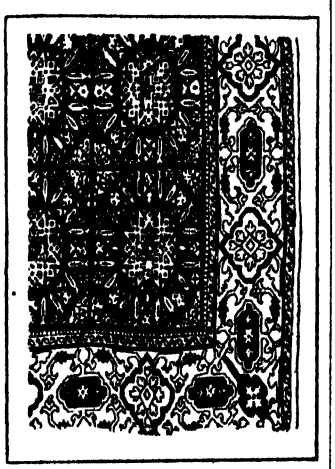

FIG. 17.—"GEOMETRICAL" TYPE

Joshaghan.—Richly coloured rugs with the Ghiordes knot and a silky, lustrous pile. The warp and weft are either of cotton or wool, and there may be two or three lines of weft. The patterns are similar to those of the old Persian floral rugs.

Muskabad.—Large carpets produced in a commercial way near Sultanabad. They are the Persian equivalent of the large Turkey dining-room carpet, but are superior to it. Cotton warp; Sehna knot; and mostly two lines of blue weft. A long and rather silky pile. The colours are mellow and the pattern is mostly a large and graceful floral one. Varieties are called *Sultanabad, Ziegler, Mahal* and *Savalan.*

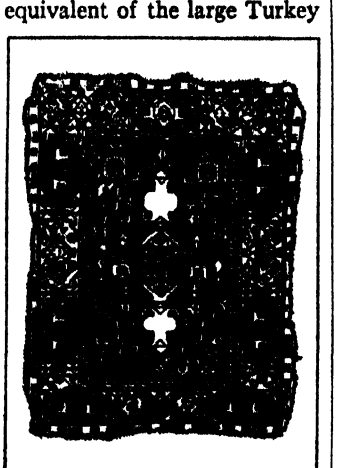

FIG. 18.—"TRANSYLVANIA" CARPET SHOWING CHARACTERISTIC SHAPE

Kashan.—The best modern Persian carpet. Very finely woven with graceful floral patterns, rather like the Tabriz, but with deeper colouring. The majority are unfortunately chemically washed. Cotton warp; Sehna knot; and mostly two lines of blue weft. Very thick in substance and most durable. Many are made with a silk pile. The *Sarouk* is very similar but is not so fine and has mostly a white weft.

Shiraz.—An easily recognized type. Woollen warp and two lines of red woollen weft: either kind of knot. The wool is very soft and silky and takes the dyes better than any other, and as a consequence the colouring is very rich and bright. The sides are mostly overcast with red and blue, and the ends often have extra embroidered bands. Tassels are often found along the sides. A common pattern is a large hexagonal panel (*see* fig. 12), and the cone diaper is also popular. Small devices and birds as found in Caucasian carpets are very frequent. The border mostly has very angularly-drawn floral forms. A great many saddle-bags are made. Kindred rugs are called *Mecca, Niris* and *Afshah.*

Khurasan.—Loosely woven rugs, often large, with a cotton warp, blue weft and the Sehna knot. There is generally a purple tone to the colouring. The *herati* is a common pattern and curious double cone-devices are almost peculiar to them. One kind is called *Herat.*

Meshed.—A sub-group of Khurasan rugs, with closer texture and lighter colours. A pole-medallion on a light field is common (*see* fig. 13).

Kirman.—Cotton warp; two or three lines of blue weft; and the Sehna knot. Finely and closely woven and of medium thickness. They have very naturalistic floral patterns and soft but rich colouring together with several light tints. Some modern ones introduce figure and pictorial subjects that are rarely pleasing.

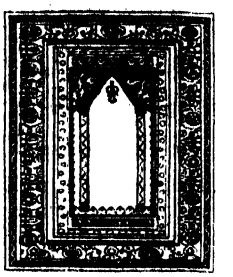

FIG. 19.—GHIORDES PRAYER-RUG OF FINE TEXTURE AND SHORT PILE

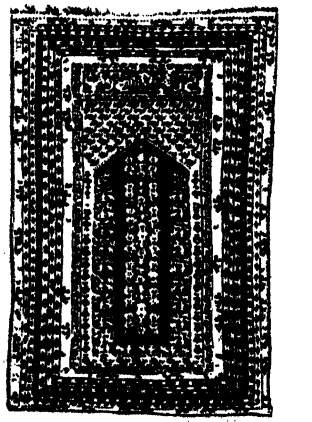
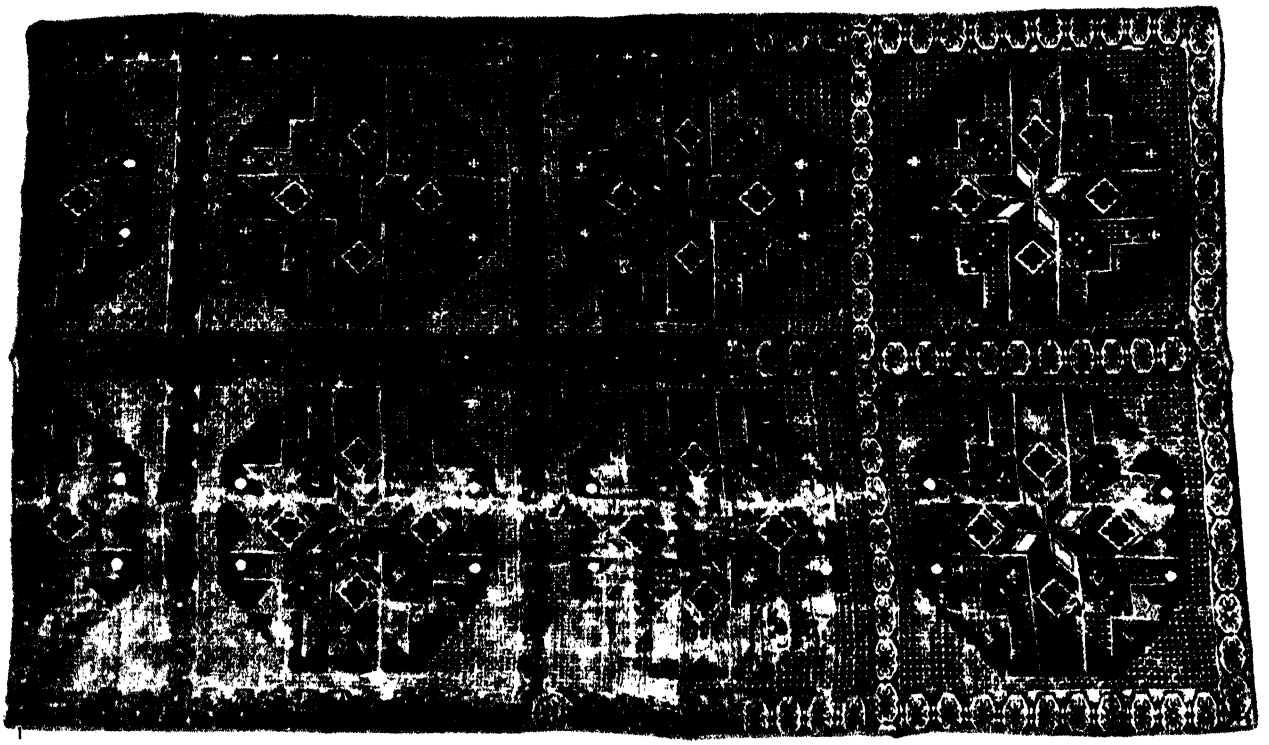
Kilims.—Tapestry-woven rugs are not largely made in Persia but the few are of very fine texture and have the same kind of patterns as the Sehna rugs.

India.—Carpet weaving is not a spontaneous art in India and it is possible that only few were made there before the Emperor Akbar introduced Persian workmen about the end of the 16th century. Most of the carpets then made followed Persian models in design and technique so closely that it is often difficult or impossible to distinguish between them. Generally however it will be found that the design is more stiffly arranged and the drawing less sympathetic and that there is a difference in the colour-scheme. The crimson, often in two shades, is more vivid: ochrous yellows and white are common and a peculiar plum colour is used. Two types of pattern however seem to be found exclusively in Indian carpets. The field of the first is divided up into quatrefoils or ogee compartments, each containing a naturalistic plant or other floral forms (*see* Plate X.). The second has detached sprigs of flowers arranged in various ways. Both types have very rich colouring and a deep crimson ground. Most of these carpets appear to have been made at Lahore for the palace of Amber at Jaipur.

The later Indian carpets are mostly very inferior, largely on account of the difficulty of obtaining good wool. Many still have the designs of Persia and of other countries but purely Indian patterns are also common. From time to time better carpets have been made in the factories and during the 19th century the government established a fairly successful manufacture in the gaols, but it is rarely that in both design and quality they rival the better products of Persia. The best come from Agra and Warangal, the latter producing some good silk rugs. Carpets from Masulipatam, Mirzapore and Tanjore are very cheap and very substantial but the wool is so harsh and the colours so dull and grey that they are quite unattractive. Cotton rugs are made in Multan, and tapestry-woven ones, called *daris*, in many places. During the 20th century carpets of good quality, with any desired pattern, are being made in Kashmir.





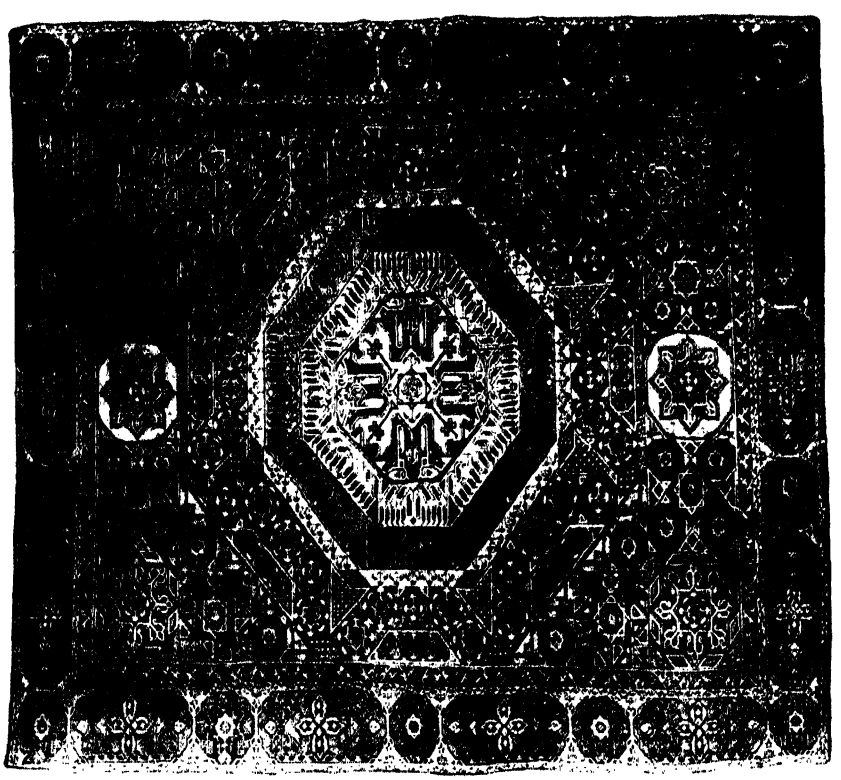


FIG. 20.—KULAH PRAYER RUG

Turkey.—The Turkish carpets of the 16th and 17th centuries are made entirely of wool and have the Ghiordes knot and two lines of weft, mostly red, after the knots. The texture is of

PERSIAN AND TURKISH RUGS, 16TH CENTURY

1. Silk rug, Central Persia, showing a hunting scene; late 16th century. The colour of the inner field is a deep rose-red. The central border is blue-green. The patterns are in yellow, blue, green and tan

2. Turkish rug, court manufactory, late 16th century The patterns are based on floral forms. The foundation colour is red, with green, blue and yellow prevailing in the design

RUGS AND CARPETS

BY COURTESY OF THE DIRECTOR OF THE VICTORIA AND ALBERT MUSEUM

PERSIAN CARPET, 16TH CENTURY

Famous carpet from The Mosque at Ardabil, Persia, A.D. 1540. 34 ft. 6 in. x 17 ft. 5 in. Knotted in woollen pile on a silk warp. The floral ornament, on a basis of scrolling stems curving about the field, is here associated with a central medallion and variously shaped panels. The ground is deep indigo and the other prevalent colours are yellow, red, white and black

medium fineness. Only about six to eight tints are used and these are mostly bright primary colours. The reds, which predominate, do not incline towards crimson. The patterns are never naturalistic but yet are based on floral forms, and very little purely geometrical ornament is introduced apart from that obviously derived from Saracenic art. One group—the Court Factory—differs from the above description in several particulars.

Holbein.—So called because they are often represented in the pictures of that painter. They have a pattern of Arabesque octagonal forms arranged regularly in rows and columns, with diamond-shaped figures between them (*see* fig. 14). The ground is mostly a chequer of two colours which rather disguises the true nature of the pattern. This design is very interesting as being essentially the same as that of the Turcoman rugs of about three centuries later.

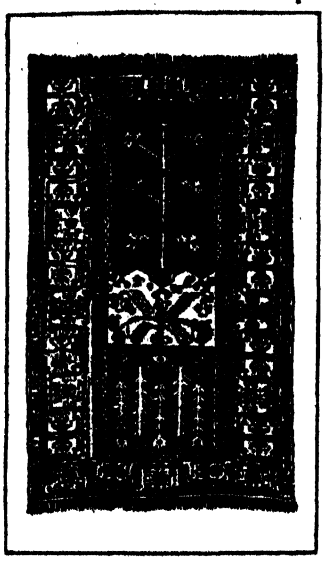

FIG. 21.—LADIK PRAYER RUG

Lobed Panels.—These have a number of angular lobed panels on a field covered with a small floral diaper.

Yellow Arabesques—These have a repeating pattern of yellow arabesques on a red ground (*see* fig. 15), and usually a border with a debased Cufic inscription.

Ushak.—A very important kind of large rugs having an almost circular medallion in the centre and the halves of circular lobed medallions against the sides. (*See* Plate IV.) The pattern seems closely connected with the *Large Medallion* Persian type. They are the direct ancestors of the well known red and blue "*Turkey*" carpet of the 19th century.

Prayer-Rugs.—The earliest known prayer-rugs have a plain red field with a very simple arch-form at one end and mostly a hanging lamp. The border often has a row of modified cloud-bands alternating with rosettes. Most of them have been preserved in Italian churches.

Bird.—Apparently akin to the last group, these have a diaper pattern of devices somewhat bird-like in shape, on a white ground (*see* fig. 16).

Court Factory.—This group, believed to have been made under direct Court patronage near Constantinople, differs in several respects from other Turkish rugs, and has much affinity with the Persian. The Sehna knot is used and the texture is fine. The warp is of fine yellow wool and the weft is often of red or green silk. The chief colours, always bright, are crimson, yellow, yellow-green, and light blue. The patterns closely resemble those of the so-called "Damascus" faience.

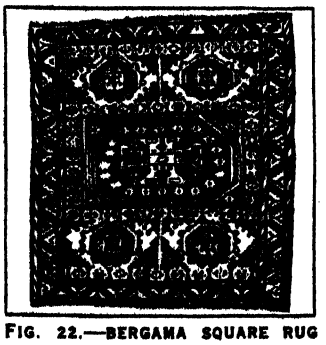

FIG. 22.—BERGAMA SQUARE RUG

Geometric.—These are coarser, but have several points of resemblance to the last group, the colours being similar and some curious technical details identical. They have arabesque geometrical patterns of octagons, stars and interlacing lines (*see* fig. 17). Dr. Sarre claims that they were made in Egypt.

Later Turkish Carpets.—Apart from the Ushak rugs, which persist to the 20th century, the above types almost disappear during the 17th century, and are succeeded by others which mostly have the form of prayer-rugs. During the 19th century the large Turkey carpet becomes merely an article of commerce and the smaller rugs deteriorate sadly in quality while keeping the design almost unchanged. Great numbers of kilims have been made. The larger ones, woven in two strips, have simple geometrical patterns, while the smaller follow in a simplified form the patterns of the pile carpets.

Transylvanian.—So called because many were found in that country. Those of the 17th and early 18th centuries have bright red and yellow colouring and mostly a hexagonal panel in the middle, and a succession of such panels in the border. During the 18th century the colour-scheme becomes more sombre and includes chiefly red, blue and a characteristic dingy purple. These later rugs are almost square in shape (*see* fig. 18).

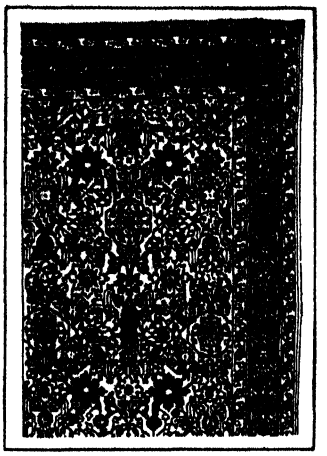

FIG. 23.—CAUCASIAN CARPET WITH CUFIC BORDER

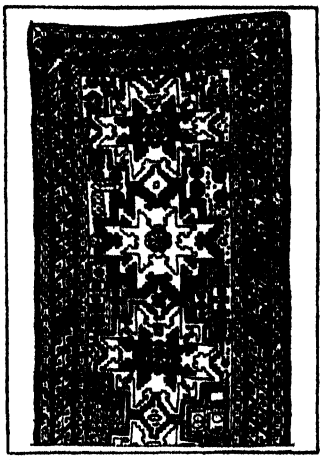

FIG. 24.—SHIRVAN RUG, FINE TEXTURE AND SHORT PILE

Ghiordes.—Mostly prayer-rugs, though in the 19th century fairly large rugs of similar design were made. They are fine in texture and have a very short pile. The pattern is a delicate mosaic of small detail. The arch is steeply pointed and often supported by two columns and the niche is mostly plain. There are several narrow border-stripes (*see* fig. 19). The main colours are red, blue and white.

Kulah.—Prayer-rugs of medium texture and blue and yellow colouring, the reds having faded. The arch is a flat-pointed one (*see* fig. 20), and there are often tree-forms in the niche. There are numerous narrow border-stripes with a pattern of small spots.

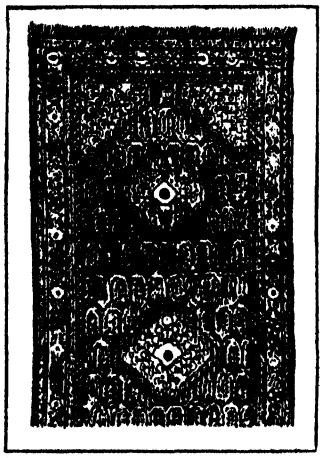

FIG. 25.—BAKU OR KHILA CARPET FROM GILAN

Ladik.—Prayer-rugs with red preponderating and some blue and yellow. One of the border-stripes is wide. A characteristic feature is the row of upright lilies either above or below the prayer niche (*see* fig. 21).

Mujur.—Loosely woven rugs with bright colours including much green.

Meles.—Prayer-rugs with brick red and yellow colouring. The pointed arch opens out at the top into a diamond shape.

Makri.—Brightly tinted rugs with two arches side by side often with different colouring.

Bergama.—Largish square rugs of loose pile. The pattern mostly consists of a number of rectangular panels (*see* fig. 22). The colouring is dark, and that, as well as the detail, resembles that of some Turcoman rugs.

The Caucasus.—The Caucasian weaver is clearly inspired by the carpets of both Persia and Turkey, but in the matter of technique and colouring his debt is chiefly to the latter. Warp and weft are both of wool; the Ghiordes knot is always used and the texture is of medium fineness. The colours are few and bright, but more white is introduced than in the Turkish rugs and there is no predominance of red. Many Persian and Turkish patterns are adopted with a much more angular treatment, and purely geometrical ornament is not disdained. A common basis for the design is the rectilinear panel fringed with latch-hooks;

and the ground is often filled with small detached devices, such as octagons, stars and animals capriciously inserted wherever there is a blank space. The drawing, apart from tone and colour, has rarely much beauty. Few of the earlier carpets—called *Kuba* in the trade—have been preserved.

Dragon.—This 17th century type, once ascribed to Armenia, has a very quaint pattern apparently based on the Persian

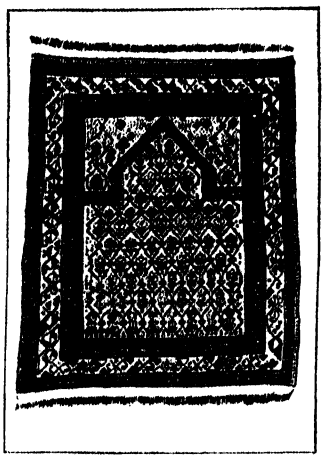

FIG. 26.—DAGHESTAN PRAYER RUG, DIAGONAL LINE PATTERN

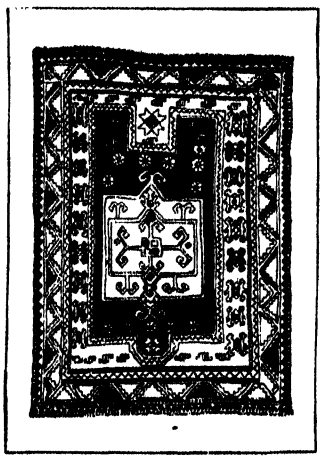

FIG. 27.—KAZAK PRAYER RUG, COARSE WITH LONG PILE

Diamond diaper; and introducing scarcely recognizable representations of the dragon and other Chinese mythological creatures. (*See* Plate X.)

Cufic Border.—A very formal arrangement of the third Persian floral type, mostly with a Cufic border (*see* fig. 23). They are found in the 18th century and onwards.

Shirvan.—An important group made by the sedentary population. It has a rather fine texture and a short pile. The chief colours are red, blue and white. Of many kinds of patterns that with repeated panels is a favourite (*see* fig. 24).

Baku or *Khila.*—Large, long rugs made like the *Shirvan,* having large cone-devices and birds (*see* fig. 25). Their soft, faded colours are supposed to go specially well with antique objects.

Daghestan.—Thicker than the *Shirvan,* with a rich yellowish tinge in the colouring, and a tendency to diagonal lines in the patterns (*see* fig. 26). The prayer rugs are often dated.

Kazak.—A very important group made by the nomadic people (*see* figs. 27 and 28). They are rather coarse and have a long pile and two to four lines of red weft. The sides are overcast in different colours. Panelled fields are common and an interesting pattern is one of large radiating devices probably derived from the *Dragon* carpets. The colours are mellow with a good deal of brick-red.

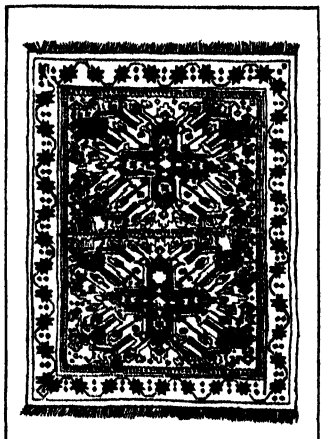

FIG. 28.—KAZAK CARPET WITH RADIATING DEVICES

Karabagh.—Woven like the *Shirvans.* The design often includes diamond-shaped panels and very angular cone-devices (*see* fig. 29); floral patterns influenced by Western art are not infrequent. Magenta and light blue are freely used.

Kilims.—Large numbers of tapestry-woven rugs are made, mostly with geometrical patterns.

Soumaks.—These, made by the Soumak method, are mostly large rugs with a pattern of three octagons in the field.

Central Asia.—As the carpets of Western Turkestan are made by nomadic Turcoman tribes living in tents and constantly moving about, it is not to be expected that very old ones can still exist. Probably in fact few go back more than a hundred years, though it is almost certain that similar rugs have been made for centuries. Turcoman rugs are easily identified, for they all, excepting the *Beluchis,* have a dark red colouring and peculiar designs. Most of the older pieces are not in reality rugs at all though those intended for hanging in tent doorways have that appearance. The majority are bags, used for storage in the tents or on the pack animals. Those called camel-bags measure about five by three feet, and the tent or wall-bags three by one or more. Saddle-bags consist of two squares of about two feet, joined together. There are also long bands about a foot wide and perhaps sixty yards long, which are for wrapping round the large tents. The small squarish rugs and larger ones of about ten by seven feet seem to be later in date and were perhaps made chiefly for sale. The Turcoman carpets (wrongly called Bokhara) have woollen warp, weft and pile, two lines of weft and nearly always the Sehna knot. They are surprisingly well woven for nomads with none but the most primitive appliances. After the predominant red, the chief colours are blue, white and a natural black that tones to a very pleasant brown. The characteristic design is the octagon—or so-called elephant's foot—arranged in rows and columns, often with diamond-shaped figures in between. The doorway hangings—called *Khatchlis* (*see* fig. 30)—have cross shaped panelling and the smaller pieces often have a rectangular diaper. Woven end-webs and tassels are freely used as embellishments. The best classification is on a tribal basis.

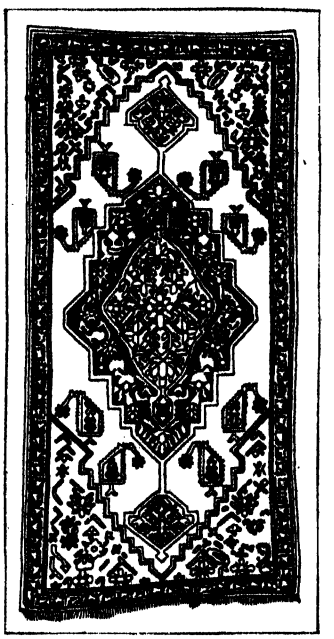

FIG. 29.—KARABAGH CARPET, BLUE AND MAGENTA

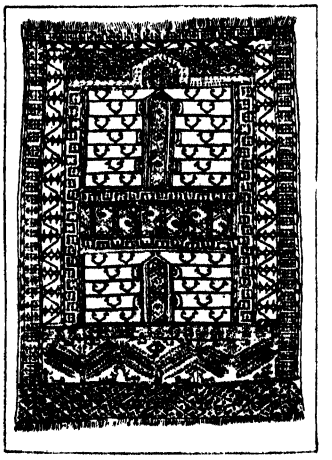
Tekke.—These are often very finely woven, sometimes with 400 knots to the square inch. The principal colour is a deep crimson (fig. 31) often modified by time so that it is best seen at the back. (*See* Plate VII.)

Yomud.—Of medium fineness, mostly with the Ghiordes knot. The chief colour is a purple red, and there is a good deal of white, especially in the border. In the pattern diamonds often displace the usual octagon (*see* fig. 32). The long tent-bands, which have the pattern in pile on a woven ground, belong to this group.

Saryk.—Like the *Tekkes* but with an almost black-purple or very deep crimson colouring, together with some very prominent white. Not very common.

Ersari.—These are rarely large pieces. The chief colour is a brown-red; dark green and a little bright yellow are characteristic. The patterns are very varied, with a tendency to zig-zags, diagonal lines and spotted effects (*see* fig. 33).



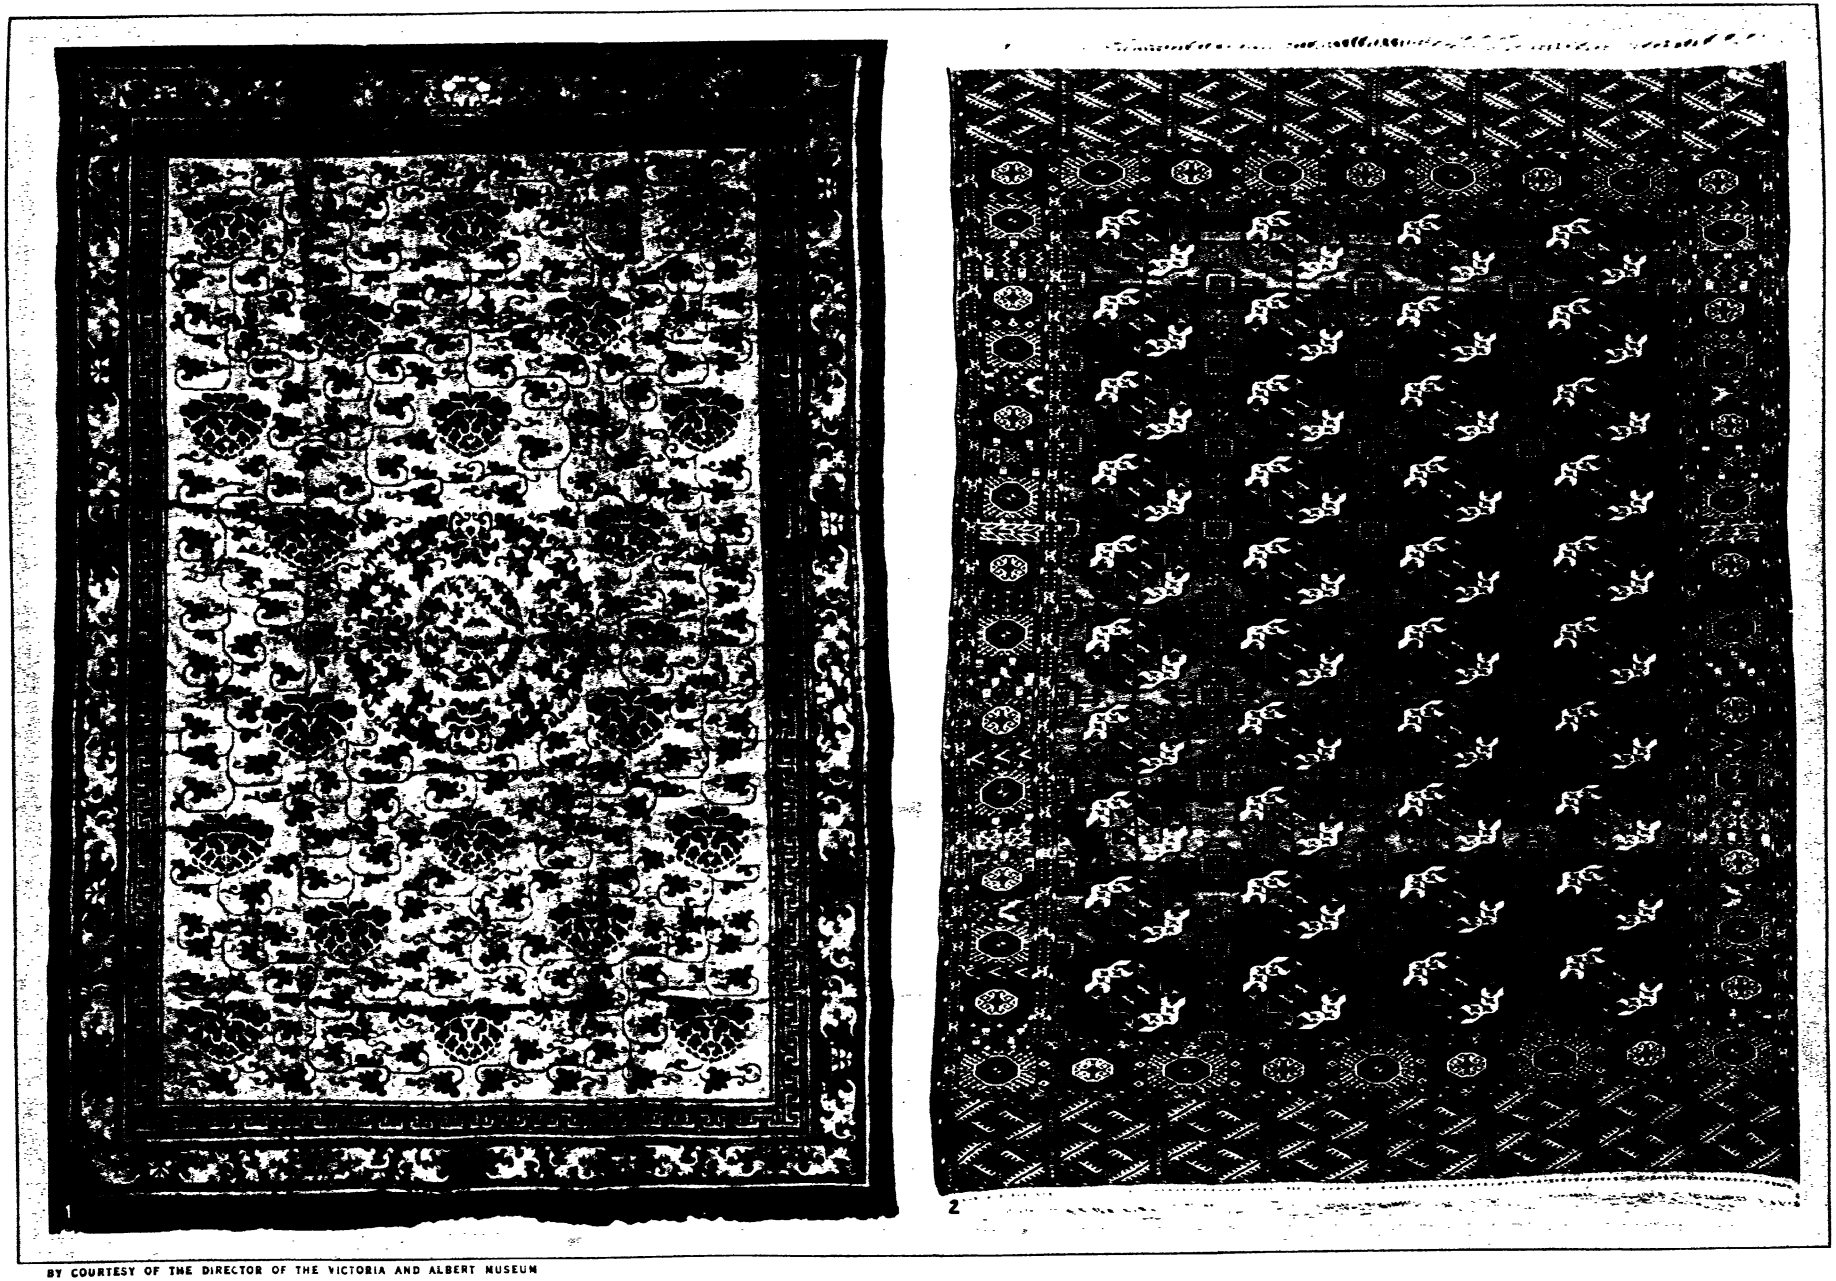


FIG. 30.—PORTIERE CARPET OR KHATCHLIS

Afghan.—Mostly large rugs with long pile and a pattern of large octagons almost touching in columns (*see* fig. 34), and akin to the *Ersaris.*

Bokhara.—A rare type apparently made in Bokhara, with rich colouring including a lot of yellow, and patterns apparently based on the Persian. Most are prayer-rugs with a characteristic pointed

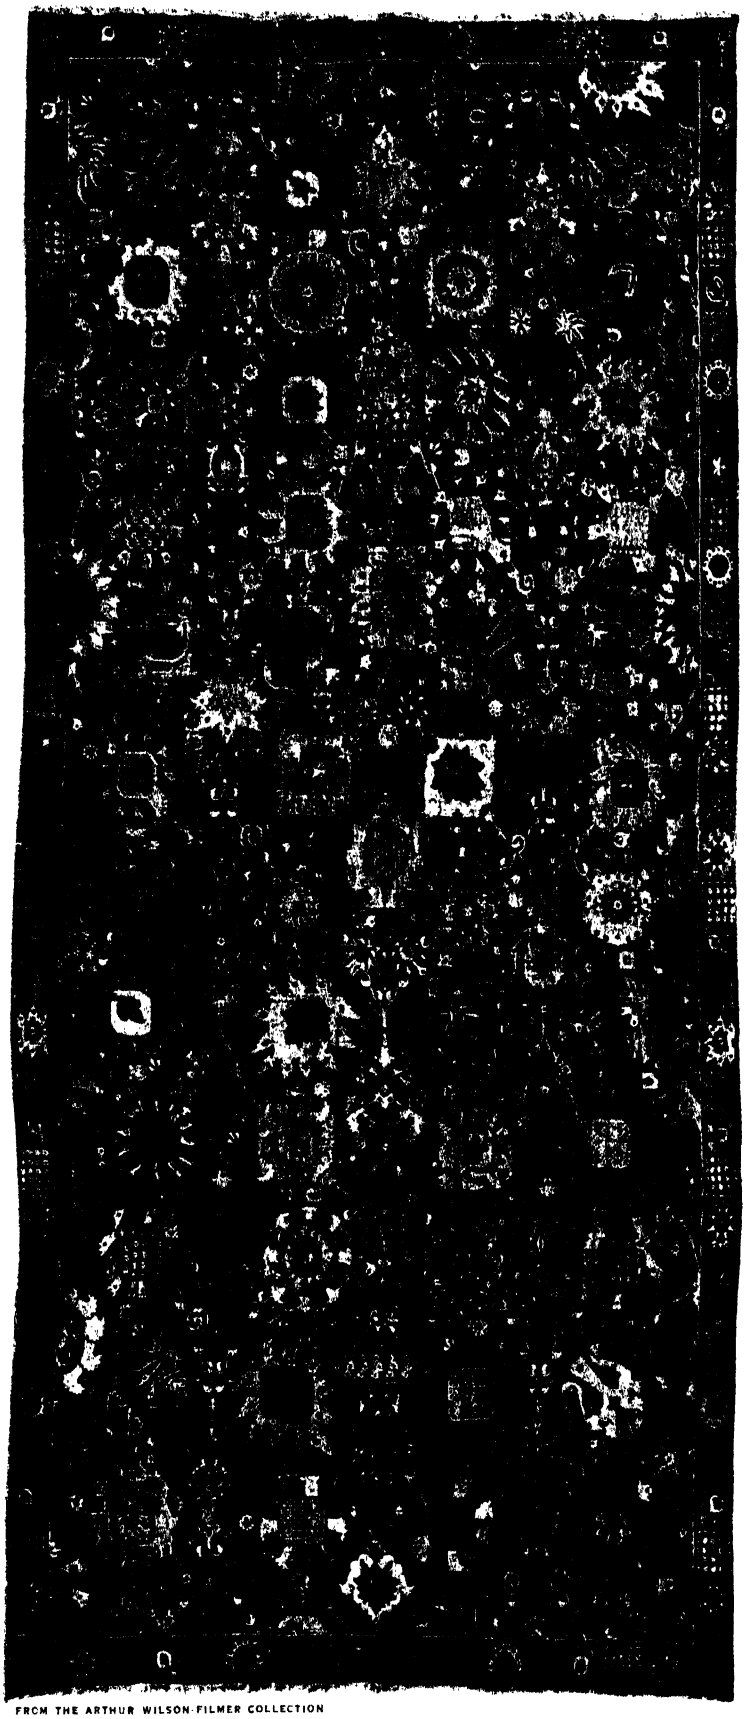
ORIENTAL CARPETS, 18TH AND 19TH CENTURIES

1. Chinese carpet, late 18th century, 11ft. 8in. x 8ft. 4in. Knotted in woollen pile on a cotton warp. The colour of the inner field is white, with the pattern in blue. The outer border is a deep blue, with the design in white and yellow



2. Tekke-Turcoman carpet, 19th century, 9ft. 7in. x 7ft. 2in. Knotted in woollen pile on a woollen warp. The carpets of the Tekke tribe, sometimes erroneously called Bokhara, are often very finely woven: the principal colour is a deep crimson

BY COURTESY OF THE CANADIAN PACIFIC STEAMSHIPS

CARPET-WEAVING

Indian workers at a loom in one of the factories for the manufacture of hand-made carpets at Jaipur, Rajputana, in northern India. Between the two rollers which, with the supporting framework, constitute the loom, are stretched the vertical warp threads. The coloured wools (or silks) are knotted in horizontal rows on the warp threads, the knots being cut to form the pile of the carpet. The weft threads are passed alternately under and over the warp threads, lines of weft alternating with lines of knots. Carpets are found with as few as 15 and as many as 1,000 knots to the square inch, from 40 to 80 knots being considered a moderately fine texture

FROM THE ARTHUR WILSON-FILMER COLLECTION

PERSIAN VASE CARPET, EARLY 17TH CENTURY

arch (*see* fig. 35).

Beluchi.—These differ from the other Turcomans in that they have a black weft, and dark purple and red colouring, sometimes with natural camel-colour and very staring white. The patterns are almost geometrical but the prayer-rugs often have tree-forms (*see* fig. 36). It is one of the cheapest rugs, but too many of the later ones are chemically washed.

Chinese Turkestan.—The earliest rugs of Chinese Turkestan date from the 17th century and mostly have a silk pile and some

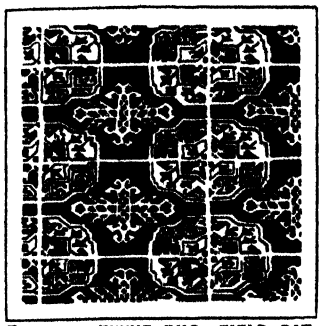


FIG. 31.—TEKKE RUG, FIELD PATTERN

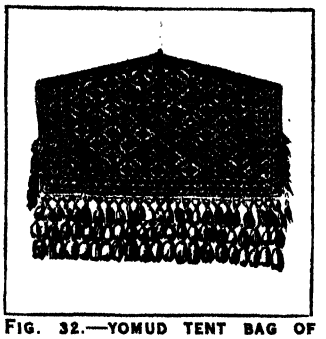

FIG. 32.—YOMUD TENT BAG OF MEDIUM FINENESS

gold and silver thread. The patterns are formal floral ones, based on the Persian but with unmistakable Chinese treatment of the detail. The later carpets are loosely woven with the Sehna knot, wool, or more rarely silk pile, and a cotton warp. The 18th century examples have rich but dark colouring, which during the 19th century gets gradually more vivid until at last it becomes excessively crude. There are two important types of design.

Medallion.—These usually have three medallions suggesting in shape a square with well-rounded corners (*see* fig. 37). One border almost invariably has a conventional Chinese pattern of foam-crested waves. This pattern is mostly called Samarkand in the trade.

Five Blossom.—These have a floral diaper with characteristic groups of five blossoms (*see* fig. 38). The colouring is often richly red and orange with a little clear blue. They are often called *Khotan* or *Kashgar.*

China.—The rugs of China proper are easily recognized by their characteristic Chinese ornament. They are of coarse texture and are woven with the Sehna knot on a cotton warp: the pile is thick with a very smooth surface. A peculiar feature is the clipping of the pile so as to form a furrow at the contours of the pattern. The prevailing colour is yellow, sometimes intentional but often resulting from the fading of shades of red and

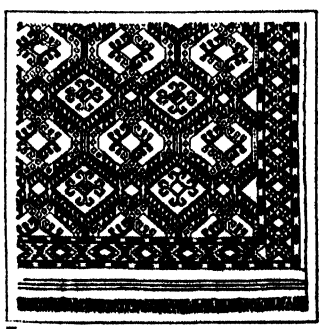

FIG. 33.—ERSARI PATTERN, CHIEFLY A BROWN RED

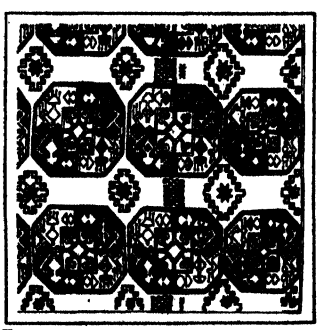

FIG. 34.—AFGHAN RUG, FIELD PATTERN

orange. Blue and white are also freely used (*see* Plate VII.) but there is little true red, brown or green. The patterns are very varied. Some carpets have repeating scrolling plant-forms. Others have, scattered about, flowers, medallions of frets and the countless symbols that are so familiar in Chinese art. Frets of the Greek type are very common in the border. Pillar carpets are peculiar to China. They are designed (*see* fig. 39) so that when wrapped round a pillar the edges will fit together and give a continuous pattern, which mostly is a coiling dragon. Many small mats, seat-covers and the like are found. The dating of Chinese rugs is an almost impossible task, as patterns have varied very little with time, and internal evidence is almost non-existent. During the 20th century numbers of large carpets have been made for export. They usually have a scattered pattern on a light ground and are soundly woven but not very artistic.

Morocco.—Large carpets, twice as long as wide, are made here. They are loosely woven with very bright but mostly faded

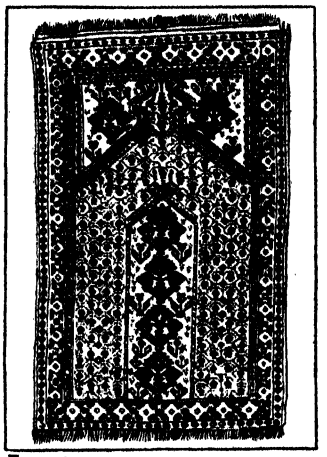

FIG. 35.—BOKHARA PRAYER RUG OF RARE TYPE

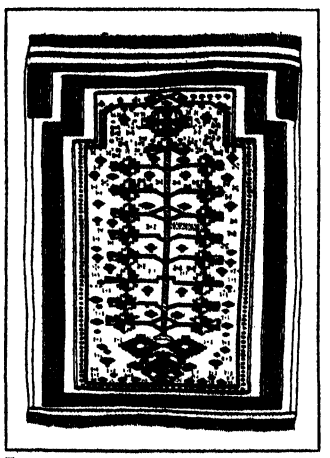

FIG 36.—BELUCHI PRAYER RUG WITH BLACK WEFT

colours. The field is often cut up into rectangular panels filled with ornament taken directly from Turkish carpets.

Spain.—Carpets seem to have been made in Spain as early as the 14th century, no doubt soon after their importation from the East. They are made entirely of wool, with some unusual technical features. The knot is tied, or rather twisted, on one warp-thread instead of on two, and the weft passes several times after each row of knots. The colours are bright and few in number, little being used but yellow, blue, red and green. The designs fall into two groups, being based either upon oriental models, such as the geometrical Turkish one or upon purely Spanish ornament (*see* Plate X.). The latter frequently introduces heraldry. One early type of long rug has shields of arms on a field with a honeycomb pattern introducing plant-forms and birds. A common design is a succession of foliated wreaths; another is a diaper of ogee compartments containing the floral device known as the "artichoke." Few knotted pile carpets seem to have been made after the 17th century, but small rugs woven in narrow breadths with a looped pile are common until at least the end of the 18th century.

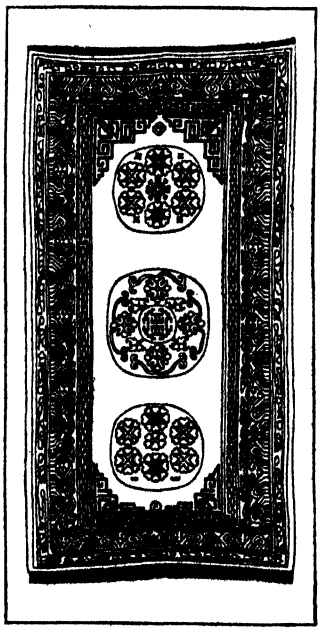

FIG. 37.—CHINESE TURKESTAN CARPET WITH THREE MEDALLIONS

England.—The art of making hand-woven carpets in England soon followed their importation from Turkey, though actual specimens of the 16th and 17th centuries are so rare that only about a dozen complete rugs are known. They have a hempen warp and weft and a woollen pile of medium fineness, tied with the Ghiordes knot. The ground is usually green and there are so many shades of the other colours that the whole number of tints is greater than in oriental carpets. The designs may be divided into two groups. In the first are found typical English patterns resembling contemporary embroidery, and often introducing heraldic devices and, fortunately, dates. The earliest known carpet of this type belongs to the Earl of Verulam and is dated 1570.

The second group has patterns following closely, except in colour, the Turkish carpets of the time. On two out of four of this type belonging to the Duke of Buccleuch, the dates, 1584 and 1585, appear. (*See* Plate IV.) Large numbers of pieces of carpet-knotting —called at the time "Turkey-work"—were made for covering chairs and stools. As the demand for carpets increased in the 18th century small factories were started at Paddington, Fulham, Moorfields, Exeter and Axminster, and the home production was stimu-

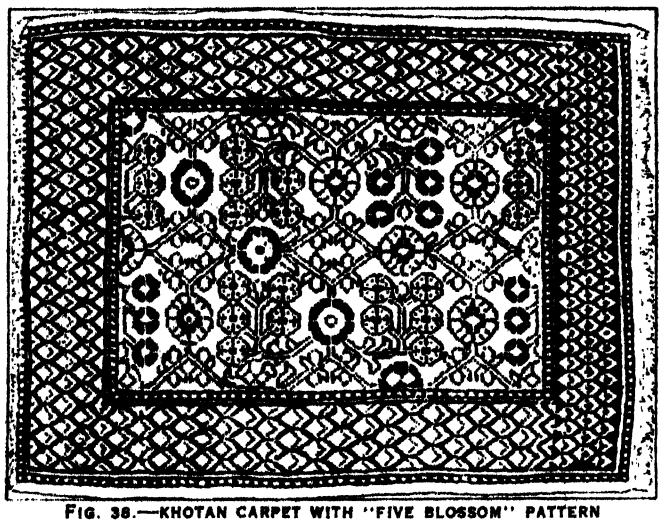

FIG. 38.—KHOTAN CARPET WITH "FIVE BLOSSOM" PATTERN

lated by premiums offered by the Society of Arts in 1756. The designers continued to adopt the decoration of the time or to copy eastern carpets. The famous Axminster factory worked on well into the 19th century and then became merged into the Wilton factory, which is still in operation. With the advent of machinery the industry dwindled and almost disappeared until, about 1880, the craft was revived by William Morris. Quite late in the century a successful factory was opened in Donegal and during the 20th century many small rugs have been knotted by handicraft societies, though their products can scarcely compete commercially with the machine or with the oriental rug. (C. E. TA.)

THE UNITED STATES

The first carpet factory in the United States was established in 1791 by W. P. Sprague at Philadelphia. From that time the development of carpet-weaving machinery has progressed rapidly, especially in the line of broadlooms. One of Sprague's earliest Axminster carpet designs represented the arms and achievements of the United States. This attracted the attention of Alexander Hamilton, who recommended the imposition of a small duty on imported carpeting, thus initiating the policy of a protective tariff. While in the early days of carpet manufacturing in the United States, looms were imported from Great Britain and the Continent, it was not long before looms were invented and constructed in the different carpet mills which had come into existence in several cities in the United States. The Jacquard pattern device was put into use in the United States shortly after its introduction in Europe. At Medway, Mass., in 1825, a small ingrain carpet mill, owned by Henry S. Burdett and managed by Alexander Wright, was started with hand looms brought from Scotland. In 1839 Erastus B. Bigelow began experimental work at Lowell, Mass., which resulted in the perfection of the first power loom ever made for weaving carpets. This wove an ingrain type, and was followed by Mr. Bigelow's development of the Brussels power loom in 1848. John Johnson of Halifax, England, undertook tapestry and velvet weaving (*q.v.*) in Newark, N.J., producing the pattern by printing the dyestuff on the individual strands of yarn. In 1876, after several years of research, Halcyon Skinner invented the moquette or spool Axminster at West Farms, N.Y. James Dunlap, in Philadelphia, developed a method of printing tapestry and velvet carpeting in the finished fabric. Imitation Smyrna rugs were made in considerable quantity by many factories during the latter part of the 19th century, the process being of the chenille Axminster type, but double faced. The three quarter width or 27 in. was the limit of weave in the several types for long periods after invention, but in the closing years of the 19th century a movement to widen the looms began in America. The ingrain carpet and Smyrna rugs gradually lost favour, while the tapestry, velvet, Axminster, Wilton and chenille rapidly grew in demand as the processes were perfected and the looms widened. Rugs were first formed by sewing carpet strips together. Later the corners of a border pattern strip were mitred to form the framed design effect. Slowly the necessary changes were made to allow weaving the border patterns in the straight strips and avoid the mitred corners. (*See* CARPET MANUFACTURE.) To eliminate the seam through the centre of rugs and in the medallion designs, popular at the time, required a wider strip and loom to weave it. Looms nine feet in width followed this trend in tapestry, velvet and Axminster in the early years of the present century and Wilton broadlooms followed after many years of experimental work and became popular about 1926. All these weaves are commonly woven up to 15 ft. in width and even wider looms were being developed in 1928. The chenille weave, developed in Great Britain in 1839, was not introduced into the United States until 1909 and was not produced in quantity until 1916. It has had a steady growth since because it is the only woven floor covering that can be woven to special order up to 30 ft. in width, any reasonable length, any shape, design or colour arrangement and an inch or better in thickness. Seamed rugs are no longer in popular demand.

France.—There are early records of carpet weavers in France, but nothing is known of their work until the foundation of the famous Savonnerie factory near Paris in 1626. There many large carpets were made, mostly with flaxen warp and weft and a woollen pile tied with the Ghiordes knot. The designs accord with contemporary French decoration and few if any were based on oriental carpets. In 1825 the factory was closed and the manufacture transferred to the Gobelins tapestry factory. During the 18th century and afterwards many tapestry-woven carpets were made at Aubusson and in other tapestry factories.

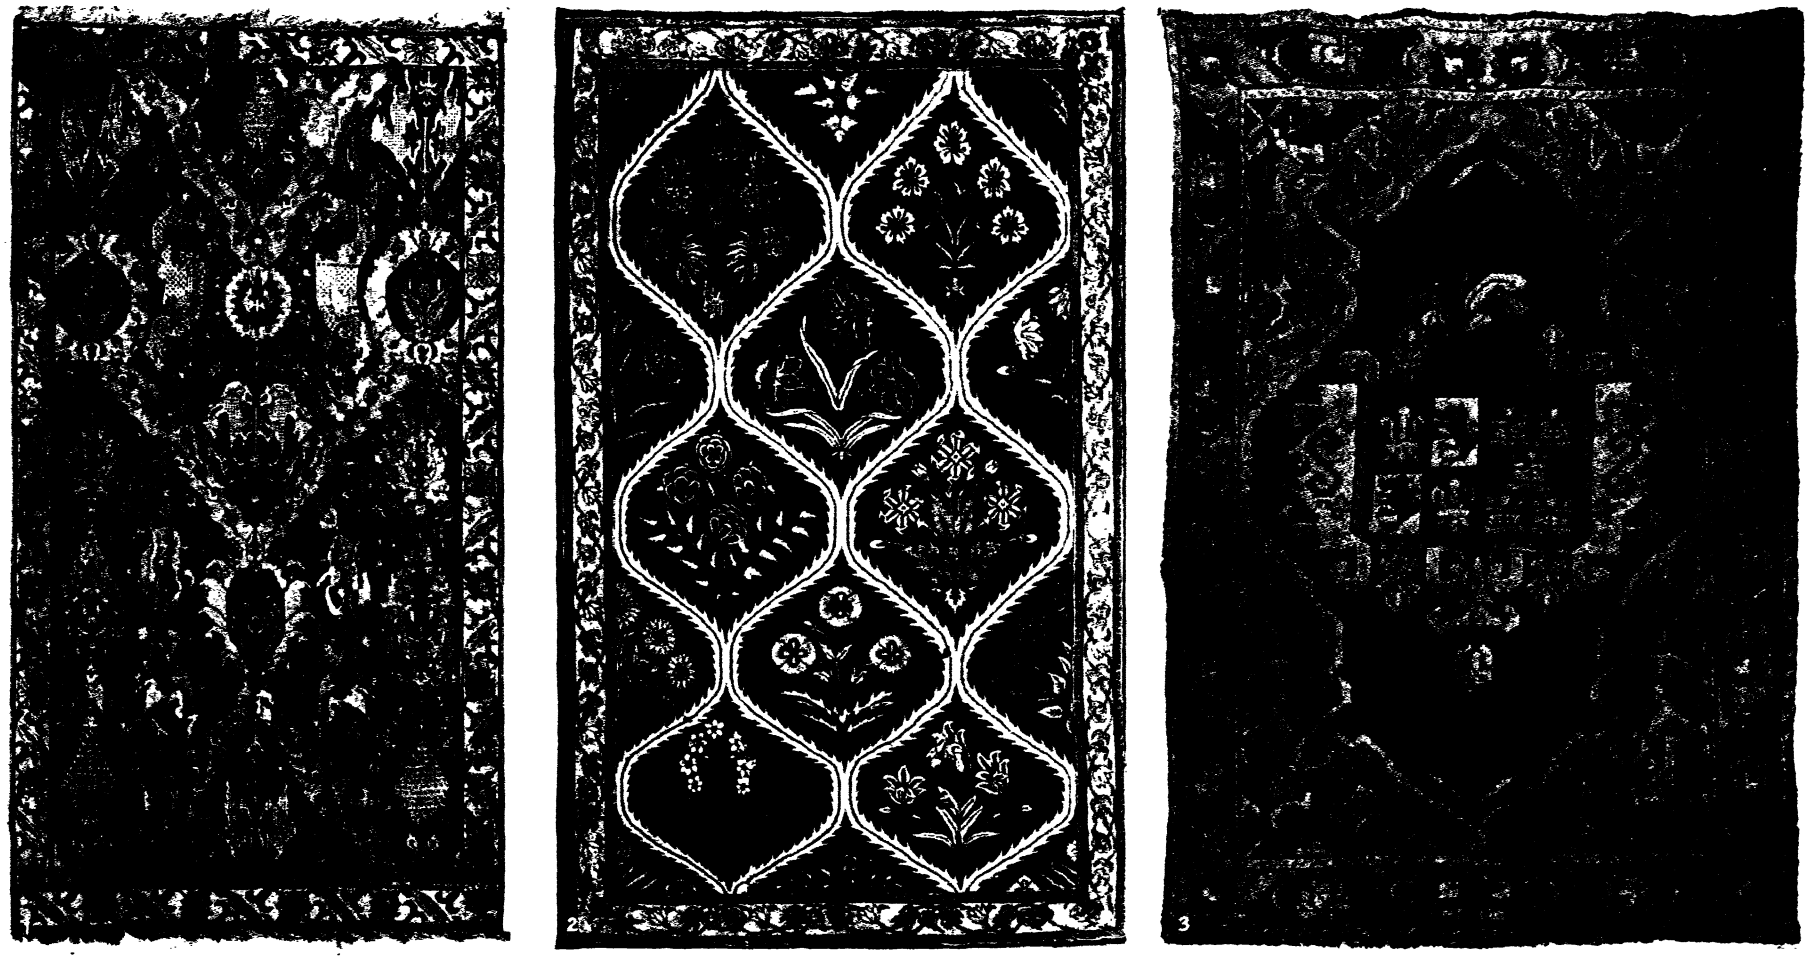

FIG. 39.—PILLAR CARPET, DRAGON DESIGN

Other Countries.—A few carpets are still in existence that were made in Poland in the 17th century, with floral patterns in light colouring. Loosely woven rugs have been much made by the peasants of Finland. They often have human figures and dates and seem mostly to have formed part of the bridal dowries. Kilims are made in the Balkan States and in Southern Russia; they resemble the Turkish pieces but have, especially the Russian, more naturalistic floral patterns. Those from Rumania generally include birds in the design.

PRACTICAL CONSIDERATIONS

It is perhaps more important that a carpet for use should be soundly made than beautiful, and certainly better that it should be beautiful than that it should accord with any particular scheme of decoration. Oriental carpets, on account of their depth of tone, rarely go badly with other objects. Accordingly when buying, the first thing to ascertain is that the foundation threads are sound and strong and that the pile is not unduly worn away. If a rug is held up to the light, holes and thin places are often revealed that were quite unnoticed when it lay on the floor. Holes that have been properly repaired are of little consequence. It should be noticed whether it is of good shape and whether it lies flat on the floor. Few rugs have the sides perfectly parallel but an excessive distortion is unsightly. A rug that is not flat tends to wear badly

THREE CARPETS

1. South Caucasian, north-western Persian, or Armenian Dragon carpet, 17th century. 11 ft. x 6 ft. 4 in. This type, called Kuba carpets, has a pattern based on the Persian Diamond diaper, with diamond-shaped compartments in the field, and conventionalized representations of the dragon and other Chinese creatures, such as the phoenix and the unicorn. The colours are brown, white, blue, yellow, red and purple

2. Indian carpet, late 16th or early 17th century. 4 ft. 8 in. x 2 ft. 11 in. This shows a type of pattern exclusive in Indian carpets with the field divided into quatrefoils or ogee compartments, each containing naturalistic flowers or floral patterns. The colours are: crimson foundation, with the design in yellow; the floral forms are in red, white, rose, blue, green, yellow and purple

3. Spanish carpet, with purely Spanish ornament, showing a shield of arms in the field, with honeycomb pattern introducing plant forms. This is a woollen pile carpet

in the baggy places, but certain good rugs, such as the *Shiraz*, are rarely quite free from this defect. A guarantee should be asked that the rug has not been chemically treated, as is too often done with the object of effecting a supposed improvement in colour. Such treatment usually results in a hopeless deterioration of the yarns. Undesirable, though less destructive, is the process of hot-rolling, which gives to inferior wool a silky gloss that is only transitory.

The Care of Carpets.—Carpets will give remarkably long service if treated with proper consideration. Their two great enemies, apart from the inevitable destructive effect of wear, are moth and damp. The former is best kept at bay by frequent moving or handling and by regular exposure to light and air. If rugs must be stored, then inspection at intervals is essential. A carpet in use is rarely in danger. There seems to be a great future for certain chemical applications that render the wool uneatable by moth, but the method is not yet fully established (1929). Damp will in time rot the threads and destroy the fabric, but it can be avoided by obvious means. If any mechanical injury is suffered, such as a cut or burn, the damage should be dealt with as soon as possible by a competent repairer, for such lesions get worse very quickly. In ordinary use, quite apart from accident, the ends and sides often tend to wear and fray out, in which case the parts should be re-overcast—a very simple operation if done in time. Places in the middle locally worn or damaged can have new knots inserted and even large holes can be restored so as to be almost as good as new, though such work is rather expensive. In carpets of lesser value, instead of new knotting, patches cut from a suitable rug can often be inserted at less cost, and sometimes a serviceable small rug can be made from a larger worn one by cutting away the bad parts.

From time to time but not more often than necessary carpets should be cleaned and the improvement in their appearance is often astonishing. If there is any doubt as to the stability of the dyes of the carpet, it should be entrusted to one of the many firms who specialize in this kind of work. In many cases, however, surface washing with a limited supply of hot water and carpet soap applied with a stiff brush may be done at home, though drying the fabric afterwards is often a difficulty, as a clean and airy place must be available for some days at least. In ordinary use carpets are properly kept free from dust by brushing, or by means of a vacuum cleaner, but in all cases where a brush is employed it is *most important* that it is not used against the lie of the pile. (*See* also TEXTILES and EMBROIDERIES; TAPESTRIES; INTERIOR DECORATION.)

RUHLA, a town of Germany, in the republic of Thuringia. Pop. (1925) 8,275. It stretches along the valley of the Erb 8 m. S. of Eisenach, and attracts a number of visitors owing to its surroundings and its mineral springs. Its staple industry is the making of wooden and meerschaum pipes; it also manufactures electrical apparatus, amber ware, watches and toys.

RUHNKEN, DAVID (1723–1798), one of the most illustrious scholars of the Netherlands, was of German origin, having been born in Pomerania in 1723. His parents had him educated for the church, but after two years at the University of Wittenberg he determined to live the life of a scholar. At Wittenberg Ruhnken lived in close intimacy with the two most distinguished professors, Ritter and Berger. To them he owed a thorough grounding in ancient history and Roman antiquities and literature; and from them he learned a pure and vivid Latin style. But neither at Wittenberg nor at any German university was Greek seriously studied, so Ruhnken went to Leyden, where, stimulated by the influence of Bentley, the great scholar Tiberius Hemsterhuis had founded the only real school of Greek learning which had existed on the Continent since the days of Joseph Scaliger and Isaac Casaubon. At Leyden he became a close friend of Hemsterhuis, and when Hemsterhuis died in 1766 Ruhnken and his fellow-pupil Valckenaer carried on the tradition. With the exception of a fruitful year (1755) spent in the libraries of Paris, he spent the rest of his life at Leyden where he died in 1798.

Ruhnken's principal works are editions of (1) Timaeus's *Lexicon of Platonic Words,* (2) Thalelaeus and other Greek commentators on Roman law, (3) Rutilius Lupus and other grammarians, (4) Velleius Paterculus, (5) the works of Muretus. He also occupied himself much with the history of Greek literature, particularly the oratorical literature, with the Homeric hymns, the scholia on Plato and the Greek and Roman grammarians and rhetoricians. A discovery famous in its time was that in the text of the work of Apsines on rhetoric a large piece of a work by Longinus was embedded.

See Wyttenbach, *Vita Ruhnkenii* (Leyden, 1799).

RUHR, a river of Germany, 142 m. long, an important right-bank tributary of the lower Rhine. It rises on the side of the Winterberg in the Sauerland, at about 2,000 ft. above the sea. It flows north and then west in a deep, well-wooded valley past the town of Arnsberg. Shortly after reaching Neheim it bends south-west, and courses through the important mining district of the Ruhr coalfield around Hagen. Hence in a tortuous course it passes Witten, Steele, Kettwig and Mülheim, and joins the Rhine at Ruhrort. The river is navigable from Witten downwards, by the aid of eleven locks. Its chief affluents are the Mähne (right) and Lenne (left).

French Occupation.—Though the occupation of the left bank of the Rhine arranged for in the Treaty of Versailles included the bridge-head at Cologne, and thus practically touched the Ruhr district, the French were not satisfied from a military point of view, as the "Westphalian basin" was the hub of the German iron and steel industry. In March 1921 the French extended the occupation to Duisburg, Ruhrort and Düsseldorf, containing 5,000 sq.km. and 877,000 inhabitants, as a sanction for Germany's refusing the Paris reparation proposals; another 37,700 sq.km. with 3,191,000 inhabitants were occupied during 1923–24, when they controlled almost the entire Ruhr district.

Before the World War most of the Lorraine iron and steel works were owned by or closely affiliated with concerns in the Ruhr. The low grade iron ore of Lorraine, apart from the quantities used on the spot went to the blast furnaces of the Ruhr. Of 21,100,000 tons mined, 3,100,000 tons went to the Ruhr. On the other hand the coke of the Ruhr was needed for the smelting of Lorraine ores, whilst the finished iron and steel goods of Lorraine found their market in south-western Germany.

The re-annexation of Alsace–Lorraine and the retirement of Luxembourg from the German customs union reduced Germany's home supply of iron ore to about 20% of its former size. At the same time France became the greatest iron ore producing country of Europe; moreover she controlled the well equipped iron and steel mills in Lorraine, expropriating the German iron and steel-masters. She also temporarily annexed the Saar mines, partly in the hope of getting coke for her iron industries. As the Saar coal did not coke well, special clauses were inserted in the Treaty of Peace, guaranteeing to France (and to the other Allies) a regular supply of the Ruhr coal and coke at statutory prices.

Political pressure apart, however, the German coalmasters held the winning hand. Compensation from the German government enabled them to erect new iron and steel works on the Ruhr, which could easily be run with high-grade Swedish or Spanish ore or with the enormous quantities of scrap available after the war. The low grade Lorraine ore, on the other hand, had either to be smelted locally or sent to the Ruhr. Smelting in Lorraine depended on the regular supply of Ruhr coke. And the export of finished products depended mainly on German markets which were open to France without duty for five years only (within the limits of Alsace–Lorraine's pre-war sales to Germany). Thus those who controlled the Ruhr coal really controlled the Lorraine iron and steel industry.

As early as the Conference of Spa (1920) when Germany had

fallen short on coal deliveries, the Allies presented her with an ultimatum, which threatened the occupation of the Ruhr in case of non-acceptance. Though this extension of the area of occupation was an arbitrary act, the German Government gave way. From this moment the French began to use this threat of an extension of the occupation as a weapon in the struggle about reparation. When the German Government refused the proposals of the Paris Conference (Jan. 29, 1921) they occupied Düsseldorf, Ruhrort and Duisburg, and continued the occupation after Germany had accepted the London ultimatum of May 5, 1921.

On Dec. 26, 1922, the Reparation Commission under French pressure announced that Germany had fallen short on the delivery of 20,000 cu.m. of boards and of 130,000 telegraph poles, the total averaging but a few million marks; a few days later a similar shortcoming in coal-deliveries variously estimated at 11 to 15·6%, was declared. Against the vote of the British delegates the Reparation Commission came to the conclusion that Germany's shortcomings had been "intentional" (*manquement volontaire*), constituting a case under Annex II § 18, which permitted the Allied and Associated Powers to take "such other measures as the respective Governments may determine to be necessary in the circumstances." The French and Belgian Governments decided to send a commission of engineers into the Ruhr, to control the activities of the Coal Syndicate and the carrying out of the deliveries as, in their opinion the coal mine owners were trying to sabotage the Treaty. This technical mission, in which Italy was to participate, but not Great Britain, was accompanied by a military force, though military occupation was not intended.

When the French and Belgian troops entered the Ruhr on Jan. 11, 1923, the Coal Syndicate had transferred their seat and their papers to Hamburg. The German Government issued a protest (Jan. 12, 1923); all reparation payments especially the delivery of coke and coal to France and Belgium ceased. Civil servants and railway officials were forbidden to obey orders from the occupying powers. The French tried to get hold of the proceeds of taxes and of government property. They controlled the distribution of coal and insisted on cutting timber. They expelled the German officials, railway servants and leading citizens and heavily fined or imprisoned recalcitrants. They erected a customs frontier, dividing the occupied district from the rest of Germany, thus controlling and stopping exports and imports into unoccupied Germany. The aim of the German resistance was to prevent the French from getting coal and coke, whilst the French tried to cut the connection with unoccupied Germany and to paralyse the district's economic life.

The struggle for the Ruhr completely destroyed German finance and with it German currency. Passive resistance in the long run meant the withdrawal of all workers, starting with the railway men, from such productive and distributive processes as might help the army of occupation. This involved the maintenance of all persons out of work at the public expense. The Ruhr occupation was the deciding factor in the collapse of the mark.

Germany's various proposals for a settlement were not accepted by the French, nor were the various suggestions of the British. At last the new German Government, presided over by Stresemann, gave up passive resistance on Sept. 26. The French Government continued to refuse negotiations and strongly supported the separatist movement all over the left bank of the Rhine.

In Nov., 1923, the industrial concerns in the occupied districts negotiated an agreement with the *Mission Interalliée de Contrôle des Usines et des Mines* (called Micum) with the object of freeing the huge iron and coal stocks which had accumulated, as the French Government would not negotiate with the German Government. It demanded the payments of the German coal tax and the coal on the dumps, whilst the new output could be sold by the works against payment of a duty; the delivery of reparation coal and coke was to be resumed on a percentage basis of the total output. Iron and steel might be sold by the works against payments. The German Government (by letters of Nov. 1 and 21) acknowledged their obligation to refund the cost of payments of delivery to the industries concerned. They did so later on by paying the iron and coal firms 700,000,000 marks.

These provisional arrangements paved the way for peace, after British and American pressure had induced the French government to agree to the appointment of the Dawes committee by the Reparation Commission. The total payments realized from the Ruhr were 490,000,000 gold marks in cash and the value of 491,900,000 gold marks in goods, leaving a total balance—after deduction of 184,000,000 marks expenses—of 798,000,000 gold marks—or not a third of the minimum payment expected under the London ultimatum.

The new French Government was willing to accept the Dawes plan, to free the prisoners and to leave the Ruhr. The plan was formally signed on Aug. 30. Within the next two months administration, railways and government property were handed back to Germany. The evacuation of the Ruhr ended on July 31, 1925 when the French troops left Essen and Mülheim. On Aug. 25 the old occupied areas of Düsseldorf, Duisburg and Ruhrort were given back.

After political pressure ceased, the mere compulsory economic co-operation of the Treaty of Versailles came to an end. But the German industrialists had realized that France had held the winning cards in the political game, whilst the French Government began to understand the limits of military pressure in the economic field. The result was the Franco-German commercial treaty, and the Franco-German (international) iron-and-steel pact. The former secured French iron and steel goods a limited sale in German territory, to be effected through the German Steel Syndicate, whilst the ore and coal supplies were left to more or less private agreements. The latter combined French and German and Belgian steel works in an international syndicate, giving each country a fixed percentage of the total output.

The economic unity which the Treaty of Peace had destroyed, was thus being restored by extremely complicated measures, after a six years' struggle between governments and industrial groups, which cost much money and bloodshed. After Germany's entry into the League of Nations and the Locarno treaties the plan of using the Ruhr as an additional security became obsolete.

RUHRORT, since 1905 a part of Duisburg, in the Prussian Rhine province, situated at the junction of the Ruhr and the Rhine, in the midst of a productive coal district, 15 m. N. of Düsseldorf and 12 m. E. of Crefeld by rail. Ruhrort is first mentioned in 1379, and obtained civic rights in 1551. Having been in the possession of the counts of La Marck, it passed into that of Brandenburg in 1614. Ruhrort has the largest river harbour in the world, and it is the principal shipping port for the coal of the Westphalian coalfield, which is dispatched in the fleet of steam-tugs and barges belonging to the port. The coal is sent principally to south Germany and the Netherlands. Grain and timber are also exported and iron ore is imported. In 1924 the port was entered and cleared by 18,000,000 tons. The industries of the town include large iron and steel works, shipbuilding yards and tanneries.

RUIZ, JUAN (*c.* 1283–*c.* 1350), Spanish poet, became archpriest of Hita. It may be inferred from his writings that he was not an exemplary priest, and one of the manuscript copies of his poems states that he was imprisoned by order of Gil Albornoz, archbishop of Toledo. It is not known whether he was sentenced for his irregularities of conduct, or on account of his satirical reflections on his ecclesiastical superiors. What seems established is that he finished his *Libro de buen amor* in 1343, while in gaol, and that he was no longer arch-priest of Hita in Jan. 1351; it is assumed that he died shortly before the latter date.

Ruiz is by far the most eminent poet of mediaeval Spain. His natural gifts were supplemented by his varied culture; he clearly had a considerable knowledge of colloquial (and perhaps of literary) Arabic; his classical reading was apparently not extensive, but he knew by heart the *Disticha* of Dionysius Cato, and admits his indebtedness to Ovid and to the *De Amore* ascribed to Pamphilus; his references to Blanchefleur, to Tristan and to Yseult, indicate an acquaintance with French literature, and he utilizes

the *fabliaux* with remarkable deftness; lastly, he adapts fables and apologues from Aesop, from Pedro Alfonso's *Disciplina clericalis*, and from mediaeval bestiaries. All these heterogeneous materials are fused in the substance of his versified autobiography, into which he intercalates devout songs, parodies of epic or forensic formulae, and lyrical digressions on every aspect of life. Ruiz, in fact, offers a complete picture of picaresque society in Spain during the early 14th century. From his Don Furón is derived the hungry gentleman in *Lazarillo de Tormes*, in Don Melón and Doña Endrina he anticipates Calisto and Melibea in the *Celestina*, and Celestina herself is developed from Ruiz' Trotaconventos. Moreover, Ruiz was justly proud of his metrical innovations. The *Libro de buen amor* is mainly written in the *cuaderna via* modelled on the French alexandrine, but he imparts to the measure a variety and rapidity previously unknown in Spanish.

See J. Puyol y Alonso, *El Arcipreste de Hita* (1906). (J. F.-K.)

RUIZ ZORRILLA, MANUEL (1834–1895), Spanish politician, born at Burgo de Osma. Deputy in 1856, he soon attracted notice among the most advanced Progressists and Democrats. After the military movement in Madrid of June 22, 1866, he had to flee to France, returning only at the revolution of 1868. In 1869 he became minister of grace and justice under Serrano: elected president of the House of Deputies in 1870, he seconded Prim in offering the throne to Amadeus of Savoy. In 1871 he formed a cabinet, and continued to be the king's chief councillor until his abdication (Feb. 1873), when Ruiz Zorrilla advocated a republic. On the restoration of Alphonso XII. (1875), he went to France, where for nearly 18 years he was the soul of the republican conspiracies. He was eventually allowed to return to Spain and died at Burgos on June 13, 1895.

RUKWA (sometimes also Rikwa and Hikwa), a shallow lake in Tanganyika Territory, lying 2,650 ft. above the sea in a north-west continuation of the rift-valley which contains Lake Nyasa. The sides of the valley here run in steep parallel walls 30 to 40 m. apart, from south-east to north-west, leaving between them a level plain extending from about 7½° to 8½° S. This whole area was once covered by the lake, but this has shrunk so that the permanent water occupies only a space of 30 m. by 12, immediately under the east escarpment. In the rains it extends some 40 m. farther N., and the north of the plain is likewise then covered with water to a depth of about 4 ft. The rest of the plain is a bare expanse intensely heated by the sun in the dry season, and forming a tract of foul mud near the lake shores. The lake has two large feeders, the one from the west the Saisi, or Momba, rises in 80° 50′ S., 31° 30′ E., and traverses a winding valley cut out of the high plateau between lakes Nyasa and Tanganyika. The other chief feeder, the Songwe, rises in 9° 8′ S., 33° 30′ E. on the same plateau as the Saisi and flows north-west. The Songwe is joined by the Rupa. The maximum depth of the lake is about 10½ ft. Its water is very brackish and of a milky colour from the mud stirred up by the wind. It contains many fish.

RULE OF ST. BENEDICT: *see* BENEDICT OF NURSIA, SAINT.

RULE OF THE ROAD. This in Great Britain and Ireland is a matter of common law, otherwise custom, the origin of which is too remote for other than conjecture. The only statutory enactments dealing with the ordering of road traffic are the terms of the Highways Act of 1835, and those of the Motor Car Order of 1904. In the former it is laid down that all vehicle drivers must keep to the left side of the road when encountering other traffic. In the latter it is specifically ordered that drivers of motor vehicles, when meeting other traffic, must keep to the left, or near side of the road; and when passing any traffic proceeding in the same direction must keep to the off, or right side of it. Those seeking for a reason for the original choice have surmised that the left side was adopted because of the need on the part of drivers to have their whip hands free, which would not be the case on the narrow tracks and roads then existing if the right side had been selected. A more fanciful explanation was the wisdom, in turbulent times, of horsemen keeping that side of the road which would admit of the sword arm being free in case of attack. But, while plausible, both leave unexplained why most other nations reversed the order, their traffic flowing along the right side of the road. On the Continent of Europe the right is the correct side for wheeled traffic in every country except Austria, Hungary, Portugal, Sweden, Czechoslovakia and Yugoslavia. In America the right is the correct order of the road for wheeled traffic.

Motors.—These differences, in view of the enormous increase of international road travel, due to the development of the motor vehicle, are becoming irksome and at times dangerous, and there is a growing desire to adopt a single universal rule. But the great disturbance and confusion inevitable in such radical change in the daily life of a nation makes the necessary surrender of its customs as disagreeable for one group as the other, and so, although discussions and proposals arise periodically, there seems to be little possibility of any agreement of the kind. Any change from the existing order would involve not only a corresponding reversal of traffic procedure, but the structural alteration of every motor vehicle in use. Experience has shown that where the left side of the road is the rule the driver must be seated on the right side of his vehicle in order that he may be the better able to keep his off-side front wheel clear of the traffic he is meeting; and, of course, the contrary holds when the right is the correct side.

Horses.—From the point of view of horse traffic the question of the adoption of a universal rule of the road in the various countries, though for obvious reasons this would appear desirable, is not so affected by considerations of safety as in the case of motor vehicles, since accidents due to forgetfulness on the part of drivers accustomed to pass on the opposite side are more easily avoided when travelling at the pace of a horse, and when they occur are likely to be less serious. It may be noted that although it is considered essential in motor vehicles that the driving seat should be on the side nearest to approaching traffic, it appears never to have been thought necessary so to construct horse carriages in countries where the rule of the road is the right; such countries are therefore at a disadvantage in this respect.

In civilian life it has always been customary for a horseman when riding one horse and leading another to ride with the led horse on his right or off side, the object being to allow full freedom to the left or bridle hand. Since it is desirable that the led horse should be on the side away from passing traffic, this obliges the rider to cross the road when a vehicle approaches and to pass it on the wrong side, a dangerous practice at any time, but more so now than formerly, owing to the naturally greater ignorance of present-day road travellers as to the ways of horses; moreover, the horseman, as he is contravening the rule of the road, has no redress in the case of accident. At night, especially, the practice of leading on the right is a very real danger, as it is then impossible to pass approaching vehicles on the off side, and the led horse, if frightened, may shy into the middle of the road and be struck by a passing vehicle before the driver is aware of any obstruction or has time to avoid it. In the army it has for some years been recognized that the ridden horse can be as well controlled by the right as by the left hand, and horses are now led on the near or left side, thus necessitating no change from the normal method of passing approaching traffic. (E. CAM., G. W.)

American Practice.—The United States has departed from the common law inherited from England as to the basic rule of the road. The rule in the United States as in the greater part of Continental Europe and elsewhere, is to pass approaching traffic on the right hand side of the roadway, whether operating a motor vehicle or driving, riding or leading a horse or other animal. Canada has abandoned the left hand in favour of the right hand rule. Neither rule appears to have any outstanding physical advantage over the other, but where either has become firmly established many structural and equipment details and practices are based upon it. While for more than a decade right hand drive prevailed, virtually all American motor vehicles are now built with the driver's seat on the left side, thus enabling the driver to watch his clearance with approaching vehicles. Highway signs and automatic traffic signals are placed to be seen from the right hand side of the road. The American rule of the road is

also consistent with the practice on the street railways and nearly all the steam railroads.

The tremendous growth of motor transport in the United States has impelled the States and municipalities to lay down numerous rules specifically setting forth the application of the basic right hand rule in various situations. For example, a vehicle meeting another must give the other vehicle half the road. A vehicle may not overtake and pass another on sharp curves or hill crests and not unless there is space ahead of the overtaken vehicle to permit the overtaker to regain safely his own side of the road. The operator of the overtaken vehicle must on signal give the overtaker ample opportunity and must not increase his speed until the other vehicle has passed him completely. It has been assumed that the overtaken vehicle will normally be near the right hand edge of the roadway, but with the development of wide streets with several definite lanes of traffic in each direction, there has been a growing tendency of operators to keep toward the centre. A rule has therefore been developed requiring slow moving vehicles to keep as far to the right as possible.

One of the most essential and also most difficult rules of the road to define and enforce equitably is the right of way rule at intersections. The fundamental rule is that the vehicle which would first reach the common point has the right of way. Supplementary to this rule is a provision of wide prevalence requiring the vehicle on the left to yield to one on the right approaching the common point at approximately the same time. A further qualifying provision in some jurisdictions is that giving right of way to the vehicle which first entered the intersection. Other widely accepted provisions are those giving emergency vehicles the right of way over other vehicles regardless of relative position at an intersection; and the through street stop rule, which requires all vehicles to come to a full stop before entering certain thoroughfares designated for high-speed through traffic, and placing upon the cross traffic the same added burden of responsibility that is upon any vehicle starting from a position of rest.

Recognizing the danger, particularly at night, of pedestrians on highways without separate footpaths being run down by motor vehicles coming from the rear, it is regarded as generally safer for them to walk on the left side. A few States have passed laws requiring this. Such laws, however, would compel the pedestrian to walk where it is at times manifestly unsafe, as on the inside of a sharp curve, and virtually deny him right of way on any other part of the roadway. A vehicle turning to the right is generally required to keep close to the right curb or edge of the roadway, while, according to the prevailing rule, a vehicle turning to the left must do so from the traffic lane next to the centre line of the roadway. The most modern and approved speed restrictions embody a general prohibition against driving too fast for the conditions, together with *prima facie* limits, for the guidance of operators and enforcement officers, beyond which the apprehended operator must prove that he was driving safely. The *prima facie* limits are ordinarily graded from business districts to rural areas. (A. B. B.)

RULE OF THE ROAD AT SEA. The principal nations have subscribed to the following regulations for preventing collisions at sea, and rules as to signals of distress.

Every steam vessel which is under sail and not under steam is to be considered a sailing vessel, and every vessel under steam, whether under sail or not, is to be considered a steam vessel. The word "steam vessel" shall include any vessel propelled by machinery. A vessel is "under way" within the meaning of these rules, when she is not at anchor, or made fast to the shore or aground.

Lights.—The word "visible" when applied to lights shall mean visible on a dark night with a clear atmosphere. The rules concerning lights shall be complied with in all weathers from sunset to sunrise, and during such time no other lights which may be mistaken for the prescribed lights shall be exhibited.

Lights for Steam Vessels.—A steam vessel when under way shall carry: (*a*) On or in front of the foremast, a bright white light, so constructed as to show an unbroken light over an arc of the horizon of 20 points of the compass, so as to throw the light ten points on each side of the vessel, viz., from right ahead to two points abaft the beam on either side, and to be visible at a distance of at least five miles. (*b*) On the starboard side a green light to show an unbroken light over an arc of the horizon of ten points of the compass, so as to throw the light from right ahead to two points abaft the beam on the starboard side, and to be visible at a distance of at least two miles. (*c*) On the port side a similar red light. (*d*) The green and red side-lights shall be fitted with inboard screens projecting at least 3 ft. forward from the light, so as to prevent these lights from being seen across the bow.

(*e*) A steam vessel under way may carry an additional white light similar in construction to the light mentioned in subdivision (*a*). These two lights shall be so placed in line with the keel that one shall be at least 15 ft. higher than the other, and in such a position with reference to each other that the lower light shall be forward of the upper one. The vertical distance between these lights shall be less than the horizontal distance.

Towing Lights.—A steam vessel when towing another vessel shall, in addition to her side-lights, carry two bright white lights in a vertical line one over the other, not less than 6 ft. apart, and when towing more than one vessel shall carry an additional bright white light 6 ft. above or below such lights, if the length of the tow, measuring from the stern of the towing vessel to the stern of the last vessel towed, exceeds 600 feet.

Not Under Control.—A vessel which from any accident is not under command shall carry: if a steam vessel, in lieu of the white steaming light, two red lights, in a vertical line one over the other, not less than 6 ft. apart, and of such a character as to be visible all round the horizon at a distance of at least 2 m.; and shall by day carry in a vertical line one over the other not less than 6 ft. apart, where they can best be seen, two black balls or shapes each 2 ft. in diameter.

Telegraph Laying.—A vessel employed in laying or in picking up a telegraph cable shall carry in lieu of the white steaming light, three lights in a vertical line one over the other not less than 6 ft. apart. The highest and lowest of these lights shall be red, and the middle light shall be white, and they shall be of such a character as to be visible all round the horizon, at a distance of at least 2 miles. By day she shall carry in a vertical line one over the other, not less than 6 ft. apart, where they can best be seen, three shapes not less than 2 ft. in diameter, of which the highest and lowest should be globular in shape and red in colour, and the middle one diamond in shape and white.

The vessels referred to in the two former classifications when not making way through the water, shall not carry side-lights, but when making way shall carry them.

Lights for Sailing Vessels.—A sailing vessel under way, and any vessel being towed, shall carry the same lights as those prescribed for a steam vessel under way, with the exception of the white (steaming) lights which they shall never carry. Whenever, as in the case of small vessels under way during bad weather, the green and red side-lights cannot be fixed, these lights shall be kept at hand lighted and ready for use; and shall, on the approach of or to other vessels, be exhibited on their respective sides in sufficient time to prevent collision, in such manner as to make them most visible, and so that the green light shall not be seen on the port side nor the red light on the starboard side, nor, if practicable, more than two points abaft the beam on their respective sides.

Lights for Small Vessels and Boats.—Steam vessels of less than 40, and vessels under oars or sails of less than 20, tons gross tonnage, and rowing boats, when under way, shall not be obliged to carry the lights mentioned under sub-sections (*a*), (*b*) and (*c*), but if they do not carry them they shall be provided with the following lights:—

1. Steam vessels of less than 40 tons shall carry: (*a*) In the fore part or on or in front of the funnel, a bright white light constructed and fixed as prescribed for a steaming light, and to be visible at a distance of at least two miles. (*b*) Green and red side-lights to be visible for at least one m., or a combined lantern showing a green light and a red light from right ahead to two

points abaft the beam on their respective sides.

2. Vessels under oars or sails, of less than 20 tons, shall have ready a lantern with a green glass on one side and a red glass on the other.

3. Rowing boats, whether under oars or sail, shall have ready a lantern showing a white light, which shall be exhibited in sufficient time to prevent collision.

Lights for Pilot Vessels.—Pilot vessels, when engaged on pilotage duty, shall carry a white light at the masthead, visible all round the horizon, and shall also exhibit a flare-up light at short intervals, which shall never exceed fifteen minutes. On the near approach of or to other vessels they shall have their side-lights lighted and shall flash or show them at short intervals, to indicate the direction in which they are heading. A steam pilot-vessel carrying specially licensed pilots shall, in addition to the lights required for all pilot boats, carry at a distance of eight ft. below her white mast head light a red light visible all round for at least two m., and also the coloured side-lights required to be carried by vessels when under way. When at anchor she shall carry, in addition to the lights required for all pilot boats, the red light above mentioned, but not the coloured side-lights.

Lights for Fishing Vessels.—Fishing vessels and fishing-boats shall carry or show:

(*a*) Open boats, by which it is to be understood boats not protected from the entry of sea water by means of a continuous deck, when engaged in any fishing at night, shall carry one all-round white light. (*b*) Vessels and boats, except open boats when fishing with drift-nets, shall carry two white lights where they can best be seen. Such lights shall be placed so that the lower of these shall be in the direction of the nets, and both shall show all round the horizon for not less than three miles. (*c*) When line-fishing, vessels and boats, except open boats, shall carry the same lights as vessels fishing with drift-nets. When shooting lines, or fishing with towing lines, they shall carry the lights prescribed for a steam or sailing vessel under way respectively. (*d*) Vessels engaged in trawling, if steam vessels, shall carry in the same position as the white steaming light a tricoloured lantern to show a white light from right ahead to two points on each bow, and a green light and a red light from two points on each bow to two points abaft the beam on the starboard and port sides respectively; and below the tricoloured lantern a white light in a lantern to show a clear uniform and unbroken light all round the horizon.

If sailing vessels, shall carry a white light in a lantern, to show a clear uniform and unbroken light all round the horizon, and shall also, on the approach of or to other vessels, show a white flare-up light or torch in sufficient time to prevent collision.

(*e*) Oyster dredgers and other vessels fishing with dredge-nets shall carry and show the same lights as trawlers. (*f*) Fishing vessels and fishing-boats may at any time use a flare-up light in addition to the lights already prescribed. (*g*) Every fishing vessel and every fishing-boat under 150 ft., when at anchor, shall exhibit a white light visible all round the horizon for at least one mile.

Every fishing vessel of 150 ft. or upwards, when at anchor, shall exhibit a white light visible all round the horizon for at least one mile, and shall exhibit a second light as hereinafter prescribed for vessels of such length. Should any such vessel, whether under 150 ft., or of 150 ft. in length or upwards, be attached to a net or other fishing gear, she shall on the approach of other vessels show an additional white below the anchor light in the direction of the net or gear. (*h*) If a vessel or boat when fishing becomes stationary in consequence of her gear getting fast to a rock or other obstruction, she shall in daytime haul down the day-signal required by subdivision (*k*); at night show the light or lights prescribed for a vessel at anchor; and during fog, mist, falling snow, or heavy rain-storms make the signal prescribed for a vessel at anchor. (*i*) In fog, mist, falling snow, or heavy rain-storms, drift-net vessels attached to their nets, and vessels when trawling, dredging, or fishing with any kind of drag-net, and vessels line-fishing with their lines out, shall, if of 20 tons gross tonnage or upwards, respectively, at intervals of not more than one minute make a blast; if steam vessels, with the whistle or siren, and if sailing vessels, with the fog-horn; each blast to be followed by ringing the bell. (*j*) Fishing vessels and boats of less than 20 tons gross tonnage shall not be obliged to give these signals; but if they do not, they shall make some other efficient sound signal at intervals of not more than one minute. (*k*) All vessels or boats fishing with nets or lines or trawls, when under way, shall in daytime indicate their occupation to an approaching vessel by displaying a basket or other efficient signal where it can best be seen. If vessels or boats at anchor have their gear out, they shall, on the approach of other vessels, show the same signal on the side on which those vessels can pass.

Vessel Being Overtaken.—A vessel which is being overtaken by another shall show from her stern to such last-mentioned vessel a white light or a flare-up light. If a lantern is used for this purpose, it shall be so screened that it shall throw an unbroken light for 6 points from right aft on each side of the vessel, so as to be visible for at least 1 mile. Such light shall be carried as nearly as practicable on the same level as the side-lights.

Lights for a Vessel at Anchor.—A vessel under 150 ft. when at anchor, shall carry forward, at a height not exceeding 20 ft. above the hull, a white light to show a clear, uniform and unbroken light visible all round for at least 1 mile. A vessel of 150 ft. or upwards, when at anchor, shall carry a similar light at a height of not less than 20, and not exceeding 40, ft. above the hull, and at such a height that it shall be not less than 15 ft. lower than the forward light, another such light. A vessel aground in or near a fairway shall carry the above light or lights and the two red lights prescribed for a vessel not under control. Every vessel may, if necessary in order to attract attention, in addition to the lights which she is by these rules required to carry, show a flare-up light or use any detonating signal that cannot be mistaken for a distress signal.

Special Lights.—Nothing in these rules shall interfere with the operation of any special rules made by the government of any nation with respect to additional station and signal lights for two or more ships of war or for vessels sailing under convoy, or with the exhibition of recognition signals adopted by shipowners, which have been authorized by their respective governments and duly registered and published.

A Steam Vessel Under Sail Only.—A steam vessel proceeding under sail only, but having her funnel up, shall carry in daytime, forward, where it can best be seen, one black ball or shape 2 ft. in diameter.

Fog-Signals.—Fog-signals shall be given:—

1. By steam vessels, on the whistle or siren. 2. By sailing vessels and vessels towed, on the fog-horn. A "prolonged blast" shall mean a blast of from four to six seconds.

A steam vessel shall be provided with an efficient whistle or siren, and with an efficient fog-horn, to be sounded by mechanical means, and also with an efficient bell. A sailing vessel of 20 tons gross tonnage or upwards shall be provided with a similar fog-horn and bell. In fog, mist, falling snow, or heavy rain-storms, whether by day or night, the following signals shall be used:—

(*a*) A steam vessel having way upon her, shall sound, at intervals of not more than two minutes, a prolonged blast. (*b*) A steam vessel under way, but stopped and having no way upon her, shall sound, at intervals of not more than two minutes, two prolonged blasts, with an interval of about one second between them. (*c*) A sailing vessel under way shall sound, at intervals of not more than one minute, when on the starboard tack one blast, when on the port tack two blasts in succession, and when with the wind abaft the beam three blasts in succession. (*d*) A vessel, when at anchor, shall, at intervals of not more than one minute, ring the bell rapidly for about five seconds. (*e*) A vessel, when towing a vessel employed in laying or in picking up a telegraph cable, and a vessel under way, which is unable to get out of the way of an approaching vessel through being not under command, or unable to manoeuvre as required by these rules shall, at intervals of not more than two minutes, sound three blasts in succession, viz.: one prolonged blast followed by two short blasts. A vessel towed may give this signal and she shall not give any other.

Sailing vessels and boats of less than 20 tons gross tonnage shall not be obliged to give these signals, but if they do not, they shall

make some other efficient sound-signal at intervals of not more than one minute.

Speed of Ships in Fog.—Every vessel shall, in fog, mist, falling snow, or heavy rain-storms, go at a moderate speed. A steam vessel hearing, apparently forward of her beam, the fog-signal of a vessel the position of which is not ascertained, shall, so far as the circumstances of the case admit, stop her engines, and then navigate with caution until danger of collision is over.

Steering and Sailing Rules to Avoid Collision.—Risk of collision can, when circumstances permit, be ascertained by carefully watching the compass bearing of an approaching vessel. If the bearing does not appreciably change, such risk should be deemed to exist.

Sailing Vessels.—When two sailing vessels are approaching one another so as to involve risk of collision, one of them shall keep out of the way of the other, as follows:—

(*a*) A vessel which is running free shall keep out of the way of a vessel which is close-hauled. (*b*) A vessel which is close-hauled on the port tack shall keep out of the way of a vessel which is close-hauled on the starboard tack. (*c*) When both are running free, with the wind on different sides, the vessel which has the wind on the port side shall keep out of the way of the other. (*d*) When both are running free, with the wind on the same side, the vessel which is to windward shall keep out of the way of the vessel which is to leeward. (*e*) A vessel which has the wind aft shall keep out of the way of the other vessel.

Steam Vessels.—When two steam vessels are meeting end on, or nearly end on, so as to involve risk of collision, each shall alter her course to starboard, so that each may pass on the port side of the other. The only cases to which this rule applies are those where by day, each vessel sees the masts of the other in a line, or nearly in a line, with her own; and, by night, to cases in which each vessel is in such a position as to see both the side-lights of the other. When two steam vessels are crossing, so as to involve risk of collision, the vessel which has the other on her own starboard side shall keep out of the way of the other.

Steam and Sailing Vessels.—When a steam vessel and a sailing vessel are proceeding in such directions as to involve risk of collision, the steam vessel shall keep out of the way of the sailing vessel.

General.—Where, by these rules, one of two vessels is to keep out of the way, the other shall keep her course and speed; but when, in consequence of thick weather or other causes, such vessel finds herself so close that collision cannot be avoided by the action of the giving-way vessel alone, she also shall take such action as will best aid to avert collision. Every vessel whose duty it is to keep out of the way of another vessel shall, if the circumstances of the case admit, avoid crossing ahead of the other.

Vessels Overtaking.—Notwithstanding anything contained in these rules, every vessel, overtaking any other, shall keep out of the way of the overtaken vessel. Every vessel coming up with another vessel from any direction more than two points abaft her beam, shall be deemed to be an overtaking vessel; and no subsequent alteration of the bearing between the two vessels shall make the overtaking vessel a crossing vessel within the meaning of these rules, or relieve her of the duty of keeping clear of the overtaken vessel until she is finally past and clear.

As by day the overtaking vessel cannot always know with certainty whether she is forward or abaft this direction from the other vessel, she should, if in doubt, assume that she is an overtaking vessel and keep out of the way.

Narrow Channels.—In narrow channels every steam vessel shall, when it is safe and practicable, keep to that side of the fair-way or mid-channel which lies on the starboard side of such vessel. Sailing vessels under way shall keep out of the way of sailing vessels or boats fishing with nets, or lines, or trawls.

Navigational Dangers.—In obeying and construing these rules, due regard shall be had to all dangers of navigation and collision, and to any special circumstances which may render a departure from the above rules necessary in order to avoid immediate danger.

Sound-signals for Vessels in Sight of One Another.—A "short blast" means a blast of about one second's duration.

When vessels are in sight of one another, a steam vessel under way, in taking any course authorized or required by these rules, shall indicate that course by the following signals on her whistle or siren:—

One short blast to mean, "I am directing my course to starboard." Two short blasts, "I am directing my course to port." Three short blasts "My engines are going full speed astern."

Proper Precautions.—Nothing in these rules shall exonerate any vessel, or the owner, or master or crew, from the consequences of any neglect to carry lights or signals, or of any neglect to keep a proper look-out, or of the neglect of any precaution which may be required by the ordinary practice of seamen, or by the special circumstances of the case.

Rules for Harbours and Inland Navigation.—Nothing in these rules shall interfere with the operation of a special rule, duly made by local authority, relative to the navigation of any harbour, river, or inland waters.

Distress Signals.—When a vessel is in distress and requires assistance from other vessels or from the shore, the following shall be the signals to be used or displayed by her, either together or separately:—

1. A gun or other explosive signal fired at intervals of about a minute; 2. The international code signal of distress indicated by NC.; 3. The distant signal, consisting of a square flag, having either above or below it a ball or anything resembling a ball; 4. A continuous sounding with any fog-signal apparatus. At night —1. A gun or other explosive signal fired at intervals of about a minute. 2. Flames on the vessel (as from a burning tar-barrel, oil-barrel, etc.); 3. Rockets or shells, throwing stars of any colour or description, fired one at a time, at short intervals; 4. A continuous sounding with any fog-signal apparatus. (E. A.)

RULHIÈRE (or RULHIÈRES), CLAUDE CARLOMAN DE (1735–1791), French poet and historian, was born at Bondy, near Paris, on June 12, 1735. He served Marshal Richelieu in the Hanoverian campaign of 1757, and during his government at Bordeaux in 1758. At St. Petersburg (Leningrad) where he was sent as secretary of legation, he witnessed the revolution which seated Catherine II. on the throne. In 1773 Rulhière became secretary to the future Louis XVIII.; in 1787 he was admitted to the Academy. He lived chiefly at Paris, where he held an appointment in the Foreign Office. He died at Bondy on Jan. 30, 1791. He befriended J. J. Rousseau in his old age.

Rulhière's historical works include *Histoire de l'anarchie de Pologne* (4 vols., 1807), edit. P. C. F. Danon; and *Éclaircissements historiques sur les causes de la révocation de l'édit de Nantes* (2 vols., 1788).

RULLUS, PUBLIUS SERVILIUS, a Roman tribune of the people in 64 B.C., well known as the proposer of one of the most far-reaching agrarian laws brought forward in Roman history. This law provided for the establishment of a commission of ten, empowered to purchase land in Italy for distribution amongst the poorer citizens and for the foundation of colonies. The commission was to be invested with praetorian powers, and Pompey, then in the East, was excluded by a provision that personal attendance was necessary to election. In fact, the commission as a whole was intended to act as a counterpoise to his power. There were provisions for the purchase of further land by the sale of recently conquered territory and the use of the revenues from Pompey's provinces. The places to which colonies were to be sent were not specified, so that the commissioners would be able to sell wherever they pleased, and it was left to them to decide what was public or private property. Cicero delivered four speeches against the bill, of which three are extant. It was not greeted with enthusiasm and was dropped before the voting. The whole affair was obviously a political move, probably engineered by Caesar, his object being to make the democratic leaders the rulers of the state. Although Caesar could hardly have expected the bill to pass, the aristocratic party would be saddled with the odium of rejecting a popular measure, and the people themselves would be more ready to welcome a proposal by Caesar himself, an expectation fulfilled by the passing of the *lex Julia* in 59, whereby Caesar at least partly succeeded where Rullus had failed.

See the orations of *Cicero De lege agraria,* with the introduction in

G. Long's edition, and the same author's *Decline of the Roman Republic*, iii., p. 241; Mommsen, *Hist. of Rome*, bk. v., ch. 5; art. AGRARIAN LAWS.

RUM or **ROUM**, an indefinite term in use among Mohammedans at different dates for Europeans generally and for the Byzantine empire in particular; at one time for the Seljuk empire in Asia Minor, and now for Greeks inhabiting Ottoman territory (Arab. *ar-Rūm*). When the Arabs met the Byzantine Greeks, these called themselves Ῥωμαῖοι, or Romans; so the Arabs called them "the Rūm" as a race-name (already in Qur. xxx. 1), their territory "the land of the Rūm," and the Mediterranean "the Sea of the Rūm." Later, inasmuch as Muslim contact with the Byzantine Greeks was in Asia Minor, the term Rūm became fixed there geographically and remained even after the conquest by the Seljuk Turks, so that their territory was called the land of the Seljuks of Rūm.

RUM, a potable alcoholic liquor obtained by distillation from fermented products of the sugar cane. The origin of the term is obscure.

Production.—Rum is chiefly produced in the West Indies and, on account of geographical origin and method of preparation, may be divided into two main classes "Jamaica" and "Demerara."

Jamaica rum is produced by fermentation of a wash consisting, in addition to water, of scum, molasses and "dunder." Liquor expressed from the sugar cane is steam-heated, the scum, containing much of the foreign matter present in the liquor, thus being driven to the top and facilitating the withdrawal of the clear sugar solution. The scum is transferred to the still house whilst the sugar liquor is either evaporated down in order to crystallize out the sugar or is first subjected to a further process of clarifying. Sugar crystals are removed from the concentrated sugar solution by centrifugals or purgers, the uncrystallized molasses being added to the scum in the still house. The "dunder" is a viscous mass remaining at the bottom of the still at the end of the distillation and is taken out and added to the wash for the next operation. In order to render the latter sour and promote fermentation the fibrous part of the crushed cane, known as "megass," is also added.

Fermentation occupies from six to twelve days, in some cases longer, and when it is complete the spirituous mass obtained is pumped into a pot still—the only kind used in the island. There are three types of rum produced in Jamaica. That for export to the United Kingdom forms the bulk of the production and is of the best quality. An inferior type for sale in the island is produced by more rapid fermentation and lacks the full flavour and aroma of that intended for the British market. The third type is the "flavoured" or "German" rum chiefly exported to the continent of Europe, where it is used for blending and flavouring purposes.

Demerara rum is prepared by the fermentation of molasses diluted with water to a density of about 1060, the solution being first rendered slightly acid with sulphuric acid. Pot stills and patent stills of various types are used for the distillation. The resultant spirit, which has a low ester content and light flavour, most nearly resembles that produced in Jamaica for local consumption.

Fictitious rum is prepared with spirit derived from potato and beet molasses, the rum flavour being imparted by the addition of artificial essence of rum chemically prepared, or of the "flavoured" Jamaican rum previously referred to. The one time extensive importation of this artificial preparation into Britain resulted in official action to differentiate between rum from Jamaica and other sugar cane producing countries and "imitation" rum, a term which must be applied to all spirit intended for sale as rum but which has not been produced in a country where the sugar cane is cultivated. In recent years, however, the importation has almost completely ceased, being only 143 proof gallons in 1926–27 against 44,000 proof gallons in 1900.

Composition.—Considerable variation is observed in the strength of rum as imported, the range being from 20 under proof to about 50 over proof, whilst the average is approximately 35 over proof or 77% by volume of absolute alcohol. The proportion of secondary ingredients also varies.

Consumption.—The quantity of rum consumed during recent years has steadily decreased, the importation into Britain since the war years 1914–1919—when abnormal quantities were imported—being as follows:

Year ended March 31	Quantities retained for consumption	Year ended March 31	Quantities retained for consumption
	Proof gallons		Proof gallons
1920*	3,673,258	1924	1,324,111
1921*	2,742,955	1925	1,147,852
1922*	1,803,151	1926	1,005,114
1923	1,328,487	1927	852,728

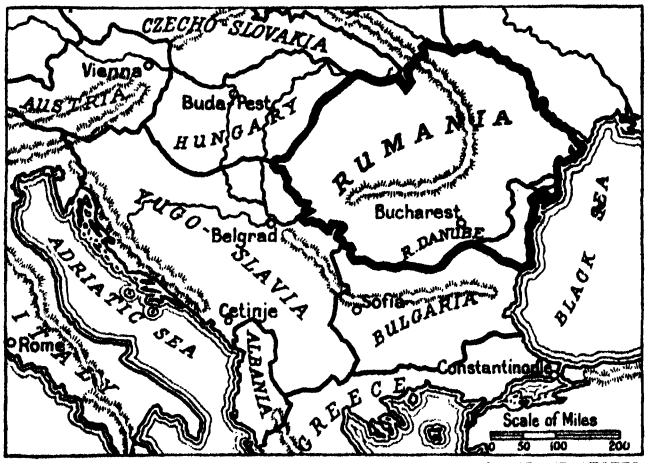
*Figures for United Kingdom; those for later years relate to Great Britain and Northern Ireland only.

These figures include a small quantity of "imitation" rum.

(F. G. H. T.)

RUMANIA or RÔMANIA, a kingdom of south-east Europe to the north of the Balkan peninsula. Its present area since the World War within the boundaries established by the Peace Treaties covers a total of 294,967 square kilometres, an area roughly equivalent to that of England, Wales and Scotland. The population within the present boundaries is 17,153,932 (1926).

The southern boundary starts near Balchik on the Black Sea, runs north-west to the Danube near Turtukaia and then follows the north bank of the Danube as far as Bazias above Gradiste in Serbia. South of this line are Bulgaria and Yugoslavia. From Gazias the frontier runs roughly north-north-west with Yugoslavia across the flat plainland of the Banat to Cenadul on the Maros river. Thence it runs north-east in front of Arad, Oradea Mare and Satmar. (From Cenadul the frontier is against Hungary.) It now turns eastward at the summit of the northern Carpathians. For this stretch it is the frontier to Czechoslovakia. It now runs north-east for a similar stretch as the frontier of Poland until it reaches a point north-east of Cernauti (Czernowitz) and east of this it bends round, turning south-east to the Black Sea. The last part is the frontier of Bessarabia against Russia, following the line of the river Dniester from Zalescio near Czernowitz to Akkerman (Cetatea Alba). Rumania is thus roughly circular in shape consisting of two halves, that on the west mountainous and that on the east largely alluvial plains. It has frontiers against six countries.



Physical Features.—Old Rumania of the time before the World War has been increased by the addition of the Dobrudja, Bessarabia, Bukovina, the Banat and Transylvania. Of these additions Bessarabia adds a further inter-fluvial region between the Dniester and the Pruth to that which, in Old Rumania lay between the Pruth and the Sereth. The Dobrudja merely extends southwards, almost to the Balkan ridge, the plain-lands of Walachia and the Danube mouth. Thus lands of a type already characteristic of Rumania have now been added to the old nucleus. Transylvania on the other hand represents an entirely new area, to the control and cultivation of which the Rumanians have not yet become accustomed. It is a homogeneous region, largely fertile plateau, with the curve of the Carpathians for its boundary on the north, east and south and the Hungarian plain on the west. These two main divisions constitute the most important feature of the country. South and east of the Carpathians conditions of climate, custom and flora have an Oriental flavour and face the east. The other side of the great Carpathian barrier, the west, is the predominant influence, although on both sides the people are, by a great majority, Rumanian in race.

The province of Bessarabia is cut up by numerous ravines and river valleys all tributary of the Pruth and Sereth. In the northern half it is hilly, rising to 1,000 ft. and timbered with beech, oak, mountain-ash and some birch. To the south it is open country until it finally reaches the lagoons and marshes of the Danube at Galatz, Ismail and Kilia.

The Bukovina, a comparatively small province, is similar in character to Bessarabia, being fertile and productive. It is, however, heavily wooded, no less than 43% of its area being covered. It is hilly, containing as it does the foothills of the northern Carpathians.

The Dobrudja, confined between the Danube and the Black sea, is almost entirely steppe land. It is of extreme fertility and consists of alluvial soil. But it is almost devoid of springs and wells, so that much of it is desolate. It is substantially of the same character as the lower part of Bessarabia and Moldavia, all alike being derivative from the Danube river and largely dependent on it.

The remaining area south and east of the Carpathians comprises Moldavia between the Sereth and the mountains and the

MAP SHOWING POSITION OF RUMANIA WITH REGARD TO OTHER STATES. THE TERRITORY OF RUMANIA WAS MORE THAN DOUBLED AS A RESULT OF THE SECOND BALKAN WAR AND THE WORLD WAR

great westward extension of the Danubian plains to the Iron Gates where the Balkan and Carpathian ridges meet and close in the lowlands.

This great southern plain of Rumania is monotonous in its features. It slopes gently upwards from the Danube to the Carpathians and is intersected by a succession of rivers which, like the Dambovita, the Oltu and the Teleorman, rise on the southern and south-eastern slopes of the mountains and flow without much deviation into the Danube. Passage from east to west is thus much hindered and interrupted.

The Carpathians.—The Carpathians themselves form a remarkable Alpine intrusion into what is, in part, a Pontic or semi-Mediterranean setting. The mountains rise from the southern plains without much preliminary undulation. They achieve a maximum height of 2,400 metres in the peaks above Braşov (near Sinaia) at or near Piatra Craiului. The most formidable ridge lies between the passes at Braşov and Sibiu. All Alpine conditions are found here and Alpine flora and fauna contrast vividly with those of the wholly different regions to the south and east. Snow lies on the peaks far into the summer while at Sinaia and similar resorts snow covers the ground for almost half the year. North of the ridge the Transylvanian plateau extends in broken and hilly country of great fertility to the northern borders. The main and more abrupt face of the mountains is everywhere on the south and east. It serves as a most formidable barrier to invasion from the Black sea and Balkan regions and is far more easy to defend from the side of the plateau. Starting from the passage round the Carpathians at the Iron Gates the only passes across the southern part of the ridge are the Szurduk pass between Deva and Turgu Jiu, the Rothenturm pass between Sibiu (Hermannstadt) and Valcea, the Predeal pass between Braşov and Ploeşti and the Oituz pass at the south-eastern extremity of the range. All admit of the passage of railroads and all except the last-named have rail-traffic now passing through them. From Oituz to the Polish frontier the range consists more of isolated masses and there is no continuous ridge of great height. It is crossed at several places, notably by the railway from Ciuc Sereda to Focsani and further north again by the railway at Campulung.

Rivers.—The Transylvanian plateau itself is traversed by rivers that rise in the northern half of the range and flow westwards to the Theiss (Tisa). One river only, the Oltu, flows from Transylvania to Walachia. It has cut the Sibiu-Valcea pass. The principal rivers of Transylvania are: the Maros, which rises in the mountains forming the eastern wall of Transylvania, and taking first a northern course flows through the country from east to west; its principal affluents are the Görgeny, the Great and Little Kokel or Nagy and Kis Küküllö, the Strell (Sztrigi) and the Cserna on the left, and on the right the Ampoly and the Aranyos, which is rich in auriferous sediments. The Maros (Mureş) is the largest and longest river of Transylvania. It forms the northern boundary of the Banat province, which is traversed also by some minor streams. This province forms the plain-land end of the gradually sloping plateau of Transylvania so that a traveller going from the Carpathian passes to the Theiss would on the whole be steadily descending. It is structurally part of the main Hungarian plain but historically and ethnically is a unity. It is rich, well-watered and fertile, and in its southern corner, where it extends to the Danube, richly endowed with coal and other minerals. Central Transylvania produces gold in small quantities, but is mainly agricultural farmland. Fruit and vines, maize, wheat and rye are largely grown. Crops of hemp, flax and tobacco are also gathered though not in large quantities. Bears, wolves, foxes and boars are found in the abundant forests of the uplands. The goldmines are situated, as in antiquity, in the isolated mass of hills in the region of Kluj, in particular at Verespatak and in the mountains of Hunedoara, near Deva. In 1900 the value of gold so obtained was £300,000. The gold is often found in combination with tellurium. Saline springs are common and salt is worked at Maros-Ujvar, Des-Akna-Kolozs, Torda and Vizakna. Of the 337,996 tons of salt obtained by the state monopoly in 1925 the bulk comes from these sources.

The Danube is a controlling feature in the life of the country. It first meets the Rumanian frontier at the Iron Gates and thence flows with a swift and deep stream to Kalafat. Here, taking a sharp turn eastwards it flows through open country with cliff banks on the Bulgarian side, and lagoons and marshes on the Rumanian. It gradually gains in width and volume but decreases in speed. It so runs without change, always with low hills on the south bank until Turnu Magurele and Giurgiu are reached. Islands are common throughout the later reaches. After Giurgiu the direction is north-east by east and the river opens out by Silistra into a maze of islands, shoals and sandbanks. At Giurgiu and Silistra are the two most important ferries. From Calarasi onwards the river has great width. It is bridged at Cernavoda by a bridge some 12 km. in length and this is the average width of the river for many miles. Near Braila and Galatz it widens still more and after its final sharp turn to the east at Galatz the Delta proper begins. The principal channel cuts through the centre of the Delta from Tulcea and enters the sea at Sulina. It is kept clear largely by dredging. There is no bridge over the Danube between Novisad in Yugoslavia and the sea except at Cernavoda.

Geology.—The axis of the Transylvanian Alps consists of sericite schists and other similar rocks; and these are followed on the south by Jurassic, Cretaceous and Early Tertiary beds. The Jurassic and Cretaceous beds are ordinary marine sediments, but from the Cenomanian to the Oligocene the deposits are of the peculiar facies known in the Alps and Carpathians as Flysch. Farther north, the Flysch forms practically the whole of the Rumanian flank of the Carpathians. Along the foot of the Carpathians lies a broad trough of Miocene salt-bearing beds, and in this trough the strata are sometimes horizontal and sometimes strongly folded. Outside the band of Miocene beds the Sarmatian, Pontian and Levantine series, often concealed by Quaternary deposits, cover the great part of the Danube plain. Even the Pontian beds are sometimes folded. In the Dobrudja crystalline rocks, presumably of ancient date, rise through the Tertiary and recent deposits to form the hills which lie between the Danube and the Black sea.

Climate.—The Moldavian-Walachian region, together with Bukovina and Bessarabia, endure the scorching summers of the Russian steppe-land and the extreme frosts and blizzards of the Pontic zone in winter. Transylvania and the Banat endure the

less violent variations of Central Europe. The Danube plains often experience a temperature of 20° below zero (Fahrenheit) and in summer 100° to 110° is common. Autumn is the mildest season; spring lasts only for a few weeks. At Bucharest the mean temperature for summer is 72° for autumn 65° and for winter 27°. For many weeks and even months the plainlands endure the north-east wind from Russia called the *Crivets*. In summer a hot south or S.W. wind sweeps up from the Mediterranean, but without freshness. The Danube has been ice-bound for periods as long as three months. The rainfall, which is heaviest in summer, particularly in the Transylvanian plateau averages 15–20 in.

Fauna.—In its fauna, Walachia has far more affinity to the lands lying south of the Danube than to Transylvania, although several species of *Claudilia*, once regarded as exclusively Transylvanian, are found south of the Carpathians. Moldavia and the Baragan Steppe resemble the Russian prairies in their variety of molluscs and the lower kinds of mammals. Over 40 species of freshwater mussels (*Unionidae*) have been observed in the Rumanian rivers. The lakes of the Dobruja likewise abound in molluscs; parent forms, in many cases, of species which reappear, greatly modified, in the Black sea. Insect life is somewhat less remarkable; but besides a distinctive genus of Orthoptera (*Jaquetia Hospodar*), there are several kinds of weevils (Curculionidae) said to be peculiar to Rumania. Birds are very numerous, including no fewer than 4 varieties of crows, 5 of warblers, 7 of woodpeckers, 8 of buntings, 4 of falcons, and 5 of eagles; while among the hosts of waterfowl which people the marshes of the Danube are 9 varieties of ducks, and 4 of rails. Roe-deer, foxes and wolves find shelter in the forests, where bears are not uncommon; and chamois frequent the loftiest and most inaccessible peaks.

ANTIQUITIES AND EARLY SETTLEMENT

Rumania is rich in antiquities of all periods from the Neolithic to the Roman but no scientific archaeological work can be said to have been done before 1900 when Prof. Tocilescu published the results of his surveys of Roman Dacia. Excavation by Rumanians did not begin before 1914.

The Neolithic period is hard to distinguish from the Chalcolithic but in general it is abundantly clear that Rumania in the first half of the third millennium B.C. formed part of a homogeneous region in which Bulgaria, Thrace, Thessaly and the Ukraine as far north as Kiev were included. This culture is distinguished by a remarkable painted pottery of high artistic quality in design and shape. The people of this area and period have, for convenience been called the people of the "Black Earth Region" because the soil is rich and alluvial and because those living upon it at this period were largely agriculturalists.

The most important sites in Rumania hitherto examined are Cucuteni near Jassy where abundant remains have been found of two periods of this culture, Erösd in Transylvania and Braşov (Kronstadt), and some sites (excavated by Germans during the World War) near Cernavoda on the Danube. The culture so revealed is one of the most remarkable that developed in Europe in the early prehistoric period. It is thought by some to have oriental affinities with regions so far afield as Turkistan and Honan in China, where remarkably similar pottery is found. In any case the "Black Earth Culture" came to an abrupt end about 2000 B.C. and was replaced by a culture coming from the north-east, equipped with weapons of war. The Bronze Age that ensued develops rapidly and concentrates mainly in the western half of Transylvania and the Hungarian plains. It is of great artistic merit and some of the finest products of the European Bronze Age in gold and bronze come from Transylvania. Inhabited sites are numerous but not large and the gold of Transylvania seems certainly to have been worked on a large scale. There was a nobility and a subordinate or serf population and the accoutrement of the nobility and their gold ornaments and plate form an outstanding feature of the civilisation they represented. The *floruit* of this Bronze Age seems to have been about the fifteenth century B.C. and the Hungarian plain seems to have been the breeding-place for movements that extended far and wide. Bronze swords of Danubian type from these regions are found during the fourteenth and thirteenth centuries penetrating, perhaps more as signs of invasion than as elements of trade, as far afield as Mycenae, Egypt, Cyprus and Crete. The makers of the swords seem to have been the peoples who were gradually pressing down southwards into the Mediterranean and who subsequently were responsible for northernisation of the Minoan world. Their gold may have reached the wealthy cities of the Mycenaean mainland. Certainly they were in close touch with Troy and Anatolia.

The Second Millennium.—Towards the close of the second millennium before Christ the Bronze Age culture of Rumania was modified by external influences and at the dawn of the Mediterranean Iron Age, Italy played a preponderant part in the commerce of the Carpatho-Danubian regions. Villanovan culture from North Italy sent its wares (particularly its fine bronze work), far and wide into Transylvania and western influences predominated. Rumania proper is almost out of touch with the Hallstatt Iron Age and does not cease to be a Bronze Age until the eighth century when devastating invasions from Scythia entered from the north east. Scythian graves are found in three large areas—in North Hungary, in South Transylvania and in Walachia. They are never rich and they indicate the intrusion of large bodies of well-armed warriors who for a time controlled the country. They were, however, soon absorbed by the native population. But the wealth and prosperity of Rumania was checked, and never really recovered until Roman times.

Hellenic penetration was marked but never very effective and the Daco-Getic peoples of Rumania were never Hellenized as were the Balkan Thracians. But of the Greek period there are many archaeological evidences. The important Milesian settlement of Histria near the Danube mouth on a lagoon island facing the modern village of Karanasuf has been well excavated. Over a hundred and fifty inscriptions illustrate the life over many centuries of this remote Hellenic town. The wealth of the inhabitants, as is evident from two large and important inscriptions of the Roman period, had at all times come from the fishing in the Delta, over which the Histrians had immemorial rights.

Kallatis, an old Dorian settlement on the site of the modern Mangalia in the Dobruja, has been partly excavated. Inscriptions there indicate that the population was strongly Dorian and that the city, with others along that coast was largely subject to the Thraco-Scythian kings of the interior. Kallatis was evidently one of the great corn-exporting emporia of the Black sea. Constanta has been identified as the ancient Tomi, the place of exile of Ovid. Remains of the city walls have been discovered across the promontory upon which the residential part of the town is built. A small museum which contained all local antiquities was looted by Bulgarian soldiers during 1917 and the contents dispersed. Greek objects of commerce have been found as far inland as the headwaters of the Pruth and the Argeşul. Wine from Thasos and the Aegean was a much valued commodity in these regions.

In Roman remains the country is extremely rich. The great wall of Trajan can be traced without difficulty between Constanta and the Danube near Cernavoda. Extensive remains of Axiopolis at its western end can be seen on the Danube, and excavations have been carried out there. The most impressive of all the Roman monuments is the Tropaeum Trajani at Adamklissi. It stands in a wild and desolate region in the rolling steppeland between the Danube and Constanta with much of its sculptured decoration still lying round the massive concrete core which survives. The Roman town of Ulmetum midway between Harsova on the Danube and the coast has also been explored and excavated. Along the Danube the traces of Trajan's campaigns are numerous. The inscription recording his construction of the road along the south bank near the Iron Gates is still visible in the cliff face near the island of Ada Kalesi. Some of the piles of the bridge he built across the Danube still survive.

In Transylvania inscriptions are found as far north as the Polish border and elements of the various defences and vallums

built at different periods can be made out. Near Cluj at the village of Verespatak considerable traces of Roman mining for gold are to be seen and a century ago a series of important inscribed wax tablets was found here, bearing record to the manner and method by which the mines were worked. Of the Dacians who opposed the Romans there is much evidence but the archaeological discoveries are not of the first importance. The site of Sarmigetusa has been identified in the mountains a little south of Deva in Hunedoara. It is a powerfully fortified hill-city and was the metropolis of the Dacians.

Post-Roman remains of the time before the Rumanians came under the influence of Byzantium are rare and little or nothing is known about the country at this time. But the great gold treasure of Petroasa, which was transported to Moscow during the war and has never been returned, is certainly of Hunnish or semi-oriental origin. It consists of two superb chalices of pure gold, inset with large garnets and with handles shaped like panthers, a large necklet of the same fabric, several large gold ewers elaborately chased and some superb torques.

Byzantine remains are not of importance until the fourteenth century when the Byzantine church and monastery of Curtea de Argeş was built. The frescoes here rank as the finest and oldest Byzantine works of art in the country.

A special architectural style grew up after this, particularly in Moldavia, based upon the Byzantine, but of a very marked character and of great beauty. It flourished mostly in the sixteenth century and the early 17th. The church of the "Three Saints" at Jassy, founded in 1639 is one of the finest examples. The style of architecture so evolved is purely Rumanian and owes little or nothing to Greek or Slavonic tradition in matters of decoration, though the structure is in essence Byzantine. Byzantine traditions in painting dominated the artists of the churches and monasteries down to the eighteenth century.

THE PEOPLES OF RUMANIA

Whereas the population of Rumania in 1914 was 7,600,000 it has, by the new provinces been increased two and a half times. The distribution of the population is as follows: within the area of the old boundaries there were (1926) 7,897,311 inhabitants. Transylvania and the Banat contain 5,487,966, Bessarabia 2,956,934 and Bukovina 811,721. Transylvania has the lowest density of population (57 to the sq.km.), while Bukovina is the most thickly populated (77 to the sq.km.). Bucharest still remains the largest city, even of the new area, with a population of 850,000 (1925) and there is no other city of the size. The next largest is Kişinau (Kishinev) in Bessarabia with 150,000. Cluj comes next with 105,000 and there are no other towns whose populations reach more than five figures.

Of the total population according to the latest ethnological statistics (1920) 11,805,000 or about 70% of the population are of pure Rumanian blood and origin. Of the remainder 1,568,000 Magyars inhabit Transylvania and parts of the Banat; 792,000 Germans live in and round the old Saxon and Alsatian towns of the Carpathian slopes and the Banat; 900,000 Jews live scattered throughout the country, but with a majority in Transylvania and Bukovina; 170,000 Turks, 290,000 Bulgars and some 30,000 Tatars and gypsies live in Moldavia, Walachia and the Dobruja. Some 37,000 Poles are found in Bukovina and neighbouring parts. Of the remainder there are 792,000 Ukrainian Russians in Bessarabia and nearly 400,000 other Slavs in the northern departments.

The Rumanians are equally distributed throughout and are one of the most industrious elements. For the most part they are engaged in the agriculture and stock-breeding activities of the country. Recent research has done much to prove beyond doubt that they are partly the descendants of the Roman merchants and veterans who settled in Dacia, even as far north as the present Polish border, before and after the campaign of Trajan and partly of the native Dacians. Archaeological and historical evidence agree to show that there was a long and thorough period of penetration of the Carpathians by Roman commerce and after the Roman withdrawal the various established Roman elements remained in the country. The very word *batran* in Rumanian, meaning "old" is derived from the Latin *veteranus* and the word *biserica* (= church) indicates the western origin of Christianity in these parts (*biserica=basilica*) and so the western connections with Italy and Roman culture. The Rumanian physical type, in many cases, seems more definitely Latin than the Italian and the language is in many respects closer to Latin than is Italian. Slavonic elements are clear in some of the prevalent types but it is by no means the preponderating influence.

The 1,500,000 Magyars are found for the most part in the towns of Transylvania. By training, education and tradition they associate themselves more happily with the German elements than with the Rumanian and they take only a small part in the agricultural development of the land. They are industrious and honest but are politically unreliable since they are encouraged by their fellow-Magyars in Hungary to oppose in every way the rule under which they live. A branch of the Magyars known as Czeklers are descendants from the original Hungarians who entered Europe in the ninth century and who stopped and settled in Rumania. These can hardly be considered as expatriated: they number 500,000 in the Banat.

Germans have settled in Rumania from time to time for various reasons. The earliest were knights and their companies, perhaps Crusaders, in the 12th century, who were persuaded by the Hungarians to settle in towns that commanded the main passes of the Carpathians and so prevent inroads of Barbarians into Europe. Gradually they developed their settlements and in 1224 their position and independence were recognized. Alsatians and Saxons together with some groups from the Rhineland were settled in these early times. They still live an exclusive and separate life, largely with their own institutions and local government. They are mainly of the Lutheran persuasion. It is remarkable to see in their churches the one hint of the Orient, which they were brought there to combat, in the shape of fine Turkish carpets of the 16th century, survivals of the period when the Turks overran the Transylvanian plateau but left the German settlements still independent. The Germans in the various German regions of Transylvania are fine types and entirely unmixed with Rumanian or Magyar blood. They wear German costumes and live in a way indistinguishable from that of modern Germans. They form a very useful element in the state and, if rather an isolated enclave in a foreign land, yet are loyal subjects of whatever régime may control them. The Germans of the Banat are of a different type and are comparatively late arrivals. They colonised the waste plains of this fertile region in the eighteenth century (*see* BANAT) and are mostly Rhinelanders and Alsatians. Their activities are almost entirely agricultural and their wealth and industry is considerable.

The Jews live mainly in the towns and have until quite recently been so restricted in their civil and legal rights that they can hardly be said to have held the status of citizens. Nevertheless they are, as always, of the greatest financial value to the country and have much of the business in their hands. Their position, if not yet quite free, is still better than it was before the war. In origin the majority are Polish and Galician, though there are some few Spanish Jews of the same kind as those at Salonika.

The Turks are the survivors from the days of Turkish domination, settled mainly in the sixteenth century. They live in the remoter districts along the Danube, particularly on the Dobruja coast and near Silistria. They are old-fashioned and recall the Turkey of a century ago; they bear little resemblance to their brethren of the new Turkish Republic. The gypsies and Bulgars are the least satisfactory element in the country. The former contribute the attractive music of the traditional Tsigane and are at least picturesque, but the latter are a difficult element. Both are found mainly in the Moldavian and Dobruja provinces. Bulgar villages are common throughout the Dobruja, intermingled with Tatar settlements and Rumanian hamlets. But the Bulgars here are of a savage type, perhaps descendants from the original Cumans (*q.v.*), of the Middle Ages, and they are neither so clean nor so industrious as the Rumanian peasants.

The Russians in Bessarabia naturally form a difficult element but they do not number much more than a quarter of the total population of the district. Nevertheless they form an important minority, situated as they are on the borders of a powerful state. They are, however, industrious and quiet and have not given rise to so many difficulties as the Hungarians.

Religion.—The State Church of Rumania, which is governed by a Holy Synod, professes the Orthodox Oriental creed. Its independence was formally recognized by the oecumenical patriarch of Constantinople, in 1885. The Rumanian Church had claimed its independence from very ancient times, but under the Turkish suzerainty and Phanariote hospodars Greeks were generally elected as bishops, and the influence of the Greek patriarch at Constantinople came to be more and more felt. In 1864 it declared itself independent of all foreign prelates. In 1872 a law was passed by which the bishops were elected by the senate, the chamber of deputies, and the synod sitting as an assembly (the only other occasion on which provision is made for such an assembly is in the event of the throne becoming vacant without any apparent heir). It was subsequently decided to consecrate the holy oil in Rumania instead of procuring it from Russia or Constantinople; but the Greek patriarch protested. Secret negotiations were entered into which came to a successful issue. The patriarch feared on the one hand that the growing influence of the Russian Church would give a colour of Slavism to the whole church, and that a Russian might eventually be appointed oecumenical patriarch at Constantinople, while the Rumanians hoped by means of the independence of their church to deprive the Russians of all excuse for interfering in their internal affairs under the pretext of religion. The Rumanians, although obtaining complete independence, agreed to recognize the patriarch at Constantinople as the chief dignitary of the Orthodox Church.

The metropolitan archbishop of Bucharest, officially styled metropolitan primate of Rumania, presides over the Holy Synod; the other members being the metropolitan of Jassy (primate of Moldavia), the six bishops of Râmnicu Vâlcea, Roman, Hushi, Buzeu, Curtea de Argeș and the lower Danube (Galatz); together with eight bishops *in partibus*, their coadjutors. Metropolitans and bishops are elected by the senate and deputies, sitting together. In Hungary there are a uniate metropolitan and three bishops belonging to the Rumanian church. The secular clergy marry before ordination; and only regular clergy (*kalugari*) are eligible for high preferment. Many convents have been closed and utilized for secular purposes. The older convents are usually built in places difficult of access and are strongly fortified; for in troublous times they served as refuges for the peasants or rallying-places for demoralized troops. The sequestration of the monastic estates, which in 1864 covered nearly one-third of Rumania, was due to flagrant abuses. Many estates were held by alien foundations, such as the convents of Mount Athos and Jerusalem; while the revenues of many more were spent abroad by the patriarch of Constantinople. Religious liberty is accorded to all churches, Jews, Muslims, Roman Catholics, Protestants, Armenians and Lipovans having their own places of worship. The addition of the new provinces has added mainly to the number of the Roman Catholics, who were few in number in old Rumania. Nearly 300,000 come from Transylvania and the Banat alone. But the Orthodox and Uniate churches control 29·6% of the inhabitants of Transylvania, according to a religious census of 1910. Bessarabia has but added to the numbers of the Orthodox Church. The Saxons of the Banat and of Transylvania are mainly Lutherans of the Augsburg Confession, but some are Roman Catholics. The Magyars are almost wholly Roman Catholics.

Constitution.—In 1862 Alexander Cuza, an able Rumanian prince visited the Sultan at Constantinople and persuaded the Turks to recognize provisionally as one land the various principalities which then made up Rumania. A provisional government was soon after constituted and on May 10, 1866, Prince Charles of Hohenzollern-Sigmaringen was elected prince of Rumania by a constituent body chosen by universal suffrage. A constitution was at the same time drawn up. The country was not, however, wholly independent until 1877 when on May 10 the two chambers proclaimed autonomy. Rumanian troops then helped the Russians at Plevna against the Turks and so definitely associated themselves with the powers who were then combating the Turkish Empire. On May 10, 1881, Charles of Hohenzollern was crowned King of Rumania.

Charles had no heir and the succession was accepted by his brother Leopold whose younger son Ferdinand became king in 1888. By the constitution no woman may ascend the throne and, in default of a male heir, the representatives can choose a king among the royal families of western Europe. The constitution was revised in 1879 and in 1884 and finally, with fundamental changes on March 29, 1923.

The Constitution of 1923 radically altered all previously made constitutions and may be considered as virtually new. The most fundamental changes were the establishment of Universal Suffrage and Agrarian Reform. This new constitution consists of 138 separate articles and is based in general upon European models. It differs from the British Constitution principally in the numerous and considerable rights accorded to the monarch. The administrative sections are based largely upon French models. For administrative purposes the land is divided into districts (*Judete*) and these into cantons (*Plași*) and the last into communes; new and old provinces alike have these divisions and no others. Every citizen has to belong to a commune and each commune has a decentralised local government. There is a Senate and a Chamber of Deputies and a newly created third body called the Legislative Council, which formulates and prepares for the two Houses all legislative and non-financial administrative measures. The Senate is partly elected on a democratic basis by direct vote in some cases: 76 senators are nominated by the 76 Districts, Chambers of Commerce nominate others and Universities have one each. Another group of Senators hold their seats *ex officio* by virtue of high office. Such are the Crown Prince, the Metropolitan, the recognised bishops and certain other ecclesiastics of high position and the President of the Academy. Their tenure of office ceases with their office. A third group of Senators is composed of ex-Presidents of Council, ex-Presidents of legislative assemblies, generals and ex-Presidents of the Court of Appeal.

The King has considerable political power and by his veto can forbid certain legislation. He must be of the Orthodox persuasion, and attains majority at the age of 18. The legislature consists of District Tribunals, Higher Tribunals, Courts of Appeal, Courts of Assize and finally of the ultimate Court of Cassation. Electoral rights depend on Rumanian birth, domicile in Rumania and upon the citizen being of the age of 25, and being literate. The general political parties are as follows: A Peasant Party founded in 1918 by Jon Mihalache is of great influence and power. A Socialist Party founded in 1910 exists among the townspeople, but it is not numerically strong and has been severely repressed. There is a Liberal Party led by Bratianu and a Conservative by Marghiloman, a National Party by Julius Maniu and Vaida Voivod. A so-called Popular Party is led by General Averescu.

The most fundamental political change since 1914 was the Agrarian Reform of December 16, 1918. It was a reform made urgent by the war and demanded by the returned soldiers. Subsequent decrees between 1918 and 1921 completed the measure. The result has been a steady increase in the output of cereals, and a very satisfactory solution of social and agricultural discontent. It was undoubtedly the wisest and most fundamental reform ever made in the country.

Commerce.—Salt and tobacco are State monopolies. The former produced a revenue of nearly 3,250,000 lei in 1925, while the latter in the same year from 14,919 tons produced the enormous income of over 3,404,000,000 lei. The tobacco is all of local growth, mainly from the Danube plains, and its quality is of the very lowest. Compared with the usual Balkan tobaccos it is a very poor leaf very badly cured. The most important industry is that of oil and petrol productions. The main oil wells lie at the foot of the Carpathians in old Rumania near Ploești at the entrance to the Predeal pass. The oil-bearing strata

extend north-eastwards towards Focsani and westwards towards Craiova. The production is rigidly controlled by the Rumanian Government although foreign companies have great interests. The principal Rumanian companies are the Steaua Romana which in 1924 produced 270,274 tons and the Astra Romana which in the same year produced 455,640 tons. The only other large producer is the Creditul Minier which in 1924 produced 220,230 tons; 37 other companies work the fields ranging in production from the small figure of 480 tons to 180,000. The total production for 1924 was 1,860,471 tons, being worth in lei (then at about 1,000 to the pound sterling) 4,584,000,000 lei.

The coal mining area in Rumania is limited to the region of Anina in the Banat but it is productive of coal of very high quality. Anina itself produces some 300,000 tons annually. Coal from the Szekul valley is similar to Welsh coal and contains 66·76% of solid carbon. The deepest and best seams are at Kölnik, Klokodics and Nermeth. The coal-fields of Szekul, Domany and Vaskö are connected with important steelworks. Unworked beds are said to exist in the Hunyad, south of Deva. Lignite is produced in large quantities in the Hunyad and in the region between Varciarova and Bacau but the most important deposits lie in Old Rumania in Moldavia. The total lignite production in 1922 was 900,000 tons. Anthracite is found in the Gori district at Schela and in Moldavia and Walachia but the total tonnage in 1922 did not exceed 201,000 tons. A natural deposit only recently exploited on a large scale is natural gas. In 1918 the region, in Transylvania of Sarmasel, Sarmgud, Zaul-de-Campie, Sarosul-Ungure, Basna and Copsa Mica covering 114 sq.km. was exploited. In general 140 million cubic metres of gas can be produced from a sq.km.; it consists of almost pure "marsh" or "methane" gas with 8,716 calories to the cubic metre. It is one of the most valuable deposits of natural gas in the world. A not inconsiderable steel industry exists in the Banat, largely connected with the Banat coal-mines, with an annual output of 200,000 tons of ore. There has, however, been a decline since 1914.

The fisheries of the Danube region are a considerable commercial asset. After the Volga fisheries those of the lower Danube are the most extensive and the richest in Europe. (The sea fisheries on the other hand, on the Rumanian coast are negligible.) The annual product of the Danube delta alone is nearly 9,000,000 kilogrammes. Elsewhere the lagoons and shallows near Giurgiu and Oltenitsa at Calarasi, Cernavoda and Harsova and near Ostrov are the most productive. Carp are the most numerous, having since 1920 amounted to nearly 3,000,000 kilogrammes in weight annually. About 150,000 kilogrammes of sturgeon are caught annually. There is considerable scope for enlargement and improvement in the fishing industry.

In wheat, rye and other grain, Rumania is one of the richest countries of south-east Europe. Old Rumania together with Bessarabia grows about three times the quantity grown in Transylvania. The total production is only slightly below that of Germany and is about a fifth that of Canada. The corn grown is of a high quality and it is harvested largely by mechanical means, with which Rumanian farms are well-provided. The export trade in corn has decreased considerably since 1914, though in 1911 it represented 70% of the value of the total exports. Since then petrol has largely replaced it in the exports of the country. The principal customers for Rumanian wheat are Belgium, Holland, Germany and Great Britain.

Of other exports there are none of great importance except wood, of which 2,500,000 tons were exported in 1924, and live stock of which some 70,000 tons were exported in the same year.

Communications.—The river Danube forms a magnificent highway for Rumanian trade passing from west to east. It also allows for the passage of imports from the Black sea into Europe. Navigation from Orsova at the Iron Gates to the Delta is easy and safe in both directions and after Calafat the current is so slight that transit from east to west is as rapid as traffic in the reverse direction. A total of some 7,000,000 tons of shipping passed in each direction along the river in 1923. Nearly a million tons of corn alone was transported during this period by this shipping. Maritime trade from Constanța and the Danube ports is considerable reaching 4,000,000 tons in 1923.

Passenger shipping amounts in all to 21,031 tons for the connections between the Black sea ports and the outside world, the fleet consisting of 14 ships.

The railways are almost entirely State-managed and largely State-owned. In all 7,305 kilometres of line are State-owned and 3,099 privately owned but controlled and managed by the State. In 1925 there existed 2,000 locomotives and 54,000 wagons of which 4,200 were for passenger use. The tracks are almost everywhere single with the exception of the lines between Ploești and Buzau, Bucharest and Campina and Arad-Curtici. The line used for the Orient Express enters the country at Curtici and runs by Alba Julia to Brașov and over the Carpathians by the Predeal Pass. The Black sea traffic is borne mainly by the Bucharest-Cernavoda-Constanța line, across the Danube at the great Cernavoda bridge. There is no line parallel with the Danube but the river traffic is tapped at Orsova whence a line runs north to Timișoara at Calafat, and thence a line runs north-east to Craiova, Slatina, Pitești and Bucharest. Smaller lines from the river join the last-named line from Corabia, Turnu Magurele and Zimnicea. Another line links Bucharest with its port Giurgiu. At Braila, Galatz and Reni, lines radiate inland and so link the corn-growing areas with the Danube ports.

Warsaw is reached via Cernauti and Russia via Tighina or Cetatea Alba (Akkerman) on the Bessarabian frontier.

New lines are contemplated between Brașov and Nehoias in order to discharge Transylvanian products to the Danube; between Bumbești and Livazeni in the Hunedoara region in order to extend the coal industry; between Ilva Mica and Dorna Vatra in order to facilitate the transport of wood from Bukovina to the south.

DEFENCE

Historical.—The history of the present Rumanian army dates from the accession of Prince Charles to the throne, and to the culmination in 1891 of the drastic reforms which he instituted. The Rumanian army subsequently participated in several of the Balkan wars and finally, on the side of the allies, in the last two and a half years of the World War. From the effect of initial disasters Rumania was saved, with a large gain in territory, by the defeat of the central powers.

Recruitment and Service.—Universal service is in force for all Rumanians, without distinction of race, language, or religion, for 29 years between the ages of 21 and 50. Certain exemptions are allowed for reasons of family, education or physical disabilities. The first two years of service are spent in the Regular army, 18 years in the reserve, and 9 years in the militia. Officers are recruited from the secondary schools, supplemented by a few army non-commissioned officers who can pass into the military schools, where the preparatory classes for all arms last for 2 years. The compulsory system is supplemented by youths volunteering between the ages of 18 and 21 for three years service.

Strength and Organization.—The budget effectives in 1927 numbered 153,145. In this total were included 13,436 officers and 3,376 civilian officials in army employment. There is also a corps of 2 brigades of frontier guards raised by the ministry of war but controlled by the finance minister, and a *gendarmerie* corps of 4 brigades under the minister of the interior but responsible to the war ministry in areas containing no troops. The organization of the army is in 7 army corps each of 3 infantry divisions and corps troops, 1 corps (2 divisions) of light infantry and 3 cavalry divisions. Each infantry division contains 3 infantry regiments, a regiment of field artillery and one of howitzers. Light divisions have these light infantry "groups," with 3 groups of mountain artillery and a regiment of mountain howitzers. Each cavalry division contains 4 regiments of Red and one of Black Hussars, and a group of horse artillery. Infantry regiments contain 2 or 3 battalions. Battalions contain 3

companies and a machine-gun company. Cavalry regiments contain 2 or 3 groups, each of 2 squadrons, and a machine-gun squadron. Field artillery regiments each contain 3 groups of 2 or 3 batteries and a specialist battery.

Higher Command.—The head of the army is the King. He can depute the command to a general officer in time of war. There is a supreme council responsible for organizing national defence, and a war office under a minister of war, with the usual departments including a general staff under a chief with his own secretariat and departments. There are seven army corps areas, each under its own commander, and, under them, divisional command areas. There are also inspectors general to supervise preparation for war in groups of 2 or 3 army corps. The various formations and units are distributed territorially in the 7 army corps areas. For recruiting, each of these is divided into districts of which there are 72 in all.

Military Education, etc.—There are 2 training schools for both regular and reserve officers, and 2 for reserve officers, 2 schools for infantry non-commissioned officers, a special infantry school, training centres for infantry and for light infantry, military colleges; an army cavalry school and special cavalry school; a training school for regular and reserve artillery officers, one for artillery officers and non-commissioned officers, a special artillery school and an artillery training centre. Also an army engineer school, technical engineer school, and field engineering school. There is a staff college under the chief of the general staff.

There is a tank regiment of one battalion of 2 companies, an artificers company and a depot company. Automatic rifles are in use in some of the infantry and cavalry units. An elaborate system of fortification, designed to form the keystone of national defence, was designed by the Belgian expert General Brialmont in 1882 and constructed at a cost exceeding £4,000,000. Since the World War, less reliance is placed in forts, and more in mobile field troops.

Army Air Force.—This contains aeroplane and balloon units, schools, anti-aircraft artillery, and various arsenals and depots. There are 3 groups of scouting planes, each group containing 4–5 scouting flights, besides a depot flight, a flight of specialists, a photography and meteorology section, machine-gun section, details and workshops. There is one "fighting squadron" containing one group of 2 flights of bombing planes and 2 groups of 3 or 4 flights of fighters, together with specialist flight, workshops and details; a naval flying group; a balloon group of 6 balloon companies, workshops and factory. There is a training centre for flying, and aviation schools for courses in flying, gunnery, bombing and mechanics work; also arsenals, depots and 6 aerodromes under a service flying group. About 15 flights of machines are maintained at the various training centres and schools.

(G. G. A.)

ECONOMIC AND FINANCIAL CONDITIONS

Area and Population.—Under the terms of the Peace Treaties arising from the World War Rumania's area and population were more than doubled. Nearly 83% of the people are engaged in agriculture, forestry and kindred rural pursuits. The total area of the country and the population are distributed as follows:—

	Sq.km.	Population
Moldavia	38,058	2,233,556
Muntenia	52,505	3,485,859
Oltenia	24,078	1,484,706
Dobrudja	23,262	693,190
Bessarabia	44,422	2,956,934
Bukovina	10,442	811,721
Banat	18,628	1,008,456
Crishana	17,086	1,142,469
Maramuresh	8,592	463,968
Transylvania	57,819	2,873,073
	294,892	17,153,932

while the following table shows the distribution of the population by trades, other than agriculturists; and includes workmen as well as clerical staffs:—

Oil	32,323
Mining	60,175
Metallurgical	44,748
Saw-mills	50,235
Chemicals	8,791
Food products	34,672
Textile	30,406
Leather tanneries	9,324
Glass workers	4,174
Building materials (cement works, etc.)	15,192
Paper and printing	9,689
Total, in above and other occupations	302,082

Agriculture.—The 24,238,076 hectares of Rumanian agricultural and forest land are distributed as follows:—

	Hectares	Per cent of total
Arable land	12,276,807	41·63
Meadowland and pastures	4,156,155	14·09
Forests	7,248,987	24·58
Orchards, and vineyards	556,127	1·89

Before the War, Rumania was still a country of large estates and one of the principal wheat exporting countries of Europe. After the emancipation of the peasants in 1864, they were granted from time to time allotments from Crown Lands but such grants were never sufficient to satisfy the general land hunger. Distribution was equally unsatisfactory in the case of Bessarabia under the Russian and Transylvania under the Austro-Hungarian Empire, but the Bukovinan peasants had been more fortunate in obtaining possession of a considerable share of the land. It was found expedient in 1920 to pass an Expropriation Law for Bessarabia, which was rapidly followed by similar laws for the Old Kingdom (1921) and for Transylvania and the Bukovina (also 1921), whereby provision was made for the total expropriation of absentee landlords, foreigners, mortmain estates and for partial expropriation of large landed properties. For purposes of comparison with the present Agrarian Reform Laws, it may be useful to reproduce a statistic compiled by Monsieur Ionescu-Sisești as to the distribution of arable land in the Old Kingdom in 1905:—

Size of holdings	Area in hectares	Percentage of total	Number of land-owners
Under 10 hectares	3,153,645	40·29	920,939
10 to 100 hectares	862,800	11·02	38,723
100 hectares and over	3,810,351	48·69	5,385
	7,826,796	100·00	965,047

To give effect to the post-war Agrarian Reform Laws official statistics show that a total of 16,500 estates (6,055,863 hectares) have been broken up, while litigation is in progress for the expropriation of a further 140,744 hectares. Not all of the land expropriated however has been handed over to the peasants as will be seen from the following:—

Progress of Expropriation to December, 1927

	Old Kingdom	Transylvania	Bessarabia	Bukovina
Hectares expropriated	2,776,401	1,711,575	1,491,920	75,967
Number of persons entitled to land	1,033,628	490,528	357,016	77,911
Number granted land	630,113	310,583	357,016	71,266
Hectares allotted to latter	1,916,350	451,653	1,025,174	27,797
State, communal, and district reserves	739,123	1,259,922	393,875	33,135
Peasants still without land	403,515	179,045	..	6,645
Balance for distribution	120,928	..	73,871	15,035

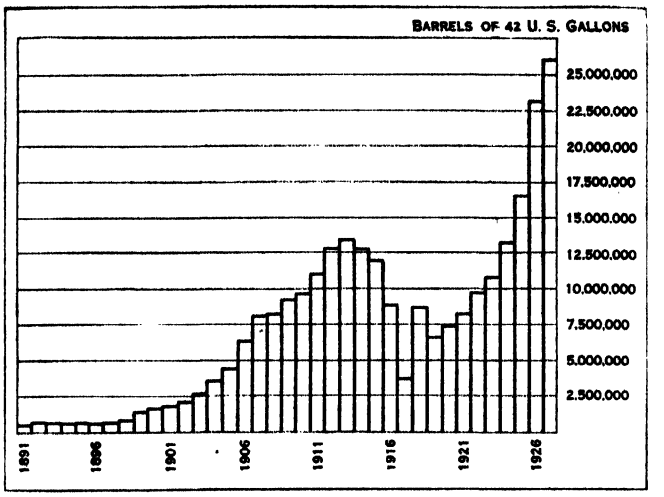
The thousands of peasants who took over the land in the first years of the agrarian reform were unskilled in management, inadequately organised on the co-operative side and lacked both the

machinery and capital required for successful farming. Although it may be assumed that with the passage of time the peasant is now better able to exploit his land and has acquired wider experience, nevertheless the shortage of money, the impossibility of cheap loans, and the heavy fall in the world price of cereals are all conditions which have combined to retard progress. Added to these unfavourable economic factors, the bad harvests of 1927 prevented any progress towards the pre-war cereal production of the territories under review, as will be seen from the following table:—

(In Thousands of Metric Tons)

	1925	1926	1927	Pre-War Averages (estimate for present territory)
Wheat	2,850	3,018	2,633	4,574
Rye	203	285	237	524
Oats	740	1,159	868	1,159
Barley	1,019	1,685	1,262	1,457
Maize	4,159	6,083	3,533	5,912

According to Rumanian economists, the division of the land will ultimately lead to increased total production, but not necessarily attaining the pre-war production of wheat.



A reliable index to Rumania's prosperity agriculturally is the number of animals maintained. In taking the following table into consideration territorial changes must also be considered:—

	1911	1920	1927
Cattle	2,667,000	4,730,000	4,991,670
Sheep	5,269,000	8,690,000	13,581,869
Pigs	1,021,000	2,514,000	3,167,722
Horses	843,000	1,485,000	1,877,285

Rural Co-operation.—As a result of the post-war agrarian legislation the functions of the co-operatives underwent change. The whole organisation had been destroyed by the Central Powers and it was found necessary to commence *de novo*. The Central Credit Bank has a capital of 12,000,000 lei of which two-thirds were found by the State. The nominal capital was increased in 1923. The rural societies provide the peasants with seeds, machinery, etc.: and in many cases make arrangements for the collection and export of produce. There were at the end of 1926 over 4,000 societies with a total of 915,388 members. Even with the limited assistance which these societies are enabled to extend to the peasant farmer, there is no doubt that they are doing good work and, were it not for them, the peasant would be unable even to raise sufficient from the land he possesses to keep himself and his dependents. As it is, with the scarcity of money, high rates of interest and the complete lack of long-term credits for the purchase of implements, seeds, etc.: the peasant is able to do justice neither to himself nor to his land. Especially is this the case in Bessarabia where, as a result of an extremely bad harvest in 1927, wheat and maize had actually to be imported into the province for alimentation and seed reserves.

Mining.—Rumania's chief mineral wealth before the War lay in her rich petroleum deposits. In 1913 Rumania produced 1,885,000 tons of petroleum, standing fourth in the list of petrol-producing countries. In the autumn of 1916 an Allied Mission, operating in concert with the Rumanian Government, put the fields out of action to prevent them falling into enemy hands. Production fell to 517,000 tons, but although by 1926 it was restored to 3,244,415, or nearly twice the pre-war figure for the Old Kingdom, Rumania's production to-day is only two per cent of the world output. During the last two years the Rumanian oil industry has been struggling with a combination of economic evils, two of the chief being high export taxation and weakening world prices due to Californian over-production. It was found possible however at the beginning of 1926 to reduce considerably the taxes on certain grades of oil, benefiting the industry to a certain degree, while the formation of an oil cartel for the control of internal prices also eased the situation to some extent in this direction also.

A measure which affected the industry greatly was the Mining Law of 1923 which nationalised the sub-soil, restricted the holdings of foreign Companies and thus countered foreign exploitation at the expense of national enterprise. New oil-bearing lands could only be obtained in concession with Government consent. Under the Rumanian Company Law of the same period, sixty per cent of all invested capital must be Rumanian, while two-thirds

GRAPH SHOWING PRODUCTION OF CRUDE PETROLEUM IN RUMANIA, 1891–1927. THE AMOUNT PRODUCED, 1857–1927 (273,968,000 BARRELS), WAS 1·7% OF WORLD PRODUCTION DURING THAT PERIOD. FIGURES FOR 1927 ARE PRELIMINARY

of the Board of Directors must be natives. Rumanians must also be employed in all industrial concerns, cause having to be shown for the importation of foreign technical and clerical assistance. The majority of the foreign Companies conformed to the provisions of the new Laws and, in the oil industry at least, it has been found that the new system was practicable. Those Companies not conforming were subject to obstruction, being ineligible for grants of State oil lands. The Maniu Government which took office in the autumn of 1928 expressed their intention of revising the Bratianu policy in regard to the mining rights.

The other principal mineral riches are coal, natural gas and salt, while there are, in a lesser degree, deposits of asphalt, amber, gold and silver, pyrites, copper, lead, antimony, mercury, manganese, chrome, bauxite and iron.

The coal supply was formerly insufficient for home requirements and supplies, chiefly from Poland, were imported. However, coal output is increasing and since 1925 Rumanian coal has been protected by a high tariff imposed on foreign coals.

According to official statistics, the annual coal output for the years 1924 to 1926 was as follows:—

	1924	1925	1926
	Metric tons		
Lignite	2,479,083	2,615,278	2,731,362
Stone coal and anthracite	313,722	313,572	322,191
Total	2,792,805	2,928,850	3,053,553

With the annexation of Transylvania, Rumania acquired the coal, iron, gold, silver, lead and copper mines of the province. The whole of the ore is handled in the three metallurgical works in the province which are State-owned. The development of the mines is delayed owing to the lack of coking coal.

Trade.—Rumania's principal exports are cereals, petroleum products and timber. Quantities for the years 1922 to 1926 show a gradual improvement, except in the case of timber exports for the latter year, which are less than those for 1923:—

(In Thousands of Metric Tons)

	1922	1923	1924	1925	1926
Cereals	1,278	1,775	1,422	851	1,791
Petroleum products	436	416	436	700	1,502
Timber	1,793	2,225	2,541	2,507	2,216

Other exports are hides, wool, vegetable oils, manufactured wood articles, fruits and, in a lesser degree, eggs. Principal imports are manufactured goods (chiefly textiles), colonial produce and chemicals. Following the Government's change of policy in 1925 in regard to export taxes, when a reduction in the taxes on cereals was effected, and as a result of the continued fall in the world prices of cereals, a further reduction in export taxes was put into effect in 1927.

Taking only imports for domestic consumption and exports of home produce, Rumania before the war showed a large and favourable balance of trade, due almost wholly to wheat exports. In the years immediately following the war however the balance was an adverse one, but the tide turned in 1922 and the monthly averages after that date are indicative of progressive recovery, with the exception of the 1927 slump only, the reasons for which have already been mentioned.

MONTHLY AVERAGES OF IMPORTS AND EXPORTS
(*In Thousands of Lei*)

	Imports	Exports
1922	1,027,114	1,169,941
1923	1,626,336	2,050,872
1924	2,182,704	2,318,633
1925	2,501,511	2,383,928
1926	3,095,517	3,185,239

Finance.—The fundamental factor in foreign exchange in Rumania is the grain harvest and the facilities for moving it, for the lei which Rumanian merchants can devote to the purchase of foreign goods are the profits on cereal exports. There was much headway to make up, owing to the devastating effect of the German occupation and the temporary chaos in agriculture which followed the expropriation of large estates. The financial position was made more difficult by the expenses incurred by the invasion of Hungary in 1919 and by the large expenditure on armaments due to Rumania's political situation, and especially to the uncertainty existing as to Rumanian sovereignty over Bessarabia. During the occupation the Germans issued some two and a half milliards of lei; they also secured large sums of Rumanian gold by the sale to the peasants of goods, especially sugar, of which there was a scarcity. Although, under the Peace Treaties, Germany was to repay her various depredations, and it was eventually agreed between the two Governments that deliveries of locomotives and other goods should be made on account of Reparations, no agreement has yet been reached in regard to the repayment by Germany of the Banca Generală note issues above referred to; Rumania, by way of retaliation, refusing to pay either amortisation or coupons of German-held Rumanian bonds in consequence.

On taking over the new territories Rumania also had to take over eight and a half million Austrian kronen and two milliards of Russian roubles. Further, at the time of the German invasion, the bullion of the National Bank with much private property in jewels, treasure and objects of art, was sent to Moscow for safety. This property, valued at 315,000,000 gold lei, ultimately fell into the hands of the revolutionary régime set up soon after, and is now considered to be irrecoverable. The decline in value of the leu was rapid between 1918 and 1922, during which period the amount of notes in circulation increased from two and a half milliards to 15 milliards and is today just over 21 milliards. The decline in the value of the leu, normally equivalent to the franc, is shown in the following table:—

Mean Rate to the £ Sterling

1919	79	1922	673·16	1925	1,008·25
1920	203·41	1923	948·75	1926	1,068·50
1921	329	1924	896·75	1927	814·75

The excessive depreciation of the leu which characterised 1926, and which was the immediate result of the excessive influx of foreign goods to forestall the new and heavily protective Customs Tariff shortly afterwards introduced by the Government, was maintained until late in the year when the extent of the exportable surplus of an exceptionally good harvest became known. At one period of the year the leu had dropped to 1,500 to the £. In addition to the excellent crop the oil production also proved to be more than usually large and almost doubled the highest pre-war output. Thus, despite a fall in world prices of both cereals and petroleum products, a favourable trade balance of more than four milliards of lei proved more than sufficient to permit the recovery of the leu and afforded besides a striking proof of Rumania's recuperative powers. The tendency of the leu to appreciate continued throughout 1927 in spite of indifferent crop yields. On Feb. 11, 1929, a loan of $101,000,000 at 7% was negotiated in Paris and other cities which made it possible for the government to pass a bill stabilizing the leu at 813.6 to the £. The main preoccupations of the Government were now directed towards the complete reconstruction of the State Railways without which neither true stability of currency nor maintained economic prosperity can be hoped for. There seems little reason to doubt that the Maniu Government will be able to proceed to ensure Rumania's future prosperity.

The policy of deflation adopted in 1922, which followed Rumania's first balanced budget has been continued, though trade has been seriously hampered thereby. The shortage of money and high rates of interest on loans have also continued and despite of an edict of the National Bank in 1927 to the effect that banks persisting in charging more than 18% on short loans would be penalised by the reduction and, in the event of continued transgression by the complete withdrawal, of discount facilities, interest is still high and likely to continue so until the effects of stabilisation supported by a foreign loan are sufficiently pronounced as to ease the money stringency. The arrangement whereby the State undertook to repay to the National Bank loans to the extent of 11 milliards of lei has proceeded satisfactorily and the State debt to the Bank has now been reduced to less than ten milliards and will continue to be thus amortised at the rate of some three-quarters of a milliard lei annually. All budgets have been balanced and the effectiveness of the measures adopted will clearly be seen from the following table:—

(*In Millions of Lei*)

	Revenue		Expenditure	Surplus
	Estimated	Real		
1924	24,000	27,744	21,404	6,340
1925	31,750	34,038	29,440	4,598
1926	28,250	31,224	28,499	2,725
1927	34,640	36,008	33,137	2,871

The Budget Estimates for 1928 were also balanced at 38,350 millions of lei or 3,710 millions more than the preceding Budget. The budget for 1929, passed in December, 1928, balanced at 38,300 millions of lei. It must also be borne in mind that laws were passed in 1926 and 1927 by which the State Railways, Post Office and the State Pensions Office became autonomous bodies with separate budgets not included in the figures given for the years in question. The same holds good for succeeding years. Were the budgets of the autonomous departments also included in the General State Budget, the latter would be found to have become much inflated, being for the years 1926 and 1927 41,881 and 53,612 millions of lei respectively. Of the 1929 budget, 15,593 million lei was allotted to the Ministry of Finance, 7,930 million lei to the Ministry of War, 4,848 million lei to the Ministry of Education, and 1,916 million lei to the Ministry of the Interior. In spite of the fact that budgets have been balanced in the face of acute financial depression, it must nevertheless be remembered that these results have only been accomplished at the cost of:—

1. Impoverishment of the Army, Air Force, Navy and Civil Services.
2. Serious deterioration of the railway system.
3. Suffering in all but the highest classes through the arbitrary maintenance of the cost of living at a figure far above the intrinsic value of the heavily depreciated currency.

Communications.—A large part of Rumanian trade is carried on the Danube, although as far as concerns river traffic and petit cabotage Rumanian services are inadequate while foreign services are generally obstructed. The main communications of Rumania converge on Braila and Galatz, and two-thirds of Rumanian imports are received from the industrial countries of Europe through these river ports. Galatz is the principal port for the export of timber, Braila for cereals, vegetables and petroleum products, etc. Constanța is the only Rumanian port open all the year round and is, for this reason, of paramount interest to the oil industry, for the carriage of whose products to the port a second pipe-line is contemplated to augment the present somewhat inadequate service. Constanța is also a port of call for Near East and Levant steamers and provides a connection for quick trans-Continental transit for travellers from the East. The incorporation of the new provinces, whose communications were naturally directed chiefly to serve the States to which they formerly belonged, have made new railway communications essential to the development of Rumanian trade and industry. A new line from Oradea-Mare to Arad obviates a detour through Hungarian territory.

The new lines for which credits were voted in 1923—viz., Brașov-Nehoiași; Ilva-Mica-Vatra Dornei; Bumbesci-Livezeni; Hamangia-Tulcea—are still (1929) under construction. The first of these provides a direct route from Brașov to Constanța; the second will give a direct connection between Transylvania and the Bukovina; the third will traverse the Vulcan Pass and permit the easy transport of coal from the Petroshani field to Craiova. Other work in hand includes the transformation of the Bessarabian railways to normal gauge and effective linking up of the Province with the Danube ports. Little progress is being made however in this direction owing to lack of credits for the reconstruction work entailed. Before the war the outlet for Bessarabian produce was Odessa and a necessary condition for Bessarabian prosperity under the changed sovereignty is the provision of an easy outlet from the Danubian ports. Until the Bessarabian lines are re-orientated towards Rumania and from Russia, and are augmented by other lines binding the province closer to itself and with the other new provinces as well as with the Old Kingdom, no change in the present unsatisfactory economic position of this territory can be hoped for.

HISTORY

For the history of the countries constituting the modern Rumania, until the end of Roman rule in them, *see* DACIA. From the 6th to the 12th century, wave after wave of barbarian conquerors, Goths, Huns, Bulgars, Slavs and others, passed over the country, and, according to one school of historians, almost obliterated its original Daco-Roman population; the modern Vlachs, on this theory, representing a later body of immigrants from Transdanubian territory. According to others, the ancient inhabitants were, at worst, only submerged for a time, and their direct descendants are the Rumans of to-day. Each of these conflicting views is supported by some evidence; and the whole controversy, too large and too obscure for discussion here, is considered under the heading VLACHS.

Towards the close of the 13th century, when the authentic political history of the Vlachs in Rumania begins, Walachia (known to the chronicles as Muntenia) and Moldavia were occupied by a mixed population, composed partly of Vlachs, but mainly of Slavs and Tatars, with an admixture of Petchenegs and Cumans. The two principalities of Walachia and Moldavia which now emerge developed, however, separately and each has its separate annals. About the year 1774 it first becomes possible to record the progress of these Danubian principalities in a single narrative, owing to the uniform system of administration adopted by the Turkish authorities, and the rapid contemporary growth of a national consciousness among the Vlachs. In 1859, the two principalities were finally united under the name of Rumania. The following article is therefore arranged under the four headings: *Walachia, Moldavia,* the *Danubian Principalities* and *Rumania.*

WALACHIA

Foundation of the Principality.—Tradition, as embodied in a native chronicle of the 16th century, entitled the *History of the Ruman Land since the arrival of the Rumans* (*Istoria tierei Românéscĭ de cândŭ au descălicata Românii*), gives a precise account, which has probably at least a background of historical truth, of the founding of the Walachian state by Radu Negru, or Rudolf the Black (otherwise known as Negru Voda, the Black Prince), voivode of the Rumans of Fagaraș in Transylvania, who in 1290 descended with a numerous people into the Transalpine plain and established his capital first at Campulung and then at Curtea de Argeș. Radu (who died in 1310) was a vassal of the king of Hungary; but his successor, who is presumed to be his son, John Bassaraba, or Bassarab the Great (1310–38) defeated his suzerain king Charles I. of Hungary in 1330, and made Walachia completely independent. His son Alexander Bassarab (1338–68) maintained and consolidated this position; but Vladislav (1364–74), although again defeating the Hungarians (1369) accepted Hungarian suzerainty in return for investiture with the banat of Severin and the duchy of Omlaș.

Mircea the Great (1386–1418) allied himself with King Ladislaus of Poland and extended his power over the Dobrudja. After the defeat of Serbia at Kosovo (1389), where a Walachian contingent had assisted the Serbs, Mircea was forced to pay tribute to the Sultan, whom, however, he defeated in 1394. Allying himself with Hungary (1395), he failed to support his ally at the battle of Nikopolis (1396) and was deposed by his son Vlad, who accepted Polish suzerainty. Mircea returned, re-established, and for a time increased, his power by exploiting the internecine quarrels between the sons of the Sultan Bayezid. In 1411, however, Mohammed II. made Walachia tributary to the Turks, while leaving intact its dynasty, territorial integrity and Christian religion.

Relations with Hungary and Turkey.—The succeeding period is one of intestine strife and shifting foreign policy. The only notable figure among the voivodes of Walachia was that of Vlad V. "the impaler" (1455–62 and 1476–7), a creature of the Sultan's. The stories of the cruelty of this savage (himself the son of Vlad III., "the devil") surpass belief. Vlad's ferocity frightened even the Turks, whom he defied for some years before they deposed him in favour of Radu the Fair (1462–75). Most of the voivodes of Walachia were, however, only able to maintain a very precarious independence by "fawning alternately on the Turks, the Tatars, the Poles and the Hungarians." The elections to the throne, though often controlled by the Divan, were still nominally in the hands of the factious native boyars, and the princes followed each other in rapid succession, often meeting violent ends. The state of the country was still primitive, the people largely pastoral, the cottages built of clay and wattle. Only the capital, Tîrgoviștea, was a considerable town of stone.

A temporary improvement took place under Neagu Bassarab (1512–21), who founded the cathedrals of Curtea de Argeș (*q.v.*) and Tîrgoviștea and many monasteries, and adorned Mount Athos with his pious works. He transferred the direct allegiance of the Walachian Church from the patriarchate of Ochrida in Macedonia to that of Constantinople. On his death, however, the Turkish commander, Mahmud Bey, seized and imprisoned his young son and successor, and nominated Turkish governors in the towns and villages of Walachia. The Walachians resisted desperately, elected Radu, a kinsman of Neagu, voivode, defeated Mahmud Bey with Hungarian help, at Grumatz in 1522, and secured recognition of Radu in 1524; but the battle of Mohács in 1526 decided the long preponderance of Turkish control. The unfortunate province served as a transit route for Turkish expeditions against Hungary and Transylvania, and was exhausted by continual requisitions. The voivode Alexander, who succeeded in 1591, and like his predecessors had bought his post of the Divan, carried the oppression still further by introducing a janissary guard and farming out his

possessions to his Turkish supporters, and again it seemed as if Walachia must succumb to the direct government of the Ottoman.

Michael the Brave, 1593–1601.—In the depth of the national distress the choice of the people fell on Michael the son of Petruşko, ban of Craiova, who had fled to Transylvania to escape Alexander's machinations. Supported at Constantinople by Sigismund Báthory (*q.v.*) prince of Transylvania (1581–98 and 1601–02), and the English ambassador, Edward Barton, and aided by a loan of 200,000 florins, Michael succeeded in procuring from the Divan the deposition of his enemy and his own nomination. Michael's genius secured Walachia for a time a place in universal history. By previous concert with the Moldavian voivode Aaron, the Turkish guards and settlers in the two Principalities were massacred at a given signal (Nov. 13, 1594). Having secured the help of Báthory by accepting his suzerainty, Michael next invaded Turkish territory, and took Rustchuk, Silistra and other places on the right bank of the Danube. A simultaneous invasion of Walachia by a large Turkish and Tatar host was successfully defeated at the battle of Mantin (1595). The Sultan now sent Sinan Pasha, "the Renegade," to invade Walachia with 100,000 men. Michael withdrew to the mountains before this overwhelming force, but, being joined by Báthory with a Transylvanian contingent, resumed the offensive, stormed Bucharest, and, pursuing the main body of Sinan's forces to the Danube, overtook the rearguard and cut it to pieces. In 1597, the Sultan, weary of a disastrous contest, reinvested Michael for life and granted the succession to his son.

Conquest of Transylvania.—On the abdication of Sigismund Báthory in Transylvania, Michael, in league with the imperial forces, and in connivance with the Saxon burghers, attacked and defeated his successor Andreas Báthory near Sibiu (Hermannstadt), seized the government, and secured his proclamation as prince of Transylvania (1600). The emperor appointed him viceroy, and the diet ratified his position. The partiality that he showed for the Ruman and Szekler parts of the population, however, alienated the Transylvanian Saxons, who preferred the direct government of the emperor. The imperial commissioner, General Basta, lent his support to the disaffected party, and Michael was driven out of Transylvania by a successful revolt, while a Polish army invaded Walachia from the Moldavian side. Michael appealed to the emperor, who was won over by his singular address, supplied him with funds, and sent him to Transylvania as imperial governor. In conjunction with Basta he defeated the superior Transylvanian forces at Goroslau, expelling Sigismund Báthory, who had again aspired to the crown. But at the moment of his returning prosperity Basta, who had quarrelled with him about the supreme command of the imperial forces, procured his murder (Aug. 10, 1601). Not only had Michael rolled back for a time the tide of Turkish conquest, but for the first time in modern history, and the only time before 1918, he united what once had been Trajan's Dacia, in its widest extent, and with it the whole Ruman race north of the Danube, under a single sceptre.

Matthias Bassaraba and Constantine Brancovan.—Sigismund now resumed the government of Transylvania, while Serban, of the Bassaraba dynasty, was, by the emperor's wishes, appointed voivode of Walachia. On his deposition by the Porte in 1611 there followed a succession of princes who, though for the most part of Ruman origin, bought their appointment at Stamboul. The most notable of them was Matthias Bassaraba (1633–54) who maintained his position and reorganized his principality despite incessant attacks from his rival Basil the Wolf, of Moldavia. Matthias's illegitimate son and successor Constantine Serban (1654–58) was the last Bassarab to rule in Walachia. On his death the Turks, who in 1698 moved the seat of government to Bucharest, at a safer distance from the Transylvanian frontier, were able to exercise a greater influence over the various notable families which aspired to rule. The immediate successors of the Bassarabs were, however, able men. Sherban Cantacuzino (1679–88) who was forced to assist the Turks at the siege of Vienna (1688) opened up secret communications with the emperor, who granted him a diploma creating him count of the empire and recognizing his descent from the imperial house of Cantacuzino. Sherban meanwhile collected his forces for an open breach with the Porte. His prudence, however, perpetually postponed the occasion, and Walachia enjoyed peace to his death in 1688. This peaceful state of the country gave the voivode leisure to promote its internal culture, and in the year of his death he had the satisfaction of seeing the first part of a Walachian Bible issue from the first printing-press of the country, established at Bucharest.

Immediately on Serban's death the boyars elected his sister's son Constantine Brancovan (1688–1714) who ruled the province skilfully until, fearing the increasing strength and prosperity of his vassal, the Sultan deposed him. He was finally beheaded at Constantinople in May 1714. A scion of the rival Cantacuzinian family was then elected and after exhausting the principality for the benefit of the Divan, was deposed and executed in 1716.

The Phanariot Regime.—From this period onwards the Porte introduced a new system with regard to its Walachian vassals. The line of national princes ceased. The office of voivode, or hospodar, was sold to the highest bidder at Stamboul, to be farmed out from a purely mercenary point of view. The princes who now succeeded one another in rapid succession were mostly Greeks from the Phanar quarter of Constantinople, and were generally men of culture and intelligence, and Constantine Mavrocordato introduced an extremely liberal agrarian reform, even decreeing the abolition of serfdom in 1747—an enactment which was not, however, carried out. But the rule of the Phanariots and their Greek satellites could not but be productive of grinding oppression, and numbers of the peasantry emigrated. In 1745 the number of tax-paying families, which a few years before had amounted to 147,000, had sunk to 70,000. The hospodar Scarlat Ghica (1758–61), removed the Turkish settlers from Walachia, but the Turks maintained their grip on the country by holding on the Walachian bank of the Danube the fortresses of Giurgiu, Turnu Severin and Orsova, with the surrounding districts.

The tide of Ottoman dominion, however, was ebbing fast. In 1769 the Russian General Romanzov occupied the principality, the bishops and clergy took an oath of fidelity to the empress Catherine, and a deputation of boyars followed. Catherine set about reorganizing the principalities on Russian lines, and at Focşani she demanded (1772) that the Sultan recognize the independence of Walachia and Moldavia under a European guarantee. The failure of these negotiations was followed by the Treaty of Kutchuk Kainarji (1774); but before considering this it is convenient to review the early history of Moldavia.

MOLDAVIA

Early History.—According to the Moldavian chroniclers of the 16th, 17th and 18th centuries, Dragoş the son of Bogdan, the founder of the Moldavian principality, emigrated with his followers from the Hungarian district of Marmaroş in the northern Carpathians. The dates assigned to this event vary from 1299 to 1342; but in any case it appears that the Vlachs of Moldavia were first reinforced and organized, after the collapse of the Cumans, by immigrants from Hungary in the early 14th century. About 1349 Bogdan Voda (1349–65) expelled the remnants of Cumans and Tatars and founded an independent principality. In 1372 by an agreement between Louis of Hungary and the emperor Charles IV., the voivodate of Moldavia was recognized as a dependency of the Crown of St. Stephen. The voivode Peter Musat (1375–91), however, recognized the suzerainty of the king of Poland, whose sister he married; and his successors, the chief of whom was Alexander the Good (1401–35) usually acknowledged Polish suzerainty.

The internal situation created by the Turkish advance was skilfully utilized by Stephen the Great (1457–1504) who, in agreement with Poland and the Sultan, evicted Vlad from the throne of Walachia and extended his own power southward at the expense of the Turks, whose armies he repelled in 1475 (battle of Rahova), 1476 and 1484. He defeated a Polish invading force in 1487, and soon after, with Turkish help, himself invaded Poland and annexed temporarily the province of Pokutia. Stephen's realm was a considerable one, extending both north and east far beyond the present Moldavia, while his international relations included Venice

and Poland. His son Bogdan III. "the one-eyed" (1504–17), however, at feud with Poland over Pokutia and unsupported by the shaken power of Hungary, was forced to agree to pay the Sultan an annual tribute (1513) in return for guarantees preserving the national religion and constitution. The terms were further regulated by a firman of 1529, Moldavia paying a tribute and supplying a contingent to the Turkish forces. Peter Rareş (1527–38 and 1541–46), the last really independent prince of Moldavia, attempted an ambitious foreign policy. Allying himself with the Turks he made war on both the imperial forces in Transylvania, and on Poland. He then allied himself with the emperor against Poland and the sultan, but was defeated and deposed in 1538. Returning in 1541 he again allied himself with the emperor against the sultan; but on his death his successors were no longer able to resist the growing Turkish power.

Moldavia Tributary to the Turks.—The tribute was gradually increased, and the sultan strengthened his hold on Moldavia by occupying successively a series of fortresses. A curious interlude in the increasing oppression was provided by the adventurer Jacob Basilicus Heraclides, an adventurer of Greek origin who succeeded in obtaining imperial support, seizing Moldavia from the voivode Alexander Lapuşeanu, and purchasing Turkish confirmation of his title (1561). Basilicus, who was a cultivated man, attempted to introduce an educational system in Moldavia and to reform its morals; but his heavy taxation and foreign advisers led to a revolt, and he was assassinated (1563). Under the restored Lapuşeanu and Bogdan IV. (1568–72) Moldavia relapsed into its earlier barbarism. Bogdan's successor, John the Terrible (1572–74) provoked by the Porte's demand for increased tribute, rose against the oppressor, but was defeated and slain (1574), and the country was left more than ever at the mercy of the Ottoman. Voivodes were now created and deposed in rapid succession by the Divan, but the victories of Michael the Brave in Walachia infused a more independent spirit into the Moldavians. The Moldavian dominion was now disputed by the Transylvanians and Poles, but in 1600 Michael succeeded in annexing it to his "Great Dacian" realm. On his murder the Poles again asserted their supremacy, but in 1618 the Porte once more recovered its dominion. Basil the Wolf (1634–53) led a temporary national reaction; but he exhausted his country in attempts to secure the throne of Walachia; and after his death the Porte instituted a Phanariot régime similar in all respects to that set up in Walachia, which endured until the beginning of the 18th century. In addition, Moldavia was repeatedly devastated in the wars between Poland and Turkey, and in various Tatar invasions. An attempt by the voivode Demetrius Cantemir to exchange the Turkish rule for Russian suzerainty (1711) proved unsuccessful. In the 18th century, however, despite extortion and oppression, a certain improvement occurred. The export trade of Moldavia at this period, principally in timber, salt, wine and foodstuffs, was considerable. Some of the Phanariot hospodars, who were generally drawn from the families of Mavrocordato, Ghica, Callimachi, Ypsilanti and Murusi, were men of culture. Gregory Ghica (1774–7) in particular made praiseworthy efforts to raise the standard of education, and encouraged the settlement of German Protestant colonists.

THE DANUBIAN PROVINCES, 1774–1859

The situation in both Moldavia and Walachia was altered by the peace of Kutchuk Kainarji (1774) which ended the Russo-Turkish war. Russia restored the principalities which she had occupied, to the sultan (Moldavia, however, being reduced by the Bukovina, which Austria profited by the situation to annex). Several stipulations were made in favour of the Walachians and Moldavians. The tribute was reduced; the agents of Walachia and Moldavia at Constantinople were to enjoy the rights of national representatives and the Russian minister at the Porte should on occasion watch over the interests of the principalities. The stipulations of this treaty formed the basis of future liberties in both principalities; but for the time all reforms were postponed.

The treaty was hardly concluded when it was violated by the Porte, which seemed intent on restoring the old system of government in its entirety, but in 1783 the Russian representative extracted from the sultan a more precise definition of the liberties of the principalities and tribute due. By the peace of Jassy (1792) the Dniester was recognized as the Russian frontier and the privileges of the principalities confirmed. In defiance of treaties, however, the Porte continued to change the hospodars almost yearly. In 1802 Russia resolved to assert her treaty rights in favour of the oppressed inhabitants of the principalities, and obtained a decree from the Porte, by which every prince was to hold office for at least seven years, unless the Russian minister was satisfied that there were sufficient grounds for his deposition, while the Turkish troops in the principalities were paid off, the boyars entrusted with a measure of local self-government, and the Russian envoy at Constantinople charged with the task of watching over the Walachian and Moldavian liberties. The principalities thus came under a veiled but effective Russian protectorate.

The revolt of the Serbs in 1804 was secretly encouraged by the Walachian voivode Ypsilanti. In the subsequent Russo-Turkish wars, Russia occupied both principalities (1806–12), greatly to their detriment, as the exactions of the Russian army almost reduced the country to a desert. Russia aspired to incorporate the principalities in her own empire, but under the Peace of Bucharest (1812), the principalities were restored to the sultan under the former conditions, with the exception of Bessarabia, which was ceded to the tsar. The Prut thus became the Russian boundary.

In 1821 Alexander Ypsilanti, an aide de camp of the tsar, entered Moldavia at the head of the Hetaerists, or Greek revolutionaries, and persuaded the hospodar Michael Sutzu to help him invade Ottoman territory. The Greeks had, however, misjudged popular feeling; a national movement in Walachia, led by Todor Vladimirescu (*q.v.*) turned, not against the Turks, but against the Phanariotes. Turkish troops, which invaded the country to crush Ypsilanti, were only finally withdrawn in 1824. The Rumanians, however, took advantage of the situation to secure a number of national reforms, including the promulgation of laws in Rumanian and the appointment of native princes, the first of whom were John Sturdza in Moldavia and Gregory Ghica in Walachia (1822–28).

Peace of Adrianople, 1829.—By the convention of Akkerman between the Russians and Turks in 1826 the privileges of the principalities were once more confirmed, and they were again ratified in 1829, under Russian guarantee, by the peace of Adrianople, which left the principalities tributary to the sultan, but placed them wholly under Russian protection. An "Organic Law," drawn up by assemblies of bishops and boyars at Jassy and Bucharest, regulated the internal constitution. This very reactionary law, which maintained and fraudulently extended the feudal pretensions of the boyars to the detriment of the peasants, was ratified by the Porte in 1834, Russia then withdrawing her troops. The new hospodars, however, Alexander Ghica (1834–42) and George Bibescu (1842–48) in Walachia and Michael Sturdza (1834–49) in Moldavia, were little more than creatures of Russia. In 1848, although the liberal and intelligent Sturdza was able to quell the popular agitation, which was partly national and partly social, Bibescu was forced to grant a constitution in Bucharest, and fled the country. The Turks, instigated by Russia, crossed the Danube and a joint Russo-Turkish dictatorship restored the Organic Law. Barbŭ Stirbeiŭ was appointed prince of Walachia, Gregory Ghica of Moldavia (Balta-Liman Convention, 1849).

Crimean War and Treaty of Paris.—During the Crimean War the principalities were occupied by Russia and Austria successively, and although they suffered severely, the Austrian occupation brought them material benefits, and the exile into which many politicians were driven brought them into contact with a higher civilization.

By the Treaty of Paris (1856) the principalities with their existing privileges were placed under the collective guarantee of the contracting Powers, while remaining under the suzerainty of the Porte. A strip of southern Bessarabia was restored to Moldavia, withdrawing the Russian frontier from the Danube mouths. The existing laws and statutes of both principalities were revised by a European commission, sitting at Bucharest, assisted by a national council convoked by the Porte in each of the two provinces.

Union of the Principalities.—The commission arrived in March 1857, and the assemblies were convoked in September. They voted unanimously for territorial autonomy, union of the principalities under the name of Rumania, a foreign hereditary prince, neutrality of Rumanian territory, and a single representative legislative Assembly. The Convention of Paris (Aug. 19, 1858) accepted these decisions with modifications. Each principality was to continue to be governed by its own prince, and to maintain its separate legislative assembly. A central commission, sitting at Focşani, was to prepare laws of common interest for submission to the two assemblies. Thereupon the two assemblies, meeting at Bucharest and Jassy respectively, elected a single prince in the person of Alexander Cuza (*q.v.*). The *de facto* union of Rumania was thus accomplished.

RUMANIA

A new conference met in Paris to discuss the situation, and in 1861 the election of Prince Cuza was ratified by the Powers and the Porte. The two assemblies and the central commission were replaced in Jan. 1862 by a single ministry and single assembly at Bucharest. In May 1864 the Assembly was replaced by two chambers (of senators and deputies). The franchise was now extended to all citizens, a cumulative voting power being reserved, however, for property, and the peasantry were emancipated from forced labour. Prince Cuza's agrarian and educational reforms were well-meant and drastic; but he attempted to force them through by too despotic measures. He alienated the good will of the nobles by abolishing forced labour; of the clergy by confiscating monastic estates; of the masses by introducing a tobacco monopoly and by the imperfect success of the agrarian reform.

On Feb. 11/23, 1866, he was compelled to abdicate, and although the Powers in Paris voted in favour of a native ruler, the principalities, on a referendum, elected, almost unanimously, Prince Charles, the second son of prince Charles Antony of Hohenzollern-Sigmaringen (*see* Charles I. King of Rumania).

Prince Charles I.—The new Prince reached Bucharest on May 10/22, 1866, and took the oath to the Constitution. In October he proceeded to Constantinople, where the Sultan invested him formally, admitted the principle of hereditary succession in the family, and the right of maintaining an army of 30,000 men.

Foreign and Domestic Politics, 1866–75.—The internal domestic situation was at first very stormy, ten governments holding office in five years. They managed, however, to pass a new constitution (July 11, 1866) providing for an upper and a lower house and allowing the Prince an absolute and unconditional veto on all legislation. An attempt was made to reorganize the army and construct railways. Less fortunate was a decree, ostensibly aimed at vagabond foreigners, but resulting in the expulsion and imprisonment of many Jews, which aroused much indignation abroad, especially in France and Great Britain. On the outbreak of the Franco-Prussian War (1870, *q.v.*) feeling ran high between the nation, which was strongly pro-French in sympathies, and the German prince. There was a revolutionary outbreak at Ploeşti and the mob, after storming the barracks, proclaimed Charles deposed. The regular troops restored order, but the prince seriously thought of abdicating. A few days later a German railway contractor named Strausberg failed to honour the coupons of the railway bonds due on Jan. 1, 1871, most of which were held by influential people in Germany. The responsibility for payment fell on the Rumanian government, which the Prussian government threatened to coerce into payment. Bitter indignation prevailed in Rumania against all things German, culminating in an attack on the German colony in Bucharest (March 22, 1871). The council of Regency having refused the prince's offer to place the government in their hands, a conservative government was formed under Lascar Catargiu to restore order. The chamber was dissolved, and at the new elections in May Catargiu received a large majority. The anti-German feeling subsided, and the railway crisis was ended in Jan. 1872 by a law under which Rumania undertook to pay the railway coupons. Catargiu's ministry held office for four years, at the end of which time the leading Liberals promoted a conspiracy for the arrest and expulsion of the prince and the formation of a provisional government. The situation was saved by the fall of the Ministry and after two interim cabinets, I. C. Bratianu took office at the head of a Liberal Ministry (1876).

The Russo-Turkish War, 1877–78.—Domestic problems were temporarily eclipsed by the re-opening of the Eastern Question (*q.v*) in 1877. Russia had shown symptoms of anger against Rumania for not having taken up a decided attitude in the approaching struggle, and the Russian ambassador Ignatiev had some months previously threatened that his government would seize Rumania as a pledge as soon as the Turks occupied Serbia and Montenegro. Prince Charles decided to send a mission, composed of Bratianu and Colonel Slaniceanu (the Minister of War), to the Imperial headquarters at Livadia, where they were well received by the emperor and were successful in not committing Rumania to active measures.

In November both Russia and Turkey sent secret envoys to Bucharest to bid for Rumanian support. Prince Charles and Bratianu temporized with both, and attempted to extract concessions from Turkey; but when the Porte, in issuing Midhat Pasha's reform plan, disregarded Rumania's hopes and national vanity, she signed a secret convention with Russia (April 16, 1877) allowing free passage to the Russian armies—the details to be regulated in a special convention—while the tsar promised to maintain her political rights and respect her integrity. On April 23, Russia declared war against Turkey, and the grand duke Nicholas issued a proclamation to the Rumanian nation, announcing his intention of entering their territory in the hope of finding the same welcome as in former wars. The Rumanian Government made a platonic protest against the crossing of the frontier, but actually acquiesced in and materially assisted the Russian advance. The Rumanian chambers were assembled on April 26, and the convention with Russia was sanctioned; while on May 11 the chambers passed a resolution that a state of war existed with Turkey. (For a detailed account of the subsequent campaign, *see* Russo-Turkish Wars, and Plevna.) The fall of Plevna left the Russian army free to march on Constantinople, and on Jan. 31, 1878 the preliminaries of peace were signed at Adrianople. They stipulated that Rumania should be independent and receive an increase of territory.

Treaty of Berlin.—Peace between Russia and Turkey was signed at San Stefano on March 13. On Jan. 29 the Rumanian agent at St. Petersburg was officially informed of the intention of the Russian Government to regain possession of the Rumanian portion of Bessarabia, *i.e.*, that portion which was ceded to Moldavia by Russia after the Crimean War, in return for the northern Dobruja (*see* Bessarabia). This exchange Rumania, while deeply resentful, was unable to prevent. The Treaty of Berlin in 1878 (*see* Berlin, Congress and Treaty of) recognized the independence of Rumania conditional on the restoration to Russia of Bessarabia (Art. 45) and a guarantee of absolute freedom of worship without loss of political rights to all persons in Rumania (Art. 44). Art. 46 transferred to Rumania the northern Dobruja (*q.v.*) with the adjacent islands.

Article 44 of the treaty caused tremendous agitation throughout the country, and almost provoked a revolution. Article 7 of the constitution of 1866 laid down that "only Christians can become citizens of Rumania"—in other words, all Jews were excluded from the rights of citizenship; and as no foreigner could own land in Rumania outside the towns, no Jew could become a country proprietor. Public opinion in Rumania rendered it almost impossible for any government to carry out the wishes of the Berlin tribunal. To do so involved a change in the constitution, which could only be effected by a specially elected constituent assembly. This body met on June 3, and sat through the entire summer. The irritation of the powers at the unexpected delay was so great that Great Britain proposed a collective Note on the subject, to be executed by the Austrian Cabinet; while Prince Bismarck threatened, if the Berlin proposition were not carried out, to refer to the suzerain power at Constantinople. At last, however, on Oct. 18, Article 7 was repealed, and it thus became possible for Rumanian Jews to become naturalized and to hold land; but this was hedged about by so many difficulties that,

although the compromise was accepted by the powers, in actual fact few Rumanian Jews were naturalized during 1880 to 1884.

Independence of Rumania.—The independence of Rumania was recognized by Italy in Dec. 1879, and by Great Britain, France and Germany on Feb. 20, 1880. Following the assassination of the tsar Alexander II. (March 13, 1881) the Rumanian Liberal Government was accused of republican and anti-dynastic tendencies. To refute this charge, the ministry proposed the elevation of the principality into a kingdom. The proclamation and coronation took place on May 10–22, 1881. All the great Powers granted immediate recognition.

Internal Policy, 1878–1907.—During this eventful period, the liberal government had held office continually. In March 1883 the Government, largely at Bratianu's initiative, introduced various important changes into the constitution. Three electoral colleges were formed instead of four, a considerable addition made to the numbers of the senate and chamber; and trial by jury introduced for press offences. These measures estranged the second leader of the Liberal party, C. A. Rosetti, who had unsuccessfully advocated reforms of a far more sweeping character; and Bratianu was now left in sole control of the Liberal party. The chambers having fulfilled their special mandate, were dissolved in Sept. 1884 and a new parliament assembled in November, the Government, as usual, obtaining a large majority in both houses.

Since 1876 Bratianu had exercised an almost dictatorial power, and anything like a powerful parliamentary opposition had ceased to exist. But he had been too long in power; the numerous State departments were exclusively filled with his nominees; and some pecuniary scandals, in which the Minister of War and other high officials were implicated, helped to augment his fast-growing unpopularity. New parties were formed in opposition, and the National Liberal and Liberal Conservative parties combined to attack him. The first of these maintained that the Government should be essentially Rumanian, and, while maintaining friendly relations with foreign Powers, should allow no interference in internal affairs. The Liberal Conservatives held very similar views, but desired a guaranteed neutrality for Rumania. The Junimists, or Young Conservatives, advocated in home affairs the amelioration of the position of the peasantry and artisan classes, whose progress they considered had been overlooked, while in foreign policy they strongly supported intimate and friendly relations with Austria-Hungary. On April 4, 1888, following the new elections of February, in which all the opposition leaders had been elected, Bratianu retired. In Oct. 1888, when a new Chamber was elected, only five of the party retained their seats. The most prominent statesman in the new Conservative-Junimist administration was P. Carp, who in the spring of 1889 succeeded in passing a bill which authorized the distribution of the state lands among the peasantry. Despite this admirable measure, he was unable to retain office, and three changes of ministry followed. The Conservative-Junimist parliament nevertheless restored tranquillity to the country. Meanwhile the gold standard had been introduced (1889), and the financial situation was regarded as satisfactory. In Dec. 1891 a stable cabinet was at last formed by Lascar Catargiu, whose Ministry passed several useful measures. The State credit was improved by the conversion of the public debt; the sale of the State lands to the peasantry was actively continued; important judicial reforms were carried out; a mining law was passed to attract foreign capital; and a State maritime service of passenger and cargo steamers was formed.

Meanwhile the Liberal opposition was being reorganized. On the death of I. C. Bratianu, in 1891, and of his brother Dimitrie in June 1892, the veteran statesman Dimitrie Sturdza was recognized as the head of the Liberals, and in 1894 started a very violent agitation in favour of the Rumanians in Hungary. Another popular Opposition cry was "Rumania for the Rumanians," directed against the right granted to foreigners under the new mining law to lease lands for long periods for the working of petroleum. In 1895, although the government carried the mining bill, the Liberal Party was able by a policy of abstention to bring about the fall of the government. A new liberal government was formed by D. Sturdza.

The very excess of their victory, however, proved a source of weakness to the Liberals, whose party broke up into factions named after their respective leaders, Sturdzists, Aurelianists and Flavists. Sturdza himself was obliged to retire, as public opinion was incensed by his harsh treatment of the head of the Orthodox Church, the metropolitan Gennadius, who, after a quarrel over the management of some wealthy charity funds, had been found guilty by the Holy Synod of certain canonical offences, and deposed. Aurelian, in co-operation with the conservative leaders, calmed public opinion by a successful compromise, but then refused to retire from the office which he had taken over on Dec. 3, 1896. After a sharp struggle, Sturdza regained office and held it from April 1897 to April 1899, when he was forced to retire by a popular outcry against his excessive subservience to the Hungarian Government.

The Conservatives, under G. G. Cantacuzino, returned to power, but were at once faced by a very severe financial crisis, due to past overborrowing and extravagant expenditure, as a result of which the treasury found itself without resources to meet a payment of bonds for £2,500,000, which had fallen due in Berlin. The Government managed to extricate itself from its immediate difficulties in the autumn of 1899, by raising a loan in Berlin, on very stringent terms. The Conservatives were united in wishing to meet the financial crisis by a moderate reduction of expenditure and a large increase of taxation, while the Liberal Opposition advocated the permanent reduction of the annual expenditure of £800,000, which would necessitate the raising of £200,000 only by fresh taxation. The Conservative programme was naturally unpopular; Carp and the Junimists were unwilling to co-operate with the government, and, on Feb. 26, 1901, Sturdza again became premier. His administration lasted until Dec. 31, 1904, and averted the impending bankruptcy of Rumania by a policy of strict retrenchment. On Jan. 4, 1905 the Conservatives returned to power, and in May succeeded in floating a conversion loan.

Agrarian Rising, 1907.—The chief cause of the agrarian insurrection of March 1907 was the unsatisfactory distribution of the land after the emancipation of the peasants in 1864. Although framed to benefit them the 1864 law did not allow them really to free themselves from the large proprietors and forced them to borrow from Jewish moneylenders. An additional cause was the harsh treatment of the peasants on the state and communal lands leased to Jewish middlemen. At first an attack on the Jews alone, the rising soon became a *jacquerie* directed against all the large landowners. Numerous towns and villages were sacked and partly burned, and 140,000 soldiers were employed to suppress the revolt. On March 24 the Cantacuzino Ministry resigned and was succeeded by a Liberal government under Sturdza, who completed the restoration of order by strong military measures and afterwards initiated remedial legislation. General elections in June confirmed the Liberal majority, and Sturdza and his successor in the leadership, Bratianu, remained in office till the end of 1911, when they gave way to a Conservative Cabinet under J. J. Carp. Violently attacked by the Liberals and new party of Conservative Democrats, under Take Jonescu, the Carp government was reconstructed in April 1912 with Maiorescu as Premier and Take Jonescu as the most important figure in the Ministry.

Foreign Affairs, 1878–1912.—Meanwhile the foreign political situation had, since the accession of Prince Charles, been comparatively uneventful. Of Rumania's three neighbours, she was bound to Bulgaria by a traditional friendship, but of this the cession of the Dobruja boded the end. It was not, however, easy for Rumania to adopt a cordial attitude towards either Russia or Austria-Hungary, for different reasons. Against Russia, Rumania was bitterly incensed in 1878. Friction continued over the delimitation of the Dobruja frontier until 1884, and after that date the loss of Bessarabia was still regretted. While the population, trained in traditional respect for Russia—a respect due largely to the influence of the Orthodox Church—was less enduring in its resentment, Ion Bratianu, who smarted under the personal humiliation which he had received at the Congress of Berlin, was the more ready to fall in with Prince Charles' pronounced and natural preference for the Central Powers. This received its

official seal when Charles secretly adhered to the Triple Alliance in 1883 (*see* EUROPE). The people at large had many reasons to dislike Austria-Hungary. Ill-feeling began with the conclusion of the Commercial Treaty of 1875, in which Rumania believed herself unfairly treated, and was intensified on the question of the Danube Commission, on which Austria-Hungary insisted on her right to place a delegate, although the sphere of activity of the Commission, which extended from Galatz to Orsova, did not touch Austrian soil (*see* DANUBE). Another constantly recurring dispute (which also caused a diplomatic rupture with Greece, lasting from 1905 to 1911) was that concerning the status of the Vlach (*q.v.*) communities in Macedonia, over which Rumania claimed the rights of a protector. Relations with the Dual Monarchy really became difficult after Bratianu's death, when the Liberals under Sturdza opened up a campaign in favour of the Rumanians of Transylvania (*q.v.*), whose awakening national consciousness was bringing them into increasing conflict with the policy of Magyarization pursued by the Hungarian government. The national cause was adopted by the Francophile Liberal Party, while the Conservatives still held to the policy of friendship with Germany; but though during the annexation crisis of 1908 Rumania still held to an attitude consistent with her secret treaty obligations, the increasing tension between Austria-Hungary and Serbia, with the resultant attempts by Austria to entice Bulgaria into her orbit, made this attitude ever more difficult. Should complications arise in the Balkans, forcing Austria to define her attitude towards Bulgaria, it seemed likely that the thread between Austria and Rumania might snap for ever.

First Balkan War, 1912.—This situation arose in Oct. 1912, when the Balkan League went to war with Turkey. Rumania's sympathies were at first uncertain; indeed, the secret Serbo-Bulgar military convention of March 13, 1912 had provided against a possible attack from Rumania. At first the Rumanian Government expressed itself disinterested in the course of the war; but the rapid success of the Bulgarians caused Rumania to intimate to Bulgaria that she would, in the event of a partition of European Turkey and in the interests of the balance of power in the Balkans, require a frontier rectification in the Dobruja. Danev, then president of the Bulgarian house of deputies, appealed to Austria, and then proceeded himself to Bucharest in Nov. 1912, where he offered to renounce for ever Bulgaria's claims to Dobruja and to modify the existing frontier in Rumania's favour. No agreement could be reached either in Bucharest or in London, although Austria-Hungary made determined efforts to reconcile and secure the friendship of both countries. The case was finally submitted for arbitration to the Conference of St. Petersburg (May 17), which assigned Silistra to Rumania. (H. TR.; X.)

Second Balkan War, 1913.—This arrangement failed to satisfy the country, and on the outbreak of the Second Balkan War, the Rumanian army, 500,000 strong and commanded by the crown prince crossed the frontier (July 10, 1913), occupying Southern Dobruja as far as Kavarna, and advancing upon Sofia. Negotiations were immediately begun at Bucharest, where an Armistice was signed on July 31, 1913, between Rumania, Serbia, Greece and Bulgaria. The Treaty of Bucharest was concluded on Aug. 10; Rumania obtained the territory which she had already occupied in the Dobruja.

Her position was now more uncertain than ever. Although the king had again renewed the secret Triple Alliance in 1914, and Austria made great efforts to win Rumania's friendship, the resentment felt by the younger generation at Magyar oppression of the Rumanians in Transylvania, and at Austria's diplomatic support of Bulgaria, increased steadily, particularly when Austria-Hungary made a diplomatic intervention in favour of Bulgaria at Bucharest in the hope of having the treaty modified. Rumania became therefore more and more convinced of the necessity of a national policy in the interests of the entire Rumanian nation, whether in the kingdom or under Austro-Hungarian or Russian rule. She hoped that Russia would enable her to realize her ambitions; but the visit of the Rumanian heir to the throne to St. Petersburg (March 27, 1914) and of the tsar to Constanța (June 14, 1914) did not bring about a definite change of policy.

Rumania During the World War.—When the World War broke out, I. Bratianu, head of the Liberal party, was in office and endeavouring to introduce a number of reforms—foremost among them being an agrarian law based on the expropriation of the large landowners, and an electoral law establishing universal suffrage except for illiterates. At first it was decided to maintain armed neutrality, but after the battle of the Marne, Take Jonescu passed from the first idea of "loyal neutrality" to that of intervention on the side of the Allies. In this he was especially supported by Filipescu, who, with other Conservatives joined hands with Take Jonescu against Marghiloman's group, which still favoured the Central Powers. Meanwhile, Austria-Hungary and Germany concluded conventions by which Rumania was exploited to feed the population of the Central Powers. There were popular demonstrations against this policy, and Filipescu vehemently demanded rupture with Austria-Hungary. One great obstacle to this was removed by the death of King Charles on Oct. 10, 1914.

The Bratianu Government continued to negotiate with the Central Powers, but in 1916 the Western Powers overcame Russia's objections, and Great Britain, France, Russia and Italy signed a treaty on Aug. 17, 1916, by which they guaranteed Rumania the Banat, Transylvania, the Hungarian plain as far as the Tisza, and the Bukovina as far as the Prut, in return for an immediate declaration of war. Rumania declared war on Austria-Hungary Aug. 27, 1916. (*See* also EUROPE: *History.*)

The Rumanian troops at once crossed the passes into Transylvania, but were expelled by mid-November. Bucharest was occupied by the armies of the Central Powers on Dec. 6, 1916. The army retired into Moldavia to reorganize there, sheltered by the Russian troops; the King, his Ministers and Parliament, had already retired to Jassy. A counter offensive had begun in July 1917, when the Russian collapse left Mackensen free to throw all his forces against the Rumanian army, which was rendered incapable of further resistance after the prolonged and glorious struggle of Mărășești in Aug. 1917. The Russian army disintegrated into pillaging bands; hostilities were suspended; and eventually an armistice followed (Dec. 6, 1917).

Agrarian and Electoral Reforms.—Parliament met at Jassy in Dec. 1916, determined to prosecute the war to a finish, and Bratianu formed a coalition with Take Jonescu and his section of the Conservative party. In April 1917 the agrarian question once more became urgent, largely owing to the effect on the public mind of the social revolution in Russia. In May direct and universal suffrage was introduced, raising the number of voters from 180,000 to over 1,200,000. Influenced by the Crown, the Conservatives in May 1917 at last accepted the radical policy of expropriation, to be applied to an area fixed at 2,000,000 hectares. A law was passed by a large majority on July 14, which left the original proprietors with a maximum of 500 hectares per estate (absentees being completely expropriated), and assigned them a compensation in State bonds, the amount not to exceed twenty times the value of the annual return from the property. A scheme for the communal holding of village associations of the land thus obtained was rejected in favour of traditional individual tenure.

The Union of Bessarabia.—On the break-up of the Russian empire, a "National Moldavian Committee" formed itself out of the Rumanian elements in Bessarabia (May 1917); in August the Ukrainian National Rada recognized Bessarabia as a separate unit. In Oct. a Supreme Council (Sfat Țarii) for Bessarabia was set up, the various nationalities being represented on it proportionately. On Dec. 17 this body proclaimed an independent Moldavian Republic, and invited Rumania to send troops into the country for its defence. Russia protested, and a state of war existed between Russia and Rumania from Jan. 28, 1918 till March 9, when an agreement was reached that the Rumanian troops should withdraw. On April 8, the Sfat Țarii voted for political union with Rumania; Bessarabia to retain a large degree of autonomy. The Central Powers sanctioned this arrangement by the Treaty of Bucharest to compensate Rumania for her other losses. No Russian Government, however, admitted the validity of these arrangements, as the Rumanian troops had not

been withdrawn as agreed, and the Ukrainian representatives of the Sfat had abstained from voting.

The Treaty of Bucharest.—Bratianu having resigned on Feb. 9, 1918, General Averescu was charged with the peace negotiations at Buftea, near Bucharest. The Dobruja was ceded as far as the Danube, Bulgaria taking over the southern half which she had lost in 1913, while the Quadruple Alliance administered the northern half conjointly. Rumania was to have a trade route to the Black Sea via Constanţa. The frontier of Hungary was advanced in the Carpathians. The Central Powers secured such terms on the Danube, in the Rumanian oilfields and over the railways, as would have placed Rumania in a state of economic slavery to them for many years. Averescu's Cabinet hesitated to sign and resigned on March 12, in favour of the Germanophile Marghiloman Ministry, which signed the treaty at Bucharest on May 7, 1918.

Marghiloman's Ministry struggled against almost unsurmountable difficulties throughout the succeeding months. In the occupied territory everyone was snatching greedily at the remnants of national prosperity; the Central Powers forced the Banque Generale to issue no less than 2,500,000,000 lei in paper money, and disorganized the finance of the kingdom; while economic ruin was ensured by the exportation of sheep and cattle, the cutting down of forests and the dismantling of factories. The population meanwhile was starving, reduced to famine rations, and the *moral* of its working-class was being perverted by revolutionary propaganda.

Peace: the Formation of Greater Rumania.—On Nov. 8, 1918, when the defeat of the Central Powers was assured, the King called to power General Coandă, who repealed all laws introduced by the Marghiloman Ministry and decreed universal, obligatory and secret suffrage for all male voters over 21. The King re-entered Bucharest (Nov. 30) after the German troops had evacuated Rumania under the terms of the Armistice. Bratianu again became Minister on Dec. 14.

The new Liberal Government had the difficult task of reuniting provinces which had been under the domination of different alien States. Bessarabia was already incorporated in the ancient kingdom, having abandoned the idea of autonomy. Her council voted for unconditional incorporation on Dec. 9, 1918. The incorporation of Transylvania (*q.v.*) followed in virtue of a resolution passed by a Rumanian assembly at Alba Iulia on Dec. 1, and that of Bukovina (*q.v.*) on Nov. 28. The Government had also to carry on difficult diplomatic negotiations for the recognition by the Allies of the new frontiers. Those fixed by the Agreement of Aug. 1916 were drawn back in places to give the Hungarians a part of the hinterland of Oradea Mare, and the Yugoslavs the western half of the Banat. A line of demarcation was fixed in Hungary, and Rumanian troops occupied the country up to this line, pending final settlement by treaty. In March 1919 a further "neutral zone" was established and Rumania was given the right of occupying it. Bela Kun's Government which now came into power in Hungary, started a campaign, as a result of which the Rumanians advanced to the Tisza (Theiss), where they were stopped by the Allies on May 9. On July 22 Kun started a new offensive; but the Rumanian army defeated his troops, crossed the Tisza—despite the interdiction of the Allies—and occupied Budapest on Aug. 4. Here they remained in the face of numerous protests until Nov. 14. The Treaties of St. Germain and Trianon recognized as Rumanian the predominantly Rumanian territories of the old Dual Monarchy.

Vaida Voivod and Averescu Governments.—The Bratianu Government resigned on Sept. 13, 1919, as a protest against Art. 60 of the Treaty of Trianon (Minorities Clause). New elections held on Oct. 3 gave a large majority for the Peasant party and the Nationalist Democrats, which coalesced as a *bloc parlementaire*, and on Dec. 9, 1919, formed a democratic Government of advanced tendencies. The President was the Transylvanian Alexander Vaida Voivod, who at once visited Paris and London and obtained the formal recognition of a Rumanian Bessarabia. During his absence, however, the landowners agitated against proposed expropriation, and the court and society felt alarmed at the Bolshevik propaganda. The Cabinet was forced to resign and General Averescu became Premier (March 19, 1920) with the support of the "League of the People" which he had founded in April 1917, an organization which included many Conservatives and some new men. He also concluded a pact with Take Jonescu's Conservative Democrats. Elections were held early in June. Averescu's party won by a large majority even in Transylvania. Take Jonescu became Minister for Foreign Affairs in his Government (June 21, 1920).

The chief object of the Averescu Government was what it called "the re-establishment of order." In fact the Bolshevist danger continued on the Dniester, where a real revolutionary movement had been attempted at Hotin under the previous Government; the Soviet Russians had friends, not only in Bessarabia, but also in the old Kingdom, and the odious crime in the Senate[1] had shown to what lengths their fanatical ardour could go. It was thought necessary therefore to continue the regime of press censorship, and to proceed against the communist leaders in May 1921. A law on workmen's unions, first of all received with noisy protests in working class circles, soon succeeded in securing agreement to accept State mediation between masters and men, and after that, thanks to a change of attitude on the part of the men, the number and importance of strikes diminished. But, except for one school for apprentices, nothing was done for the instruction or education of the urban classes.

Agrarian and Fiscal Reforms.—At the same time the popularity of General Averescu among the rural population forced him to carry through his agrarian reforms. The bill was only introduced in the spring of 1921, by the Minister of Agriculture, Garoflid, a big landowner, who belonged to the "progressive" party of the Germanophiles. After impassioned controversy, decisions on the whole favourable to the peasantry were finally secured, while the compensation to be paid by the new owner was increased by a payment to be raised from a special tax on new fortunes. Later on regulations drawn up by the Liberal Minister of Agriculture were to change in many respects the enactments of the Garoflid law. A drastic fiscal reform, which, while introducing many happy innovations, in some respects went beyond what could be carried out in the country, was introduced by N. Titulescu after March 1921.

Foreign Policy.—Take Jonescu gave Rumanian foreign policy a definite direction. Marriages were concluded between the Crown Prince and Princess Helen of Greece, March 10, 1921, the Princess Elizabeth and the Crown Prince of Greece, Feb. 27, 1921, and Princess Marie and King Alexander of Yugoslavia, June 6, 1922.

Rumania and Poland were equally threatened by Russia, who had never recognized Rumania's right to Bessarabia, and seemed little satisfied with Poland's right to retain her White Russian and Ukrainian territories. The Rumanian-Polish Treaty (March 3, 1921) provided for mutual assistance in the event of an unprovoked attack upon either party on their eastern frontier; for common diplomatic action towards their eastern neighbours, and for a military convention. Rumania took cognizance of Poland's agreement with France, Poland of Rumania's agreements with other States for the maintenance of the Treaties of Trianon and Neuilly, the last-named clause referring to Rumania's relations with the Little Entente. Although Take Jonescu failed to secure from Prague and Belgrade his wish of a wider defensive alliance to include Greece and Poland, for mutual guarantee against any aggressor, including Russia or Bulgaria, Rumania concluded a Convention with Prague for mutual protection against an attack from Hungary (April 23, 1921) and with Belgrade against an unprovoked attack from Hungary or Bulgaria (June 7, 1921), thus entering the system of the Little Entente. Her Eastern policy was regulated by agreement with Poland (*see* POLAND; CZECHOSLOVAKIA; and LITTLE ENTENTE). Relations with Russia remained, meanwhile, extremely strained, especially as Italy and Japan still hesitated to ratify the Bessarabian treaty. During 1924

[1]On Dec. 9, 1920 an infernal machine exploded in the Senate killing the bishop Radu and mortally wounding D. Grecianu (the Minister of Justice) and another senator.

Russia kept up continuous agitation and threat of war; for three days in 1924 there was even a communist republic at Tatarbunar in South Bessarabia. A conference with the Soviet representatives held in Vienna (March 27 to April 2, 1924) led to no result, although an understanding was reached at Cetatea Albă to prevent incursions of Bolshevik bands.

The Bratianu Government.—Meanwhile, in 1921, the Liberals recommenced an agitation for power. After the opening of Parliament in Nov. 1921, the king formally demanded a détente. General Averescu resigned, and after various combinations had been rejected, the king, wishing to maintain unity of direction, appointed J. J. Bratianu to office on Jan. 19, 1922. Bratianu, whose Liberals now comprised the bulk of the wealthy circles of Old Rumania, the Conservative Party as such having been swept out of existence owing to its Germanophile war policy, proposed at once to consolidate his party and to take exceptional measures, amounting to a dictatorship, to "save the country." He carried through forced elections. The Peoples Party, the Popular Transylvanians, the Peasant Party and the Nationalist Democrats, who had opposed him, declared the Parliament illegal and all legislation passed by it null and void in their eyes, and abstained from voting. A party administration took office almost at once. The brother of the president of the council, Vintila Bratianu, was entrusted with the task of re-establishing order in the finances, which were endangered by the quantity of Treasury bonds and unfunded loans.

The Coronation and the Constitution.—The coronation of the king and queen, which had already been prepared for by the preceding Government, was carried through with ceremony by Bratianu. On Oct. 15, 1922, Ferdinand I. and Queen Mary assumed the crowns of United Rumania at Alba Iulia, the Transylvanians of the Opposition absenting themselves from the ceremony. The new law of the Constitution, debated by the Nationalist Democrats only, and with reservations, was adopted March 28, 1923. It was a reproduction of that of 1866, with the addition of the election of deputies by universal suffrage, with a vague right of representation of electoral minorities, and adding to the Senate the old dignitaries and members of Parliament and representatives of the Chambers of Commerce and Agriculture. The subsoil and forests were nationalized. The admission of Jews to citizen rights was incorporated in the constitution, but open competition with the newcomers provoked violent trouble in the universities, which was exploited by certain politicians. In agrarian affairs, in labour questions, in military matters, and above all in foreign affairs, there were no innovations. In the financial sphere the position was long maintained of isolation towards foreign capital, which was excluded wherever possible, and only admitted under irritating restrictions for the exploitation of the oil-fields. The attempt to commercialize properties and State enterprises did not succeed.

The opposition, systematically divided, long remained sterile; but in March 1925 the Transylvanians united with the new "Nationalist-Popular" group under the name of the National Party, and came to an understanding with the Peasant Party. The new coalition produced a programme based on concessions to the peasants and national minorities, the abolition of arbitrary government and a revised financial policy. Violent attacks on the Government were launched in May and June, but suspended when it was thought that the Government would soon retire. The People's Party negotiated with the Liberals in the hope of forming the next government with their support. Nevertheless J. J. Bratianu wished to carry his reforms through to the end. The law for the unification of the Church had already been passed, introducing the Transylvanian system of elective councils for each parish, each diocese and for the religious life of the country in general. In the autumn he put forward an Education Bill which was attacked, not only by the national minorities, but even by the Rumanian opposition parties as infringing on the liberty of private, religious and national education by imposing on it too strict state control.

The Crown Prince Charles.—At the end of Dec. 1925 the heir to the throne, the Crown Prince Charles left Rumania abruptly. At Venice he renounced all his rights, including that of bringing up his little son Prince Michael, and repeated his intention of disassociating himself from his country. Meanwhile, a Crown council had met at Sinaia. The king insisted that the party leaders recognize the situation created by the Prince's action. After some hesitation, the National Peasant opposition abstaining from voting, the chamber and senate, in view of the precarious state of the king's health, appointed (Jan. 11, 1926) a provisional council of regency, consisting of the Patriarch Miron Cristea, the president of the Supreme Court of Appeal, Buzdugan, and Prince Nicholas, the king's second son.

The Parliamentary Situation.—When the chambers reassembled, Bratianu forced through an electoral law of the Fascist type. Any party which received 40% of the total votes cast, the other votes being divided among several political bodies, was rewarded with half the number of seats, without counting what it got on the scrutiny (March 1926). The local elections in February, despite the Government's methods, showed the growth of feeling in favour of the Nationalist and Peasant Coalition, which had been joined by Averescu's party. Accordingly, after much hesitation, the king in March asked Averescu to form a cabinet, which also included four seceding members from the Transylvanian faction.

Averescu Government, 1926–27.—Elections, held in May, gave General Averescu's party four-fifths of the seats in the chamber, a result largely due to great pressure exercised at the polls. The Liberals returned only 16 deputies; yet it was clear that the Government existed largely only on Liberal sufferance. In foreign policy, Averescu followed the course marked out by his predecessors, at the same time showing his own sympathies by initiating a marked leaning towards Italy. The defensive treaties with Yugoslavia and Czechoslovakia were renewed in June, and on June 10 a treaty of alliance and non-aggression was signed with France, with a supplementary protocol and arbitration convention. France undertook to respect the existing frontier in Bessarabia. With Italy, an agreement for the funding of the Rumanian war debt to Italy was reached on June 15, when arrangements were also made for supply of Italian capital to the Rumanian oil-fields. In August Averescu visited Italy, and on Sept. 16 Rumania signed with Italy a treaty of friendship and arbitration. These measures were severely criticized by the Opposition, principally on the ground that they failed to achieve the much-desired ratification by Italy of the Bessarabian treaty. Meanwhile, this policy, which was simultaneous with Italy's activity in Albania, somewhat decreased the cordiality between Rumania and Yugoslavia within the Little Entente, although co-operation continued through a renewed crisis with Bulgaria, occasioned by a recrudescence of *comitadji* (*q.v.*) activity. In this crisis Rumania played to some extent the part of mediator. In financial and economic policy, Averescu's Government took a line directly opposite to its predecessors', increasing the fiduciary circulation, encouraging the admission of foreign capital and initiating negotiations for a much-needed foreign loan. Some members of the Cabinet were also said to favour stabilization of the lei, rather than Bratianu's policy of deflation.

Averescu's policy won a signal success, admitted even by the Opposition, when Italy agreed to recognize the Bessarabian Treaty (March 14, 1927). Yet his increasing independence alarmed the Liberals, particularly in view of the very precarious state of the king's health. The Nationalist and Peasant parties had definitely coalesced on Sept. 16, 1926, forming a bloc which commanded the sympathies of a large proportion of the population. The Nationalist wing of this group had opened up communications with the exiled Prince Charles, who appeared to be repenting his renunciation of the throne. On Feb. 1, 1927, the National Peasants Party publicly urged that the renunciation be repealed. This was, however, strongly opposed by Averescu. It was clear that the situation would become very critical on the king's death.

Before this event occurred, however, Averescu, having failed to reach an agreement with the National Peasants, resigned (June 4). Stirbey, a friend of the king's, took over a temporary Coalition Government, with the declared object of holding "legal and open elections." Internal party difficulties proved, however, too great,

and on June 21 Stirbey gave way to J. Bratianu, who, by traditional methods adapted to the new electoral law, secured 70% of the votes in the country. The National Peasants, despite universal popularity, polled only 20% of the votes, and Averescu's party, whose fall from power was succeeded by scandalous revelations of ministerial corruption and wholesale venality, secured not a single mandate.

Death of King Ferdinand; New Liberal Government.—On July 29 King Ferdinand died at Pelişor, universally regretted. The Liberals were, however, now firmly in the saddle, and the expected outbreak of internal disorder and pro-Charles agitation did not occur. The Government at first adopted a very firm attitude, fortified by the increased confidence with which Rumania was again regarded by France and her colleagues in the Little Entente. When, however, Manoilescu, Under-Secretary for Finance in the late Averescu Government, was arrested on Oct. 23 on his return from Paris, and was found to be bearing messages from Prince Charles to all political leaders in the country, suggesting his return, public feeling ran so high in Rumania in favour of the accused that the Government dared not convict him at the courtmartial which was held on him.

Relations between Government and opposition had become excessively strained, but when J. Bratianu, who had long been the very soul of the Liberal Party, died suddenly (Nov. 24), the Government tried to come to terms with the National Peasants by an offer of nearly 50% of the portfolios. The offer was rejected, on the ground that the Government had usurped power by oppressive and illegal means. The Liberals, unexpectedly, weathered the storm, and Vintila Bratianu became head of the party and of a new Ministry.

Meanwhile, relations with Hungary had become increasingly strained owing to the prolonged dispute (dating from 1923) over the expropriation, under the Agrarian Reform, of the Hungarian optant landowners in Transylvania, which was again fruitlessly discussed before the Council of the League in September and December. On Dec. 8, Hungary, and also the Jewish community, were presented with a fresh grievance by an outbreak of hooliganism by Rumanian students at Oradea Mare and Cluj. The opposition redoubled their agitation, and the Rumanian opposition and the Hungarian nation thus found themselves aligned, although not in any real sense united, in their hostility to the Rumanian Liberal Government.

A crisis was expected to occur after the meeting of the National Peasant Party at Alba Iulia on May 6, 1928. This party had now rallied round it almost the whole Opposition, which united in demanding real representative government, a measure of devolution and local autonomy, and economic reform. The occasion was seized by the ex-Crown Prince Charles, who, after involving himself in an escapade which betokened a profound ignorance of the situation, attempted to issue to the Alba Iulia meeting a proclamation demanding his own return, attacking the Liberals and putting forward a programme which combined some of the demands of the Opposition with a guarded but unmistakable reference to an arrangement with Hungary, on whose support he seemed to be counting. The manifesto, however, fell flat; and the Congress of the Opposition remained merely an imposing though somewhat melodramatic demonstration, in the face of which the government coolly and firmly maintained its attitude.

Negotiations for a foreign loan, which all parties agreed to be a prime necessity, were carried on through the summer. They hung fire, and on Nov. 3 the Liberal cabinet, after a vain attempt at reconstruction on coalition lines, resigned in consequence of a disagreement with the council of regency. M. Maniu, leader of the National Tsaranists, or National Peasant Party, formed a cabinet which carried through elections on Dec. 12. The Government secured 349 seats in the Chamber, the Liberals 13, the Jorga-Averescu group 5, the Independent Peasants 5, and the minority groups 15. The new Government began well, abolishing censorship and martial law, mitigating the police régime, and promising concessions to the minorities, and other much-needed and long sought for reforms. (N. L. F.)

RUMANIAN LANGUAGE AND LITERATURE.

Latin was introduced into the farther end of eastern Europe at the time when Trajan's legions occupied Dacia (A.D. 101–107). The natural riches of this region attracted settlers from all points of the Roman empire. In A.D. 274 Aurelian determined to withdraw all the Roman legions and likewise part of the civilian population menaced with disaster by the constant incursions of the Goths, and from the 3rd to the 6th century Rumanian evolved normally maintaining touch with Western Europe through Illyria and especially Dalmatia. In the course of the 6th century, however, it was cut off from the Latin world by the invasions of the Slavs and Bulgarians, whilst the bulk of the Romanic population was compelled to seek shelter in places less exposed to barbarian attack. Dalmatia was the worst sufferer: Salona, the most important city in that province, was occupied and partly destroyed, its inhabitants fleeing to the coast and islands of the Adriatic. Slav influence bore heavily on the conquered, who received from their victors a liturgy and an alphabet (the Cyrillic alphabet which the Rumanians retained till the latter part of the 19th century when they adopted the Roman alphabet). The constitution of the Rumanian language was also profoundly affected. It is from the Slav invasion that Rumanian starts upon its peculiar course of evolution and begins to acquire those characteristics distinguishing it from all other Romance languages. The centre of formation of Rumanian, which till the 7th century had been north of the Danube, followed the drift of the population and was transferred south of the river. But, as a result of slow migrations of which the history is barely known and which lasted from the 9th to the 12th century, we find in the 13th century two groups of Rumanians, one, the more important, north of the Danube, the other, much less considerable, south. From the 13th century onwards the northern group again becomes the main centre of language formation. To these two groups must be added a third in certain parts of Istria whither Rumanian was brought by successive migrations of settlers north of the Danube between the 10th and 14th centuries.

At the present time Rumanian is divided into four dialects: (i.) Daco-Rumanian, spoken by some 12,000,000 persons in Wallachia, Moldavia, Bessarabia, Transylvania, the Bánat of Temesvár, Bukovina and in some places on the right bank of the Danube, the Dobruja in particular; (ii.) Macedo-Rumanian, spoken by about 600,000 Armînî in portions of Macedonia, Albania, Thessaly, Epirus; (iii.) Meglenitic, spoken north-west of Salonica; (iv.) Istro-Rumanian, spoken by about 3,000 persons at the beginning of the 20th century (number rapidly diminishing) in the villages of Sousniévitsa, Lettay, Gradigné, Grobrique, Brdo, Noselo and Jéane. Speakers of this dialect have entirely disappeared at Squitatsa and in the Arsa valley. They are known as Tširibiri by the Italians and Slavs; their language is called vlaški or tširibirski.

The vocabulary of Rumanian is a mirror of the history of the

Rumanian people. Its basis is a development of Vulgar Latin; to this have been added in the course of centuries elements from the languages of the various populations with which the Rumanians have successively lived on friendly or hostile terms: Albanians, Byzantines, Bulgarians, Serbs, Hungarians, Poles, Turks. The most important added ingredient is Slavonic. It has ousted many words of Latin origin relating to the most ordinary manifestations of life, human activities and social conditions: relationship, parts of the body, animals, plants, metals, implements, etc. The affirmation itself *da* is borrowed from the Slavonic.

Slavonic has altered the sounds of a few words, introduced novel reflexive forms, and in composition and derivation played a very important rôle. The Latin negative prefix *in* has, for instance, been replaced by the Slavonic *ne, e.g., nebătut, necertat, neegal.* The Latin prefix *dis-*, expressing separation, has given place to Slavonic *rază, e.g., răsbi,* instead of Latin *dis-solvere, risipi* instead of Latin *dispergere.* Slavonic has also introduced a few suffixes such as *-că* (old Bulgarian *ůka*) *e.g., săteancă* (country-girl); *-nic* (old Bulgarian *iníku*) *e.g., falnic* (proud, presumptuous). The element next in importance is Magyar, present, however, in Daco-Rumanian only, to which it has given not only words but also some suffixes: *-aş, -iş, -uş, -şag, -şug.*

Among the characteristic features of Rumanian are the following:

1. Lat. *au* has been preserved as a diphthong (as in Sardo-Sicilian, in part of Provençal and the Grisons dialect) *e.g.*, L. *aurum*, Rum. *aur;* L. *audere*, Rum. *auzi.*

2. Lat. open *e* has become *ie* even when in closed syllable (as in Spanish and Friulian) *e.g.*, L. *perdit*, Rum. *pierde.*

3. Lat. *a*, open *e*, and *o* followed by *n* have become respectively *î, e.g.*, L. *canto*, Rum. *cînt;* L. *bene*, Rum. *bine;* and *u*, L. *carbonem*, Rum. *cărbune.*

4. Lat. tonic *e, o*, preceding a syllable with open vowel became first respectively: *ea, oa, e.g.*, L. *directa*, Rum. *dreaptă*, L. *porta*, Rum. *poartă;* this *ea* has been reduced in Daco-Rumanian at times to *a*, at times to *e, e.g.*, L. *legem*, Rum. *lege* (formerly *leage*). L. *mensa*, Rum. *masă* (formerly *measă*) but has been maintained in Macedo-Rumanian: *oa* has generally remained without alteration in Daco-Rumanian as in *voastră* but has been confused with close *o* in Istro-Rumanian.

5. Lat. intervocalic *l* has passed to *r* (as in some Italian dialects, in Ladin, in Franco-Provençal and in Vaudois), *e.g.*, L. *filum*, Rum. *fir;* L. *mola*, Rum. *moară;* L. *gula*, Rum. *gură.*

6. Lat. *qua* and *gua* have respectively become *pă* and *bă, e.g.*, L. *aqua*, Rum. *apă;* L. *equa*, Rum. *iapă;* L. *lingua*, Rum. *limbă* (compare Logudorese *abba* and *limba*). This modification which is normal inside the word appears at times in the initial syllable, *e.g.*, L. *quattuor*, Rum. *patru.*

7. Lat. *Kt, Ks*, have respectively become *pt, ps, e.g.*, L. *lactem*, Rum. *lapte;* L. *coxa*, Rum. *coapsă.*

8. Lat. *Sk, e, i*, has become *sht, e.g.*, L. *piscem*, Rum. *peşte.*

9. Lat. intervocalic *b, v, ll* (in group vowel +*lla*) have disappeared, *e.g.*, L. *caballum*, Rum. *cal;* L. *lavare*, Rum. *la;* L. *stella*, Rum. *stea.*

10. In the Istro-Rumanian dialects and, till the 17th century in Transylvanian (as in parts of Franco-Provençal) Lat. intervocalic *n* has been changed into *r, e.g.*, L. *lana*, I.-R., Tr., *lare;* L. *manum*, I.-R., Tr., *mare;* L. *virum*, I.-R., Tr. *vire.*

11. There still exists a system of declensions of substantives and adjectives with five cases: N., V., Acc., Gen., Dative.

12. The definite article is put after the substantive, *e.g., lup, lupul, lupului, lupilor.*

13. The formation of the numerals from 11–90 proceeds upon the Slav system. (*a*) From 11–19 *spre* (L. *super*) is inserted between 1, 2, 3, 4, 5, 6, 7, 8, 9 and *zece*, 10, *e.g.*, 11, *unsprezece;* 12, *doisprezece* (masc.) *douăsprezece* (fem.); 13, *treisprezece.* (*b*) From 20–90 *zeci* (10) is added to 2, 3, 4, etc., *e.g.*, 20, *douăzeci;* 30 *treizeci.* The ordinals are formed by adding to the corresponding cardinals the ending *-lea* (masc.) and *-a* (fem.) *e.g., al doilea*, the second (masc.), *a doua*, the second (fem.), *al unsprezecilea;* the eleventh (masc.), *a unsprezecea*, the eleventh (fem.). *Întîiul* (from L. *antaneum*) or *cel dîntîiu* (masc.); *întîia* or *cea dintâiu* (fem.) means the first.

14. All infinitives have shed the final posttonic syllable of Vulg. Lat. *e.g., a aduna, a tăcea, a începe, a fugi.* These infinitives are those of the four conjugations existing in Rumanian.

15. The future present is formed by the infinitive of the verb to be conjugated, preceded or followed by the present indicative of *a voi.* In colloquial Rumanian it is often expressed by the present indicative of *a avea*, followed by the conjunction *să* and the verb in the present subjunctive; or the present indicative of *a avea* may be replaced by *o* which is invariable. The following examples give the four different ways of expressing this tense: *voi ruga, rugavoi, am să rog, o să rog* (I shall pray).

16. The passive is expressed by a special construction of the subject with the reflexive form: *e.g., Mînăstirea s'a zidit de Ştefan cel Mare* (The monastery has been built by Stephen the Great). Another construction, more modern, is similar to the one to be found in other Romance languages: *e.g., Sunt bătut* (I am beaten).

17. Preposition *pre* or *pe* (Lat. *per*) is used before names of persons and before pronouns in the accusative. Compare the use of *a* (Lat. *ad*) in Portuguese, Spanish, dialects of Southern Italy and Engadine, *e.g., Am văzut pe prinţul* (I have seen the prince); *Iacă un moşneag pe care ţi-l recomand* (There is an old man I recommend you).

LITERATURE

Various Influences.—The intellectual development of Rumania has never until modern times been affected by Latin culture, but it has been most profoundly influenced successively by Slavonic, Greek and Byzantine, and Western, notably French and Italian, literature. Rumanian literary history may be divided into three periods: the Slavonic, from the beginnings in the middle of the 16th century down to 1710; the Greek, from 1710 to 1830; and the modern, from 1830 to the present. The change from Slavonic to Rumanian was very gradual. Slavonic had been the language of the church from the early middle ages, and was therefore hallowed in the eyes of the people and the clergy. Through the political connection with Bulgaria and Serbia it had also been the language of the chancelleries and the court. The beginnings of Rumanian literature proper consist of translations, as literal as possible, from Slavonic, prompted by the activities and aspirations of the Calvinistic reformers in Transylvania.

The second period is marked by a complete waning of Slavonic influence, through the literary activity of the Phanariote rulers. The Slavonic kingdoms to the south had ceased to exist, politically and culturally, whilst the Greeks brought with them the old literature from Byzantium and drove out the last remnants of Slavonic. They treated Rumanian as an uncouth and barbarian language, and imposed their own Greek upon the church. This Greek period corresponds to that of the Renaissance in the West; but when the rule of the Phanariotes was shaken off, the cultural link was broken too, and under Western influences began the romantic movement which has dominated Rumanian literature since 1830. Much of the Rumanian literature of the first two periods has been preserved only in mss.; few of these have been investigated, and a still smaller number have been compared with their original.

First Period: c. 1550–1710.—Rumanian literature begins, like all modern European literature, with translations from the Bible. The oldest of these are direct translations from Slavonic texts, following the original word for word, even in its grammatical construction. The first impetus towards the printing of the Rumanian translations came from the princes and judges in Transylvania. It was under their orders and often at their expense that the first Slavonic printing-presses were established in places like Kronstadt (Braşov) Oraştia, Sasz-Shebesh and Alba Julia, where Slavonic and Rumanian books appeared. The foremost printer and translator was a certain Diakonus Koresi, of Greek origin, who had emigrated to Walachia and thence to Transylvania. He

was assisted in his work by the "popes" (parish priests) of those places where he worked. The very first book published in Rumanian is the Gospels printed in Kronstadt between 1560 and 1561. An absolutely identical Slavonic text of the Gospels appeared in the same year, or one year earlier, which no doubt was the original for the Rumanian translation. Following up the list of publications of the books of the Bible in chronological order, we find Diakonus Koresi immediately afterwards printing a Rumanian translation of the Acts of the Apostles; in 1577 he printed at Sasz-Shebesh a Psalter in both Slavonic and Rumanian; the Rumanian follows the Slavonic verse for verse.

The first complete Rumanian translation of the New Testament appeared at Alba Julia, in Transylvania, in 1648. Its chief author was a certain Hieromonach Sylvestre, a Walachian who had undertaken the work at the command of Prince Gabriel Bethlen of Transylvania and while it was based on the Slavonic version, it was collated with the Hungarian Calvinistic translation and the Greek original. The first edition of the complete Bible was published (1688) by order of Prince Ioan Sherban Cantacuzino, by Radu Greceanu, assisted by his brother Serban and by Bishop Metrofan of Buzeu. This may be considered as the supreme literary monument in Walachia in the 17th century. At least 100 years had to pass before a new edition of the whole Bible was undertaken. The first rhymed Psalter in Rumanian was published by Dositheiu in 1673.

The ancient collections of homilies in Rumania are due to the same proselytizing movement. Almost the first book printed by Koresi (at the expense of the magistrate of Kronstadt, Foro Miklaus, *c.* 1570), seems to have been a translation from some Calvinistic compilation of homilies, one for every Sunday in the year. A Slavonic original sent by the metropolitan Serafim of Walachia served as the basis for a second collection of homilies known as *Evangelie învățătoare* (1580). The first collection of homilies, known as *Cazanii,* appeared in Dlŭgopole, *i.e.,* Câmpulung, in Walachia, in 1642. It was compiled by a certain Melchisedec and contained 13 homilies.

The Rumanian language was not yet introduced into the church. The burial service seems to have been the first to be translated from the Slavonic. Two *Evhologia* appeared during the second half of the 17th century, one by the bishop Dositheiu (Jassy, 1679–80) and the other by Ioan of Vinti (Belgrad, 1689). This *Molitävnic* (prayer-book) has been the basis of all subsequent editions of the Rumanian prayer-book. The liturgy proper was also translated by Bishop Dositheiu in 1679, but a translation from the Greek, by Jeremia Kakavela (Jassy, 1697), was the one adopted in the churches. In 1694 Alexander Dascalul translated, and the bishops Mitrofan of Buseu and Kesarie of Râmnicu Vâlcea printed (among other church books) the 12 volumes of the *Mineu* in Slavonic with Rumanian rubrics, and short lives of the saints, as well as the *Triod* and the *Anthologion.*

In addition to the activity of the Reformers in Transylvania, there was also a Roman Catholic propaganda in Rumania; the Orthodox Church found it necessary to convoke a synod in Jassy in 1642 under the presidency of Peter of Mogila, and a formulary of the Orthodox creed was drawn up. An answer to the Lutheran Catechism of Heidelberg (translated into Rumanian and printed at Fogaras in 1648) was also prepared by Bishop Varlaam. R. Greceanu translated the formulary from Greek into Rumanian under the title *Pravoslavnică mărturisire* (Bucharest, 1692). Of a more decided polemical character is the *Lumina* of Maxim of Peloponnesus, translated from the Greek (Bucharest, 1699).

Of far greater interest is the literature of maxims, and lives of saints, real or apocryphal, intended to teach by example. Such are the maxims in the *Floarea darurilor,* translated from the Greek (Sneagov, 1700), and going back to the Italian *Fiore de virtù;* the *Mântuirea păcătosilor,* or "Salvation of sinners," translated from the Greek by a certain Cozma in 1682, which is a storehouse of mediaeval *exempla;* and above all the *Mirror of Kings,* ascribed to Prince Neagoe Bassaraba, written originally in Slavonic (or Greek, if the prince be really the author), and translated *c.* 1650.

The first law-books were also compiled during this period. The Slavonic *Nomokanon,* which rests on Greek legislation and embodies the canonical and civil law, had previously been used in Rumania. In 1640 there appeared in Govora the first canonical law-book, which was at the same time the first Rumanian book printed in Walachia. This *Pravilă* (code) was probably the work of the historian Moxa or Moxalie. In 1646 appeared the *Pravilă aleasă,* or "Selected Code," compiled by Evstratie the logothete and published with the authority of the then reigning Prince Vasile Lupul (Basil the Wolf), hence known as the Code of Vasile. In 1652 there appeared in Bucharest a complete code of laws, adapted from the Greek and Slavonic under the direction of the prince of Walachia, Matthias Bassaraba. The *Indreptarea legii,* in which *Pravilă* of Vasile was incorporated without acknowledgment, remained the recognized code almost down to 1866. It embraces the canonical as well as the civil law. The chief authors were Uriil Năsturel and Daniil M. Panoneanul.

The earliest historical works are short annals, written originally in Slavonic by monks in the monasteries of Moldavia and Walachia. In 1620 Moxa translated from the Slavonic a short history of the world down to 1498. Two other universal histories were translated from Greek and Slavonic chronographs. One by Pavel Danovici contains the history of the world told in the style of the Byzantine chroniclers; it includes the legend of Troy, the history of Pope Sylvester and the description of the various church councils; and it concludes at the year 1636. The second is the *Hrongraf* of Dorotheus of Monembasia, translated by a certain Ion Buburezău. Both are still in ms. The Old Slavonic annals were later on translated and new notes were added, each subsequent writer annexing the work of his predecessor, and prefixing his name to the entire compilation. The most important author whose writings rank as classical is Miron Costin, who either took up the thread where it was left by Simion and Ureche and wrote the history of Moldavia from 1594–1662, or continued the history from where (probably) Evstratie had left it (*c.* 1630–62). Nicolae Costin (d. 1715), son of Miron, completed the history at both ends. He starts from the creation and endeavours to fill up the lacuna from 1662 to his own time, 1714.

In Walachia the beginnings are the work of an anonymous author, whose chronicle, continued by a certain Constantin Capitanul, describes the history of Walachia from Radu Negru (*i.e.,* Rudolph the Black), *c.* 1290–1688. An addition to this chronicle from the time of the Roman Conquest to Attila is ascribed to Tudosie Vestemianul, twice metropolitan of Walachia (1669–73, 1677–1703). The chronicle of Capitanul was further continued by Radu Greceanu to 1707, and finally by Radu Popescu to 1720. A comprehensive history of both principalities was written by an anonymous author, probably the Spatar Milescu, who finished his eventful life as ambassador of Russia to China (still in ms.), and the *Hronicul Moldo-Vlahilor* of Prince Demetrius Cantemir (*see* CANTEMIR) is more an apology for the Roman origin of the Rumanians than a true history. Cantemir wrote the original in Latin and translated it into Rumanian in 1710. His style shows an immense superiority to that of the previous historians. Of poetry there is scarcely a trace except some rhymed Psalters and a few rhymed dedications to patrons.

Second Period: 1710–1830.—The Phanariote period has been described as one of total decay; political degradation was thought to be reflected in spiritual life. The facts do not warrant this opinion. The few students of Rumanian literature disregarded the vast ms. material accumulated during the Phanariote régime, and out of ignorance and political bias condemned the whole period as sterile. Another influence was far more potent than the conduct of the Greek princes, though some of the latter were benefactors of the people. In Transylvania one section of the Rumanian population had accepted the spiritual rule of the pope; they now became Greek Catholic, instead of Greek Orthodox. Rome strove to educate the priesthood above Orthodox standards, and developed a vigorous proselytizing activity. The substitution of the Latin alphabet for the Cyrillic, and the movement emphasizing the Roman origin of the Rumanian people, were among the means employed by the Roman Church to win over the Rumanians of Transylvania from the fold of Orthodoxy. Thus a great change was wrought towards the end of the 18th century and

in the first half of the 19th century in the whole spiritual life of the Rumanian race. It suited the promoters of the Latin movement to pretend that they started a new era. But this movement imposed a handicap upon Rumanian literature from which authors have begun to free themselves only recently.

By the end of the 17th century Rumanian had become the authorized language of the church, and the Rumanian translation of the Gospel, printed in 1693, had become the authorized version. Most of the liturgical books adopted in this period are still used. Such are the *Ceasoslov,* revised by Bishop Kliment of Râmnicu Vâlcea (1745), the *Evhologion* (1764), the *Kataviasar* (1753). The 12 folio volumes of the Mineiu, by Bishops Kesarie and Filaret of Râmnicu Vâlcea (1776–80), and the monumental Lives of the Saints, also in 12 folio volumes, translated from the Russian and published (1809–12) under the auspices of the Metropolitan Veniamin of Moldavia, compare in beauty, richness and lucidity of language with the Bible of 1688. The most important works of the Fathers were also translated from the original Greek into Rumanian in this period.

In Transylvania, with the conversion to Greek-Catholicism of Bishop Athanasius in 1701, the Greek Orthodox had to place themselves down to 1850 under the protection of the Serbian metropolitan of Karlovatz. No writer of any consequence arose among them. The "United" fared better, and many a gifted young Rumanian was sent to Rome and helped from Vienna to obtain a serious education and occasionally also temporal promotion. With a view probably to counteract the literary activity in Rumania, the bishops P. P. Aaron and Ioan Bobb were indefatigable in the translation of Latin writers. First and foremost a new translation of the whole Bible was undertaken by Samuel Klain. It appeared at Blazh (1793–95). It falls short of the older version of 1688; it was modernized in its language, and no doubt a careful examination would reveal differences in the translation of those passages in which the Catholic tradition differs from the Eastern. Bobb translated Thomas à Kempis's *Imitatio Christi* (Blazh, 1812) and wrote a *Theologhie morală* (1801).

After 1727 Rumanian was recognized as the language of the law-courts, and through the annexation of Bukovina by Austria (1774) and of Bessarabia by Russia (1812), codes for the civil and political administration of those provinces were drawn up in Rumanian. Such legal codes reflect the German or Russian original. They were, however, of importance as they served as models (to some extent) for the new legislative code compiled in Moldavia under Prince Calimach; this was originally published in Greek (1816), and afterwards translated into Rumanian with the assistance of G. Asaki (Jassy, 1833). The Walachian civil laws and local usages were collected and arranged under the direction of Prince Ypsilanti (1780) in Greek and Rumanian; and under Prince Caragea another code was published (1817), which remained in force until 1832.

The last and probably the best writer of Rumanian history in the Phanariote period is Neculcea. He wrote a history of Moldavia to his own time, but for the period before 1684 his work is more or less an abstract from older writers. The original part covers the period 1684–1743, and is to some extent an autobiography of a very adventurous life. Neculcea adds to his chronicle a collection of historical legends, many of them still found in the ballads of Moldavia. In Walachia there was not a single historian of importance in the first half of the 18th century. In the second we have the chronicle of Dionisie Eclesiarh (1764–1815), a simple-minded and uncritical writer who describes contemporary events. The ancestor of a great family of poets and writers, I. Vacarescu described the history of the Ottoman empire from the beginning to 1791, interpolating doggerel verses.

Whilst a political and national revival was taking place in Moldavia and Walachia, towards the beginning of the 19th century, the Latin movement went on in Transylvania. There ethical and religious tendencies got the upper hand. Three historians had been partly educated in Rome under the protection of Prince Borgia and the influence of the Jesuit Minotto and the College of the Propaganda; they were Samuel Klain, Petru Maior and George Sincai. To Klain's initiative can be traced most of the work of the three. Unfortunately his writings, with a few exceptions, are still in ms. He is the author of the first history of the Rumanians in Dacia written according to Western standards. The tendency is to trace the modern Rumanians directly from the ancient Romans, and to prove their continuity in these countries from the time of Trajan to this day. Political and religious aims were combined in this new theory. A conflict was raging between the Hungarians and Rumanians, and history was required to furnish proofs of the greater antiquity of the Rumanians in Transylvania.

Imaginative Literature.—These books had no immediate influence in Walachia and Moldavia, where fiction and the drama had developed under the influence, first, of Greek and then to an increasing extent of French, Italian and German models. It was towards the end of the 18th century that Rumanian literature began to emancipate itself, very slowly of course, and to start on a career of its own in poetry and *belles lettres.* Curiously enough, the first novel to be translated was the "Ethiopic History" of Bishop Heliodorus. The *Odyssey* and *Iliad* were then translated into prose, and the *Arabian Nights,* after undergoing an extraordinary change in Italian and modern Greek, appear in Rumanian literature at the middle of the 18th century under the name of *Halima.* The young men of Walachia had come into contact with Western literature. Most of the writings of Florian, Marmontel, Le Sage, Montesquieu and others were rapidly translated into Rumanian.

Nowhere has the theatre played a more important rôle in the history of civilization than in Walachia and Moldavia. It formed the rallying-ground for the new generation which chafed under the tyranny of a Greek court. A certain Aristia, of Greek origin, but soon acclimatized to his surroundings as teacher at the high school in Bucharest, was the first to adapt foreign dramas for the Rumanian stage. These were first performed in Greek and afterwards translated into Rumanian. The plays produced on the Rumanian stage included most of the dramas of Molière, some of Corneille, Kotzebue and Metastasio, whose *Achille in Schiro* was the first drama translated into Rumanian (by Iordache Slătineau, printed at Sibiu in 1797). Schiller was also translated, and a few plays of Shakespeare (*Hamlet,* etc.) from a French version.

The lyrical and epic poetry of the time follows somewhat the same lines, but with certain notable differences. Transylvania, which awoke to a new life towards the end of the 18th century, produced some of the most popular poets. Among them were Vasile Aaron (1770–1822) and Ion Barak (1779–1848). Aaron wrote the *Passion,* in 10,000 verses (1802; often reprinted); the lyrical romances of *Piram şi Tisbe* (1808) and *Sofronim şi Hăriti* (1821); and the humorous *Leonat şi Dorofata,* a satire on bad women and on drunken husbands, now a chapbook. Barak wrote *Răsipirea Ierusalimului* (1821), "The Destruction of Jerusalem," almost as long as Aaron's *Passion;* and he versified a Magyar folktale, *Arghir şi Elena,* which has also become a chapbook, and has been interpreted as a political poem with a hidden meaning. He also translated the *Arabian Nights* from the German. In Walachia a certain Ion Budai Deleanu, a man of great learning, author of a hitherto unpublished Rumanian dictionary of great value, wrote *Tiganiada* (1812) a satirical epos in which gipsies play the chief part.

The love-songs of the time are primitive imitations of the Neo-Greek lyric dithyrambs and rhapsodies, which through the teaching of the princes of Walachia were considered the fountain head of poetical inspiration. But a closer acquaintance with the West led to greater independence in poetical composition. In the three generations of the Vacarescu one can follow this process of rapid evolution. Ianache Vacarescu, author of the first native Rumanian grammar on independent lines, was also the first who tried his hand at poetry, following Greek examples. He then studied Italian, French and German poetry, and made translations from Voltaire and Goethe. His son Alecu (b. 1795) followed his example. Both were overshadowed by the grandson Ioan (b. 1818). The collected poems of I. Vacarescu were published in 1848; but among them were some of the poems of Ianache and Alecu, which were confused with his own work.

In Moldavia a similar development took place, translations leading up to independent production. The most prominent figure is that of the scholar and linguist Constantin Konaki (1777–1849).

Third Period: from 1830.—The agitation for the transliteration of the alphabet, the elimination of all non-Latin words, and the ostracism of the old literature, completely crippled all literary activity, first in Transylvania and then in Rumania. The Latin movement was first brought into Walachia by the Transylvanian George Lazar who became a teacher at St. Sava's school in Bucharest and spread the doctrines of the Latin movement. Of his pupils there was one whose influence became decisive: Ion Eliade (Heliade), afterwards also known as I. E. Radulescu (1802–72), a man of immense activity, great initiative and still greater imagination. He it was who ushered in the new epoch, and for almost 40 years presided at almost every literary undertaking. There are two periods in his life, the latter the exact opposite and negation of the former. Up to 1848 he was closely connected with politics, the theatre and education. He founded the first political and literary review, and had a genius for discovering talent. About this time he turned to philology and fell under the spell of the Transylvanian school, the views of which he embraced with an ever-growing and toward the end fanatical zeal. He translated dramas and novels from French and Italian, and the number of his publications is legion.

All the prominent Rumanians of this period were politicians, striving to emancipate the country from the Turkish yoke, and later to effect the union of Moldavia and Wàlachia. These political aspirations form the keynote of the poetry and historical novels of Bolintineanu (1826–73). He was discovered by Radulescu, spent nine years in exile, returned in 1857 to Walachia and rose to high administrative posts. His main strength lay in his historical ballads, a *genre* which he introduced. Grigorie Alexandrescu (1812–85), another pupil of Eliade, is noted chiefly for his satirical rhymed fables. In Teodor Serbănescu (b. 1839) we find the reflex of Bolintineanu of the earlier period, in the beauty and simplicity of his lyrics.

Like Serbănescu, Vasile Alecsandri (1821–90) (*q.v.*) was a Moldavian. In 1855 he published, under the influence of Percy's *Reliques*, his collection of folk poems, *Ballades et chants populaires de la Roumanie*. This, together with the old chronicles, edited by Mihail Kogălniceanu (1845), constituted a living monument of the vernacular. Their importance as an inspiration and stimulus to the new writers was fully appreciated by Titu Maiorescu, who became the leading critical spirit in Rumanian letters.

Under Maiorescu's influence a group of national writers gathered round the newly founded periodical *Convorbiri Literare*. Among them were I. Creangă, who in his "Recollections of Childhood" and other tales embodied the spirit of the Moldavian peasantry; I. L. Caragiale, who, beside a realistic drama and two volumes of excellent short stories, showed in his comedies *Scrisoarea din Urmă* (The Lost Letter) and *Noaptea Furtunoasă* (Stormy Night) the grotesque effects of a hasty introduction of Western manners into a semi-oriental society; and above all the poet Michail Eminescu (*q.v.*). He has been called the Rumanian Leopardi, on account of his all-pervading sadness. But there is another side to Eminescu—his broad conception of the Rumanian race. It was this that impressed writers of the later generations such as Prof. Torga, who in his *Istoria Literaturii Romine in secolul al XVIII. lea, 1688–1821*, etc. (1901) arrived at a clearer understanding of what a national literature may be. His own periodical *Sămănătorul*, and the reviews *Convorbiri Literare*, edited by Prof. Mehedintzi, *Luceafărul* and *Viața Românească*, are the chief exponents of modern Rumanian letters.

Among Eminescu's followers the most important is A. Vlahuta (b. 1859). G. Coşbuc is the poet of the Rumanian peasant. He is a Transylvanian, and so is Octavian Goga, another poet of rich gifts, who however has in latter years turned to politics and is one of the best leader writers.

Rumanian prose suffered in consequence of the philological confusion brought about by Eliade and his assistants, mostly Transylvanians who came to Rumania proper after 1848. N. Bălcescu edited the ancient Walachian chronicles and wrote an admirable history of the reign of Michael the Brave. His friend and literary executor A. Odobescu was a consummate scholar of ancient and mediaeval antiquities, an unsurpassed satirist, and creator of the Rumanian historical novel (*Mihnea Voda*, 1858, and *Doamna Kiajna*, 1860). The first Rumanian novel to describe contemporary manners is the *Ciocoii vechi şi noi* (1863) of Nicolae Filimon (1819–65).

Ioan Ghica, a contemporary of the revolutionaries of 1848, gathered his recollections into two volumes, *Amintiri* (1890) and *Scrisori către V. Alecsandri* (1887), which beside their historical value have become a model of Rumanian prose. Among writers of fiction mention is also due to Ion Slavici (b. 1848), whose short stories describe the life of the Transylvanian peasantry; Barbu Stefănescu de la Vrancea (b. 1858), whose stories are characterized by a wealth of imagery and richness of language; Ion Popovici-Bănătseanu, and Marcu Beza, whose volume of short stories *Pe Drumuri* (1914) and novel *O Viața* (1921) represent the life of the romantic Vlach population scattered throughout the mountains of Macedonia, Epirus and Thessaly. I. Al. Bratescu-Voinesti's two volumes of short stories, *In Lumea Dreptătii* (In the World of Justice, 1908) and *In Tuneric şi Lumină* (Darkness and Light) were awarded, in 1925, the great prize of the Rumanian Academy. Duiliu Zamfirescu's trilogy *Din Viata Comăneştilor* is a kind of Rumanian Forsyte Saga, while Liviu Rebreanu's novel *Ion* (1921) deals with the peasant's love of the land. Michael Sadonuvea is a prolific writer of vivid and graphic short stories depicting the life of the Rumanian country-side.

Most popular among Rumanian dramatists is Ioan Caragiale (b. 1852) who has brought on the stage living types of the lower and middle classes, and has skilfully portrayed the effect of modern veneer on old customs. Barbu de la Vrancea's trilogy, *Apus de Soare, Luceafărul, Viforul* (Sunset, The Evening Star, The Storm), is inspired by Rumanian history and folklore; Victor Eftimiu's fairy play *Insiră-te, mărgărite!* (String, Ye Pearls!) is founded on a folk tale; so is Adrian Maniu's rhymed drama *Meşterul* (The Master Builder, 1922).

Among the critics and essayists Dobrogeanu Gherea (b. 1853) stands out with his *studii critice* (1890 *seq.*). But in the domain of prose writing Rumania, like all the other nations of south-eastern Europe, lags behind.

The World War does not seem to have either altered or much inspired literary production. An attempt to depict the general spirit during the German invasion of Rumania was made in a novel, called after the national colours, *Roşu, Galben şi Albastru* (1925) ("Red, Yellow and Blue") by I. Minulescu, known as a disciple of the French symbolists. From the same school proceeded likewise a younger poet, Ion Pillat, who in his *Satul meu* (1925) ("My Village") manifests a definite return to the Rumanian tradition.

Popular Literature.—There existed in Rumania another set of literary monuments at least as old as any of the books hitherto enumerated, but which appealed to a wider circle. Rumanian folk-literature contains both popular written books and oral songs, ballads, etc. It is advisable to group the material in three sections: (1) the romantic and secular literature; (2) the religious literature;—both of these being written—and (3) the modern collections of ballads, songs, tales, etc.

To the first belong the oldest books, such as the *History of Alexander the Great*, which was known in Rumania in the 17th century. It rests mostly upon a Sloveno-Greek text and is of the utmost interest for the study of this cycle of legends. The first printed copy appeared in 1794, and it has been reprinted in innumerable editions. Next comes the legend of Constantine, of his town and his exploits—a remarkable collection of purely Byzantine legends. In addition to these there is the history of St. Sylvester and the conversion of Constantine, etc., all still in ms. *The History of Barlaam and Ioasaf* (*see* BARLAAM AND JOSAPHAT) may also be mentioned here. The *History of Arkir and Anadam*, printed by Anton Pann from older mss., is the now famous Old Testament apocryphon of Akyrios the Wise, mentioned in Tobit and found in many languages. In Rumanian it rests on an older

Greek-Slavonic text, and owes its great popularity to the wise and witty proverbs it contains. "Esop," whose wonderful biography (by Planudes) agrees in many points with Arkir, has also become one of the Rumanian popular books. The history of *Bertoldo*, which, though of Italian origin, reached Rumania through a Greek translation, belongs to the same cycle of rustic wisdom and cunning. These books are of course anonymous, most of them being translations and adaptations. One man, however, stands out prominently in this section of romantic and secular folk-literature. This was Anton Pann, who was born in 1797 at Slivden, of Bulgarian parentage, and died at Bucharest in 1854. Carried away by the Russians in his early youth, he settled in Rumania, and in about 20 years he published no fewer than 50 books, all of them still popular. Besides his edition of the Rumanian Church service-books with musical notation, he published a series of tales, proverbs and songs either from older texts or from oral information; and he made the first collection of popular songs, *Spitalul amorului*, "The Hospital of Love" (1850–53), with tunes either composed by himself or obtained from the gipsy musicians who alone performed them. Of his numerous writings two or three are of the greatest interest to folklore. His *Povestea vorbii* (first ed. 1 vol., 1847; 2nd ed. 3 vols., 1851–53) is a large collection of proverbs ingeniously connected with one another and leading up to or starting from a popular tale exemplifying the proverb. The *Fabule şi istorioare* (2 vols., 1839–41) is a collection of short popular stories in rhyme; *Sezătoarea la tară* (1852–53) is a description of the Rumanian *Spinnstube*, for which the peasants gather in one of their houses on a winter's night, the girls and women spinning and working, the young men telling tales, proverbs, riddles, singing songs, etc.

Far larger than the secular is the religious popular literature; it comprises many apocryphal tales from the Old and the New Testaments, and not a few of the heretical tales circulated by the various sects of Asia Minor and Thracia, which percolated into Rumania through the medium of Slavonic. A brief enumeration of the chief tales must suffice. Only a few of them have hitherto been published. They exist in numerous mss. which testify to their great popularity; in the popular songs one finds many traces of their influence upon the people's imagination. They include the *History of Adam and Eve*, the *Legend of the Cross*, *The Apocalypse of Abraham*, the *History of the Sibyl*, the *Legends of Solomon;* numerous New Testament apocryphal tales, starting with legends of St. John the Baptist. A number of astrological calendars and *prognostica* are among the best known and most widely circulated popular books, and the lives of St. Alexius, Xenophon, etc., have become chapbooks.

The whole of this popular literature belongs to what may be called the cycle of the Balkan nations, in every one of which exact parallels are to be found. Not that there was any direct, deliberate borrowing by one nation from the other, but all of them seem to have stood for a long time under identical psychological influences and to have developed on similar lines. One of the first to collect these treasures of Rumanian poetry was V. Alecsandri, who, however, retained only their poetical beauty and did not reproduce them with that strict accuracy which modern study of folklore demands. A. M. Marienescu collected those of Transylvania (1859); S. F. Marian, those of the Bukovina (1873); T. T. Burada, those of the Dobrudja (1880); but the most complete collection is that of G. Dem. Teodorescu, *Poesii populare române* (Bucharest, 1885). The collection of fairy tales started later than that of the ballads. The first collection is the German translation of tales heard by the brothers Schott (1845). The most important collections, now deservedly considered as classical from every point of view, are the successive publications of P. Ispirescu.

It would be giving an incomplete picture of the contribution of Rumanians to literature if one passed over the works of Rumanians which have appeared simultaneously in foreign countries and in Rumania: Charles Adolphe Cantacuzene (*Sourires Glacés*), the Princess Marthe Bibesco (*The Eight Paradises, Catherine-Paris, A Royal Victim*), Princess Elizabeth Bibesco (*I Have only Myself to Blame*).

Şăineanu, *Autorii români moderni* (Bucharest, 1891); Winifred Gordon, *Rumania* (1918); M. Beza, *Papers on the Rumanian People and Literature* (1920). Several of the stories cited above are contained in *Isvar* by Princess Bibesco. (M. Be.; A. Bi.)

RUMELIA or **ROUMELIA,** a name used by the Turks to denote their possessions in the Balkans (Turkish *Rumili*, the land of the Romans, *i.e.*, Byzantines), particularly the ancient provinces, including Constantinople and Salonika, of Thrace and Macedonia; later particularized to denote the province composed of central Albania and western Macedonia. Eastern Rumelia (the present southern Bulgaria) became, by the Berlin Treaty of 1878, an autonomous province within the Turkish empire, but proclaimed its unity with Bulgaria on Sept. 18, 1885. (*See* BULGARIA).

RUMFORD, BENJAMIN THOMPSON, COUNT (1753–1814), British-American scientist, philanthropist and administrator, was born at Woburn (Mass.), on March 26, 1753. The Thompson family to which he belonged settled in New England about the middle of the previous century and were moderately wealthy farmers. At the age of 14 Benjamin was sufficiently advanced "in algebra, geometry, astronomy, and even the higher mathematics," to calculate a solar eclipse within four seconds of accuracy. In 1766 he was apprenticed to a storekeeper at Salem, in New England, and there occupied himself in chemical and mechanical experiments, and in engraving. At the outbreak of the American War when he was between 17 and 18 years of age he went to Boston, where he became assistant in another store. At 19 he married the widow of Col. Benjamin Rolfe, a woman possessed of considerable property, and his senior by 14 years.

This marriage was the foundation of his success. Soon after it he became acquainted with Governor Wentworth of New Hampshire, who conferred on him the majority of a local regiment of militia. As he was distrusted by friends of the American cause, it was considered prudent that he should seek an early opportunity to leave the country. On the evacuation of Boston by the royal troops, therefore, in 1776, Governor Wentworth sent him with despatches to England. On his arrival in London Lord George Germain, secretary of state, appointed him to a clerkship in his office. Within a few months he was advanced to the post of secretary of the province of Georgia, and in about four years under-secretary of state. He continued his scientific pursuits, however, and in 1779 was elected a fellow of the Royal Society. The explosive force of gunpowder, the construction of firearms, and a system of signalling at sea were subjects which particularly interested him. On the resignation of Lord North's administration, of which Lord George Germain was a member, he left the civil service, and was nominated to a cavalry command in the revolted provinces of America. But the War of Independence was practically at an end, and in 1783 he quitted active service, with the rank and half-pay of a lieutenant-colonel. He now decided to join the Austrian army, to campaign against the Turks. At Strassburg he was introduced to prince Maximilian, afterwards elector of Bavaria, and was by him invited to enter the civil and military service of that State. Having obtained leave of the British Government to accept the prince's offer, he received the honour of knighthood from George III., and remained at Munich 11 years as minister of war, minister of police, and grand chamberlain to the elector. During his stay in Bavaria he contributed a number of papers to the *Philosophical Transactions*. He reorganized the Bavarian army; he improved the condition of the industrial classes and he did much to suppress mendicity. In one day he had 2,600 beggars and depredators in Munich and its suburbs alone arrested and transferred to an industrial establishment which he prepared for them. In this institution they were housed and fed, and they not only supported themselves, but earned a surplus for the electoral revenues. The principle on which he acted is stated by him in the following words: "To make vicious and abandoned people happy, it has generally been supposed necessary first to make them virtuous. But why not reverse this

order? Why not make them happy, and then virtuous?"

In 1791 he was created a count of the Holy Roman Empire, and chose his title of Rumford from the name of the American township to which his wife's family belonged. In 1795 he visited England, where he lost all his private papers, including the materials for an autobiography. In London he applied himself to the discovery of methods for curing smoky chimneys and to improvements in fireplace construction. But he was quickly recalled to Bavaria, Munich being threatened at once by an Austrian and a French army. The elector fled, and it was entirely owing to Rumford that a hostile occupation of the city was prevented. It was now proposed that he should be Bavarian ambassador in London; but the fact that he was a British subject presented an insurmountable obstacle. He returned to England, however, as a private citizen.

In 1798 he presented to the Royal Society his "Enquiry concerning the Source of Heat which is excited by Friction," in which he combated the current view that heat was a material substance, and regarded it as a mode of motion. In 1799, he, with Sir Joseph Banks, projected the establishment of the Royal Institution. It received its charter from George III. in 1800, and Rumford selected Sir Humphry Davy as scientific lecturer there. He lived in London until 1804, when he went to Paris, marrying (his first wife having died in 1792) the wealthy widow of Lavoisier, the celebrated chemist. He separated from her eventually and took up his residence at Auteuil. He died there suddenly on August 21, 1814, in the 62nd year of his age.

Rumford was the founder and the first recipient of the Rumford medal of the Royal Society. He was also the founder of the Rumford medal of the American Academy of Arts and Sciences, and of the Rumford professorship in Harvard university. His complete works with a memoir by G. E. Ellis were published by the American Academy of Arts and Sciences in 1870–75.

RUMFORD FALLS, a manufacturing village of Oxford county, Maine, U.S.A., on the Androscoggin river, 60 m. N. of Portland; served by the Maine Central railroad. Pop. (1920) 7,016 (39% foreign-born white); estimated locally at 11,000 in 1928. Rumford Falls has the largest water-power east of Niagara; a hydro-electric station with an installed capacity (1928) of 42,000 h.p.; and large paper and paper-bag mills. The village was founded in 1893 as an industrial community.

RŪMĪ (1207–1273). Mohammed b. Mohammed b. Husain albalkhī, better known as Maulānā Jalāl-uddīn Rūmī (or simply Jalāl-uddīn), the greatest Sūfic poet of Persia, was born on Sept. 30, 1207 (604 A.H. 6th of Rabī' I.) at Balkh, in Khorāsān. His father was invited to Iconium (or Rum), and from this place Jalāl-uddīn took his pen-name.

Jalāl-uddīn founded the order of the Maulawī (Mevlevī) dervishes, famous for their piety as well as for their garb of mourning, their music and their mystic dance (samā), which is the outward representation of the circling movement of the spheres, and the inward symbol of the circling movement of the soul caused by the vibrations of a Sūfī's fervent love to God. Most of Rūmī's matchless odes were composed in honour of the Maulawī dervishes, and even his *opus magnum*, the *Mathnawī* (*Mesnevi*), or, as it is usually called, *The Spiritual Mathnawī* (*mathnawī-i-ma'nawī*), in six books with 30,000 to 40,000 double-rhymed verses, can be traced to the same source. The idea of this immense collection of ethical and moral precepts was first suggested to the poet by his favourite disciple Hasan, better known as Husām-uddīn, who in 1258 became Jalāl-uddīn's chief assistant. Jalāl-uddīn dictated to him, with a short interruption, the whole work during the remaining years of his life. Soon after its completion Jalāl-uddīn died, on Dec. 17, 1273.

Jalāl-uddīn's life is fully described in Shams-uddīn Ahmed Aflākī's *Manākib-ul 'ārifīn* (written between A.D. 1318 and 1353), the most important portions of which have been translated by J. W. Redhouse in the preface to his English metrical version of *The Mesnevī, Book the First* (London, 1881); there is also an abridged translation of the *Mathnawī*, with introduction on Sufism, by E. H. Whinfield (2nd ed., 1898). Complete editions have been printed in Bombay, Lucknow, Tabriz, Constantinople and in Bulaq (with a Turkish translation, 1268 A.H.), at the end of which a seventh daftar is added, the genuineness of which is refuted by a remark of Jalāl-uddīn himself in one of the Bodleian copies of the poem, Ouseley, 294 (f. 328*a seq.*). A revised edition was made by 'Abd-ullatīf between 1024 and 1032 A.H., and the same author's commentary on the *Mathnawī, Latā'if-ulma'nawī*, and his glossary, *Latā'if-allughāt*, have been lithographed in Cawnpore (1876) and Lucknow (1877) respectively, the latter under the title *Farhang-i-mathnawī*. For the other numerous commentaries and for further biographical and literary particulars of Jalāl-uddīn, *see* Rieu's *Cat. of the Persian MSS. of the Brit. Mus.*, vol. ii. p. 584 *seq.*; A. Sprenger's *Oudh* Cat., p. 489; Sir Gore Ouseley, *Notices of Persian Poets*, p. 112 *seq.*; H. Ethé, in *Morgenländische Studien* (Leipzig, 1870), p. 95 *seq.*, and in Geiger and Kuhn's *Grundriss der iranischen Philologie* (Stuttgart, 1896–1904), vol. ii. pp. 287–292. Selections from Jalāl-uddīn's diwan (often styled *Dīwān-i-Shams-i-Tabrīz*) are translated in German verse by V. von Rosenzweig (Vienna, 1838); into English by R. A. Nicholson (2nd ed., 1898) and W. Hastie (1903).

RUMINANTIA, a term employed by Cuvier to include all the artiodactyle ruminating ungulate mammals classed under the groups Pecora, Tylopoda, and Tragulina. (*See* ARTIODACTYLA, PECORA, TYLOPODA.)

RUMMY or **RUM** is a card game which is said to have originated in Texas. It is played on the same lines as Coon-Can (*q.v.*), the object being to form in one's hand sequences of three cards or more of the same suit, or to collect three or more of a kind such as three knaves, or four sevens. The game is played by three, four or five players. Two full packs, properly shuffled, are used. Seven cards are dealt, one at a time, to each player, and the top card of the stock is turned face upwards on the table. The player on the left of the dealer must either take up the exposed card into his hand, or take the top unexposed one from the stock. He then discards a card from his hand and places it, face upwards, on the top of, or in the place of, the exposed card, so that there is never more than one card exposed. The next player follows the same routine, and so it goes on round until someone calls "Rummy." Rummy is called when the counting cards, that is the cards in the caller's hand which do not form a sequence or three of a kind, count up to seven or less, court cards counting ten and an ace counting one. The figure seven seems rather high, but that is how it is played in England. Suppose that the seven cards dealt to a player are three knaves, the king of clubs, the seven and eight of spades, and the four of hearts. If he is lucky enough to pick up either the six or the nine of spades, he discards the king of clubs and he is left with a sequence in spades, three knaves, and the four of hearts, so he says "Rummy" at once.

Directly a player rummies that deal is finished, and all the hands are exposed and added up. A score has to be kept, and each player is debited with the amount of the counting cards in his hand, reckoned by pips. Court cards count ten each, aces one, and other cards their face value. Say that a player has in his hand two queens, three nines, and two fours, he would be debited with 28—ten each for the queens, and eight for the two fours; the three nines are free. When a player's score amounts to 100 he is out, but he has the right to buy himself in again at one point more than the next highest score.

Before commencing, each player contributes to the pool two counters, or units; the units may be given any value. When a player buys himself in he has to contribute three more units to the pool. Suppose a player goes over the 100, and the other three scores are 57, 76, and 82, he can buy himself in again at 83 by subscribing an additional three units to the pool. Besides this each player pays on every hand one unit for every completed ten; if his counting cards amount to 26 he pays two units, if they tot up to 41 he has to hand over four units, and so on. The players are reduced by elimination until there is only one left, and he takes the pool. (X.)

The United States.—In the United States it is played differently from the British game. It is most often played by two. Except in "double rum," only one pack is used; another pack is out of play, at the left of the second dealer to mark that fact. Ten cards are dealt in "double rum," seven cards are dealt to each of two players in rum, or six cards in case more than two play. On the opening play, beginning with the player at the dealer's left, each player in turn may accept the exposed card or decline it; if

all decline the exposed card, the eldest hand must accept it or draw from stock. No player can buy himself in again; the game terminates when one player scores 100 points, and a new game starts with all players in it.

Three or more of a kind or a sequence of at least three cards may be played as made or may be retained in the hand. Any player may add a fourth card to an exposed three of a kind or he may add a single card at a time to an open end of an exposed sequence. After the claim of "rum" or "down" has been made the remaining players may board all threes or fours of a kind held; also each player may board completed sequences or add cards to sequences exposed. The player left with the smallest count in his hand collects from each other player the net difference in score left in the hand. Unless game is made before the stock becomes exhausted a collection and redeal is made of all cards exposed on the table; the new stock is boarded and its top card is exposed.

Variations that may be played are: (1) A player able to board all his cards, in cards of a kind, in sequences, or by adding to boarded plays, scores 50 points bonus; if another player can also claim a "slam," the latter scores the 50 points, also 10 points from the former slam claimant; (2) the joker may be introduced and played as its holder wishes, either as a stop at one end of a sequence or as the fourth card of an exposed three of a kind; (3) a mistaken claim of ability to make any play adds 10 points to every other player's score. (E. V. S.)

RUNCIMAN, WALTER (1870–), British statesman, was born at South Shields Nov. 19, 1870, the son of Sir Walter Runciman (b. 1847) 1st Bart., a Newcastle shipowner. He was educated at Trinity College, Cambridge, and afterwards joined his father in his shipping business, being from 1896 to 1905 managing director of the Moor Line of cargo steamers. In 1898 he unsuccessfully contested Gravesend in the Liberal interest, but was elected for Oldham in 1899, although he only held the seat for a year. In 1902 he stood successfully for Dewsbury, and retained this seat until 1918. In 1905 he entered Campbell-Bannerman's Government as parliamentary secretary to the Local Government Board. He became financial secretary to the Treasury in 1907, president of the board of education in 1908, and was president of the board of agriculture from 1911 to 1914. From 1912–4 he was also commissioner of woods and forests, and from 1914–6 president of the board of trade. On the formation of Lloyd George's ministry in 1916 he retired from the Government. In 1920 he unsuccessfully contested North Edinburgh and in 1924 was returned for Swansea West. He was an active member of the Radical group formed within the Liberal party, and was thus opposed to the leadership of Lloyd George. (*See* LIBERAL PARTY.) Runciman was a director of the Westminster Bank, and owner of a group of periodicals, in addition to his shipping interests. In 1926–27 he was president of the Chamber of Shipping of the United Kingdom. He wrote *Liberalism as I see it* (1927).

RUNCORN, market town, urban district, river-port, Northwich parliamentary division, Cheshire, England, on the south of the estuary of the Mersey, 16 m. above Liverpool. Pop. (1921) 18,476. It is on the L.M.S. railway, and the Bridgewater canal (1773), which here descends into the Mersey by a flight of locks. Runcorn, being on the Manchester ship canal, is a subport of Manchester, and has extensive wharfage and warehouse accommodation. The chief exports are coal, salt and pitch; but there is also a large traffic in potters' materials. It is connected with Widnes by a railway and a transporter bridge. The town possesses shipbuilding yards, iron foundries, rope works, tanneries, soap and alkali and chemical works. As the Mersey is here fordable at low water, Runcorn was in early times of considerable importance. On a rock which formerly jutted into the Mersey Aethelfleda erected a castle in 916. The ferry is noticed in a charter in the 12th century.

RUNDALE, the name of a form of occupation of land, somewhat resembling the English "common field" system. The land is divided into discontinuous plots, and cultivated and occupied by a number of tenants to whom it is leased jointly. The system was common in Ireland, especially in the western counties. In Scotland, where the system also existed, it was termed "run-rig."

RUNEBERG, JOHAN LUDVIG (1804–1877), Swedish poet, son of a sea-captain, was born at Jakobstad, in Finland, on Feb. 5, 1804. He was educated at the University of Åbo and after its removal to Helsingfors, Runeberg became, in 1830, amanuensis to the council of the university. In 1831 his verse romance of Finnish life, *Grafven i Perrho* (The Grave in Perrho), received the small gold medal of the Swedish Academy, and the poet married Fredrika Charlotta Tengström, daughter of the archbishop of Finland. In the same year he was appointed university lecturer on Roman literature. In 1837 Runeberg accepted the chair of Latin at Borgå college, of which he was rector in 1847–50, and lived at Borgå for the rest of his life.

His two idylls, *Elgskyttarne* (The Elk-Hunters) and *Hanna* had won for him a place second only to Tegnér among the poets of Sweden. Later works are *Nadeschda* (1841); *Julqvällen* (1841); *Fänrik Ståls Sägner* (2 series, 1848 and 1860), patriotic poems on the war of independence of 1808; and *Kungarne pa Salamis* (1863), a tragedy. In 1844 he published the noble cycle of unrhymed verse romances derived from old Scandinavian legend and entitled *King Fjalar.* Runeberg died at Borgå on May 6, 1877. His writings were collected by C. R. Nyblom in six volumes in 1870, and his posthumous writings in three volumes (1878–79).

The poems of Runeberg show the influence of the Greeks and of Goethe upon his mind; but he possesses a great originality. It is hardly possible to over-estimate the value of his patriotic poems as a link between the Swedish and Finnish nations. He has remained one of the most popular Swedish poets, although his whole life was spent in Finland.

An account of his life and works by C. R. Nyblom is prefixed to the *Samlade Skrifter* of 1870. For a minute criticism of Runeberg's principal poems, with translations, see Gosse's *Studies in the Literature of Northern Europe* (1879). A selection of his lyrical pieces was published in an English translation by Messrs. Magnusson & Palmer in 1878. There are also monographs on Runeberg by Dietrichson and Rancken (Stockholm, 1864), by Cygnäus (Helsingfors, 1873), by Ljunggren (Lund, 1882–83), Peschier (Stuttgart, 1881), and by W. Soderhjelm (Stockholm, 1904). A further edition of his *Samlade Skrifter* appeared in 1907.

RUNES, the oldest form of Germanic writing. This form of writing was in use in the Scandinavian North in the 3rd century, and in remote districts of Sweden almost down to our own times.

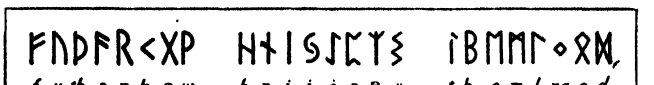

FIG. 1.—THE EARLIER RUNE-STAVES

During the first centuries of their vogue runes consisted of 24 letters: the so-called older or all-Germanic runic staves (fig. 1). Their peculiar forms appear first in inscriptions found all over Europe from Rumania and western Russia to the east of France and Friesland, but in greatest number in England and Scandinavia. Runes, which at first sight seem to betray derivation from the southern European alphabets, the Greek and the Latin, differ from these radically in their arrangement, as we may see from some inscriptions which use the runic staves in their entirety, the most important being the Kylver Stone in Gothland (5th century), the Vadstena *braktea* from Östergötland, Sweden (fig. 2), the Charnay clasp from eastern France and the Thames sword from southern England. Moreover every rune had its special name which we know through the oral traditions recorded in Anglo-Saxon manuscripts. The 24 runes were divided up into three groups of eight each, each group coming later to be called in Scandinavian an *ætt,* a word which probably meant "number of eight." The runic staves, at least at a later

FROM L. F. A. WIMMER, "DIE RUNENSCHRIFT," (WEIDMANN)

FIG. 2.—THE VADSTENA BRAKTEA

period, were called *futhark*, after their initial letter.

As regards sound values, it may be mentioned that *th* was pronounced approximately as in the English *thing; d* like *th* in the English *this; g* had a sound corresponding to a fricative *d; b* in the same way, therefore corresponding to *b* in the Spanish *Habana;* ŋg like *ng* in *England* and *R*, finally, almost like *s* in the English *is*.

The oldest extant decipherable runic writings as to the origin of which we can speak with any certainty hail from discoveries in the bogland in south-western Denmark, Vi-mose in Fyn, and Torsbjaerg in Slesvig. Most archaeologists date the first-mentioned from the middle of the 3rd century, the second from the 4th. The inscriptions are few in number and brief. Those which can be deciphered contain one or two names of men. These earliest finds of runes in Denmark were supplemented by a whole series of others from the 4th, 5th and 6th centuries—inscriptions on single objects, arms, ornaments, and more especially gold *brakteas*. Archaeological research establishes the fact that south-western Denmark was really the cradle of the knowledge of runes, whence the use of runes spread to Norway and Sweden. It has been ascertained, moreover, that from Slesvig it made its way in the 5th century along the southern coast of the North Sea to England and the Continent.

If then Slesvig and Fyn are the original home of the runes in northern and western Europe, our next question is: did the runes originate in Denmark or were they imported from elsewhere? It has been established that a number of runes which are contemporaneous with the oldest of those found in the Danish bogland have been discovered along a line of country passing through Pomerania, Brandenburg, Volhynia and Rumania. Moreover these discoveries include archaic objects the primary forms of which do not hail from western Europe but are found in south-eastern Europe, on the northern coast of the Black Sea and along the lower Danube. From this fact the Swedish archaeologist, B. Salin, drew the conclusion a quarter of a century ago that the runes came to Scandinavia from south-eastern Europe. The eastern European runes are certainly Gothic in part, and it is certain that runes were known and used among the Goths in the first half of the 4th century, because Ulfilas, the Apostle of the Goths, constructed his Gothic writing on the basis of runes. It may be added that in the 3rd and 4th centuries there is no trace of the existence of runes in the western Teutonic world, *i.e.*, south-west of the line Slesvig, Berlin, Bukarest.

This signifies that the runes originated with the Goths in south-eastern Europe, in a milieu, therefore, in immediate touch with Greek and Latin culture. Greek was the prevailing language along the lower Danube; Latin was the language of the Roman forces and colonists. Archaeological and historical discoveries indicate, therefore, that the runes had their source in one or other of the classical alphabets—or in both.

It remains to consider what the runes themselves have to tell about their origin. The Dane, L. Wimmer, has made it clear paleographically that they are derived from classical writing. It has been demonstrated by him that the runes have the same signs for the vowels *a, e, o*, as the Greek and Latin alphabets, but these letters in the Latin are the result of a Greek modification of the Semitic guttural signs. Wimmer has demonstrated, too, once for all, that at least the runes for *f, h*, and *r*, derive from the Latin alphabet. As quite a number of runes like *a, i, b, t, m* and *n*, may be traced typographically to the Greek and Latin alphabets, and as it undoubtedly would be natural to seek the source of the runes in a single alphabet, Wimmer seeks to trace all the runes back to Latin. In so seeking, however, he has been forced into assumptions and deductions which must be regarded as improbable and irrational. In February 1928, the Norwegian, C. J. S. Marstrander, in a very weighty treatise, seeks to show that the runes derive from a late Northern Etruscan alphabet, most of the letters of which were made up out of the Latin but which in regard to sounds, not to be found in the Latin, preserved a number of Northern Etruscan letters. This alphabet was in use at the beginning of our era in the region of the eastern Alps among Celtic tribes and it was through intercourse with these that the Teutons, probably the Marcomanni who lived in Bohemia, created the runes. Certain runes are more easily and naturally explained in the light of Marstrander's paper than in that of any other interpretation that has been put forward, but on the other hand new difficulties present themselves in regard to other runes. Archaeological and chronological facts seem also hard to reconcile with Marstrander's hypothesis. He has promised us a more exhaustive treatise on certain questions bearing upon the

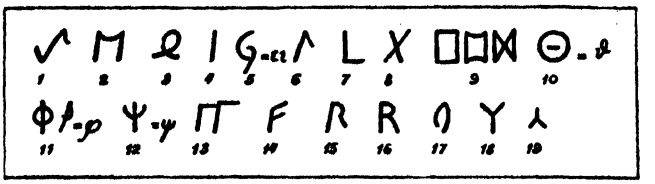

FIG. 3.—CLASSICAL LETTERS AND RUNES

problem. Until this is available, or at all events until Marstrander's hypothesis can be examined thoroughly, the theory regarding the origin of the runes put forward in 1904 by von Friesen along the following lines may be accepted.

We have just noted that certain runes may safely be said to derive from Latin letters. On the other hand the runes possess certain characteristic features which are in agreement with the Greek alphabet. These are: (a) the phonetic signs in both alphabetical systems number 24, which in view of the use of the runes for magical purposes has acquired its special significance. The Latin alphabet consisted originally of 21 letters, afterwards, when *y* and *z* were adopted from the Greek, of 23; (b) the use in the runes of a special sign for ŋg points directly to the Greek indication of ŋg by γγ; (c) every rune has its special name, an arrangement which seems to be inspired by the peculiar Greek names inherited from the Semitic alphabet, *alpha, beta, gamma*, etc. The Latin letters, on the contrary, were called in classic times as they are now *a, be, ce, de*, etc.

In addition we come upon a question of phonetic nature. Like the early Germanic, the Gothic language was specially notable for its wealth in spirant sounds such as *th* in the English *thing* and *this, ch* in the German *auch, g* in the German *tage, b* in the Spanish *Habana*. Hardly any sounds of this kind are to be met with in the later Latin of Imperial Rome except *f* and *s*, while Greek at this period possessed in addition both *th* and *ch*.

A comparison between the runes and the ordinary cursive form of the Greek alphabet gives us a number of concordances which can scarcely be attributed to chance. The Greek cursive alphabet has two forms of *e* (fig. 3, 1 and 2), the runes also have two forms: a Greek form of *o* (fig. 3, 3), which accords with the runic *o*. In the Greek is found a consonant *i*-sound which is written as fig. 3, 4 or fig. 3, 5, which latter form accords with the runic *j*. Also in the formation of other consonants we find the runic letters in remarkable accord with the Greek: the runic *l* accords with the Greek, fig. 3, 6 (compare the Latin fig. 3, 7); the runic *g*, with the sound value *ch* and *g* (ʒ), accords with the Greek (fig. 3, 8) *ch;* the runic (fig. 3, 9) *th* in the English *this* with the Greek (fig. 3, 10). In other cases we find in the runes forms which are identical with the Greek but with different sound values: the runic form for *th* in the English *thing* accords with the Greek, fig. 3, 11 (f); the runic form for *R* or *z* (in the English *is*) accords with the Greek (fig. 3, 12). Finally the runic form for ŋg clearly derives from the Greek (fig. 3, 13) except for the symmetrical stylization usual in the formation of the runes.

These numerous resemblances between the runes and the Greek letters can scarcely be the result of chance. The concordance between the runes and the Greek cursive writing is particularly striking and, significantly, the runes which have their source in the Latin also in many cases derive clearly from the cursive form: the runic *f* is stylized Latin cursive (fig. 3, 14), and the runic *r* is always open in its middle part like the Latin cursive (fig. 3, 15), while the Latin uncial and lapidary *r* (fig. 3, 16) is closed. The runic for *u* also seems to come from the Latin cursive *o* (fig. 3, 17).

The close relationship between the runes and the classic cursive handwriting—the ordinary handwriting used in everyday life and also by less cultured people—indicates that the art of writing

did not come to the Goths by the way of scholarship. Some individual Goths—mercenaries, for instance—from the north-western coast of the Black Sea, in the course of visits to the Roman provinces, learnt Greek and Latin and the Greek and Latin forms of writing used in state edicts and in private life. They acquired in addition an imperfect acquaintance with the lapidary and uncial style which was the basis for the ordinary cursive handwriting, wherefore some forms of the better style occasionally appear. Such a Goth or several such Goths working together, undertook to write out the Gothic language on the basis of the knowledge of Latin and Greek writing thus acquired. The result of these efforts is the runic stave.

FROM L. F. A. WINNER, "DIE RUNENSCHRIFT" (WEIDMANN)

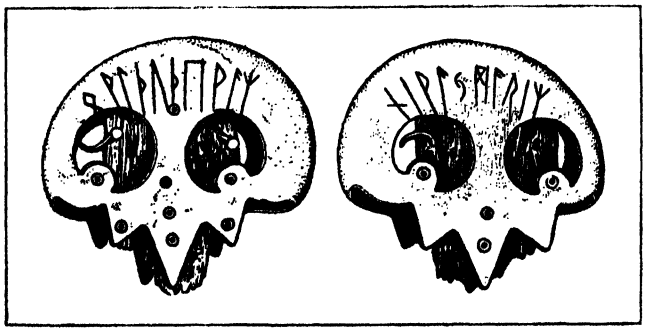

FIG. 4.—THE KOVEL SPEAR-HEAD

Like the letters of the classic alphabet, runes soon came to be used for purposes of magic, a use which continued for a long time. But that the chief purpose of the runes was to give the spoken language a fixed form is demonstrated at an early date by the fact that Ulfilas built up his Gothic letters upon runes, which even before his time had solved the difficult problem of representing the Gothic phonetic system by the use of classic letters.

Removed from the sphere of classical culture, the runic writing soon came to be used chiefly for inscriptions: it was carved or cut on wood, metal or stone. In the process the individual letters began to undergo a certain kind of symmetrical stylization or conventionalization which gave them a substantially different appearance from that of their classic prototypes, and, probably, in connection with this the runes came to be put in an order entirely different from that of the classic alphabets.

From the region of the Black Sea the knowledge of runes soon spread to distant corners of the great dominion which the Goths established in the 3rd and 4th centuries between the Black Sea and the Baltic, and in the middle of the 3rd century we begin to find single objects with runic inscriptions on them in Gothland, Denmark and Norway.

Between the Black Sea and the Baltic we find at the same period runic letters in the Gothic language as on the spear-head from Kovel in Volhynia (fig. 4). On this may be read *tilarids*, which is either a man's name or, more likely, the name given to the costly spear-head inlaid with silver ornamentation. The word

FROM L. F. A. WINNER, "DIE RUNENSCHRIFT," (WEIDMANN)

FIG. 5.—THE THORSBJAERG CHAPE

means "the one which reaches the goal," and it may have some magical significance.

Of the same period are certain Scandinavian discoveries of runes, among them the Thorsbjaerg chape from Slesvig (fig. 5) which bears the inscription *owlthuthewaR niwajmariR;* this is probably the names of two men, *Wulthu-thewaR* and *NiujamariR*, both names being of the familiar old Germanic double-jointed type.

It has already been pointed out that Slesvig and Fyn constituted a cradle for the runes during the Roman iron age and the earlier portion of the transmigration era (A.D. 250–450). There are many signs that runic writing was brought hither from the Black Sea by the Heruli, a people who play an important part in the history of the transmigration period and who seem to have had their origin in Denmark. Slesvig in those early days and until well into the middle ages was of primary importance for the intercommunication and exchange of merchandise between the Baltic regions on the one side and Western and Southern Europe on the other. In particular Slesvig had been long the traffic-route from the Rhineland and England up to the Scandinavian North. Regular communication by sea round Skagen and by the Skagarack and Kattegatt into the Baltic did not begin until the 13th century.

FROM S. MÜLLER, "NORDISCHE ALTERTUMSKUNDE" (WALTER DE GRUYTER & CO.)

FIG. 6.—THE GALLEHUS INSCRIPTION

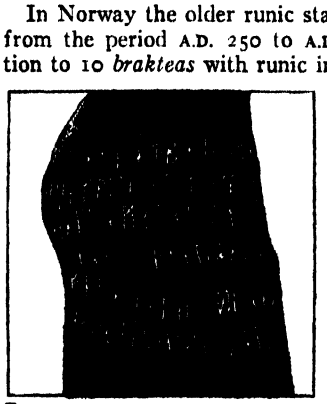
A remarkable runic inscription found in Slesvig is that on a golden horn from Gallehus (fig. 6), which dates from the beginning of the 5th century. It reads: *ek hlewagastiR holtijaR horna tawido*—"THlewagast from Holt made the horn." There are altogether about a dozen inscriptions on loose objects, also inscriptions of the older type as well as about 40 runic *brakteas* dating from between the 3rd and 6th centuries, which were found in Danish soil.

At a very early period—some time in the 3rd century—runic writing had spread from Denmark into Norway. Here as early as the 4th century the custom had begun of fitting stone monuments with runic inscriptions. One of the finest and longest inscriptions is that of the Tune stone from South-Eastern Norway (fig. 7). It would seem to date from the earlier half of the 5th century and reads: *(wiwa)R (?) woduride staina (satido) thrijoR dohtriR da(i)lidun arbija si(bi)josteR arbijano, ek wiwaR after woduride wita(n)-dahalaiban worahto(runoR)*, which apparently may be translated: "Viv (?) raised this stone to Vodurid. Three daughters shared the inheritance as nearest of kin among his survivors. But I, Viv, engraved the runes to my master (=breadgiver, *cf.* the English *lord*) Vodurid."

FROM L. F. A. WINNER "DIE RUNENSCHRIFT," (WEIDMANN)

FIG. 7.—THE TUNE STONE, SOUTH-EASTERN NORWAY

In Norway the older runic staves had a relatively wide vogue: from the period A.D. 250 to A.D. 800 there are extant, in addition to 10 *brakteas* with runic inscriptions, about 50 inscriptions, mostly on erected stones or stones inserted in tumuli but also on loose objects.



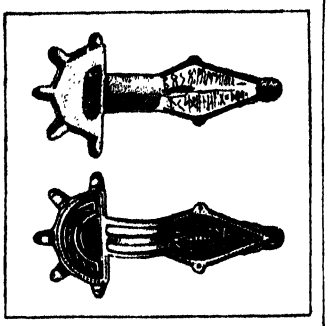


FIG. 8.—THE BJORKETORP INSCRIPTION

But the runes moved from south-western Denmark also up the Baltic. Here, as one might expect, the ancient centre for trade and intercourse in Northern Europe, the island of Gothland became also a region in which the older runic staves continued to be written throughout the entire period, though not to such an extent as in Norway. We find the runic inscriptions more sparsely on the mainland of Sweden—in Uppland, Södermanland and Östergötland. They are more frequent in Västergötland. In all about 20 runic inscriptions from the transmigration period have been found in Sweden, as well as a few runic *brakteas*. Of special note among them are the late (7th century) inscriptions from the most western parts of Blekinge which show a continuation of the

development of the runic letters which took place in south-western Norway, so rich in runes, during the early and middle periods of the transmigration era. Probably these inscriptions also came from Norwegian immigrants. The best preserved specimen is the Bjorketorp stone (fig. 8) which has its place in a fine stone setting and bears inscriptions on both its sides: *uthArAbAsbA* = ruin-bringing prophecy, and *hAid runo ronu fAlAhAk hAd(e)rA ginarunAR ArAgeu hAerAmAlAusR uti AR welAdAude sAR thAt bArutR* = "This is the secret meaning of the runes; I hid here power-runes, undisturbed by evil witchcraft. In exile shall he die by means of magic art who destroys this monument." The inscription constitutes, therefore, a magical protection for the fine stone setting.

AARBOGER FOR NORDISK OLDKYNDIGHED OG HISTORIE (DUKONGELIGE NORDISKE)

FIG. 9.—THE FREILAUBERSHEIM BROOCH

Of these Blekinge Stones the runic *k* has the form, fig. 3, 18, which about the year 500 was developed in Norway, while at the same time the form, fig. 3, 19, appears in Denmark, a form which proceeds thence to England.

For in the 5th century the runes went to the Germanic Continent and to England from South-Western Denmark. On the continent, where the runic *k* retains its original form, there have been found inscriptions from the Rhine Province, Hesse, Nassau, Thüringen, Württemberg, Bavaria, Austria, as well as in Charnay, the old Burgundian Kingdom in Eastern France, in what is now the *département* of Saône et Loire. These inscriptions are few and, like the Danish ones, all inscribed on loose objects, and they are not long. They are all held to belong to the period A.D. 450–550. As an illustration may be instanced the inscription on the clasp from Freilaubersheim in Rhenish Hesse (fig. 9): *boso wraet run-ath(i)k dalina godd(a)*, which means: "Boso wrote the runes—to thee, Dallina, he gave (the clasp)."

If this knowledge of runes constituted merely a brief episode on the western Germanic continent, it flourished for five centuries in England. The Anglo-Saxon rune staves like the continental-Germanic, have two cross-strokes in the letter *h*, differ from it in the form of the *k*, and from the Scandinavian and Eastern-Germanic, as well as from the Continental-Germanic runes with their 24 letters, in this, that new letters are created to render the most important novelties in the rich Anglo-Friese vowel system. Later there were added also new consonant letters. The beginning of this development of the system of letters had been already effected on the southern portion of the coast of the North Sea in Friesland, where, in the Holland of to-day, may be seen inscriptions belonging to the end of the 5th century and to the 6th with new runic letters for *a*- and *o*- sounds. In England there developed a runic stave with 28 letters in it (fig. 10) and in the 9th century the number increased to 33.

In England there are extant about 50 runic inscriptions upon loose objects and upon raised stones (stone crosses). Among the most remarkable and also the best preserved are those which are carved on a casket made of whalebone, the so-called Frank's casket

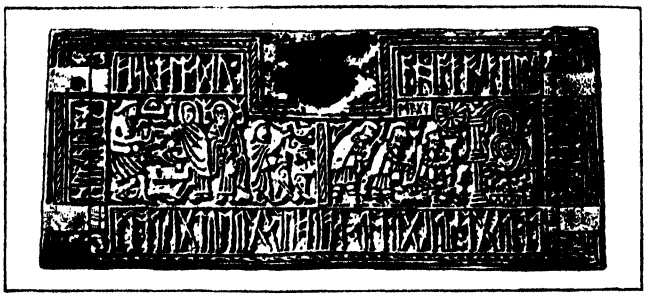

FIG. 10.—THE EARLIER ANGLO-SAXON RUNES

(fig. 11). The inscriptions together with illustrations from Biblical history and from Roman and Germanic legends cover the sides of the casket and the lid and are held to be not later than about A.D. 650. The inscription on one side reads: *hronæs ban fisk flodu ahof on fergenberig warth gasrik grorn thær on greut giswom*, which means: "The whalebone (is this). The flood threw the fish on the firm rock. The monster (?) was stranded on the stone in agony."

Here may also be reproduced the younger 33 lettered Anglo-Saxon runic stave (fig. 12), out of the Cod. Cotton. Otho B. 10. in the British Museum, a manuscript which gives the runic names of oldest date.

In England the runes persisted throughout the entire Anglo-Saxon period. The most remarkable monuments from later times are the two celebrated runic crosses from Bewcastle and Ruthwell on the Anglo-Scottish border.

FROM AN ENGLISH MISCELLANY PRESENTED TO DR. FURNIVALL (BRITISH MUSEUM)

FIG. 11.—FRANK'S CASKET

Thanks to the tradition kept alive in England from ancient times and also to the fact that the names borrowed by Ulfilas from the runes to render Gothic letters are to be seen in the manuscript (not, indeed, in an unchanged state) preserved in the National Museum at Vienna, we are able to reconstruct approximately the name which every runic letter seems to have borne from the commencement. Younger traditions handed down in Scandinavia are also of value although the later peculiarly

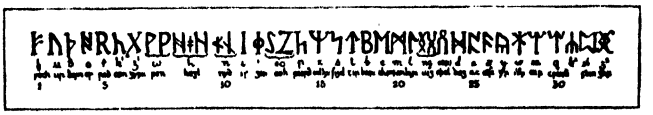

FIG. 12.—THE LATER ANGLO-SAXON RUNES

Northern runic staves contained only 16 letters and the names of 8 letters therefore have been lost. In the first column below are given the Anglo-Saxon names of runic letters, in the second the Scandinavian and in the third the Gothic names reconstructed:—

f	*feh,*	money	*fé, fa*	goods	*faihu* (read fehu)

d	*dæg*	day			*dags*

Thus the great modification of the Germanic sound-system caused by vowel-mutation, by breaking and by other changes in sound during the transmigration period resulted in a considerable enlargement of the runic alphabet in England. In Scandinavia, it is curious to note, the same linguistic development produced a directly opposite result: the number of the runes was reduced from 24 to 16. And this, although the Scandinavian stock of sounds reached 30 or 40 during the later transmigration period. The explanation of this would seem to lie in the fact that, while the original 24 runes covered adequately the old Germanic sounds, it became the habit later, as the result of the increase in the sound-system, to represent different sounds with the

same runic letter. This brought about the simplifying of the alphabet: when a single runic letter could be used to render several sounds, many of the old letters became superfluous. Simultaneously the formation of many of the runes was simplified. This twofold reduction of numbers and forms began in Scandinavia as far back as the 6th century, and at the beginning of the Viking era this had resulted in a special 16 letter Scandinavian alphabet. This alphabet appears in two distinct forms, the one

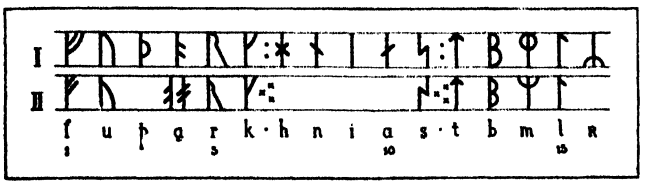

FIG. 13.—THE DANISH RUNES

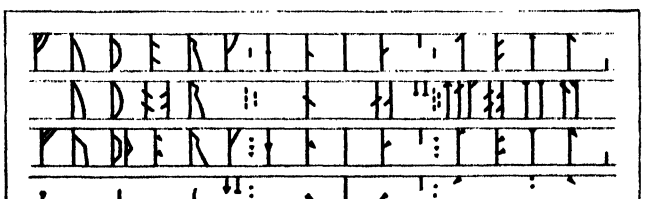
Danish (fig. 13), the other Swedish-Norwegian (fig. 14). The Danish was used also in South-western Sweden.

In Denmark runes seem to have been very little used after the close of the 6th century, and the form of the runic *k*, as well as other details, indicates that it was through an impulse from Norway or Sweden that runes came into use again in Denmark at the close of the 8th century. About 200 inscriptions upon raised stones are extant, as well as a few upon loose objects. Most of these inscriptions date from between A.D. 800 and the middle of the 11th century. Despite their laconic and often stereotyped wording, they are among the most remarkable, both as regards style and matter, that have been found in Scandinavia. They give us the names of several hundred men and women who lived in Denmark during this important period, from members of the Royal house down to the lower grades of society, and they provide us with data for visualizing the life of the people and of individuals in war and peace.

The runic monuments which date from the beginning of this period are few in number. One of the oldest and most remarkable inscriptions with runes of the later period is the Helnæs stone at Fyn (fig. 15): *rhuulfR sati stain nuRa kuthi aft kuthumut bruthur sunu sin turuknathu (haliR uti) ouaiR fathi.* If it were written in a more adequate phonetic alphabet, *e.g.*, *ð* the Early Norwegian Icelandic alphabet which includes ð, this inscription would have run: *"HrólfR setti stein, NóRa goði, aft Guðmund broð urusunu sinn drunknaðu haliR uti. ÁveiR fáði;* which means: "Rolf raised this stone, priest and chieftain of the Helnæs dwellers, in memory of his brother's son, Gudmund. The men were drowned at sea. Aveir wrote (the runes)."

From the earlier half of the 10th century we have the smaller of the two famous Royal Stones of Jällinge in Jutland (fig. 16): *kurmR kunu(n)kR karthi ku(m)bl thusi aft thurui kunu sina tanmarkaR but;* which means: "King Gorm made this monument



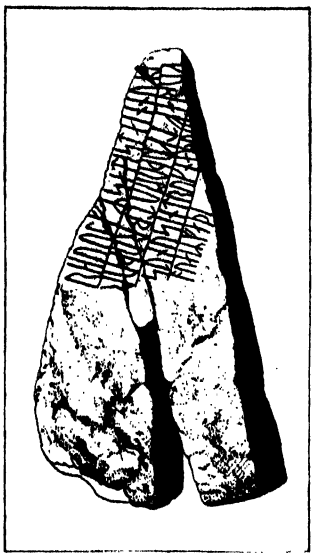


FIG. 14.—THE SWEDISH-NORWEGIAN RUNES

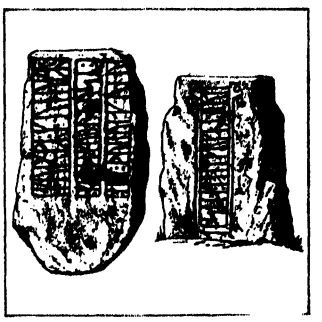
in memory of his wife, Tyra: he (Gorm) who improved Denmark."

The great majority of Denmark's 200 runic stones date, however, from the end of the 10th and the beginning of the 11th centuries. It was the period when the Vikings' raids on England were renewed, resulting at last in the conquest of the country by the Danish King Sven Twybeard, who is mentioned in two of the runic inscriptions, and Canute the Great. The relations between Denmark and England are reflected in the history of the runic inscriptions inasmuch as it was probably due to influence by the Anglo-Saxon runes that the Danish alphabet now began to be enlarged by so-called pointed runes, *see* page 664.



From Denmark the Danish runes spread about A.D. 1000 to Sweden where runic inscriptions on raised stones became more numerous than anywhere else in the world. There are known in Sweden about 2,400 runic inscriptions, chiefly from the 11th century and the beginning of the 12th, the majority of them written in Danish runes. No fewer than half of them belong to the central region of the kingdom, Uppland. These monuments enable us to follow the upward course of the Danish runes through Sweden from Shåne and Västergötland to the southern part of Norrland, and it can be noted that the inscriptions in the south are, on an average, of earlier date than those in the north. The custom of erecting runic stones was not long-lived anywhere. Generally speaking, it was abandoned whenever a region became definitely Christianized and controlled by the Catholic Church, but it seems to have had a vigorous final revival during the missionary period. The course of the spread of Christianity throughout Sweden during the 11th century —beginning in the south and proceeding to the north—is therefore traceable in a special way in the appearance of the runic stones. From the beginning runic stones were erected for the most part in the graveyard of the villages, and one principal reason for giving up the custom of erecting them must have been that with the spread of Christianity the dead had to be buried in the cemetery adjoining the parish church, often at a distance from the home. Thereby monuments lost much of their interest for the survivors. In Uppland, more especially, the runic inscriptions were accompanied by cleverly executed ornamental design, the patterns of which were taken from wood-cuts—the art of wood-cuts having been highly developed during the transmigration and Viking periods. Not merely the runes themselves but also these ornamental designs needed craftsmanship, therefore, and we find that many runic inscriptions are executed by expert craftsmen.

FROM L. F. A. WIMMER, "DIE RUNENSCHRIFT" (WEIDMANN)

FIG. 15.—THE HELNÆS STONE

The oldest and most remarkable (about A.D. 1025–1050) of these Uppland professional writers of runes was Asmund. He is probably identical with Osmundus, who is mentioned by the Bremen ecclesiastical historian, Adam. Osmundus was one of the Englishmen of Scandinavian origin who prepared the way in Sweden for the conquest of Christianity. Other talented masters of the art were Fot and Öpir. Asmund's stones record the names of a number of Swedes who took part in Canute the Great's conquest of England. On the Ängeby Stone (fig. 17), one of Asmund's inscriptions reads as follows: *rahnfrithr lit risa stain thina aftiR biurn sun thaiRa kitilmuntaR. kuth hialbi hans ant aukuths muthiR. hon fil a uirlanti. in osmuntr markathi.* This means: "Ragnfrid had this stone erected in memory of Björn, her and Kättilmund's son. God and God's Mother help his soul! He fell in Estland. But Asmund engraved (the Stone)."

FROM L. F. A. WIMMER, "DE DANSKE RUNEMINDESMAERKE" (GYLDENDALSKE BOGHANDEL)

FIG. 16.—THE EARLIER JÄLLINGE STONE

When the reduction of the runic alphabet from 24 letters to

16 came about, the simplifying of the individual letters was carried furthest in the Swedish-Norwegian runes. These are to be found in Gothland, in eastern Götaland, in Svealand, and in Norway, dating from the beginning of the Viking era, about A.D. 800. As we have just seen, they are displaced on monuments by the Danish runes in the beginning of the 11th century in Sweden, but many circumstances indicate that even after this period they are used for more private purposes. Comparatively few runic monuments have Swedish-Norwegian runes on them but among these few must be mentioned the largest and most original of all, the Rök-Stone (fig. 18). The top and the four sides are covered with runes. The older forms of runes are also used together with different kinds of secret writing.

FIG. 17.—THE ENGEBY STONE

The stone was erected by a father in memory of his son and the inscriptions would seem to have in some degree magical purpose: to wreak vengeance on the son's slayers. The beginning of the inscription reads: *aft uamuth stonta runaR thaR in uarin fathi fathiR aft faikion sunu;* which means: "In memory of Vämod stand these runes. And Varin, the father, made them in memory of his son, overtaken by death."

The Swedish-Norwegian runes take an original form in Sweden. From the start they are characterized by a great reduction in the length of the cross-strokes. In order to reduce as much as possible the length of the stroke whether written or incised also, the vertical strokes were as far as possible done away with.

Thus came into existence the so-called Hälsinge Runes (fig. 19), named after the region of Hälsingland, in which they have been found inscribed on a number of rune-stones dating from the 11th century. It is, however, now established that they were known and used in the central region of Sweden adjoining Lake Mälar, where very likely they were invented. The Hälsinge Runes are a kind of runic shorthand and they give us a clear indication that runes were widely used not merely on monuments but for all kinds of announcements: legal provisions, contracts, genealogies, poems, etc. The abbreviated form of the Hälsinge Runes is clearly due to the need of saving time, trouble and material.

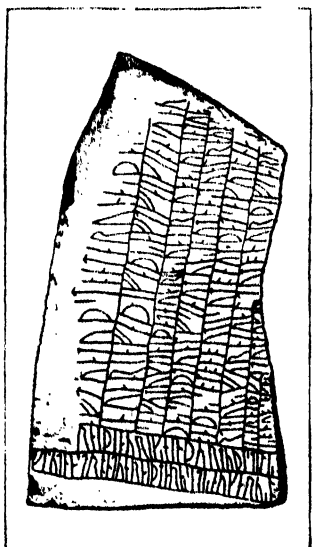


FIG. 18.—THE RÖK STONE SEEN FROM THE FRONT

In Norway there appeared in the 11th century a peculiar mixture of Swedish-Norwegian and Danish runes, which later led to an extension of the 16 letter alphabet to one better adapted to the northern sounds-system—the pointed runes. The Danes probably got the idea from England at the close of the 10th century. The Anglo-Saxon rune for *y* was a *u* inside which an *i* was written. This rune is to be met with in Denmark before the year A.D. 1000, and after this model there was constructed out of the *i* a special letter for *e* and out of the *k* a special letter for *g*. These new letters are used generally in the Danish runes during the 11th century, although not consistently. When the Danish and Swedish-Norwegian alphabet came to be blended during the 11th century in Norway, it would seem that towards the close of the century means were found to employ the wealth of letters thus produced to form a systematic representation of all the sounds in the language. The Latin alphabet, which had come into use with the introduction of Christianity, must have been of service in the construction of this radical improvement of the runes as equivalent for sounds. Thus came into existence the completed pointed runic alphabet (fig. 20).

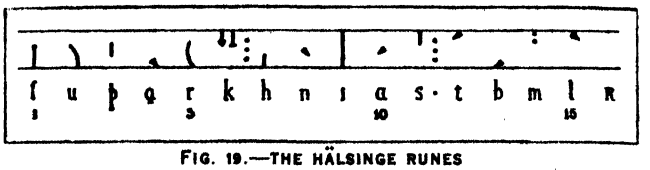

FIG. 19.—THE HÄLSINGE RUNES

Only in Gothland was the completed runic stave used to any great extent for inscriptions on monuments. But here and there in other parts of Scandinavia single monuments are to be found with inscriptions on them in the pointed runes. In Gothland there are about 250 erected stones adjacent to the churches and also out in the country parts, and the custom of raising such monuments persisted until much later. Gothland, moreover, had to begin with its own pointed runic alphabet, built up on the basis of the Danish runes alone. This was displaced later by the pointed runic alphabet in general use in Scandinavia.

The pointed runes were generally known and used in the whole of the Scandinavian North throughout the Middle Ages as the writing of cultured laymen. They were mainly used for private records. We possess a Danish legal manuscript, *Codex runicus*,

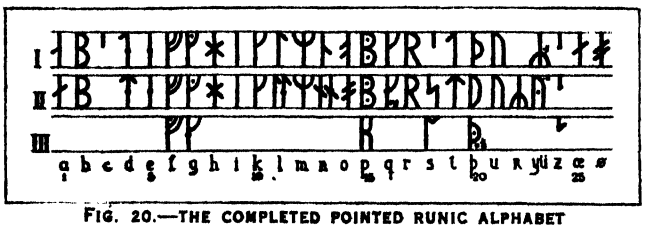

FIG. 20.—THE COMPLETED POINTED RUNIC ALPHABET

written in runes, dating from the end of the 13th century. There is extant, too, a prayer-book of later date, which is evidently intended also for a layman not familiar with Latin. St. Bridget, who was a member of a Swedish family of nobles, spells Swedish, when she comes to acquire the use of the Latin alphabet, in the way in which she learnt as a child with runic letters. There is evidence of the use of runes in Gothland as late as the 17th century though they were widely reinforced by Latin letters.

Runes were kept up longer than elsewhere in outlying Swedish regions like Dalarna and Härjedalen, where they were used for making occasional notes down to our own times. (O. v. F.)

RUNGE, CARL DAVID TOLMÉ (1856–1927), German mathematician and scientist, was born at Bremen on Aug. 30, 1856. He studied at Munich and Berlin. In 1883 he was appointed "privat-dozent" in Berlin, and in 1886 he became professor

of mathematics at the Technical High school, Hanover. He held the post of professor of applied mathematics at Göttingen until he retired in 1924. Runge died on Jan. 3, 1927. His early work was on the theory of functions and algebra, and showed the influence of Weierstrass and Kronecker. Later he devoted himself to the practical applications of his subject; he devised graphical methods, solutions of differential equations and Fourier analyses which were useful to engineers. His work with Kayser on spectral series is well known. Runge investigated the magnetic resolution of spectrum lines, the flame and spark spectrum of radium, and with Paschen designed a mounting for a concave grating.

He is the author of *Theorie und Praxis der Reihen* (1904); *Graphical Methods* (1912, etc.); *Vektoranalysis* (1919).

RUNNIMEDE or **RUNNYMEDE,** a meadow on the south bank of the river Thames, England, in the county of Surrey and the parish of Egham. It is celebrated in connection with the signing of Magna Carta by King John on June 15, 1215. It has been disputed whether the ceremony took place actually in the meadow or on Magna Carta or Charter island lying off it. The charter itself indicates Runnimede by name, but this may have included the island, which is the traditional site and was in 1217 the meeting-place of Henry III. and Louis of France.

RUNNING. The most primitive form of athletic exercise considered as a sport, running has been in vogue from the earliest times, and the simple foot-race (*δρόμος*) run straight away from starting point to goal, or once over the course of the stadium (a little over 200yds.), formed an event in the Greek Olympic pentathlon, or quintuple contest (*see* GAMES, CLASSICAL). There was also the race once over the course and return (*δίαυλος*) and the *δόλιχος*, a long race run many times (often as many as 12; *i.e.*, about 2¾m.) up and down the stadium. There was also the *δρόμος ὁπλιτῶν*, a short race for warriors, who wore full armour and carried sword and shield. Except in the warriors' race, the Greek runners were naked, save occasionally for a pair of light shoes. No records of the times returned have been handed down, but the contests must have been very severe since the ancient Olympic chronicles preserve the memory of several men who fell dead at the end of the long course. According to Virgil (*Aen.* V. 286 *et seq.*) running was practised in circus exhibitions in ancient Italy.

The best runners in the middle ages were most often found among the couriers maintained by potentates and municipalities. The Peichs, or Persian couriers, of the Turkish sultans, often ran from Constantinople to Adrianople and back, a distance of about 220m., in two days and nights. In districts of India and Africa not traversed by railways, native runners are still employed to carry the mails.

In all parts of Great Britain track, road and cross-country running have been popular forms of recreation for many centuries. To-day, however, practically all the sprint records are held by Americans, while many of those for the middle distances stand to the credit of Scandinavian or Continental athletes and all previous figures at distances from 30 to 100m. have been eclipsed by the 40-year-old South African farmer, Arthur Newton.

Running at the present day is divided into three classes—

Sprinting.—Sprinting consists of running over short distances with a full and continuous burst of speed, the chief distances being 100yds., 220yds. and 440yds., and the like metric distances. Distances up to and including 220yds. are, in America, called "dashes." The course for sprint races, when run in the open air, is marked off in lanes for the individual runners by means of cords stretched upon short iron rods. In the modern style of sprinting the result depends often upon the start. The old method of dropping a handkerchief was the worst possible way to give the starting signal, since the muscles react most slowly to the impression of sight, less so to those of touch, and most quickly to those of sound, a difference of $\frac{1}{25}$sec. in reaction amounting to over 1ft. in a run of 100yds. All modern foot-races are, therefore, started by the report of a pistol. Until 1887 all classes of foot runners commenced their races from a standing position. In that year Charles H. Sherrill, of Yale university, U.S.A., demonstrated an entirely new method, known as the "crouch," this method of starting becoming in a short time universal.

It has often been maintained that a 100yds. race can, and should, be run on one breath. This is not so. Some men breathe all the time, but the majority endeavour to increase their running as the 75yds. mark is reached and a second breath is taken. Many types of finishing style have been tried, and it is finally admitted to be wrong to fling up the arms as the tape is breasted. Some runners go straight past the winning-post without any break in the rhythm of the running action, others throw their bodies forward, and some few have successfully effected a jump; but the best type of finish is probably that recommended by the late S. A. Mussabini, in which the athlete goes down to the tape at the finish line, as if he were falling forward, in the last stride of the race.

The improvement in style, shoes and track surfaces has resulted in the continued reduction of sprinting records. Great Britain has produced a number of sprinters capable of equalling 10secs. at 100yds. and 22secs. at 220yds., and quite a number to beat 50 secs. for 440yds., but the palm for producing record-breaking sprinters must go to America.

At the English championships 10secs. has been beaten five times, the first occasion being in 1912; 22secs. for a furlong has been beaten nine times since 1913, and 49secs. for 440yds. only beaten four times since 1881. In the American championships "even time" has been beaten ten times at 100yds. and 11 times at 220yds., but 49secs. for 440yds. has been beaten only three times since 1896. The Oxford and Cambridge records read 100yds., $9\frac{9}{10}$secs., A. E. Porritt, Oxford, 1925; and 440yds., 49⅕secs., D. MacMillan, Cambridge, 1912. Those for the American universities were, in 1927, 100yds., 9⅗secs., H. P. Drew, University of California, 1914, and C. Paddock, University of Southern California, 1921; 220yds., 20⅖secs., R. Locke, University of Nebraska, 1926; and 440yds., 47⅖secs., J. E. Meredith, University of Pennsylvania, 1916. The official world's records are held by C. W. Paddock, U.S.A., for the 100yds., 9⅗secs., and for 220yds., 20⅖secs., as set out at the end of this article, but application was made to the I.A.A.F. in 1927 for the recognition of 100yds. in 9⅗secs., by C. W. Paddock, U.S.A., 1926, and 220yds. in 20⅖secs. by R. A. Locke, U.S.A., 1926.

Experiments, made with an electrical timing apparatus of his own invention, by Prof. A. V. Hill, F.R.S., of the University of London, who has taken a keen interest in the scientific aspects of athletic sport, have brought to light many interesting points in connection with sprinting and the physiological processes involved in severe muscular exercise in man. Prof. Hill's observations and experiments, conducted at Cornell university, U.S.A., indicate that 90% to 95% of the effort made by a sprinter travelling at top speed is expended in overcoming not the resistance of the air, but the frictional resistance of his own muscles. The force exerted by the first-class sprinter at maximum speed is equal to 80% to 90% of his body weight, and in running 100yds. he does sufficient work to lift himself 240ft. to 270ft. into the air. He will bring into play approximately 8h.p. and attain his maximum speed at 60yds. or 70yds. from the start, when he may be travelling as fast as 24 m.p.h. Approximately one second is lost in the starting process, even when the modern "crouch" start is employed. After the 70yds. mark is reached the runner begins to lose speed, through fatigue occasioned by the rapid appearance of lactic acid in the muscles, as much as ⅛ oz. of such acid being secreted in the muscle substance every second. In the course of a 200yds. race run at top speed throughout, the speed drops as much as 15% between 70yds. and 190yds.

The quarter-mile race is almost always run on a circular track and, at many important meetings, each runner is provided with his own lane to which he must keep throughout the race, the starting positions being so allotted that each runner may traverse the full course. Tactics, which do not apply to the shorter "dashes," enter into the quarter-miler's scheme of things, and the race is run according to the athlete's type. The quarter-mile is a distance which it is almost impossible to cover at top speed all the way. The sprinter-type of runner must try to start fast enough to get a good position rounding the first bend and should hold his top

speed for 75yds. to 100yds., after which he drops his pace to a "float" with a long, swing stride. When he has travelled some 300yds. he begins gradually to increase his pace for the final dash for the tape. The middle-distance type of quarter-miler must make up in endurance what he lacks in speed, and should try to win his race by keeping out of the first struggle for position and so save his strength for the fight at the finish. J. E. Meredith, University of Pennsylvania, U.S.A., in 1916 ran a quarter-mile in 47⅘secs., and half a mile in 1 min. 52⅕secs. In the same class may be placed Eric Liddell, Scotland, who in 1920 won the Olympic 400 metres race (2½yds. less than 440yds.) in the new world's record time of 47⅗secs.

Middle-Distance Running.—The chief middle distances are 600yds., 880yds., 1m. and 2m., but of these the 600yds. and 2m. are not reckoned as championship races. Endurance, speed and strategy are all essentials of success in middle-distance races, but a true appreciation of pace and the ability to run strictly in accordance with a pre-arranged time schedule are the most important attributes of the first-class performers at distances of 1m. and over.

The improvement which has taken place in half-mile records since the late P. M. Thornton, C.U.A.C., won the first English championship of 1866 in 2min. 5secs., as compared with the performances of J. E. Meredith, University of Pennsylvania, U.S.A., who in 1916 covered the distance in 1min. 52½secs., and Dr. Otto Peltzer, Germany, who in 1926 established the world's record of 1min. 51⅘secs., is due largely to the appreciation of the principle that there is no race in which judgment of pace in the initial 440yds. counts for so much as in the half-mile. The majority of coaches agree that the first quarter-mile should be run 3secs. faster than the second quarter-mile, but the late S. A. Mussabini, doyen of British coaches, held exactly the opposite view. The important principle involved is that there must be a 3secs. variation between the pace of the two quarter-miles.

In America the 100yds. dash is considered the principal event at all championship fixtures; but in England it is the 1m. race which is regarded as the blue ribbon of the track. To runners at this latter distance it is the prearranged time-table that is all important. The following schedule sets out the quarter-mile lap times of five of the fastest miles that have ever been run:—

Yds.	W.G.George (Eng.), 1886.	J. P. Jones (U.S.A.), 1913.	N. S. Taber (U.S.A.), 1915.	A. G. Hill (Eng.), 1921.	P. Nurmi (Finland), 1923.
	secs.	secs.	secs.	secs.	secs.
1st. 440	58½	61⅘	58	59⅗	58⅘
2nd. 440	63¼	67⅗	67	64⅘	63⅗
3rd. 440	66	66⅖	68	67½	64⅘
4th. 440	65	58½	50⅗	62⅖	63⅗
1 mile	4·12¾	4·14⅗	4·12⅗	4·13¼	4·10⅗

W. G. George was the type of superman runner who appears but rarely, and it is significant that nothing approaching his performance of 1886 was produced until 1913. In 1915, N. S. Taber, Brown University, U.S.A., by means of a specially framed handicap, beat George's record, and in 1921 A. G. Hill went very near to still more sensational time when he won the A.A.A. championship. The fact that W. R. Seagrove and H. B. Stallard, both of Cambridge university, forced Hill to run the first quarter-mile in less than a minute upset his whole plan of campaign and probably cost him a world's record. Hill had been well trained by the late S. A. Mussabini, who had evolved a theory that each quarter-mile of a mile race should be covered as nearly as possible in the same time, and it was planned that Hill should hold to a 62secs. schedule for each lap. How he was forced by the pace set up by the Cambridge blues to digress from that schedule may be seen from the above table. Much the same thing happened at Stockholm in 1923, when Paavo Nurmi, the phenomenal Finn, established the present world's record. He also aimed at a 4min. 8secs. mile. His opponent, Edvin Wide, Sweden, however, led for the first lap at such a speed that Nurmi simply dared not let him get away. At the half distance they were absolutely level, 880yds. having been covered in 2min. $1\frac{8}{10}$secs., namely, 2½secs. faster than Nurmi had planned. From that point the Finn forged ahead and, covering three-quarters of a mile in 3min. $6\frac{7}{10}$secs., was almost level with his schedule, which should have been 3min. 6secs. The first fast lap, however, had told on Nurmi and he was able to return only $63\frac{7}{10}$secs. for the fourth and final quarter-mile. There is little doubt that sooner or later a runner will appear with sufficient will-power to allow his opponents to do as they please, while he himself adheres strictly to his time-table, and then, provided the man has the form and the speed of a George, a Hill or a Nurmi, the 4min. 8secs. mile will become an accomplished fact.

The 2m. race is an indoor championship in America, and figures also in the inter-collegiate outdoor championships, in place of the 3m. which is included at the Oxford and Cambridge sports.

Long-Distance Running.—This includes all flat races from the three miles, which figures in the Oxford and Cambridge sports programme, upwards, as well as steeplechasing, road and cross-country running. Great Britain was for centuries the home of long-distance running, and for many years all world's records from two to ten miles were held by the English runner, Alfred Shrubb, those from 12 to 90 miles standing also to the credit of British athletes. Since 1912, however, there have appeared such phenomenal foreign performers as the late Jean Bouin, France, his compatriot, J. Guillemot, the Finns, Hannes Kolehmainen, Paavo Nurmi, Villie Ritola, V. Sipila and A. Stenross, and the Swedes, E. Wide and Sven Lündgren, who have changed most of the figures up to 30m. From 30m. to 100m. all records have been recently eclipsed by the 40-year-old South African farmer, Arthur Newton. Hard, conditioning training over a prolonged period is necessary for a distance runner. Good pace-making, strategy and such an appreciation of time and pace as will allow the athlete to "run to the watch," are of great importance. Nurmi, who was one of the greatest distance runners in the world in 1924, made it his practice to carry a stop-watch in his hand in order to time himself over the various stages of any race in which he ran. In England at the championship meetings the distance events are four and ten miles; and at the Olympic games, 5,000 metres (approximately 3¾m.) and 10,000 metres (nearly 6¼m.); there is also the marathon race (26m., 385yds.)

Steeplechasing was originally only a cross-country run over a course plentifully provided with natural obstacles; but at the present day the steeplechase takes place on the grass plat inside the cinder track of the athletic field; the obstacles, comprising 3ft. hurdles and a combined hedge and water jump, are artificial. The championship distance in England and America is 2m., and at the Olympic games 3,000 metres (3,280·87yds.).

Cross-Country Running still remains more popular in England than elsewhere, but of late years French teams have, upon occasion, beaten the best runners that England, Scotland, Wales or Ireland were able to assemble. An International race at 10m. takes place annually, and that is the distance also of the English national championship. A 10,000 metres (almost 6¼m.) steeplechase was added to the Olympic programme in 1920 and 1924. These Olympic races, however, have not proved satisfactory on account of the indifferent nature of the country selected.

Team Racing is a form of distance running which, in 1927, was rapidly regaining its popularity in Great Britain, largely through the enterprise of the Birchfield Harriers. There is no A.A.A. team championship, but a race of this kind was added to the Olympic programme in 1900 and won by England. In 1908 the distance was 3m. and Great Britain was again successful. In 1912 the distance was reduced to 3,000 metres (2m., less 239·13 yds.), and since this reduction in the distance was made America has won twice and Finland once. It is usual for a running team to be comprised of five men, the first four of whom to finish score points for their side, as one for first, two for second, and so on, the team having the least score being reckoned the winners.

Relay Racing.—This form of competition has long been practised in America and has become popular in Great Britain. Relay races are usually run by four men, each going a quarter of the distance. From 1911 to 1926 only one relay race was included in the English championships. This was really a medley race in which the first man ran 880yds., the second and third 220yds. each, and the fourth 440yds. In 1927 the medley relay was abandoned and two other relay races substituted, *i.e.*, a 440yds. relay, in which each of four runners goes 110 yds., and a 1m. relay (4 x 440yds.).

The American national championship relay distances are 440-yds., 880yds., 1m. and 2m., four runners representing each team, and each running an equal distance. In addition there is, in the United States, the most famous of all relay fixtures, the Pennsylvania university relay meet, at which English university athletes have competed successfully upon several occasions.

The Olympic relay distances are 400 metres (437·45 yds.) and 1,600 metres (almost a mile).

This method of racing was started in the United States about the year 1890, on the model of the Massachusetts Firemen's "bean-pot" race. The old method was for the men running the second quarter of the course each to take over a small flag from the first relay men as they arrived, before departing on their own stage of the race, at the end of which they, in their turn, handed on their flags to the awaiting next runners. The flags, however, were considered cumbersome, and for a time it was sufficient for the outgoing runner to touch or be touched by his predecessor.

RUODLIEB, a romance in Latin verse by an unknown German poet who flourished about 1030; he was almost certainly a monk of the Bavarian abbey of Tegernsee. The poem is one of the earliest German romances of knightly adventure, and its picture of feudal manners gives it value as an historical document.

The best edition is by F. Seiler (Halle, 1882).

RUPEE, the standard coin of the monetary system in India (Hindustani *rupiya,* from Sanskrit *rupya*). A silver coin of 175 grains Troy, called *tanka,* approximating to the rupee, was struck by the Mohammedan rulers of Delhi in the 13th century; but the rupee itself, of 179 grains, was introduced by Sher Shah in 1542. The English at first followed various indigenous standards; but since 1835 the rupee has uniformly weighed 180 grains, containing 165 grains of pure silver. The weight of the rupee (one *tola*) is also the unit upon which the Indian standard of weights is based. Down to about 1873 the gold value of the rupee was 2s., and ten rupees were thus equal to £1; but after 1873, owing to the depreciation of silver, the rupee at one time sank as low in value as 1s. In order to provide a remedy the government of India decided in 1893 to close the mints, and in 1899 to make the rupee legal tender at fifteen to £1. The Government also engaged to sell Council drafts on India to an unlimited amount at a price from 1s., 4⅛d. to 1s. $3\frac{29}{32}$d. per rupee. This worked satisfactorily, owing to the fact that normally India exports more than she imports. Should there be a trade balance temporarily adverse to India, so that the market quotation of sterling against the rupee fell below 1s. $3\frac{29}{32}$ d., the Government undertook to sell reverse Council drafts on London. The exchange was thus maintained at 1s. 4d., and the rupee linked to a gold currency, sterling,

with the sale of Council and reverse Council drafts as a somewhat artificial substitute for the shipment of gold.

The success of this system depended upon two conditions. First, the bullion value of the rupee must not rise above 1s. 4d., otherwise it would pay the public to melt down rupees for their silver content. Secondly, the secretary of State must have sufficient rupees at his command to enable him to redeem such quantities of Council drafts as the public wished to buy. Until the outbreak of the World War, both these conditions were fulfilled. The secretary of State had little difficulty in amassing sufficient rupees to meet his engagements, while it was only found necessary to sell reverse Councils on three occasions in the present century.

The Rupee Crisis.—The World war altered the situation. India's exports increased owing to the Allies' demand for raw materials, while imports of manufactured goods were forcibly curtailed owing to the inability of belligerent countries to produce them. Also the campaign in Mesopotamia was financed in rupees. All these causes led to a greatly increased demand for rupees, and by 1916 the secretary of State was experiencing great difficulty in obtaining enough to meet in full the demand for Council drafts.

At the same time, partly owing to troubles in Mexico, the price of silver rose; in short, by 1916 the two conditions on which the Indian currency was based were ceasing to operate. Radical modifications had to be introduced. The sale of Council drafts was rationed, and their price gradually increased in sympathy with that of silver. All gold imported had to be sold to the Government, and the private importation of silver was prohibited. Rupee notes could be issued to a certain extent, but the danger of inconvertibility had to be watched. But the quantity of silver available still fell below the country's requirements, and the convertibility of the note issue was threatened. In April 1918, the Pittman Act enabled the U.S. Government to sell 200 million fine ounces of silver to India at a price of $1.015 per fine ounce. This shipment eased the situation and preserved the currency till the Armistice.

In May 1919, the Babington-Smith committee sat to evolve a new system, made necessary by the grave modifications due to war measures. It recommended the fixation of the exchange at Rs. 10 to the gold sovereign; the sale by open tender of Council and, if necessary, of reverse Council drafts; free importation and exportation of gold and free importation of silver. Owing to unforeseen circumstances, the scheme broke down almost immediately. The report was issued at the moment when the prices of commodities, including silver, were at their highest; and the slump followed. The price of silver collapsed, and rendered unnecessary the raising of the value of the rupee. Also the 1921 trade depression had a serious effect in India. The demand for raw materials dried up, but meantime goods ordered from Europe continued to arrive up till the end of 1921. Consequently, a heavy adverse trade balance set in. The rupee began to fall, until finally it arrived at round about the pre-war level of 1s. 4d. The sale of reverse Councils was quickly found to be too expensive a remedy, and was abandoned.

By 1923, conditions had improved, and the excess in imports of 1921 had largely been absorbed. The Babington-Smith report still remained nominally in force for a few years, but it became necessary to reconcile the official currency system with the facts of the case. The Hilton-Young committee was appointed, and presented its report in 1926. It recommended the formal adoption of the gold standard for India, and the establishment of a new central bank. A bill passed in 1927 gave effect to the first part of the report. It stabilized the rupee at 1s. 6d. gold. Pending the establishment of the central bank, the Government of India was bound to buy or sell gold at the gold points corresponding to the new parity of 1s. 6d.; these duties are to be taken over by the central bank when established. The Bill to establish the central bank was thrown out by the Assembly; the Government of India continued indefinitely to maintain the exchange at the new level of 1s. 6d.

The rupee is divided into 16 annas, and the anna is sub-divided into 12 pies. (*See* also CURRENCY.) (N. E. C.)

RUPERT (HRODBERT), **ST.**, according to the *Gesta Sancti Hrodberti*, which dates from the ninth century, a kinsman of the Merovingian house, and bishop of Worms under Childebert III. (695–711). At the invitation of the duke of Bavaria, Theodo II., Rupert went to Regensburg (Ratisbon), where he began his apostolate. He founded the church of St. Peter near the Wallersee, and subsequently, at Salzburg, the church of St. Peter, together with a monastery and a dwelling for the clerks, as well as a convent for women "in superiori castro Iuvavensium." He died at Salzburg. He is regarded as the apostle of the Bavarians.

See *Bibliotheca hagiographica Latina* (Brussels, 1899), n. 7390–7403; W. Levison, "Die älteste Lebensbeschreibung Ruperts von Salzburg" in *Neues Archiv für aeltere deutsche Geschichtskunde*, xxviii. 283 *seq.*; Hauck, *Kirchengeschichte Deutschlands* (3rd ed.).

RUPERT (1352–1410), German king, and, as Rupert III., elector palatine of the Rhine, was a son of the elector Rupert II. and Beatrice, daughter of Peter II., king of Sicily. He was born at Amberg on May 5, 1352, and succeeded to the government of the Palatinate on his father's death in 1398. On Aug. 21, 1400, having helped depose King Wenceslaus at Oberlahnstein, Rupert was elected German king at Rense, and crowned at Cologne on Jan. 6, 1401. An expedition to Italy against Gian Galleazzo Visconti, duke of Milan (1401–2), proved a failure, but he was recognized by Pope Boniface IX. in Oct. 1403. After some years of struggle with the anarchy in Germany and the partisans of Wenceslaus, Rupert died at Landskron near Oppenheim on May 18, 1410. He was buried at Heidelberg. He married Elizabeth, daughter of Frederick IV. of Hohenzollern, burgrave of Nuremberg, and left three sons and four daughters. Rupert, who earned the surname of *clemens*, was brave and generous, but his resources were totally inadequate to bear the strain of the German kingship.

BIBLIOGRAPHY.—C. Höfler, *Ruprecht von der Pfalz genannt Clem römischer König* (Freiberg, 1861); A. Winkelmann, *Der Romzug Ruprechts von der Pfalz* (Innsbruck, 1892); and J. Weizsäcker, *Die Urkunden der Approbation König Ruprechts* (1899).

RUPERT, PRINCE, COUNT PALATINE OF THE RHINE AND DUKE OF BAVARIA (1619–1682), third son of the elector palatine and "winter king" of Bohemia, Frederick V., and of Elizabeth, daughter of James I. of England, was born at Prague on Dec. 17, 1619. A year later his father was defeated at the battle of the Weisser-Berg, near Prague, and driven from Bohemia. After many wanderings the family took refuge in Holland, where Rupert's boyhood was spent. In 1633 the boy was present at the siege of Rheinberg in the suite of the Prince of Orange, and in 1635 he served in this prince's bodyguard. In 1636 he paid his first visit to England, was entered as an undergraduate, though only nominally, at St. John's college, Oxford, and was named as the governor of a proposed English colony in Madagascar. But this scheme did not mature, and Charles sent his nephew back to Holland, having, however, formed a high opinion of his energy, talent and resolution. In 1637 he was again serving in the wars, and in 1638, after displaying conspicuous bravery, he was taken prisoner by the imperialists at the action of Vlotho (17th October) and held in a not very strict captivity for three years. In 1641 he was released, and, rejoining his mother in Holland, was summoned to England to the assistance of his uncle, for the Great Rebellion was about to break out.

The Civil War.—In July 1642 he landed at Tynemouth. Charles at once made him general of the horse and independent of Lord Lindsey, the nominal commander of the whole army. From this point until the close of the first Civil War in 1646 Prince Rupert is the dominant figure of the war. His battles and campaigns are described in the article GREAT REBELLION. He was distinctively a cavalry leader, and it was not until the battle of Marston Moor in 1644 that the Royalist cavalry was beaten. The prince's strategy was bold as well as skilful, as was shown both in the Royalist movements of 1644 which he proposed, and in the two far-ranging expeditions which he carried out for the relief of Newark and of York. In Nov. 1644, in spite of the defeat at Marston Moor, he was appointed general of the king's army. But this appointment, though welcome to the army, was

obnoxious to the king's counsellors, who resented the prince's independence of their control, to some of the nobility over whose titles to consideration he had ridden roughshod, and to some of the officers whose discipline and rapacity were likely to be repressed with a heavy hand. These dissensions culminated, after the prince's surrender of Bristol to Fairfax, in a complete break with Charles, who dismissed him from all his offices and bade Rupert and his younger brother Maurice seek their fortunes beyond the seas.

Rupert's character had been tempered by these years of responsible command. By 1645, although the parliamentary party accused him not merely of barbarity but of ingratitude for the kindnesses which his family had received from English people in the days of the Palatinate War, Rupert had in fact become a good Englishman. He was convinced, after Marston Moor, that the king's cause was lost, in a military sense, and moreover that the king's cause was bad. When he surrendered Bristol without fighting to the uttermost, it was because Fairfax placed the political issue in the foreground, and after the capitulation the prince rode to Oxford with his enemies, frankly discussing the prospect of peace. Already he had deliberately advised Charles to make peace, and had come to be suspected, in consequence, by Charles's optimistic adviser Digby. But to Charles himself the news of the fall of Bristol was a thunderbolt. "It is the greatest trial to my constancy that has yet befallen me," he wrote to the prince, "that one that is so near to me in blood and friendship submits himself to so mean an action." Rupert was deeply wounded by the implied stain on his honour; he forced his way to the king and demanded a court-martial. The verdict of this court smoothed over the matters for a time, but Rupert was now too far estranged from the prevailing party at court to be of any assistance, and after further misfortunes and quarrels they separated, Charles to take refuge in the camp of the Scots, Rupert to stay, as a spectator without command, with the Oxford garrison. He received at the capitulation a pass from the parliament to leave England, as did also his faithful comrade Maurice.

For some time after this Rupert commanded the troops formed of English exiles in the French army, and received a wound at the siege of La Bassée in 1647. Charles in misfortune had understood something of his nephew's devotion, and wrote to him in the friendliest terms, and though the prince had by no means forgiven Digby, Colepeper and others of the council, he obtained command of a Royalist fleet. The king's enemies were now no longer the Presbyterians and the majority of the English people but the stern Independent community, with whose aims and aspirations he could not have any sympathy whatever. A long and unprofitable naval campaign followed, which extended from Kinsale to Lisbon and from Toulon to Cape Verde. But the prince again quarrelled with the council, and spent six years (1654–60) in Germany, during which period nothing is known of him, except that he vainly attempted (as also before and afterwards) to obtain the apanage to which as a younger son he was entitled from his brother the elector palatine. At the Restoration he settled in England again, receiving from Charles II. an annuity and becoming a member of the privy council. He never again fought on land, but, turning admiral like Blake and Monk, he played a brilliant part in the Dutch Wars. He died at his house in Spring Gardens, Westminster, on Nov. 29, 1682.

Apart from his military renown, Prince Rupert is a distinguished figure in the history of art as one of the earliest mezzotinters. It has often been said that he was the inventor of mezzotint engraving, but this is erroneous, as he obtained the secret from a German officer, Ludwig von Siegen. One of the most beautiful and valuable of early mezzotints is his "Head of St. John the Baptist." He was also interested in science, experimented with the manufacture of gunpowder, the boring of guns and the casting of shot, and invented a modified brass called "prince's metal."

Prince Rupert was duke of Cumberland and earl of Holderness in the English peerage. He was unmarried, but left two natural children; one a daughter who married General Emmanuel Scrope Howe and died in 1740, and the other a son, whose mother (who claimed that she was married to the prince) was Frances, daughter of Sir Henry Bard, Viscount Bellamont. The son was killed in 1686 at the siege of Buda.

See E. Warburton's *Life of Pr. Rupert* (1849) and additional authorities quoted in the memoir by C. H. Firth in the *Dict. Nat. Biog.*

RUPERT [RUPPRECHT] (1869–), German prince, the eldest son of King Louis III. of Bavaria, was born on May 18, 1869, at Munich. In 1906, after extensive travels in India and elsewhere, he was appointed to the command of the I. Bavarian Army Corps. At the outbreak of the World War he was commander of the Bavarian troops (the VI. German Army) and led them to victory in the great battles fought in Lorraine (Aug. 20–2, 1914). In the following October he was placed in command on the German front in Artois and southern Flanders, and, after having been advanced to the rank of field-marshal, was entrusted in the spring of 1917 with the chief command of the northern group of armies on the Western Front. In 1900 he married Marie Gabriele, a sister of the queen of the Belgians; she died in 1912; and in 1921 he married Princess Mitonia of Luxembourg and Nassau. Through his mother, the Archduchess Maria-Thérèse of Austria-Este, Prince Rupert was the descendant of the Stuart kings of England and, according to legitimist ideas, in the succession to the British crown. (*See* FRONTIERS, BATTLES OF THE.)

RUPERT'S LAND, a former district of Canada. The generous charter of Charles II. given in 1670 to the Hudson's Bay Company (*q.v.*) was interpreted to include all the country which was drained into Hudson Bay. As Prince Rupert was first governor of the Hudson's Bay Company his name was given to the concession under the name "Rupert's Land." It must be observed that Athabasca, New Caledonia and British Columbia were not included in the grant. They were held under the title Indian Territories by the Hudson's Bay Company by licence terminable every twenty-one years, the last term closing with 1859. Rupert's Land was transferred to Canada by the imperial government in 1870, and ceased to exist as a political name. It is still used as the title of the episcopal diocese, which is in the main coincident with the province of Manitoba.

RUPILIUS, PUBLIUS, Roman statesman, consul in 132 B.C. During the inquiry that followed the death of Tiberius Gracchus, conducted by himself and his colleague Popillius Laenas, he proceeded with the utmost severity against the supporters of Gracchus. In the same year he was despatched to Sicily, where he suppressed the revolt of the slaves under Eunus. During 131 he remained as proconsul of the island, and, with the assistance of ten commissioners appointed by the senate, drew up regulations for the organization of Sicily as a province. These regulations were known by the title of *leges Rupiliae,* Rupilius was subsequently brought to trial (123 B.C.) and condemned for his treatment of the friends of Gracchus. He died soon afterward.

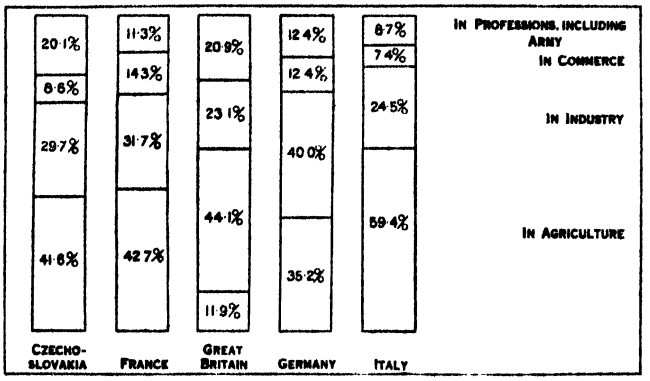
RURAL DEPOPULATION. In all countries of the world there is a trend from the country-side towards the town; even in countries where the rural population is increasing, the urban population is increasing at a greater rate, so that practically everywhere the proportion of the rural to the total population is decreasing.



In the old world this tendency is most noticeable in Great Britain, where the rural population has decreased not only relatively, but absolutely. There are fewer people in rural districts than there were 60 or 70 years ago, and the agricultural personnel is smaller. In 1921, according to the Selborne Report, there were 700,000 fewer cultivators than in 1870. Incidentally, there are fewer cultivators per 1,000 acres than in any other European country.

In the new world, Australia shows the most striking drift from rural to urban districts; statistics prove that one-half of its population live in the five capital cities, and only somewhat over 30% can be classed as rural. This is an example of a new country, still in the agricultural stage of its development, with approximately the same apportionment of population as a long

industrialised county, Britain.

What Is the Ideal Ratio?—The old idea (were such an idea ever really formulated) of a balanced population, was that half the nation should live in the country and the other half in the towns. But the old order changeth, and the question is: how far is the change beneficial or the reverse, not only from the economic but from the social and political points of view and, above all, in its relation to the physical standard of the race?

Reverting to Australia, the fact emerges that a rural population

FROM CISAR & POKORNY, "CZECHOSLOVAK REPUBLIC" (BENN)

COMPARATIVE TABLE SHOWING HOW THE POPULATION OF VARIOUS COUNTRIES IS DIVIDED AMONG DIFFERENT OCCUPATIONS

of some 30% not only produces sufficient food for the other two-thirds, but actually an exportable surplus to the value of £125,000,000 per annum, being 50% of the total output from the land. The reason for this is that the output per head of those engaged in agriculture (including stock raising) is very high—perhaps the highest in the world. One Australian can plough, sow and harvest 300 acres of wheat. He employs 8 horses and a 5-furrow plough; later in the season, these 8 horses draw a combined reaping and threshing machine, which cuts the *ears* of corn, threshes, bags the grain, and leaves the bags standing in the field—all in one operation. Next, the cultivator drives a wagon with patent appliance that picks up the sacks. However, though the output per man be high, the yield per acre is low—only some 11 bushels, as compared with the English average of 31 bushels per acre.

This example shows the high output *per cultivator* under up-to-date extensive cultivation, and demonstrates that a ratio of rural to urban population of : 1 :: 1 need no longer be maintained, since the Australian ratio of : 1 :: 3 is evidently effective in that country. But Australia is an extreme example, and there is no doubt that as population increases there, intensive cultivation must replace extensive and the yield per acre go up, and the output per man go down.

In Canada, the population is about evenly divided between town and country. New Zealand, South Africa and the British Colonies are still predominantly rural and agricultural. A few decades ago, 65% of the population of the United States was rural, but this section has been decreasing rapidly, especially since 1918; in 1920 it had decreased to 49% of the total population, and the process continues. In France the population is evenly divided between town and country; and, even in a country like Denmark which lives by its agriculture, half the workers are urban and half rural. But the rural section exports large quantities of produce.

The accompanying diagram taken from the publication "La Republique Tchécoslovaque" throws an interesting light on the conditions in five European sections.

In Great Britain, the rural population is: 1 :: 5. Its output per man, however, is lower than in Australia, and it not only produces no surplus to export, but it meets only half the home food requirements. These ratios are, of course, only a rough indication, and accurate calculations would take up too much space, since the problem is complicated by the effect of imports and exports, also by the commodities being produced in some places under an extensive, and in others under a comparatively intensive, system of agriculture.

It is clear from the diagram that the proportion of cultivators in Great Britain is altogether too small. The same comment applies to the British empire; the temperate parts of the empire suitable for white habitation have an area of 7,000,000 square miles; yet including the motherland, there are only 3,500,000 white cultivators in this vast area. In contrast, European France, on one thirty-seventh of that area, employs nearly 9,000,000 tillers of the soil.

The conclusion seems to formulate itself: while no longer necessary to maintain a ratio of : 1 :: 1 between rural and urban populations, a ratio of : 1 :: 5 is exaggerated, and something between the two should be the objective.

Physical Deterioration.—So far the economic point of view has been considered briefly: how many cultivators are required to feed the rest of the nation? But the rural population has a second and most important function to perform; the physical standard of the race depends largely upon it.

All evidence points to the fact that the physical standard of the urban population deteriorates unless there is a constant infusion of fresh blood from the country; the birth-rate of the third generation of townsmen falls off noticeably, and American tests show that the country-born or their children produce more leaders of men than do the succeeding generations of townsmen. In the case of Great Britain, there is an added need for a high proportion of rural folk in that they provide the type of settler most needed in the oversea parts of the British empire—people possessed of a "land sense" and capable of developing the agricultural resources of its dominions and colonies.

It cannot be disputed that, taking a long view, stability—moral, social and economic—rests upon an adequate rural population. Indications are not wanting that the rural population of Great Britain is not only inadequate, but dangerously so.

Causation.—It is now time to examine the main causes of the drift to the towns. First may be put the love of excitement and adventure; enterprising youths wish to see the world; but there is little doubt that by the time they reach 40 many would gladly return to the country had they the facilities for doing so. Secondly, there is the higher wage attraction, often chimerical, since the urban wage in many cases is little higher than the rural when all pros and cons are weighed. A third reason is the alleged dulness of the country-side; but the advent of motor transport and wireless, and the great increase in village clubs with their social halls, have already wrought so great a change that this cause of depopulation is fast disappearing. A fourth cause, which, although important, figures more largely than the facts of the case warrant, is the increased use of machinery in agriculture; this may have some effect where cultivation is extensive, but not where cultivation is intensive. For instance, in Denmark more agricultural machinery is used than in Britain, yet twice as many cultivators per 1,000 acres are employed.

Great Britain has certain causes of rural depopulation which are peculiarly its own. Perhaps the most basic is that with the development of steam power, and with world conditions particularly favourable to British industry during the first half of the 19th century, the nation's whole attention was concentrated upon urban industry. The very future of the race was deemed to depend upon industrial development, its civilization was to be an urban civilization. This may be regarded almost as the *idée fixe* of the past century, not only of economists and politicians but of the whole nation; in consequence the rural side was neglected. Other nations, for various reasons, did not suffer to the same extent from this complex, they did not lose sight of the importance of the rural side, and they definitely endeavoured to keep a just balance between urban and rural development.

Secondly: the primary rural industry—agriculture—is undercapitalized. (The working capital per acre in Great Britain is much lower than it is in other great European countries.) It is an axiom that population follows capital. A third point is the lack of organization among the rural population; even a cursory study of European countries brings to light a strong contrast in

the degree of organization. A highly organized agriculture not only keeps people *in* the country, but definitely attracts them *to* the country. This is only a natural consequence, since members of an organized industry earn more profits, and are more secure of those profits than members of an unorganized industry.

Agriculture in Great Britain not only employs fewer cultivators per 1,000 acres than in highly organized countries, but it is practically without the network of subsidiary industries that give vast employment in other countries. In consequence, its absorbing power is low and the net result is that agriculture and other rural industries cannot absorb more than about half of the country-born children educated in rural schools.

From the diagram it will be seen that, of the five nations under review, not only has Great Britain the fewest agriculturists, but also the lowest number of persons who make their living by manual work. One reason for this is that Great Britain has been and still is the emporium of the world, and the great distributing nation. Although this may justify a larger number of non-manual workers than exists in other countries, it is clear that the number engaged in agriculture is too small.

The fourth cause of migration from the country must be put down to the prevailing system of education, which has not tended to create a "land sense"; rather has it influenced the rising generation away from the land. This defect is being overcome gradually, but has not yet disappeared. It certainly is not surprising if rural teachers, seeing the unorganized state of agriculture, and the consequent lack of opportunity, use their influence in favour of an urban career—at all events for their more intelligent pupils.

For the fifth cause of the depletion of the British country population, one must look into past history. The enclosure acts necessitated by the need for higher production to feed the growing towns, were operated in such a way as to reduce the number of those directly interested in the land, and to turn the agricultural labourers into a landless proletariat entirely dependent upon wages. These evils were avoided in Germany, for instance, by taking effective measures to enable the "ex-commoners" to become small occupying owners.

Remedies.—The mere enumeration of the causes of depopulation indicates the possible remedies.

Since agriculture is the main industry of the country-side, it is essential that it should employ the economic maximum of cultivators; but it must be on the basis of an organized and not of an unorganized industry. The form that organization should take, however, is important. The State, in the opinion of the present writer, should show itself generally sympathetic and should remove any existing barriers to voluntary effort, but it should not attempt to organize the industry; this can be done only by agriculturists themselves through the medium of co-operation carried out in co-operative creameries, bacon factories, sugar, jam, fruit bottling and pulping factories and the organization of marketing generally.

Since population follows capital there should be a definite system of agricultural credit, independent of, but working harmoniously with the system of urban credit, and upon a basis of co-operative control. Without exception in all other European countries it has been found necessary to base the organization of agriculture upon a system of organized rural credit. This has not been clearly apprehended in Great Britain, and, in consequence, much time and effort have been wasted.

Pari passu with higher organization comes a higher degree of intensification, since then it pays to make two blades grow where one grew before, and with increased profit more hired labour can be employed and at better wages. This in itself, however, is not sufficient; since enclosure divorced the labourer from the land, it is necessary to undo the process and give him easy access to land. Allied to this is the question of house accommodation. With more available houses, many young men would doubtless marry and remain in the country.

As already stated, several potent forces are at work making the country-side brighter; but something more than that is needed —community life must be developed. The countryman must be made to feel that he is indeed a member of the rural community, and has his part to play in it. It is really easier to create the community spirit in rural than in urban districts; and that spirit is a valuable national asset.

Factory and Farm.—Finally, much more could be done to encourage dual occupation. In Bohemia, the factories are not all crowded into great cities, making life hideous, but scattered throughout the country districts; the industrial buildings, not at all unpleasing, are surrounded by a kind of garden city, and employees who wish it can have a plot of land to cultivate. In the new industrial Italy, workers are frequently allied to both factory and land. Again, the majority of Antwerp dock labourers have a piece of land which they can till when shipping is slack. In England a certain amount of fortuitous dual occupation exists wherever allotments are provided, and there are one or two cases where work on the land has been definitely organized in connection with an urban industry. But there is room for great development. It is of extreme importance to enable men to occupy themselves profitably and wholesomely when otherwise they would be workless and deteriorating. The proper use of the land makes this possible. In this connection a sound motto would be: "ruralize the townsman."

But nothing should be allowed to divert attention from the main problem: the great need for increasing the number of cultivators both at the centre and in the outlying parts of the world. Certain writers have put forward the danger of a world-wide shortage of food due, they say, to the disappearance of virgin soil and to the land under cultivation having reached its limit of production. The answer to this statement is that in the first place, the limit of production is still an unknown quantity; every new discovery extends it. Secondly, of the area of the world suitable for white habitation, only a fraction is as yet under cultivation. But the danger does not lie here, rather it lies in a possible shortage of cultivators.

The argument is not merely economic, it arises out of the very nature of man. His roots are struck deep in the soil. To uproot, much more to cut off, is a dangerous operation. Civilization will tend to lose much of its reality, if there is not a reasonable proportion of human beings concerned with basic work, under good conditions, upon the land. The need of our time is spiritual and mental dynamic working through men of fine physique. Such is the dynamic which rises out of life and work on the land.

(C. Tu.)

UNITED STATES

In common with almost all other nations of the western world the United States has been growing more and more largely urban. It is, however, a mistake to suppose that the United States as a whole has been actually losing rural population (all people living in places of less than 2,500 are called rural by the census) or even farm population during most of this period of rapid urban growth. Only since 1910 does it appear that there has been an actual decline in farm population and only since 1920 has this decline been at all rapid. The estimated decline of 1910–20 was 462,691 while that of 1920–27 was about 3,800,000. There is not yet any definite proof of a continuous decline in the rural population as a whole, although there is little doubt that it has declined somewhat since 1920. There are, however, many counties in the northern States where the rural population has been declining for a long time. In some of the rural counties in central New York, the population outside the county seats has been declining for a century. But the loss in farm and rural population in the northern and eastern States has in the past been more than offset by the very rapid gains in the West and South-west so that the rural population has shown substantial gains at each census until 1920 when it only amounted to 3·2%. As compared with the urban population, however, the rural population has been growing very slowly.

The Causes.—The causes of the movement from the country to the city are many, but one stands out as most important. It is the development of farm machinery, which has made it unnecessary to have as much man power per acre as in former days. The

TABLE I. *Percentage Growth of Urban and Rural Population in the United States 1880–1920*

	Urban	*Rural*
1880–1890	55·3	13·6
1890–1900	36·2	12·2
1900–1910	38·8	9·2
1910–1920	28·8	3·2

individual farmer's volume of labour has been hugely increased by the gang plough, the multiple-row cultivator, the four horse grain drill, the threshing machine, the "combine," and now the tractor with an increasing variety of space-covering tools which may be attached to it.

But if such tools make it possible for a man to till more acres than his father, they have to be made and the village blacksmith who supplied our grandfathers with ploughs and flails and hoes, etc., is no longer in business. To the factory has gone not only the making of tools but most of the other equipment the farmer uses—his truck and automobile, his wire for fencing, his lumber, his stone or brick, etc. In addition all the manifold household tasks connected with making the family clothing, with butter and cheese, with butchering and with many other tasks formerly part of the routine of farm life have also gone to the factory. It is not surprising then that many farm boys and girls have followed their jobs to the factories and stores and are now numbered among our city population.

It must be remembered that man's consumption of agricultural products is *relatively* fixed while his consumption of fabricated goods may apparently increase without limit. Hence under a given system of agricultural production only a certain proportion of the population is needed on the farms while the rest can work at trades, in factories and in commerce. In the United States to-day it appears that about 20% of the population can supply the necessary agricultural products. Under the present industrial system most of the rest will live in cities (large or small) for there are the factories and stores, etc., which supply the non-agricultural products used. It is possible that in time Americans will learn better than to live in cities and then there may again be a rapidly increasing rural population but it will not be an agricultural population since that is not needed. When an increase in the proportion of the agricultural population sets in we may be sure that harder times are approaching.

As to other causes of rural depopulation often cited, viz., desire for the excitement of the city, the loneliness of the farm, the greater opportunity of the city, etc., we must recognize that they all have some influence but they are of minor importance. If the jobs available were in rural communities the young people would stay there and would make their own excitement if they must have it and would find opportunities there which were satisfactory. Indeed the development of giant power may lead to the growth of a rural industrial population. The use of the individual electric motor for driving machines in the factory may, in time, lead to the decentralization of production into small units just as the use of steam power led to the centralization of manufacturing in great units. There may then be a reversal of the present movement of population into the large cities. (W. S. T.)

RURAL EDUCATION. "Learn by doing." This well-worn phrase, so applicable to education in all its phases, applies with redoubled force to rural education, both with respect to the teacher and the taught. The curriculum of the rural primary school, while consistent with that of the town school in some respects, must be based very largely upon environment. For this purpose the basic subject would appear to be nature study. In rural areas the pupils are in the midst of nature's great laboratory, and have all necessary material at hand. A systematic study of nature will inculcate the habit of observation and the pupils will be trained to think and to inquire. Consequently, by the time the pupils reach the age of 11+ years, they should be well grounded in the subjects of the primary school curriculum—reading, writing and arithmetic—and should be interested in and observant of their environment, and be ready to study more systematically the applications of their observations.

The problem then arises as to the course to be followed in the central schools or senior classes. Here "the treatment of the various subjects of the curriculum should respond sympathetically to the local environment." It is necessary that the pupils be encouraged to take an interest in local industries and occupations and for this purpose the teacher must continuously draw illustrations from local examples. For boys, nature study should develop into rural science. For them there should be systematic instruction in the physics and chemistry of soils, manures, plant and vegetable life, taken in connection with gardening and rural carpentry. Girls should be provided with instruction in cookery, laundry and general housewifery. Their instruction in domestic science must be correlated with local conditions, and they should be taught to manage the domestic side of homes such as they are likely to meet with in rural areas. Personal hygiene should also form a prominent part of their curriculum, for the maintenance of good health is a necessary part of education. In their instruction in needlework, much importance should be attached to mending, patching and darning.

With such a curriculum, pupils should not only be able to make themselves ordinarily intelligible to others, but also be sufficiently intelligent themselves to make good use of the "tools" they have already handled and to become capable and happy citizens.

The problem of the curriculum for children of 11+ years is considerably more difficult in rural areas. The scattered character of the population, the difficulty of communication and the persistent "parochial" idea with regard to education, all render the task of the organisation of central schools more difficult for those who do not go on to a secondary school. In some areas, the village school must always remain the unit and post-primary education must be provided in the primary school by means of a special curriculum such as that outlined for the top classes. Where a number of schools are sufficiently near one another and the accommodation admits, senior classes can be collected in one building, where the number in the age-groups of the post-primary pupils will be sufficiently large to justify a separate teacher and the instruction should be to that extent the better.

As has been experienced in a large rural area, central schools can be established. Although generally they will be non-selective central schools, yet a selective central school here and there can with great advantage be established. Although selective central schools are not to be regarded as in any sense competitors of the present day secondary schools, yet such schools provide facilities for those of the primary school who are unable to find accommodation in the secondary schools and who need a secondary education of the more practical character. Education should be viewed as an "organic whole."

The majority of central schools established in a rural area will probably be of the non-selective type. Where such schools are established, there should be separate rooms for practical work for both boys and girls. Here especially, it is necessary that the pupils should "learn by doing," and in order to carry out this to the full, the teachers must be trained upon similar lines. There will probably always be rural schools and good teachers are as essential there as in town schools; and in the case of a rural teacher, knowledge of country life and occupations would appear to be a *sine qua non*. Such teachers are generally those who have spent the early part of their training at least in country schools. Consequently it would appear necessary to retain to a limited extent, albeit in a somewhat modified form, the rural pupil teacher system. When framing the syllabus of work to be done in colleges for the training of teachers, provision should be made for those teachers interested and experienced in country life and occupations by the introduction of special courses whereby that interest may be fostered, and that experience enlarged. However trained, the rural teacher must be interested in rural life, and the education given in rural schools must be thoroughly practical in all its aims and aspects and in every sense consistent with the environment.

BIBLIOGRAPHY.—*The New Prospect in Education* (Board of Education, Educational pamphlets, no. 60); H. Morris, *The Village College* (1924); *Report* of the Departmental Committee on the Training of the Rural Teacher (appointed 1927). (J. S. D.)

THE UNITED STATES

Rural education refers to the schools centred about rural communities varying in population from a few families to 2,500 people. Before the development of the consolidated schools rural education was limited to the elementary school which was housed in a one or two-room building. With the appearance of the union and consolidated districts rural education included all schools below college grade. The rural schools range in size from the one-teacher elementary school to the consolidated school which often includes both elementary and high school with several teachers. There are at least three distinct types of rural school organization: (1) the local district which includes usually a one or two-teacher school; (2) the consolidated district which is a union of two or more local districts, and (3) the county district which is the largest unit of rural school organization. In several of the States the township is the local school unit.

Since rural children live in a different environment from urban children, rural education attempts to utilize the materials of that environment. This does not mean that there is a fundamental difference in the ultimate aims of rural and urban education. Both types of school are attempting to provide conditions that will enable the children of each to meet effectively the problems of life. Rural education, like urban education, is utilizing materials from all sources which will enrich the experience of the individual, enabling him to seek new levels of achievement. The function of the rural school is not confined to the preparation of boys and girls to be farmers. While provision is made for training in this field and its related activities, provision is also made for those rural children who are planning on other lines of work than agriculture. Better rural schools are offering several curricula and are not limiting their work to one highly specialized curriculum.

Changing conditions in rural America demand that the educational facilities of the rural school must be equal to those of the urban school. The rural child, like the urban, is a potential member of the social, economic and political democracy. In many rural communities efforts are being made to apply all known means of improving the schools, such as modern buildings and equipment, scientific curricula and methods of teaching, effective supervision and professionally trained teachers. Every method that has proved effective in improving the urban schools is being applied to the rural schools with the necessary modifications to meet the needs of the rural people.

Campbell, in his book, *Rural Life at the Cross Roads* (1927), estimated that there were in the United States approximately 4,000 rural schools of the modern type which may be classed as fully adequate; about 10,000 rural schools employing several teachers each, but too small, too poorly organized, too poorly taught and too poorly supported by farm groups which have no definite purpose to achieve through them, to be classed as adequate; and approximately 168,000 one-teacher schools which are the least adequate of all. (W. D. A.)

RURKI, a town of British India, in the Saharanpur district of the United Provinces. Pop. (1921) 16,716, including the cantonment. It is the headquarters of the workshops of the Ganges canal, and also of the Bengal Sappers and Miners. The Thomason Civil Engineering College, founded in 1848, was instituted in order to train Indians in engineering, and students originally received stipends. The college works in co-operation with the workshops and foundry of the canal, and also trains in surveying, photography and other subjects, having chemical, physical, electrical and mechanical laboratories and workshops.

RUSCHUK (Bulg. *Russé*), the capital of the department of Ruschuk, Bulgaria, on the right bank of the Danube, where it receives the R. Lom. Pop. (1926) 45,672. It is connected by rail with Varna and Sofia; by boat and rail with Bucharest. It is the chief Danubian port of Bulgaria, and an important commercial centre. It possesses sugar, tobacco and cigarette factories, soapworks, breweries, aerated water factories, dyeworks, tanneries, sawmills, brick and tile works and a celebrated pottery.

In Roman times Ruschuk was one of the fortified points along the line of the Danube. In the *Tabula Peutingeriana* it appears as Prisca, in the *Antonine Itinerary* as Serantaprista, in the *Notitia* as Seragintaprista and in Ptolemy as Priste Polis. Destroyed by barbarian invaders in the 7th century the town recovered its importance only in comparatively modern times. It played an important part in the Russo-Turkish wars of 1810, 1828–29, 1853–54 and 1877–78. In 1877 it was nearly destroyed by Russian artillery.

RUSELLAE, an ancient town of Etruria, Italy, about 10 m. S.E. of Vetulonia and 5 m. N.E. of Grosseto, situated on a hill with two summits, the higher 636 ft. above sea-level. It was one of the twelve cities of the Etruscan confederation, and was taken in 294 B.C. by the Romans. In 205 B.C. it contributed grain and timber for the needs of Scipio's fleet. The place was deserted in 1138, and the episcopal see was transferred to Grosseto. The walls, nearly 2 m. in circumference, are in places well preserved. They consist of large unworked blocks of a travertine which naturally splits into roughly rectangular blocks; these are quite irregular, and often as much as 9 ft. long by 4 ft. wide: in the interstices smaller pieces are inserted.

RUSH, BENJAMIN (1745–1813), American physician, was born in Byberry township, near Philadelphia. In 1760 he graduated at Princeton. In 1768 he took his M.D. at Edinburgh, and after spending a year in the hospitals of London and Paris began practice in Philadelphia. In 1774 he founded with James Pemberton the first anti-slavery society in America. In 1776, as a member of Congress for the State of Pennsylvania, he was one of those who signed the Declaration of Independence. In 1787 he was a member of the Pennsylvania convention which adopted the Federal constitution. After lecturing many years at the Philadelphia medical college, he became professor of the institutes of medicine and of clinical practice, succeeding in 1796 to the chair of the theory and practice of medicine, at the University of Pennsylvania. In 1799 he was appointed treasurer of the U.S. Mint in Philadelphia. He died in Philadelphia on April 19, 1813, after a five days' illness from typhus fever.

RUSH, RICHARD (1780–1859), American statesman and diplomat, son of Dr. Benjamin Rush, was born in Philadelphia, Pa., on Aug. 29, 1780. He graduated at Princeton in 1797, and was admitted to the bar in 1800. He was attorney-general of Pennsylvania in 1811; controller of the Treasury of the United States, 1811–14; attorney-general in the cabinet of President James Madison, 1814–17; acting secretary of State from March to Sept., 1817; minister to Great Britain, 1817–25; secretary of the Treasury in the cabinet of President J. Q. Adams, 1825–29; and candidate for vice-president on the Adams ticket in 1828. In 1818, while minister to Great Britain, he, in association with Albert Gallatin, concluded with British plenipotentiaries the important treaty which determined the boundary line between the United States and Canada from the Lake of the Woods to the Rocky mountains and provided for the joint occupation of Oregon for ten years. He also conducted the negotiations with Canning in 1823 relating to the South American policy of the Holy Alliance.

He followed the Adams-Clay faction of the Democratic-Republican Party in the split of 1825–28, but returned to the Democratic Party about 1834 on the bank issue. In 1835 he and Benjamin C. Howard, of Baltimore, Md., were sent by President Jackson to prevent an outbreak of hostilities in the Ohio-Michigan boundary dispute. In 1836–38 Rush was commissioner to receive the Smithson legacy (*see* SMITHSONIAN INSTITUTION), and in 1847–49 he was minister to France. He died in Philadelphia on July 30, 1859.

He published *A Narrative of a Residence at the Court of London from 1817 to 1825* (2 vols. 1833–45; all editions after the 1st ed. of the 1st. vol. are entitled *Memoranda of a Residence*, etc.); *Washington in Domestic Life* (1857), compiled from letters written by Washington to his private secretary in 1790–98; and *Occasional Productions, Political, Diplomatic and Miscellaneous* (1860); and while attorney-general he suggested the plan for the compilation, *Laws of the Nation* (5. vols., 1815), ed. by John B. Colvin.

RUSH. Under the name of rush or rushes, the stalks or hollow stem-like leaves of several plants have minor industrial applications. The common rushes (species of *Juncus; see* JUNCACEAE)

are used in many parts of the world for chair-bottoms, mats and basket-work, and the pith serves as wicks in open oil-lamps and for tallow candles—whence rushlight. The fibrous stems and leaves of the bulrush or reed-mace, *Typha angustifolia*, are used in north India for ropes, mats and baskets. *Scirpus* and other Cyperaceae are used for chair-bottoms, mats and thatch; the rush mats of Madras are made from a species of *Cyperus*. The sweet-rush, yielding essential oil, is a grass, *Andropogon Schoenanthus*, known also as lemon grass. Large quantities of the horse-tail, *Equisetum hiemale*, are used under the name of Dutch or scouring rush for scouring metal and other hard surfaces on account of the large proportion of silica the plant contains. Flowering rush is *Butomus umbellatus* (*see* ALISMACEAE); wood-rush is the common name for *Luzula* (*see* JUNCACEAE). *Acorus Calamus* (family Araceae), sweet-flag, is also known as sweet-rush.

RUSHDEN, urban district, in the Wellingborough parliamentary division, Northamptonshire, England, 66m. N.W. from London by the L.M.S. railway. Pop. (1921) 13,505. The church of St. Mary is a cruciform building. It is mainly Decorated with Perpendicular additions, but retains some Early English details. The industrial population is employed in boot and shoe making. The town is now almost continuous with Higham Ferrers.

RUSHDI PASHA (*c.* 1864–1928), Egyptian statesman, was born about 1864, and educated in France. On his return to Egypt he became successively a judge in the Mixed Tribunals, a judge in the Egyptian Court of Appeal, and Director-general of Wakfs. He became minister of justice in 1908, and two years later minister of foreign affairs, on the assassination of Boutros Pasha, returning later to the ministry of justice. In April 1914 he was made prime minister and at the outbreak of the World War was acting as regent in the absence of the khedive. The fact that Egypt was still technically part of the Ottoman empire, and that Turkey at first declared for neutrality, made his position extremely difficult. He had, however, a strong cabinet, and, when Turkey entered the war on the side of Germany, he agreed to the proclamation of a British protectorate. Abbas Hilmi was deposed, and Prince Hussein chosen as sultan by the British government.

After the Armistice, there was a strong movement, led by Saad Pasha Zaghlul (*q.v.*) for the recognition of Egypt's independence. Rushdi pressed the British Government for a definition of the position, and even asked to be received in London with Adly Pasha to discuss the question. This proposal was not accepted, and on March 1, 1919 he and his cabinet resigned. A few days later Zaghlul Pasha was arrested by the British authorities and deported to Malta. This step led to serious rioting, and he was soon released and continued his journey to Paris to champion Egypt at the Peace Conference. The British Government had to appeal once more to Rushdi Pasha, who consented, after the release of Zaghlul, to form a ministry again. The treatment which he had received had, however, greatly diminished his prestige, and he was obliged to resign again ten days later. He retired into private life, and did not take office again until the Milner Commission (1919) had made its report.

An Egyptian cabinet was required which should have sufficient support in Egypt to undertake negotiations in London towards an agreed settlement. Adly Pasha was made prime minister, and Rushdi became president of the Council, being chosen to accompany him to England. He was, however, failing in health, and his final illness was probably aggravated by his anxiety with regard to the negotiations, as he believed that no Egyptian representative assembly would accept the terms which the British Government sought to impose. He died on March 13, 1928.

RUSHVILLE, a city of Indiana, U.S.A., 39 m. S.E. of Indianapolis, on Flat Rock Creek, at an altitude of 967 ft.; the county seat of Rush county. It is on Federal highway 52, and is served by the Baltimore and Ohio, the Big Four, the Erie, the Nickel Plate, and the Pennsylvania railways. The population was 5,498 in 1920 (95% native white) and was estimated locally at 6,300 in 1928. It has various manufacturing industries and a large trade in grain, livestock (especially blooded hogs), and lumber. Rushville was chartered as a town in 1816 and as a city in 1883.

RUSHWORTH, JOHN (*c.* 1612–1690), the compiler of the *Historical Collections* commonly described by his name, was the son of Lawrence Rushworth of Acklington Park, Warkworth, Northumberland. In 1638 he was appointed solicitor to the town of Berwick. He was enrolled in Lincoln's Inn in 1641, and was called to the bar in 1647. He attended all public occasions of a political and judicial character, such as proceedings before the Star Chamber or the Council, and made shorthand notes of them. On April 25, 1640, he was appointed an assistant clerk to the House of Commons. He became secretary to Fairfax, and then, for a short time, to Cromwell. He was afterwards employed by the council of State and during the protectorate, and sat in Cromwell's parliament for Berwick.

He made his peace with the Government of Charles II., and though he was threatened with trial as a regicide he was not seriously molested. During the reign of Charles II. he continued to act as agent for the town of Berwick, and he sat for it in parliament. He was also for a time agent for Massachusetts. From 1684 till his death on May 12, 1690, he was a resident in the King's Bench prison. At this time he had destroyed his memory by over-indulgence in drink. The collection of papers which he made was published in eight volumes folio between 1659 and 1701. The volumes from the fourth onwards appeared after his death.

RUSKIN, JOHN (1819–1900), English writer and critic, was born in London, at Hunter Street, Brunswick Square, on Feb. 8, 1819, being the only child of John James Ruskin and Margaret Cox. They were Scots, first cousins, the grandchildren of a certain John Ruskin of Edinburgh (1732–1780). John Ruskin, the author's grandfather, was a wine merchant in Edinburgh, who ran through his fortune, and ended his days in debt. His son, John James Ruskin (1785–1864), father of the author, was sent, on leaving Edinburgh High School, to London to enter the wine trade. There, in 1809, he founded the sherry business of Ruskin, Telford and Domecq; Domecq being proprietor of a famous vineyard in Spain, Telford contributing the capital of the firm, and Ruskin having sole control of the business. Ruskin built up a great business, paid off his father's debts and formed near London a most hospitable and cultured home, where he maintained his taste for literature and art.

Margaret Ruskin, the author's mother, was a handsome, strong, stern, able, devoted woman of the old Puritan school, Calvinist in religion, unsparing of herself and others, rigid in her ideas of duty, proud, reserved and ungracious. The child was brought up under a rigid system of nursing, physical, moral and intellectual; kept without toys, not seldom whipped, watched day and night, but trained from infancy in music, drawing, reading aloud and observation of natural objects. When he was four the family removed to a house on Herne Hill, then a country village, with a garden and rural surroundings. The father, who made long tours on business, took his wife, child and nurse year after year across England as far as Cumberland and Scotland, visiting towns, cathedrals, castles, colleges, parks, mountains and lakes. At 14 the child was taken through Flanders, along the Rhine, and through the Black Forest to Switzerland, where he first imbibed his dominant passion for the Alps. His youth was largely passed in systematic travelling in search of everything beautiful in nature or in art. And to one so precocious, stimulated by a parent of much culture, ample means and great ambition, this resulted in an almost unexampled aesthetic education. In childhood also he began a systematic practice of composition, both in prose and verse. His mother trained him in reading the Bible, of which he read through every chapter of every book year by year; and to this study he justly attributes his early command of language and his pure sense of style. His father read to him Shakespeare, Scott, Don Quixote, Pope and Byron, and most of the great English classics; and his attention was especially turned to the formation of sentences and to the rhythm of prose. He began to compose both in prose and verse as soon as he had learned to read and write, both of which arts he taught himself by the eye. He wrote enormous quantities of verse, and began dramas, romances and imitations of Byron, Pope, Scott and Shelley.

His schooling was irregular and not successful. At 15 he was sent for two years to the day-school of the Rev. T. Dale of Peckham, and at 17 he attended some courses in literature at King's college, London. In painting he had lessons from Copley Fielding and afterwards from J. D. Harding. But in the incessant travelling, drawing, collecting specimens and composition in prose and verse he had gained but a very moderate classical and mathematical knowledge when he matriculated at Oxford; nor could he ever learn to write tolerable Latin. As a boy he was active, lively and docile; a good walker, but ignorant of all boyish games, as naïve and as innocent as a child; and he never could learn to dance or to ride. He was only saved by his intellect and his fine nature from turning out an arrant prig. He was regarded by his parents, and seems to have regarded himself, as a genius.

At the age of 17 he saw Adèle, the French daughter of Monsieur Domecq, Mr. Ruskin's partner, a lovely girl of fifteen. John fell rapturously in love with her; and, it seems, the two fathers seriously contemplated their marriage. The young poet wooed the girl with poems, romances, dramas and mute worship, but received nothing except chilling indifference and lively ridicule. To the gay young beauty, familiar with Parisian society, the raw and serious youth was not a possible *parti*. She was sent to an English school, and he occasionally saw her. His unspoken passion lasted about three years, when she married the Baron Duquesne. Writing as an old man, long after her death, Ruskin speaks of his early love without any sort of rapture. But it is clear that it deeply coloured his life, and led to the illness which for some two years interrupted his studies and made him a wanderer over Europe.

As the father was resolved that John should have everything that money and pains could give, and should one day be a bishop at least, he entered him at Christ Church, Oxford, as a gentleman-commoner—then an order reserved for men of wealth and rank. Ruskin's Oxford career, broken by the two years passed abroad, was not very full of incident or of usefulness. Both he and his college took kindly the amazing proceeding of his mother, who left her husband and her home to reside in Oxford, that she might watch over her son's health. The one success of his Oxford career was the winning the Newdigate Prize by his poem "Salsette and Elephanta," which he recited in the Sheldonian Theatre (June 1839). Two years of ill-health and absence from home ensued. And he did not become "a Graduate of Oxford" until 1842, in his 24th year, five years after his first entrance at the university. In fact, his desultory school and college life had been little more than an interruption and hindrance to his real education—the study of nature, of art and of literature. Long before Ruskin published books he had written for various periodicals on architectural and other subjects.

After leaving Oxford, Ruskin set to work steadily at Herne Hill on the more elaborate defence of Turner, which was to become his first work. *Modern Painters*, vol. i., by "a Graduate of Oxford," was published May 1843, when the author was little more than twenty-four. It was vehemently attacked by the critics, and coolly received by the painters. Even Turner was somewhat disconcerted; but the painter was now known to both Ruskins, and they freely bought his pictures. The family then went again to the Alps, that John might study mountain formation and "Truth" in landscape. In 1845 he was again abroad in Italy, working on his *Modern Painters*, the second volume of which appeared in 1846. He had now plunged into the study of Bellini and the Venetian school, Fra Angelico and the early Tuscans, and he visited Lucca, Pisa, Florence, Padua, Verona and Venice, passionately devoting himself to architecture, sculpture and painting in each city of north Italy. He wrote a few essays for the *Quarterly Review* and other periodicals, and in 1849 (*aet.* 30) he published *The Seven Lamps of Architecture*, with his own etchings, which greatly increased the reputation acquired by his *Modern Painters*.

On April 10, 1848, a day famous in the history of Chartism, Ruskin was married at Perth to Euphemia Chalmers Gray, a lady of great beauty, of a family long intimate with the Ruskins. The marriage, we are told, was arranged by the parents of the pair, and was a somewhat hurried act. It was evidently ill-assorted, and brought no happiness to either. They travelled, lived in London, saw society, and attended a "Drawing-room" at Buckingham Palace. But Ruskin, immersed in various studies and projects, was no husband for a brilliant woman devoted to society. No particulars of their life have been made public. In 1854 his wife left him, obtained a nullification of the marriage under Scots law, and ultimately became the wife of John Everett Millais. John Ruskin returned to his parents, with whom he resided till their death; and neither his marriage nor the annulling of it seems to have affected seriously his literary career.

Ruskin's architectural studies, of which *The Seven Lamps* was the first fruit, turned him from Turner and *Modern Painters*. He planned a book about Venice in 1845, and *The Stones of Venice* was announced in 1849 as in preparation. After intense study in Italy and at home, early in 1851 (the year of the Great Exhibition in London) the first volume of *The Stones of Venice* appeared (*aet.* 32). It was a concrete expansion of the ideas of *The Seven Lamps*—that the buildings and art of a people are the expression of their religion, their morality, their national aspirations and social habits. It was, as Carlyle wrote to the author, "a sermon in stones," "a singular sign of the times," "a new *Renaissance*." It appeared in the same year with *The Construction of Sheepfolds*—a plea for the reunion of Christian churches—in the same year with the essay on *Pre-Raphaelitism*, the year of Turner's death (19th December). *The Stones of Venice* was illustrated with engravings by some of the most refined artists of his time. The author spent a world of pains in having these brought up to the highest perfection of the reproductive art, and began the system of exquisite illustration, and those facsimiles of his own and other sketches, which make his works rank so high in the catalogues and price-lists of collectors. This delicate art was carried even farther in the later volumes of *Modern Painters* by the school of engravers whom Ruskin inspired and gathered round him. And these now rare and coveted pieces remain to rebuke us for our modern preference for the mechanical and unnatural *chiaroscuro* of photogravure—the successor and destroyer of the graver's art.

Although Ruskin was practised in drawing from the time that he could hold a pencil, and had lessons in painting from some eminent artists, he at no time attempted to paint pictures. He said himself that he was unable to compose a picture, and he never sought to produce anything that he would call a work of original art. His drawings, of which he produced an enormous quantity, were always intended by himself to be studies or memoranda of buildings or natural objects precisely as they appeared to his eye. Clouds, mountains, landscapes, towers, churches, trees, flowers and herbs were drawn with wonderful precision, minuteness of detail and delicacy of hand, solely to recall some specific aspect of nature or art, of which he wished to retain a record. In his gift for recording the most subtle characters of architectural carvings and details, Ruskin has hardly been surpassed by the most distinguished painters.

In 1853 *The Stones of Venice* was completed at Herne Hill, and he began a series of *Letters* and *Notes* on pictures and architecture. In this year (*aet.* 34) he opened the long series of public lectures wherein he came forward as an oral teacher and preacher, not a little to the alarm of his parents and amidst a storm of controversy. The Edinburgh Lectures (November 1853) treated Architecture, Turner and Pre-Raphaelitism. The Manchester Lectures (July 1857) treated the moral and social uses of art, now embodied in *A Joy for Ever*. Some other lectures are reprinted in *On the Old Road* and *The Two Paths* (1859). These lectures did not prevent the issue of various *Notes* on the Royal Academy pictures and the Turner collections; works on the *Harbours of England* (1856); on the *Elements of Drawing* (1857); the *Elements of Perspective* (1859). At last, after prolonged labour, the fifth and final volume of *Modern Painters* was published in 1860 (*aet.* 41). This marks an epoch in the career of John Ruskin; and the year 1860 closed the series of his works on art strictly so called.

The last forty years of his life were devoted to expounding his views, or rather his doctrines, on social and industrial problems, on education, morals and religion, wherein art becomes an incidental and instrumental means to a higher and more spiritual life.

And his teaching was embodied in an enormous series of lectures, letters, articles, selections and serial pamphlets. These are now collected in upwards of thirty volumes in the final edition. The entire set of Ruskin's publications amounts to more than fifty works having distinctive titles. For some years before 1860 Ruskin had been deeply stirred by reflecting on the condition of all industrial work and the evils of modern society. His lectures on art had dealt bitterly with the mode in which buildings and other works were produced. In 1854 he joined F. D. Maurice, T. Hughes and several of the new school of painters, in teaching classes at the Working Men's College. But it was not until 1860 that he definitely began to propound a new social scheme, denouncing the dogmas of political economy. Four lectures on this topic appeared in the *Cornhill Magazine* until the public disapproval led the editor, then W. M. Thackeray, to close the series. They were published in 1862 as *Unto this Last*. In the same year he wrote four papers in the same sense in *Fraser's Magazine*, then edited by J. A. Froude; but he in turn was compelled to suspend the issue. They were completed and ultimately issued under the title *Munera Pulveris*. These two small books contain the earliest and most systematic of all Ruskin's efforts to depict a new social Utopia. They contain a vehement repudiation of the orthodox formulas of the economists; and they are for the most part written in a trenchant but simple style, in striking contrast to the florid and discursive form of his works on art.

In 1864 Ruskin's father died, at the age of 79, leaving his son a large fortune and a fine property at Denmark Hill. John still lived there with his mother, aged 83, infirm, and failing in sight, to whom came as a companion his cousin, Joanna Ruskin Agnew, afterwards Mrs. Arthur Severn. At the end of the year 1864 Ruskin delivered at Manchester a new series of lectures—not on art, but on reading, education, woman's work and social morals—the expansion of his earlier treatises on economic sophisms. This afterwards was included with a Dublin lecture of 1868 under the fantastic title of *Sesame and Lilies* (perhaps the most popular of his social essays), of which 44,000 copies were issued down to 1900. He made this, in 1871, the first volume of his collected lectures and essays, the more popular and didactic form of his new Utopia of human life. It contains, with *Fors*, the most complete sketch of his conception of the place of woman in modern society.

In the very characteristic preface to the new edition of 1871 Ruskin proposes never to reprint his earlier works on art; disclaims many of the views they contained, and much in their literary form; and specially regrets the narrow Protestantism by which they were pervaded. In the year 1866 he published a little book about girls, and written for girls, a mixture of morals, theology, economics and geology, under the title of *Ethics of the Dust;* and this was followed by a more important and popular work, *The Crown of Wild Olive*. This in its ultimate form contained lectures on "Work," "Traffic," "War" and "The Future of England." It was one of his most trenchant utterances, full of fancy, wit, eloquence and elevated thought. But a more serious volume was *Time and Tide* (1867), a series of twenty-five letters to a workman of Sunderland, upon various points in the Ruskinian Utopia. This little collection of "Thoughts," written with wonderful vivacity, ingenuity and fervour, is the best summary of the author's social and economic programme, and contains some of his wisest and finest thoughts in the purest and most masculine English that he had at his command. In 1869 he issued *The Queen of the Air*, lectures on Greek myths, a subject he now took up, with some aid from the late Sir C. Newton. It was followed by some other occasional pieces; and in the same year he was elected Slade professor of art in the University of Oxford.

He now entered on his professorial career, which continued with some intervals down to 1884, and occupied a large part of his energies. His lectures began in February 1870, and were so crowded that they had to be given in the Sheldonian Theatre, and frequently were repeated to a second audience. He was made honorary fellow of Corpus Christi, and occupied rooms in the college. In 1871 his mother died, at the age of 90, and his cousin, Miss Agnew, married Arthur Severn. In that year he bought from Linton, Brantwood, an old cottage and property on Coniston Lake, a lovely spot facing the mountain named the Old Man. He added greatly to the house and property, and lived in it continuously until his death in 1900. In 1871, one of the most eventful years of his life, he began *Fors Clavigera*, a small serial addressed to the working men of England, and published only by George Allen, engraver, at Keston, in Kent, at 7d., and afterwards at 10d., but without discount, and not through the trade. This was a medley of social, moral and religious reflections interspersed with casual thoughts about persons, events and art. *Fors* means alternatively fate, force or chance, bearing the *Clavis*, club, key or nail, *i.e.*, power, patience and law. It was a desultory exposition of the Ruskinian ideal of life, manners and society, full of wit, play, invective and sermons on things in general. It was continued with intervals down to 1884, and contained ninety-six letters or pamphlets, partly illustrated, which originally filled eight volumes and are now reduced to four.

The early years of his Oxford professorship were occupied by severe labour, sundry travels, attacks of illness and another cruel disappointment in love. In spite of this, he lectured, founded a museum of art, to which he gave pictures and drawings and £5,000; he sought to form at Oxford a school of drawing; he started a model shop for the sale of tea, and model lodgings in Marylebone for poor tenants. At Oxford he set his pupils to work on making roads to improve the country. He now founded "St. George's Guild," himself contributing £7,000, the object of which was to form a model industrial and social movement, to buy lands, mills and factories, and to start a model industry on co-operative or Socialist lines. In connection with this was a museum for the study of art and science at Sheffield. Ruskin himself endowed the museum with works of art and money; a full account of it has been given in E. T. Cook's *Studies in Ruskin* (1890), which contains the particulars of his university lectures and of his economic and social experiments. It is unnecessary to follow out the history of these somewhat unpromising attempts. None of them came to much good, except the Sheffield museum, which is an established success, and is now transferred to the town.

In *Fors*, which was continued month by month for seven years, Ruskin poured out his thoughts, proposals and rebukes on society and persons with inexhaustible fancy, wit, eloquence and freedom, until he was attacked with a violent brain malady in the spring of 1878 (*aet.* 59); and, although he recovered in a few months sufficiently to do some occasional work, he resigned his professorship early in 1879. The next three years he spent at Brantwood, mainly in retirement, and unhappy in finding nearly all his labours interrupted by his broken health. In 1880 he was able to travel in northern France, and began the *Bible of Amiens*, finished in 1885; and he issued occasional numbers of *Fors*, the last of which appeared at Christmas 1884. In 1882 he had another serious illness, with inflammation of the brain; but he recovered sufficiently to travel to his old haunts in France and Italy—his last visit. And in the following year he was re-elected professor at Oxford and resumed his lectures, but increasing brain excitement, and indignation at the establishment of a laboratory to which vivisection was admitted, led him to resign his Oxford career, and he retired in 1884 to Brantwood, which he never left. He now suffered from frequent attacks of brain irritation and exhaustion, and had many causes of sorrow and disappointment. His lectures were published at intervals from 1870 to 1885 in *Aratra Pentelici, The Eagle's Nest, Love's Meinie, Ariadne Florentina, Val d'Arno, Proserpina, Deucalion, The Laws of Fesolé, The Bible of Amiens, The Art of England* and *The Pleasures of England*, together with a series of pamphlets, letters, articles, notes, catalogues and circulars.

In the retirement of Brantwood he began his last work, *Praeterita*, a desultory autobiography with personal anecdotes and reminiscences. He was again attacked with the same mental malady in 1885, which henceforth left him fit only for occasional letters and notes. In 1887 it was found that he had exhausted (spent, and given away) the whole of the fortune he had received from his father, amounting, it is said, to something like £200,000; and he was dependent on the vast and increasing sale of his works, which produced an average income of £4,000 a year, and at times

on the sale of his pictures and realizable property. In 1872 a correspondent had remonstrated with him in vain as to taking "usury," *i.e.*, interest on capital lent to others for use. In 1874 Ruskin himself had begun to doubt its lawfulness. In 1876 he fiercely assailed the practice of receiving interest or rent, and he henceforth lived on his capital, which he gave freely to friends, dependants, public societies, charitable and social objects. The course of his opinions and his practice is fully explained in successive letters in *Fors*.

Until 1889 Ruskin continued to write chapers of *Praeterita*, which was designed to record memories of his life down to the year 1875 (*aet.* 56). It was, in fact, only completed in regular series down to 1858 (*aet.* 39), with a separate chapter as to Mrs. Arthur Severn, and a fragment called *Dilecta*, containing letters and early recollections of friends, especially of Turner. These two books were published between 1885 and 1889; and except for occasional letters, notes and prefaces, they form the last writings of the author of *Modern Painters*. His literary career thus extends over fifty years. But he has left nothing more graceful, naïve and pathetic than his early memories in *Praeterita*—a book which must rank with the most famous "Confessions" in any literature. The last ten years of his life were passed in complete retirement at Brantwood, in the loving care of the Severn family, to whom the estate was transferred, with occasional visits from friends, but with no sustained work beyond correspondence, the revision of his works, and a few notes and prefatory words to the books of others. He wished to withdraw his early art writings from circulation, but the public demand made this practically impossible.

The close of his life was one of entire peace and honour. He was loaded with the degrees of the universities and membership in numerous societies and academies. "Ruskin Societies" were founded in many parts of the kingdom. His works were translated and read abroad, and had an enormous circulation in Great Britain and the United States. He died suddenly after only two days' illness on Jan. 20, 1900. He was buried in Coniston churchyard by his own express wish, the family refusing the offer of a grave in Westminster Abbey.

Ruskin's life and writings have been the subject of many works composed by friends, disciples and admirers. The principal is the *Life*, by W. G. Collingwood, his friend, neighbour and secretary (2 vols., 1893; 2nd ed., 1900). His pupil, E. T. Cook, published his *Studies in Ruskin* in 1890, with full details of his career as professor, and a *Life of Ruskin* in 1911. J. A. Hobson, in *John Ruskin, Social Reformer* (2nd ed., 1899), has elaborately discussed his social and economic teaching, and claims him as "the greatest social teacher of his age." An analysis of his works has been written by Mrs. Meynell (1900). His art theories have been discussed by Professor Charles Waldstein of Cambridge in *The Work of John Ruskin* (1894), by Robert de la Sizeranne in *Ruskin et la religion de la beauté* (1897), and by Professor H. J. Brunhes of Fribourg in *Ruskin et la Bible* (1901). The monumental "library edition" of Ruskin's works (39 vols., 1903–12), prepared by E. T. Cook, with A. Wedderburn, is the greatest of all the tributes of literary admiration. *See* also *Centenary Addresses* (1919) ed. J. H. Whitehouse; J. R. Morley, *John Ruskin and Social Ethics* (1917); A. Williams-Ellis, *The Tragedy of John Ruskin* (1928). (F. Har.)

RUSSELL (Family). The great English Whig house of the Russells, earls and dukes of Bedford, rose under the favour of Henry VIII. Obsequious genealogists have traced their lineage from "Hugh de Rozel," *alias* "Hugh Bertrand, lord of le Rozel," a companion of the Conqueror, padding their fiction with the pedigree of certain Russells who are found holding Kingston Russell in Dorset as early as the reign of King John. But the first undoubted ancestor of the Bedford line is Henry Russell, a Weymouth merchant, returned as a burgess for that borough in four parliaments between 1425 and 1442. He may well have been the son of Stephen Russell, another Weymouth merchant, whose name is just before his in the list of those men of substance in Dorsetshire who, in 1434, under the act of parliament, were to be sworn not to maintain breakers of the peace. Stephen Russell, having served the office of bailiff of Weymouth, was returned as burgess to the parliament of 1395, and one William Russell was returned for King's Melcombe in 1340. Both Stephen and Henry were in the wine trade with Bordeaux, and in 1427 Henry Russell was deputy to the chief butler of England for the port of Melcombe. In 1442 a pardon under the privy seal significantly describes Henry Russell of Weymouth, merchant, as *alias* Henry Gascoign, gentleman, and it is therefore probable that the ducal house of Bedford springs from a family of Gascon wine-merchants settled in a port of Dorsetshire, a county remarkable for the number of such French settlers.

Henry Russell of Weymouth made a firm footing upon the land by his marriage with Elizabeth Hering, one of the two daughters and co-heirs of John Hering of Chaldon Hering, a Dorsetshire squire of old family, heir of the Winterbournes of Winterbourne Clenston and of the Cernes of Draycot Cerne. John Russell, eldest son of this match, born before 1432, and returned to parliament for Weymouth in 1450, had his seat at Berwick in Swyre, he and his son and heir, James Russell, being buried in the parish church of Swyre.

John Russell, son and heir of James, on the accession of Henry VIII. advanced rapidly serving the crown as soldier and as diplomatic agent. He fought well at Thérouanne, saw the Field of the Cloth of Gold and the French disaster at Pavia, lost an eye by an arrow at Morlaix. In 1523 he was knight-marshal of the king's household. In 1526 he married a rich widow, Anne, daughter and co-heir of Sir Guy Sapcotes by the co-heir of Sir Guy Wolston, a match which brought to the Russells the Buckinghamshire estate of Chenies, in whose chapel many generations of them lie buried. His peerage as Lord Russell of Chenies dated from 1539, and in the same year he had the Garter. Having held many high offices, he was named by Henry VIII. as one of his executors. At the crowning of Edward VI. he was lord high steward, and after his defeat of the western rebels was raised, in 1550, to the earldom of Bedford. Queen Mary, like her brother, made him lord privy seal. He died in London in 1555, leaving to his son a vast estate of church lands. In the west he had the abbey lands of Tavistock, which give a marquess's title to his descendants. In Cambridgeshire he had the abbatial estate of Thorney, in Bedfordshire the Cistercian house of Woburn, now the chief seat of the Russells. In London he had Covent Garden with the "Long Acre."

He left an only son, Francis, second earl of Bedford, K.G. (*c.* 1527–1585), who, being concerned in Wyatt's plot, escaped to the Continent and joined those exiles at Geneva whose religious sympathies he shared. He returned in 1557, and was employed by Queen Mary before her death. Under Queen Elizabeth he governed Berwick, and was lord-lieutenant of the northern counties.

Three of his four sons died before him, the third, killed in a border fray, being father of Edward, third earl of Bedford, who died without issue in 1627. The fourth son, William, created Lord Russell of Thornhaugh in 1603, was a soldier who fought fiercely before Zutphen beside his friend Sir Philip Sidney, whom he succeeded as governor of Flushing, and was from 1594 to 1597 lord-deputy of Ireland. He died in 1613, leaving an only son, Francis, who in 1627 succeeded his cousin as fourth earl of Bedford. This earl built the square of Covent Garden, and headed the "undertakers" who began the scheme for draining the great Fen Level. He opposed the king in the House of Lords, but might have played a part as mediator between the sovereign and the popular party who accepted his leadership had he not died suddenly of the smallpox in 1641 on the day of the king's assent to the bill for Strafford's attainder. William, the eldest surviving son, succeeded as fifth earl, Edward, the youngest son, being father of Edward Russell (1653–1727), admiral of the fleet, who, having held the chief command in the victory of La Hogue, was created in 1697 earl of Orford. The fifth earl of Bedford, after fighting for the parliament at Edgehill and for the king at Newbury, surrendered to Essex and occupied himself with completing the drainage of the Bedford Level. He carried St. Edward's staff at the crowning of Charles II., but quitted political life after the execution of his son, Lord Russell, in 1683. In 1694 he was created duke of Bedford and marquess of Tavistock, titles to which his grandson, Wrothesley Russell, succeeded in 1700.

The "patriot" Lord Russell had added to the family estates by his marriage with Rachel, daughter and co-heir of Thomas Wrothesley, the fourth earl of Southampton, from whom she finally inherited the earl's property in Bloomsbury, with Southampton House, afterwards called Bedford House. Her son, the second duke of Bedford, married the daughter of a rich citizen, John Howland of Streatham, a match strangely commemorated by the barony of Howland of Streatham, created for the bridegroom's grandfather, the first duke, in 1695. The third duke, another WROTHESLEY RUSSELL (1708–1732), died without issue, his brother JOHN (1710–1771) succeeding him. This fourth duke, opposing Sir Robert Walpole, became, by reason of his rank and territorial importance, a recognized leader of the Whigs. In the duke of Devonshire's administration he was lord-lieutenant of Ireland, and he served as lord high constable at the coronation in 1760.

His son Francis, styled marquess of Tavistock, was killed in 1767 by a fall in the hunting field, and Lord Tavistock's son FRANCIS (1765–1802) became the fifth duke. This was the peer whom Burke, smarting from a criticism of his own pension, assailed as "the Leviathan of the creatures of the crown," enriched by grants that "outraged economy and even staggered credibility." He pulled down Bedford House, built by Inigo Jones, Russell Square and Tavistock Square rising on the site of its gardens and courts. Dying unmarried, he was succeeded by his brother JOHN, the sixth duke (1766–1839), whose third son was the statesman created, in 1861, Earl Russell of Kingston Russell, better known as Lord John Russell. Lord Odo Russell, a nephew of "Lord John," and ambassador at Berlin from 1871 to his death in 1884, was created Lord Ampthill in 1881. HERBRAND ARTHUR RUSSELL (b. 1858), the eleventh duke and fifteenth earl, succeeded an elder brother in 1893. (O. B.)

RUSSELL, BERTRAND ARTHUR WILLIAM, F.R.S. (1872–), was born May 18, 1872. His father was son of Lord John Russell, his mother a daughter of the second Lord Stanley of Alderley. At the age of three he was left an orphan. His father had wished him to be brought up as an agnostic; to avoid this he was made a ward of Court, and brought up by his grandmother at Pembroke lodge, in Richmond park. Instead of being sent to school he was taught by governesses and tutors, and thus acquired his perfect knowledge of French and German. In October 1890 he went into residence, as a very shy undergraduate, at Trinity college, Cambridge. After being a very high Wrangler and obtaining a First Class with distinction in philosophy he was elected a fellow of his college in the autumn of 1895. But he had already left Cambridge in the summer of 1894 and for some months was attaché at the British embassy at Paris. In December 1894 he married Miss Alys Pearsall Smith at the Friends meeting house at Westminster. After spending some months in Berlin studying social democracy (*German Social Democracy*, 1896), they went to live at a small cottage, some miles from Haslemere, where he devoted his time to the study of philosophy. A visit to the Mathematical Congress at Paris in 1900 with his friend Alfred Whitehead (afterwards professor of philosophy at Harvard) had important results. Russell was impressed with the ability of the pupils of the Italian mathematician Peano, and immediately studied Peano's works. In a short time he wrote his first important book, *The Principles of Mathematics* (1903) and in collaboration with Alfred Whitehead proceeded to develop and extend the mathematical logic of Peano and Frege. The first volume of their joint book, *Principia Mathematica*, was published in 1910.

During all this period Russell lived very simply and worked very hard. He and his wife had moved to a small house near Oxford, but he often went abroad, and from time to time, as when Mr. Chamberlain started his tariff reform campaign, abandoned philosophy for politics. In 1910 he was appointed lecturer at his old college. After the World War broke out he took an active part in the No Conscription fellowship. He was fined £100 as the author of a leaflet describing an early Christian conscientious objector. His library was seized to pay the fine; it was bought in by a friend; but many valuable books were lost. His college deprived him of his lectureship. He was offered a post at Harvard university, but was refused a passport. He intended to give a course of lectures (afterwards published in America as *Political Ideals*, 1918) but was prevented by the military authorities. In 1918 he was sentenced to six months' imprisonment for an article he had written in the *Tribunal*. His excellent *Introduction to Mathematical Philosophy* (1919) was written in prison. His *Analysis of Mind* (1921) was the outcome of some lectures he gave in London which were organised by a few friends who got up a subscription for the purpose. The *Practice and Theory of Bolshevism* (1920) was written after a short visit to Russia to study the conditions on the spot.

In the autumn of 1920 he went to China to lecture on philosophy at the Peking university. In the spring he caught pneumonia, and for three weeks was on the point of death. To the distress of his friends some enterprising Japanese newspapers announced his death. The more philosophic Chinese, who wished to be present at the deathbed of the philosopher Lo Sou, offered to bury him by the Western Lake. But the German doctors saved his life. On his return in September 1921 he married Miss Dora Black and they lived for six years in a small house in Chelsea during the winter months. He earned a livelihood by lecturing, journalism and writing popular books such as the *A.B.C. of Atoms* (1923), the *A.B.C. of Relativity* (1925) and *On Education* (1926). The summers, spent near Lands End, were devoted to serious work such as the new Introduction to the second edition of the *Principia Mathematica;* the *Analysis of Matter* (1927) and the *Outline of Philosophy* (1928). In 1922 and 1923 he stood for parliament as Labour candidate for Chelsea; and his wife stood in 1924. He also in 1924 and 1927 lectured in the United States. In 1927 he and his wife started a school for young children.

His admirable and lucid English style may be attributed to the fact that he did not undergo a classical education at a public school; his religious views and his moral character may be due to the wise exercise of the paternal jurisdiction of the court of chancery; but his wit, his love of truth, and his capacity for hard work seem to be innate. (C. P. Sa.)

Philosophy.—What is fundamental in Russell's philosophy is his logic; his views on metaphysics and ethics, on the nature and relations of matter and mind have changed profoundly in the course of his life, but these changes have all proceeded from successively deeper applications of his logical method. He, therefore, prefers to classify his philosophy not as a species of Idealism or Realism but as "Logical Atomism," since what distinguishes the whole of his work is his use of logical analysis as a method and his belief that by that method we can arrive at ultimate "atomic facts" logically independent both of one another and of being known.

His first great achievement was to free logical analysis from the domination of ordinary grammar, and to realize that the grammatical form of a sentence often fails to reflect the logical form of its meaning. In his *Principles of Mathematics* (1903) he insisted that relations could not be reduced to qualities of their terms, and that relational facts were not of the subject-predicate form, but he still thought that any descriptive phrase which could be made the subject of a sentence must stand for a term which had being, even if like "the round square" it were self-contradictory. But in his article "On Denoting" (*Mind*, 1905), and in subsequent writings, he put forward his "Theory of Descriptions" which is perhaps the most important as well as the least controvertible of his discoveries. According to this theory "the present king of France" is not a name for a non-existent entity but an "incomplete symbol" which only has meaning in connection with a context. The meaning of such a statement as that "the present king of France is bald" is firstly that there is someone who is at present both king of France and bald, and secondly that there are not at present two kings of France; and when such statements are analysed in this way the need to believe in entities such as "the present king of France" (which are said by some philosophers to have "being" but not "existence") is altogether removed. Similarly when it is said that "unicorns are not real," this does not have the same kind of meaning as

the grammatically similar statement that "lions are not versatile." For this last statement means that certain animals, namely lions, lack a certain characteristic, namely versatility; but "unicorns are not real" does not mean that certain animals, namely unicorns, lack the characteristic of reality. For there are no such animals and no such characteristic;—what is meant is simply that there are no animals which have one horn but otherwise resemble horses. The destructive effect of this logical analysis on many philosophical theories of existence and reality is evidently of the first importance.

Russell has applied similar methods to propositions, classes and numbers and argues that each of these categories consists of what he calls "logical constructions," and not of genuine entities. In saying, *e.g.*, that classes are logical constructions, he does not mean that they are entities constructed by the human mind, but that when we express facts by sentences which have for subject such a phrase as "the class of men," the true analysis of the fact does not correspond to the grammatical analysis of the sentence. When, for instance, we say "the class of men includes the class of criminals," the fact we assert is really about the characteristics of being a man and being a criminal and not about any such entities as classes at all. This notion of a logical construction was much employed by Russell in his work in mathematical logic, and he has also used it extensively in the philosophy of matter and mind, and has even adopted as a fundamental principle that constructions (in his special sense of the word) are to be substituted for inferred entities wherever possible.

By applying this method he has been led to a view of the world on which the ultimate constituents of mind and matter are of the same type, the difference between minds and bodies lying in their structure and not in the elements of which they are composed. A man's mind is composed of sensations and images, which are identified by Russell with physical events in his brain, the difference between physics and psychology lying not in the events they study but in the kind of laws about those events which they seek to establish, physics being concerned with structure and psychology with quality. This theory has been worked out in connection with modern physics in *The Analysis of Matter* (1927).

In the theory of knowledge Russell's earlier rationalism has been considerably modified in a pragmatist or behaviourist direction, and in the *Analysis of Mind* (1921) he rejects consciousness as a fundamental characteristic of mind and adopts a form of "neutral monism" about perception, which he combines with representationism as regards memory and judgment. An exposition of his philosophical attitude is to be found in *An Outline of Philosophy* (1927).

Mathematics.—Russell maintains that mathematics and formal logic are one and that the whole of pure mathematics can be rigidly deduced from a small number of logical axioms. He argued this in outline in the *Principles of Mathematics* (1903) which was followed by a detailed demonstration of his thesis in *Principia Mathematica* (1911–13) written in collaboration with Dr. Whitehead. In this colossal work the deduction is actually performed according to the strictest symbolic principles and carried so far as to include all the essential parts of the theory of aggregates and real numbers. Besides this the great advances made by Russell in the analysis of logical concepts allowed the deductions to be carried not only much further forwards, but also much further backwards towards first principles. Above all he succeeded in solving the notorious Paradoxes of the Theory of Aggregates by means of the "Theory of Types." As part of this theory, it was, however, found necessary to introduce an "Axiom of Reducibility" which has never obtained general acceptance, so that Russell's work cannot be regarded as a final solution of the problem, although in the second edition of *Principia Mathematica* (1925) he finds an ingenious way of overcoming the difficulties in the particular case of mathematical induction.

(*Cf.* article on MATHEMATICS, FOUNDATIONS OF.) (F. P. R.)

RUSSELL, GEORGE WILLIAM (1867–), Irish writer and painter, known as Æ, was born at Lurgan, Co. Armagh, April 10, 1867. Educated at Rathmines School, Dublin, he entered an accountant's office, but in 1897 joined the Irish Agricultural Organisation Society, and became an organiser of agricultural societies. From 1904 to 1923 he was editor of *The Irish Homestead*, the organ of the agricultural co-operative movement. In 1923 he became editor of *The Irish Statesman*.

Russell's publications include *Homeward: Songs by the Way* (1894); *The Earth Breath* (1897); *Literary Ideals in Ireland* (1899), a collection of essays written in collaboration with W. B. Yeats, W. Larminie and John Eglinton; *Ideals in Ireland* (1901), another book of collaborative essays; *The Nuts of Knowledge* (1903), a selection of lyrics. In 1904 appeared two books of verse, the *Divine Vision* and *New Poems*, an anthology of verses by young Irish poets; and a collection of mystical tales, *The Mask of Apollo*. Other books of verse include *By Still Waters* (1906), *Collected Poems* (1913), and *Gods of War* (1915). *The Hero in Man* (1909) and *The Renewal of Youth* (1911) were imaginative musings, as was *Imaginations and Reveries* (1915). In 1906 appeared *Some Irish Essays*, and in 1907 *Deirdre*, a three-act play. *Co-operation and Nationality* and *The Rural Community*, published in 1912 and 1913 respectively, were pamphlets embodying co-operative ideals, which are further developed in his *The National Being, Thoughts on an Irish Polity* (1917). *The Candle of Vision*, an attempt to discover the element of truth in the mystical imagination, appeared in 1918. This was followed by *The Interpreters* (1920), a symposium in the Platonic fashion in which world politics are related to motions in the *anima mundi*. A volume of poems, *Voices of the Stones*, appeared in 1925.

RUSSELL, JOHN (1745–1806), British portrait painter in pastel, was born at Guildford, Surrey, on Mar. 29, 1745. At an early age he entered the studio of Francis Cotes, R.A. In 1767 he set up his own studio, and in 1770 obtained the gold medal at the Royal Academy for figure drawing. He exhibited regularly at the Academy from its beginning down to 1805. Although he painted in oil, in water-colours and in miniature, it was by his works in crayon that he became famous. He made his own crayons, blending them on his pictures by a peculiar method termed "sweetening," which consisted in rubbing in the colours with his fingers and softening them in outline until they melted one into another. His works have survived in perfect condition. He died at Hull on April 20, 1806.

His "Child with Cherries" is in the Louvre. The J. Horace Harding Collection, New York City, contains his "Mr. and Mrs. Aigar and Children." In *The Elements of Painting in Crayon* he described his methods. *See* George C. Williamson, *John Russell* (1894).

RUSSELL, JOHN RUSSELL, 1ST EARL (1792–1878), British statesman, third son of the 6th duke of Bedford, by Georgiana Elizabeth Byng, second daughter of the 4th Viscount Torrington, was born in London on Aug. 18, 1792. After an early education desultory on account of his weak health he spent three years at Edinburgh university, living in the house of Professor John Playfair. On leaving the university, he travelled in Portugal and Spain, and in 1813 he was returned for the ducal borough of Tavistock. In domestic questions he cast in his lot with those who opposed the repressive measures of 1817, and protested that the causes of the discontent at home should be removed by remedial legislation. Failing of success, he resigned his seat for Tavistock in March 1817, and meditated permanent withdrawal from public life, but was dissuaded from this step by the arguments of his friends. In the parliament of 1818–20 he again represented the family borough in Devon, and in May 1819 began his long advocacy of parliamentary reform by moving for an inquiry into the corruption which prevailed in the Cornish constituency of Grampound. During the first parliament (1820–26) of George IV. he sat for the county of Huntingdon, and secured in 1821 the disfranchisement of Grampound, but the seats were not transferred to the constituency which he desired. Lord John Russell paid the penalty for his advocacy of Catholic emancipation with the loss in 1826 of his seat for Huntingdon county, but he found a shelter in the Irish borough of Bandon Bridge. He led the attack against the Test Acts by carrying in February 1828 with a majority of forty-four a motion for a committee to inquire

into their operations, and after this decisive victory they were repealed (May 9, 1828). He warmly supported the Wellington ministry when it realized that the king's government could only be carried on by the passing of a Catholic Relief Act (April 1829). For the greater part of the short-lived parliament of 1830–31 he served his old constituency of Tavistock, having been beaten in a contest for Bedford county at the general election by one vote; and when Lord Grey's Reform ministry was formed, in November 1830, Lord John Russell became paymaster-general, without a seat in the cabinet. This exclusion was the more remarkable in that he was chosen (1st of March 1831) to explain the provisions of the Reform Bill, to which the cabinet had given formal sanction. The Whig ministry was soon defeated, but, after the general election, returned with increased strength. The Reform Bill became law (June 7, 1832), and Lord John stood justly in the mind of the people as its champion. After the passing of the Reform Bill he sat for South Devon, and was paymaster-general in the ministries of Grey and Melbourne.

Russell had visited Ireland in the autumn of 1833, and had come back with a keen conviction of the necessity for readjusting the revenues of the Irish church. To these views he gave expression in a debate on the Irish Tithe Bill (May 1834), whereupon Stanley, with the remark that "Johnny has upset the coach," resigned his place. The latter was abruptly, if not rudely, dismissed (Nov. 1834) by William IV. when the leadership of the House of Commons became vacant and Russell was proposed as leader. In Lord Melbourne's new administration of 1835 Russell became home secretary and leader of the House of Commons. In the third Melbourne administration (1839) Russell was secretary of State for the colonies and under him New Zealand became a British colony and England claimed the whole of Australia. A fine literary sense and a great love of all forms of religious and civil liberty fed his keen interest in culture for the people and resulted in a Government grant of £30,000 for education and the institution of official inspectors for schools. With Brougham he founded in 1835 the Society for Promoting the Diffusion of Useful Knowledge. At the general election of 1841 the Whigs sustained a crushing defeat; the return of Russell for the City of London was one of their few triumphs. In 1845 he committed himself for the first time to the repeal of the Corn Laws.

On Peel's resignation (1846) the task of forming an administration was entrusted to Russell, and he remained at the head of affairs from July 1846 to Feb. 1852, but, though his ministry at once set to work to adapt the Free Trade policy to all branches of British commerce, his tenure of office was not marked by any great legislative enactments. His celebrated Durham letter (Nov. 4, 1850) on the threatened assumption of ecclesiastical titles by the Roman Catholic bishops weakened the attachment of the "Peelites" and alienated his Irish supporters. The impotence of their opponents, rather than the strength of their friends, kept the Whig ministry in power, and, although beaten by a majority of nearly two to one on Locke King's County Franchise Bill in Feb. 1851, it could not divest itself of office. Lord Palmerston's unauthorized recognition of the French *coup d'état* was followed by his dismissal from the post of foreign secretary (Dec. 1851), but he had his revenge in the ejectment of his old colleagues in Feb. 1852. During Lord Aberdeen's administration Lord John Russell led the Lower House, at first as foreign secretary (to Feb. 21, 1853), then without portfolio, and lastly as president of the council (June 1854). In 1854 he brought in a Reform Bill, but in consequence of the war with Russia the bill was allowed to drop. His popularity was diminished by this failure, and although he resigned in Jan. 1855, on Mr. Roebuck's motion for an inquiry into the conduct of the war in the Crimea, he did not regain his old position in the country. At the Vienna conference (1855) Lord John Russell was England's representative, and immediately on his return he became secretary of the colonies (May 1855), but the errors in his negotiations at the Austrian capital followed him and forced him to retire in July of the same year.

For some years after this he was the "stormy petrel" of politics. He was the chief instrument in defeating Lord Palmerston in 1857. He led the attack on the Tory Reform Bill of 1859. A reconciliation was then effected between the rival Whig leaders, and Russell become foreign secretary in Palmerston's ministry (1860) and accepted an earldom (July 1861). During the American War Russell exercised a powerful influence in restraining his country from taking sides in the contest, and he warmly sympathized with the efforts for the unification of Italy, but he was not equally successful in preventing the spoliation of Denmark. On Palmerston's death (Oct. 1865) Russell was once more summoned to form a cabinet, but the defeat of his ministry in the following June on the Reform Bill which they had introduced was followed by his retirement from public life. His leisure hours were spent after this event in the preparation of numberless letters and speeches, and in the composition of his *Recollections and Suggestions* (1875). He died at Pembroke Lodge, Richmond Park, on May 28, 1878.

Earl Russell was twice married—first in 1835, to Adelaide, daughter of Mr. Thomas Lister, and widow of Thomas, second Lord Ribblesdale, and secondly, in 1841, to Lady Frances Ann Maria, daughter of Gilbert, second earl of Minto.

Russell's tales, tragedies and essays (including *The Nun of Arrouca*, 1822, and *Essays and Sketches by a Gentleman who has left his Lodgings*, 1820) are forgotten, but his historical works, *Life of William Lord Russell* (1819), *Memoirs of the Affairs of Europe* (1824–29, 2 vols.), *Correspondence of John, 4th Duke of Bedford* (1842–46, 3 vols.), *Memorials and Correspondence of C. J. Fox* (1853–57, 4 vols.) and *Life and Times of C. J. Fox* (1859–66, 3 vols.) are among the chief authorities on Whig politics. He also edited the *Memoirs, Journal and Correspondence of Thomas Moore* (1853–56, 8 vols.).

The chief biography is that by Sir Spencer Walpole (1891, 2 vols.). The volume by Stuart J. Reid (1895, "Prime Ministers of Queen Victoria" Series) should also be consulted.

See also J. Russell, *The Latter Correspondence of Lord John Russell, 1840–1878* (1925, 2 vols.).

RUSSELL, THOMAS (1762–1788), English poet, was born at Beaminster, early in 1762. He was educated at Winchester under Joseph Warton, and at New college, Oxford. He died at Bristol on July 31, 1788, and was buried at Powerstock, Dorset. In 1789 was published a thin volume, containing his *Sonnets and Miscellaneous Poems*, now a very rare book. It contained 23 sonnets, of regular form, and a few paraphrases and original lyrics. The sonnets are the best, and by right of these Russell takes his place as a precursor of the romantic school. His sonnet, "Suppos'd to be written at Lemnos," is his masterpiece.

RUSSELL, LORD WILLIAM (1639–1683), English politician, was the third son of the 1st duke of Bedford and was born on Sept. 29, 1639. About 1654 he was sent to Cambridge with his elder brother Francis (on whose death in 1678 he obtained the courtesy title of Lord Russell). On leaving the university, the two brothers travelled abroad, visiting Lyons, Geneva, Augsburg, and Paris, but returned to Woburn in December 1659. At the Restoration he was elected for the family borough of Tavistock. He appears to have indulged in the follies of court life and intrigue; for both in 1663 and 1664 he was engaged in duels, in the latter of which he was wounded. In 1669 he married Rachel (1636–1723), second daughter of the 4th earl of Southampton, and widow of Lord Vaughan, thus becoming connected with Shaftesbury, who had married Southampton's niece. With his wife Russell always lived on terms of the greatest affection and confidence. She corresponded with Tillotson and other distinguished men, and a collection of her admirable letters was published in 1773.

On the formation of the "country party," in opposition to the policy of the Cabal and Charles's French-Catholic plots, Russell began to take an active part in affairs. He then joined Cavendish, Birch, Hampden, Powell, Lyttleton and others in vehement antagonism to the court. With a passionate hatred and distrust of the Catholics, and an intense love of political liberty, he united the desire for ease to Protestant Dissenters. He inveighed (Jan. 22, 1673) against the stop of the exchequer, the attack on the Smyrna fleet, the corruption of courtiers with French money, and "the ill ministers about the king"; he supported the proceedings against the duke of Buckingham, and against Danby (*see* LEEDS, DUKE OF); and in March 1678 he seconded the address praying the

king to declare war against France. The country party hated Danby and James more than they hated Louis. The French king formed a temporary alliance with Russell, Hollis and the opposition leaders, on terms. Russell in particular entered into close communication with the marquis de Ruvigny (Lady Russell's maternal uncle), who came over with money for distribution among members of parliament. By the testimony of Barillon, however, it is clear that Russell refused any part in the intended corruption.

By the wild alarms which culminated in the Popish Terror Russell was apparently deeply affected. He threw himself into the party which looked to Monmouth as the representative of Protestant interests, a grave political blunder, though he afterwards was in confidential communication with Orange. On Nov. 4, 1678, he moved an address to the king to remove the duke of York from his person and councils. At the dissolution of the pensionary parliament, he was, in the new elections, returned for Bedfordshire. Danby was at once overthrown, and in April 1679 Russell was one of the new privy council formed by Charles on the advice of Temple. Only six days after this we find him moving for a committee to draw up a bill to secure religion and property in case of a popish successor. He does not, however, appear to have taken part in the exclusion debates at this time. In June, on the occasion of the Covenanters' rising in Scotland, he attacked Lauderdale personally in full council.

In January 1680 Russell, along with Cavendish, Capell, Powell, Essex and Lyttleton, tendered his resignation to the king, which was received by Charles "with all my heart." On June 16, he accompanied Shaftesbury, when the latter indicted James at Westminster as a popish recusant; and on Oct. 26 he took the extreme step of moving "how to suppress popery and prevent a popish successor"; on Nov. 2, now at the height of his influence, he seconded the motion for exclusion in its most emphatic shape, and on the 19th carried the bill to the House of Lords for their concurrence. The limitation scheme he opposed, on the ground that monarchy under the conditions expressed in it would be an absurdity. On December 18 he moved to refuse supplies until the king passed the Exclusion Bill. The prince of Orange having come over at this time, there was a tendency on the part of the opposition leaders to accept his endeavours to secure a compromise on the exclusion question. Russell, however, refused to give way a hair's-breadth.

On March 26, 1681, in the parliament held at Oxford, Russell again seconded the Exclusion Bill. Upon the dissolution he retired into privacy at his country seat of Stratton in Hampshire. In the wild schemes of Shaftesbury after the election of Tory sheriffs for London in 1682 he had no share; upon the violation of the charters, however, in 1683, he began seriously to consider as to the best means of resisting the government, and on one occasion attended a meeting at which treason, or what might be construed as treason, was talked. Monmouth, Essex, Hampden, Sidney and Howard of Escrick were the principal of those who met to consult. On the breaking out of the Rye House Plot, of which neither he, Essex, nor Sidney had the slightest knowledge, he was accused by informers of promising his assistance to raise an insurrection and compass the death of the king. Refusing to attempt to escape, he was brought before the council, when his attendance at the meeting referred to was charged against him. He was sent on June 26, 1683, to the Tower. Monmouth offered to appear to take his trial, if thereby he could help Russell, and Essex refused to abscond for fear of injuring his friend's chance of escape. Before a committee of the council Russell, on June 28, acknowledged his presence at the meeting, but denied all knowledge of the proposed insurrection. He reserved his defence, however, until his trial. He would probably have saved his life but for the perjury of Lord Howard, who expressly declared that Russell had urged the entering into communications with Argyll in Scotland. Howard's perjury is clear from other witnesses, but the evidence was accepted. Russell spoke with spirit and dignity in his own defence, and, in especial, vehemently denied that he had ever been party to a design so wicked and so foolish as that of the murder of the king or of rebellion. The legality of the trial, in so far as the jurors were not properly qualified and the law of treason was shamefully strained, was denied in the act of 1 William & Mary which annulled the attainder. Hallam maintains that the only overt act of treason proved against Russell was his concurrence in the project of a rising at Taunton, which he denied, and which, Ramsay being the only witness, was not sufficient to warrant a conviction.

Russell was sentenced to die. Many attempts were made to save his life. The old earl of Bedford offered £50,000 or £100,000, and Monmouth, Legge, Lady Ranelagh, and Rochester added their intercessions. Russell himself, in petitions to Charles and James, offered to live abroad if his life were spared, and never again to meddle in the affairs of England. He refused, however, to yield to the influence of Burnet and Tillotson, who endeavoured to make him grant the unlawfulness of resistance, although it is more than probable that compliance in this would have saved his life. He drew up, with Burnet's assistance, a paper containing his apology, and he wrote to the king a letter, to be delivered after his death, in which he asked Charles's pardon for any wrong he had done him. A suggestion of escape from Lord Cavendish he refused. He behaved with his usual quiet cheerfulness during his stay in the Tower, and spent the last morning in devotion with Burnet. He was executed at Lincoln's Inn Fields on July 21, 1683.

A true and moderate summing-up of his character will be found in his *Life*, by Lord John Russell (1820).

RUSSELL, SIR WILLIAM HOWARD (1821–1907), English war correspondent, was born at Lilyvale, near Tallaght, Co. Dublin, on March 28, 1821, being one of the Russells of Limerick, whose settlement in Ireland dates from the time of Richard II. He entered Trinity college in 1838. Three years later he was thrown very much on his own resources, but a relative, R. W. Russell, who had been sent to Ireland by *The Times*, deputed him to report the Irish elections at Longford, and his success definitely turned his attention to journalism. Coming to London in 1842, he went to Cambridge, but left before taking a degree. He was special correspondent for *The Times* in Ireland in 1845, in Denmark in the war of 1849–50, and in the Crimean War. His letters written from the Crimea were published in book form as *The War, 1855–56*. The exposure made by Russell of the mismanagement in the Crimea contributed to the fall of the Aberdeen ministry. Russell also served as correspondent in India in 1858, in America in 1861–3, in the Seven Weeks' War of 1866, in the Franco-German war of 1870; and he was with Wolseley in South Africa in 1879 and in Egypt in 1882. In 1860 he founded the *Army and Navy Gazette*. Russell was knighted in May 1895, and was the recipient of numerous war medals and various foreign orders. He died on Feb. 11, 1907.

His works include: *My Diary in India in 1858–59* (1860); *My Diary, North and South, during the Civil War in America, 1862* (1862); *My Diary during the Last Great War* (the Franco-Prussian War of 1870) (1873); *Hesperothen*, a description of a tour in the United States and Canada (1882); and *The Great War with Russia* (1895).

RUSSELL OF KILLOWEN, CHARLES RUSSELL, BARON (1832–1900), lord chief justice of England, was born at Newry, county Down, on Nov. 10, 1832, the son of Arthur Russell. The family was Roman Catholic. Educated first at Belfast, afterwards in Newry, and finally at St. Vincent's College, Castleknock, Dublin, in 1849, he was articled to a firm of solicitors in Newry. In 1854 he was admitted, and began to practise his profession. In the legal proceedings arising out of Catholic and Orange disturbances young Russell distinguished himself in the cause of his co-religionists. After practising for two years, he determined to seek a wider field for his abilities. He went to London in 1856, and entered Lincoln's Inn. In 1858 he married Ellen, daughter of Dr. Mulhulland of Belfast, and in 1859 he was called to the bar, and joined the Northern Circuit. He had to rely upon himself. But the equipment was sufficient. A well-built frame; a strong, striking face, with broad forehead, keen grey eyes, and a full and sensitive mouth; a voice which, though not musical, was rich, and responded well to strong emotions, whether of indignation, or scorn, or pity; an amazing power of concentrating thought; an intellectual grasp, promptly seizing the real points of the most entangled case, and rejecting all that

was secondary, or petty, or irrelevant; a faculty of lucid and forcible expression, which, without literary ornateness or grace of style, could on fit occasions rise to impassioned eloquence—all these things Russell had. But beyond and above all these was his immense personality, an embodiment of energetic will which riveted attention, dominated his audience, and bore down opposition. In his early years Russell's practice was mostly at the Passage Court at Liverpool, and he published a book on its procedure in 1862.

In 1872 Russell "took silk," and from that date for some time he divided the best leading work of the circuit with Holker, Herschell and Pope. Holker became solicitor general in 1874, Herschell in 1880, and about that time Pope left the circuit. Russell's success as a Q.C. during this period of his career was prodigious. He excelled in the conduct alike of commercial cases and of those involving, as he used to say, "a human interest," although undoubtedly it was the latter which more attracted him. He was seen to the least advantage in cases which involved technical or scientific detail. If his advocacy suffered a defeat, however, it was never an inglorious defeat. Those who were on the Northern Circuit at the time could not easily forget the case of *Dixon* v. *Plimsoll*—a libel action brought by a Liverpool shipowner against Plimsoll—in which Holker won a notable victory for the defendant; or *Nuttall* v. *Wilde*, a breach of promise action, in which Pope led brilliantly for the successful plaintiff, and Russell's speech for the defence was one of the finest in point of passion and pathos that was ever heard upon the Northern Circuit.

In 1880 Russell was returned to parliament as an independent Liberal member for Dundalk. From that time forward until 1894, he sat in the House of Commons: for Dundalk until 1885, and afterwards for South Hackney. During the whole of this epoch, in home affairs, Irish business almost monopolized the political stage; and Russell was Irish to the core. From 1880 to 1886, as a private member, and as the attorney-general in Gladstone's administrations of 1886 and 1892, he worked in and out of parliament for the Liberal policy in regard to the treatment of Ireland as few men except Russell could or would work. His position throughout was clear and consistent. Before 1886 on several occasions he supported the action of the Irish Nationalist party. He opposed coercion, voted for compensation for disturbance, advocated the release of political prisoners and voted for the Maamtrasna inquiry. But he never became a member of the Irish Home Rule or of the Parnellite party; he was elected at Dundalk as an independent Liberal, and such he remained. When, as attorney-general in the Gladstone administration, he warmly advocated the establishment of a subordinate parliament in Ireland, he did so because he sought the amelioration and not the destruction of Ireland's relations with the rest of the kingdom.

Russell rapidly became in London what he was already in Lancashire, a favourite leader in *nisi prius* actions. The list of *causes célèbres* in the period 1880–94 is really a record of Russell's cases, and, for a great part, of Russell's victories. The best known of the exceptions was the libel action *Belt* v. *Lawes* in 1882, which, after a trial lasting more than 40 days, resulted in a verdict for the plaintiff, for whom Sir Hardinge Giffard (afterwards Lord Chancellor Halsbury) appeared as leading counsel. The triumph of his client in the Colin Campbell divorce suit in 1886 afforded perhaps the most brilliant instance of Russell's forensic capacity in private litigation. More important, however, as well as more famous, than any of his successes in the ordinary courts of law during this period were his performances as an advocate in two public transactions of mark in British history. The first of these in point of date was the Parnell Commission of 1888–90, in which Sir Charles Russell appeared as leading counsel for Parnell. In April 1889, after 63 sittings of the commission, in the course of which 340 witnesses had been examined, Sir Charles Russell, who had already destroyed the chief personal charge against Parnell by a brilliant cross-examination, in which he proved it to have been based upon a forgery, made his great opening speech for the defence. It lasted several days, and concluded on April 12. This speech, besides its merit as a wonderful piece of advocacy, possesses permanent value as an historical survey of the Irish question during the last century, from the point of view of an Irish Liberal. The second was the Bering Sea Arbitration, held in Paris in 1893. Russell, then attorney-general, with Sir Richard Webster (afterwards Lord Alverstone, L.C.J.), was the leading counsel for Great Britain. Russell maintained the proposition, which he again handled in his Saratoga address to the American Bar Association in 1896, that "international law is neither more nor less than what civilized nations have agreed shall be binding on one another as international law." The award was, substantially, in favour of Great Britain.

In 1894, on the death of Lord Bowen, Russell accepted the position of a lord of appeal. A month later he was appointed lord chief justice of England in succession to Lord Coleridge. Brief as was his tenure of the office, he proved himself well worthy of it. He was dignified without pompousness, quick without being irritable, and masterful without tyranny. In 1896 Lord Russell (Pollock and Hawkins being on this occasion his colleagues on the bench) presided at the trial at bar of the leaders of the Jameson Raid. Russell's conduct of this trial, in the midst of much popular excitement, was by itself sufficient to establish his reputation as a great judge. One other event at least in his career while lord chief justice deserves a record, namely, his share in the Venezuela Arbitration in 1899. Lord Herschell, a British representative on the Commission, died somewhat suddenly in America before the beginning of the proceedings, and Russell took his place.

Russell contributed to the reform of the law by his advocacy of improvement in the system of legal education, and in promoting measures against corruption and secret commissions, though the bills he introduced did not become law. He died on Aug. 10, 1900. Few English lawyers have ever excited the admiration abroad that Lord Russell did, both on the Continent of Europe and in America.

See R. B. O'Brien, *Life of Lord Russell of Killowen* (1909).

RUSSELL SAGE FOUNDATION, an institution established by Mrs. Russell Sage in memory of her husband. The initial endowment was $10,000,000, to which $5,000,000 was added by her will. It was incorporated by an act of the legislature of New York in April 1907, "for the improvement of social and living conditions in the United States of America." The charter further states: "It shall be within the purposes of said corporation to use any means to that end which from time to time shall seem expedient to its members or trustees, including research, publication, education, the establishment and maintenance of charitable or benevolent activities, agencies and institutions, and the aid of any such activities, agencies or institutions already established." The income only may be spent.

The management of the foundation is vested in a board of nine trustees, which is self-perpetuating. The staff of the foundation study social conditions and methods of social work, interpret the findings, make the information available by publications, conferences and other means of public education, and seek in various ways to stimulate action for social betterment. Departments exist for dealing with charity organization, industrial studies, remedial loans, etc., and there is a consultation service on delinquency. The foundation does not relieve individual need and it avoids duplicating the work of existing agencies. In 1922 the foundation organized the Committee on Regional Plan of New York and its environs, providing the funds and office space and some staff assistance in preparing a plan for the future development of the New York region, an undertaking which took about seven years to complete.

RUSSIA. Russia is the general name given to those territories of Europe and Asia which are comprised within the Union of Socialist Soviet Republics (U.S.S.R.). The six republics within the Union are the Russian Socialist Federated Soviet Republic, the Transcaucasian Socialist Federated Soviet Republic, and the Ukrainian, White Russian, Uzbek and Turkmen Socialist Soviet Republics (*qq.v.*). In the Russian Socialist Federated Soviet Republic are included the following provinces, areas, autonomous areas and republics. The latter are inhabited chiefly by non-Russian peoples and the native tongue is the official language within them.

Provinces	*Areas*
Archangel	Far Eastern
Astrakhan	Leningrad
Briansk	North Caucasian
Ivanovo-Voznesensk	Siberian
Kaluga	Uralsk
Kostroma	
Kursk	*Autonomous Areas*
Moscow	Kalmuck
Nizhegorod	Karakalpak
North Dwina	Komi
Orenburg	Marii
Orel	Oirat
Penza	Votyak
Ryazan	
Samara	*Autonomous Republics*
Saratov	Bashkir
Smolensk	Buriat-Mongol
Stalingrad	Chuvash
Tambov	Crimea
Tula	Dagestan
Tver	German Volga
Ulianovsk	Karelian
Vladimir	Kazak
Vologda	Kirghiz
Voronezh	Tatar
Vyatka	Yakutsk
Yaroslavl	

The Transcaucasian Socialist Federated Soviet Republic includes within it the republics of Armenia, Azerbaijan and Georgia, with their dependent autonomous areas.

A separate article is devoted to each of the above units, and to their dependencies.

The name "Russia" is derived through *Rossiya* from Slavonic *Rus* or *Ros* (Byzantine Ῥῶς or Ῥώσοι), a name first given to the Scandinavians who founded a principality on the Dnieper in the 9th century, and afterwards extended to the collection of Slav states of which this principality formed the nucleus. The word *Rus* is probably derived from *Ruotsi* (a Finnish name for the Swedes), which seems to be a corruption of the Swedish *rothsmenn* "rowers" or "seafarers."

PHYSICAL FEATURES

Extent.—The U.S.S.R. has an area of 8,336,864 sq.m. as against 8,660,000 sq.m. occupied by the former empire of the Tsars. This diminution in territory is due to the loss of Finland, to the formation of the separate countries of Estonia, Latvia, Lithuania and Poland from the western portions of the former Russian empire, to the cession of the Kars district to Turkey, and to the occupation of Bessarabia by Rumania, losses which followed the 1917 revolution. Russia occupies the eastern part of Europe, the Caucasus region, the whole of Northern Asia and the western part of Central Asia. Its northern boundary from the peninsula of Rybachi eastwards is formed by the Arctic Ocean (*q.v.*) and its seas, the White, Barents, Kara and Nordenskiöld. The Bering Strait separates it from Alaska on the north-east, and the eastern ocean boundary includes the Bering Sea, the Okhotsk Sea and the Sea of Japan. The southernmost point of the Russian east coast is Posieta Bay, and lat. 50° N. divides the island of Sakhalin into a northern Russian part and a southern Japanese part. On the west of Russia lie Finland, Estonia, Latvia, Lithuania, Poland and Rumania. The dispute between Russia and Rumania as to the occupation of Bessarabia is still unsettled; the present boundary between Rumania and Russia is the Dniester river, but the Russians claim that it should be the Pruth river. The northern coast of the Black Sea from the Dniester eastwards and the eastern coast as far as Makrialos are Russian. Turkey and Persia lie south of the Transcaucasian republics, and the southern part of the Caspian coast, from Astara on the west to the Atrek river on the east, is in Persian territory. To the south of Asiatic Russia lie Persia, Afghanistan, Eastern Turkestan, Mongolia, Manchuria and Korea.

The most northerly point is Cape Chelyuskin in the Siberian Area in 77° 52′ N., and the most southerly Kushk Post on the Afghan frontier in 35° 30′ N., the most easterly is Cape Dezhnev in the Far Eastern Area in 169° 3′ W., while in the Ukraine on the west Russia reaches 26° 10′ E. It is thus the largest unbroken political unit in the world and occupies more than one seventh of the land surface of the globe. The British Empire, with its scattered units, alone exceeds it in size. Russia is essentially continental; her greatest extent of coast line lies north of the Arctic circle, where much of the sea is icebound for ten months out of the twelve, only the port of Murmansk, under the influence of the warm Atlantic drift remaining open all the year round. On the eastern coast Vladivostok, the most southerly harbour, needs icebreakers to keep it open, while the Sea of Okhotsk is most unfavourable to navigation, owing to its dense fogs and masses of floating ice. The Caspian Sea is an inland sea; the only outlet from the Black Sea is through the Bosporus, and the ports on the northern shore are liable to be icebound. Leningrad is now Russia's sole outlet to the Baltic, and is usually icebound from the end of November to the end of April.

Russia has only a few island possessions. The Aleutian archipelago and Alaska were sold to the United States in 1867, and the Kurile Islands ceded to Japan in 1875. The Baltic Islands with exception of those at the mouth of the Neva were ceded after the 1917 revolution. The Commander Islands off Kamchatka, the Shantar Islands near the Pacific coast and the Island of Sakhalin north of lat. 50° N. remain Russian. The chief islands off the Arctic coast belonging to Russia are Kolguev Island, Novaya Zemlya (with Vaygach Island), the Nicholas II. group north of the Taimyr peninsula, the New Siberia Islands (north of Laptev Sound) and Wrangel Island. Attempts on the part of V. Stefansson in 1921–24 to establish a British claim to Wrangel Island met with no official support in Britain or Canada, and in August 1924, the Russian flag was hoisted on the island. Franz Josef land is not included among Russian claims and is at present a *terra nullius;* Spitsbergen and Bear Island were recognized as being under Norwegian sovereignty in 1920.

GENERAL STRUCTURE

Russia is a very large region of vast plains characterised by climatic extremes in eastern Europe, western and northern Asia. Within its limits Europe and Asia overlap into one another in various ways and even the Ural Mountains are only an incomplete boundary between the European section, in which southward drainage (to the Black and Caspian Seas) is more important and the Asiatic section, which drains largely to the Arctic, though some rivers flow into the Aral Sea.

The fundamental feature of Russia is the great platforms, once in all probability a continuous platform, of Archaean and Palaeozoic rocks, the latter still horizontal over enormous areas though folded, for example, in the Urals. Russia, therefore, apart from the border lands of the Pacific, Mongolia, Eastern Turkestan, Afghanistan, Persia and Armenia, shows far less mountain folding than do western and southern Europe and Central Asia, though the foldings of the latter have to some extent influenced the physical geography of the Russian plains and have penetrated into them to form the Urals.

The fold mountains of central Asia on the whole become continuously younger as we proceed from the region of Lake Baikal southwestwards to the Pamirs and the Hindu Kush. Range after range runs, more or less, west to east, each successive one tending to extend farther west than that to the north of it. These ranges are discussed in the general article on Asia (*q.v.*) and it is necessary here rather to refer to their influence on the northern platform. The ranges called Sayan (with basaltic lavas in the east), Tannu-Ola and Altai belong to ancient foldings, the last being mainly Hercynian or Permo-Carboniferous, according to prevailing opinion. These old ranges are deeply dissected by what seem to be erosion-valleys with steep sides and alluvial bottoms (old lake floors) on which settlements have been made; some lakes still remain. Lake floors abound on the surface of Asiatic Russia illustrating the fact that in earlier post glacial times lakes seem to have covered vast areas in this region. To the south of the Altai mountains is the great physical feature called the Dzungarian Gate between the Altai and the Tian Shan. This is a region of very varied topography in which in spite of local heights, relatively low land (some of it less than 1,500 ft. above sea-

level) projects from the lower western lands far to the east between the mountain ranges named. Towards the west side of the Dzungarian region lies lake Balkhash, now without outlet but still fresh.

Natural Divisions.—On the south side of the Dzungarian Gate rises sharply the immense range of the Tian Shan, far surpassing the Alps in extent and differing markedly from them in character. Their general direction is west-south-west to east-north-east and they rise sharply from the high plains along their flanks with much conspicuous faulting. Westwards they branch forming almost independent chains with some northward deflection. Suess has suggested that their structural features may be traceable ultimately through western Asia via the Turgai steppe to the Urals as well as south of Aral to the Caucasus. The Urals lie approximately along long. 60° E., and far to the east the next conspicuous feature of northern Russia is the edge of the Yenisei plateau approximately along long. 90° E. These two lines, probably related to one another in origin, help to divide north Russia into natural regions,

(*a*) Northern European Russia west of the Urals.
(*b*) The Urals themselves.
(*c*) The great lowland of the Ob.
(*d*) The plateau east of the Yenisei and west of the Lena to which may be added
(*e*) The region east of the Lena dominated in the main by fold mountains belonging to the border zone of the Pacific ocean.

Northern European Russia possesses large areas of unfolded Palaeozoic rocks lying on an ancient (Archaean) floor of granites, gneisses, and syenites which emerges on the west in Finland, the Kola peninsula, and Scandinavia. Along the line from the White Sea to the Gulf of Finland (via lakes Ladoga and Onega) the ancient floor becomes covered by Palaeozoic rocks, Devonian, Carboniferous and Permian succeeding one another eastwards towards the Northern Dwina. The upper Permian beds have yielded Glossopteris and other plants characteristic of "Gondwana Land" and animal remains like those of the corresponding formation in S. Africa. Beyond that river the lower levels are mainly alluvials but there are glacial Pleistocene deposits between the river lines.

The basin of the Petchora is divided from the land farther west by a minor fold belt bringing up Devonian and some crystalline schist along the line of the Timan hills that may be traceable as a branching of the mid-Urals northwestward to Cape Kanin. The whole region has a very low relief and is consequently unprotected from Arctic cold. Apart from the Timan hills this region is below the 600 foot contour. Its lakes are discussed in the article on Europe (*q.v.*). Its chief rivers are the Petchora for which Strelbitsky gives a length of 915 m. and Tillo a length of 1,024 m., the Mezen for which the estimates are 496 and 507 m., and the Northern Dwina for which these authorities give a length of 358 and 447 m. respectively. These determinations vary because Strelbitsky ignored minor windings. The upper waters of Petchora and Northern Dwina interlace with those of the feeders of the Kama, a tributary of the Volga. As a consequence of the low relief the Petchora is navigable for 770 m., the Mezen for 450 m., and the Northern Dwina for 330 m., while the Vychegda, a large tributary of this river, is navigable for 500 miles. The Onega river has rapids on it.

The Urals.—The structural relationships of the Urals have been mentioned above. Here the Palaeozoic strata are folded on the west of a longitudinal axis which exhibits crystalline rocks and is faulted on a large scale. The Devonian rocks in this area are of marine origin. Its greatest heights are chiefly in the regions of folded Palaeozoic rocks and the folds die away into the Russian platform westwards in small parallel chains known as Parma. Though there is much copper in the Permian rocks on the west the main metalliferous veins of the area are in the faulted zone of crystalline rocks to the east. The greatest height reached in the Urals is 5,535 ft. in the northern Urals (at Töll-poz-iz or Muraï-Chakhl). The passes are often low, that on the way from Perm to Sverdlovsk being only 1,245 ft. above sea-level. The range is continued to the Arctic coast, Vaygach Island, and Novaya Zemlya. Details are given under articles Ural Mts., Uralsk Area, Novaya Zemlya, etc. On the south the Urals finger out in a plateau region dissected by feeders of the Ural, and a few feeders of the Volga.

The Ural river drains the southern Ural mountains, turns west and then south to the Caspian Sea which it reaches after a course of 1,477 m.; it has fewer deltaic channels than formerly. The basin of the Ob is one of the largest areas of unbroken lowland on the earth. The floor material is almost entirely alluvial with a little Tertiary here and there. It rises in the westward prolongations of the Sayan mountains and is 2,260 m. long but its very large tributary the Irtish comes from the Dzungarian Gate and adds enormously to the area of the basin, which is bounded southwards by the Turgai and the hills of Semipalatinsk, while the Tobol, another large tributary flows to the Ob from the north of the Turgai. It is widely thought that under the alluvial floor would be found a continuation of the platform of North European Russia let down through the dislocation of the east border of the Urals. The lowland extends without an appreciable break to the Yenisei, and only at some places near that river do the older rocks help to form the surface.

The Yenisei Area.—East of the Yenisei the character of the land changes abruptly, a sharp edge rises rapidly to more than 600, and in one place to quite 3,300 ft. above sea-level and east of this edge is a great dissected plateau of ancient rocks. Archaean rocks with granites, etc., are exposed near the Yenisei and away to the north-east, but there are larger areas of Cambrian and Silurian rocks and these are covered over a vast stretch of country by Permo-Carboniferous rocks. The plateau extends eastwards to the Lena along the valley of which is found evidence of an invasion of the sea in Cretaceous times. The plateau is an ancient block to which Suess gave the name of Angara land. Large areas on this plateau rise somewhat above the 1,600 ft. contour, and the diversities of surface are due largely to river dissection. There is evidence in the Taimyr peninsula of a fold axis with a general direction west-south-west to east-north-east but apparently no heights reaching above the 1,500 ft. contour.

The Yenisei is the collecting stream beneath the western edge of this old block and it rises in the Sayan mountains receiving nearly all its tributaries from the eastern side. Of these the upper Tunguska or Angara comes from Lake Baikal, the middle or stony Tunguska, and the lower Tunguska from the block itself. The river is some 3,000 m. long. Like the Ob, this river may be said to be formed of a pair of streams, the upper Yenisei and the Angara.

Eastern Siberia.—Beyond the Angara block eastwards stands an important series of mountain-ranges concerning which much new knowledge has recently accrued (*see* S. Obruchev, *Geogr. Journal*, lxx., 1927, p. 464), though it is not yet available for maps. The Stanovoi (Jurgur) mountains and the Kolimski (Kolyma) mountains are more or less parallel to the coasts of the sea of Okhotsk but the former are also roughly parallel to the edge of the Angara block on the other side of the Lena, and 100 m. or so north of Okhotsk they are linked not only with the Kolimski mountains to the east but with the Verkhoyansk mountains which go westwards and northwards keeping more or less parallel to the edge of the Angara block with the Lena between them and it. Like the other great rivers mentioned above, this one is formed of a pair, the upper Lena and the Vitim. The length of the Lena is estimated at 2,860 miles. The Verkhoyansk and the Kolimski mountains thus form a great semi-circle of mountains apparently determined in the west by the Angara block and in the east by the depression of the sea of Okhotsk. Within this semi-circle most atlases show ranges stretching northward, but according to Obruchev the older surveys are very incomplete. He finds that the ranges are disposed in more or less parallel curves within the main outer one above mentioned.

The Tas Kistabit mountains come next to the western Kolimski, the Cherski mountains are a longer range parallel to the whole curve of the Verkhoyansk-Kolyma line and stretching from the east of the Yana river to the west of the Omolon river. Within

this again is a smaller range. The Cherski mountains are the newly discovered ranges named after a Russian explorer who died in this region in 1892, the river Indigirka traverses it by a winding gorge often less than a mile wide and the tributaries of this river also make gorges in this range, in which an altitude of about 3,300 m. (10,727 ft.) was observed. These high mountains are apparently almost without glaciers because of the aridity of the region. A geological traverse going northward between the Kolima and the Indigirka shows an east-west axis of igneous material alternating with Permian and Triassic rocks.

East of the mouth of the Omolon river a great axis of crystalline rock, flanked on both sides by Permian runs parallel to the coast as far as Cape Dezhnev (East Cape). The Kolimski mountains curving from the southwards come north-eastwards as the Anadir mountains and end in Cape Chukotski. This latter high line is flanked on the south-east by the Penzhina and Anadir valleys forming an almost continuous low line from the sea of Okhotsk across the base of the Kamchatka peninsula to the Gulf of Anadir north of the Bering Sea. The Kamchatka peninsula is described at some length in a special article (*q.v.*). Northward from Cape Lopatka along the east coast as far north as the curve of the Aleutian islands is a belt of volcanoes, part of the "girdle of fire" of the Pacific. The central longitudinal range of the peninsula is continued north-eastward, south of the Anadir valley to Cape Navarin. There thus seem to be three great structural lines abutting upon the neighbourhood of the Bering Strait and the north coast of the Bering Sea.

The main curve of the Stanovoi (Jurgur) mountains, supposedly fold mountains, continues westward on the south and apparently approaches the Yablonoi mountains, really the eastern edge of the Malkan horst, at an angle. To the west-north-west lies the Vitim plateau. To the south-east is found a type of topography analogous to that of Kamchatka and extreme north-east Asia. There are successive ranges more or less parallel to the coast, imbricating to some extent and separated by lines of lowland fairly parallel with their axes. The Liao-ho, Sungari and lower Amur valleys form a continuous lowland from the Gulf of Pechihli to the strait between the mainland and Sakhalin. The Ussuri and lower Amur valleys form a low line from Vladivostok northwards with the high range of the Sikhota Alin on its eastern flank. The sea of Japan and the Gulf of Tartary, narrow waters separating Sakhalin from the mainland, form still another low line with the Sikhota Alin on the west and the high axis of Sakhalin, Hokkaido, etc., on the east. As in the case of Kamchatka so also here the high axis is met on the east at a considerable angle by the Kurile islands of volcanic type and south of this junction, that is in Japan, the high axis is volcanic, just as east Kamchatka is volcanic south of its junction with the Aleutians. The great river of this eastern region is the Amur, which has a very large tributary, the Sungari, on the south; the Amur's course is governed mainly by the mountain lines of the region and its length is about 1,700 miles.

Having now, with the aid of references to other articles, briefly sketched some main features of the regions of Arctic drainage, the circum-Arctic platform and the Pacific mountains, we may turn to regions which drain elsewhere and which illustrate, though only slightly, some influences of the mountain building forces working in central Europe on blocks of ancient rock which have resisted folding and have remained almost horizontal. These regions are those which drain to the enclosed seas, the Black Sea, Caspian Sea, Aral Sea and Lake Balkhash, or looked at structurally they reveal on the west a succession of very slight undulations, anticlines and synclines, of small relief, with axes north-west to south-east from the vicinity of the Carpathians to the borders of the Arctic region, and on the east the subdued features due mainly to the great virgations of the Tian Shan range.

Considering the matter first structurally we have from the Sea of Azov west-north-westward to beyond Kiev an anticlinal zone in which appear granites and gneisses, some of which are thought to be Archaean. The Dnieper from Kiev to Dnepropetrovsk (Ekaterinoslav) follows the northern border of this zone of hard rock through which the river cuts its way below the latter town. Next follows a syncline in which early Tertiary deposits are most widespread, whereas farther south they only capped parts of the old rocks. The syncline is named after the river Donetz which follows its axis. Towards the Sea of Azov Palaeozoic rocks are brought to the surface and the land stands somewhat higher. In this region is the Donetz coalfield, the coal belonging to upper Carboniferous strata as in western Europe. The next zone is the central anticline which is parallel with the two structural zones described and which is thought to die away towards the Caspian. The axis of this anticline is marked to some extent by the Don river where it flows south-eastward below Pavlovsk while, much further north-west, the course of the southern Dwina is clearly related to it. Along it in the Don region the Cretaceous deposits, capped interfluvially by early Tertiary here and there, form the most important outcrops but on the north-west there is a great area of Devonian (*v. inf.*).

North-east of this anticlinal zone is the immense "Moscow basin" floored mainly by Palaeozoic rocks mainly still horizontal, with some Triassic deposits, but there are patches of Jurassic and Cretaceous strata as for example around Moscow and in the great bend of the Volga, and also farther north from Kostroma to Ust-Sysolsk on a tributary of the Vychegda. There was an intrusion of the sea in Jurassic times which became much more extensive in the Cretaceous period; no upper Cretaceous is known, however, in northern Russia. Around the Moscow basin in the south-west and west the lower Carboniferous system (with poor coal at Tula, etc.), outcrops in a great curved belt from the region of Tula almost to the White Sea. Beyond this belt north-westward is the area of Devonian rocks towards Latvia and Estonia and across to the White Sea. They rest unconformably on Silurian rocks which outcrop along the southern shore of the Gulf of Finland and of lake Ladoga. The Devonian rocks are partly lacustrine (old red sandstone) and partly marine in origin, and the two types are often interstratified; a basal red sandstone is covered by a dolomitic limestone which in turn has a sandstone over it.

The Timan hills (p. 684) on the north-east may be said to be an upfold bordering the Moscow basin. The main axis of the basin is parallel to the course of the Volga above Nizhniy-Novgorod, continued north-westward by the Mologa, *i.e.*, rivers running broadly parallel to the sections of the Dnieper, Donetz and Don already noted. Permian rocks outcrop over large areas on the north. The dips of the strata are small and anticlines and synclines are here, really slight undulations which might be followed right across Russia from the Dniester to the Timan hills always with lines roughly north-west to south-east (or west-north-west to east-south-east) well marked in geology and drainage, though not much indicated in relief save that there is a marked low line of the Dnieper valley above Dnepropetrovsk, the Pripet marshes or Rokitno swamps and the upper Bug, where it continues the line of the Dnieper and Pripet in Poland. This belt of lowlands is of special importance because of the great marshes just named; they form the effective barrier between Russia and peninsular Europe. (*See* EUROPE: *Geography.*)

Turning now to the east one notes the virgations of the Tian Shan, orographically very subdued in the Aralo-Caspian lowland. One stretches north-westward parallel to and north of the Syr Darya river and apparently re-emerges from the lowland in one of the southern branches of the Urals which are at first a plateau and only rise to any considerable height north of lat. 52° N. Another virgation stretches parallel to the first, this time just north-north-east of the Amu-Darya or Oxus river, and is continued into the Mangishlak peninsula that projects into the north-east of the Caspian Sea. Farther south still are the hills of the Persian border reaching the Caspian Sea between the Gulf of Kara Boghaz and the town of Krasnovodsk, and continued on the west of that sea by the mighty Caucasus. In the Aralo-Caspian lowland the rocks of these virgations are masked by a quaternary covering with Tertiary deposits south of the lower Oxus and on the Ust Urt plateau between Aral and Caspian. Between the Aralo-Caspian-Balkhash area and the Arctic drainage area of the Ob and its feeders, is the higher land of Semipalatinsk related

structurally to the Altai and floored by Palaeozoic and igneous rocks. West of this the land continues to be somewhat above the level of the lowlands on either side and is floored by Tertiary deposits, but the higher land narrows down in the Turgai region which according to general opinion until Oligocene times had a sea-communication right away to the Arctic on the north. The two great rivers of the region are the Amu-Darya (Oxus), 1,500 m. long, and the Syr Darya, 1,500 m. long, both reaching the Aral Sea.

Structural geologists have spread familiarity with the idea of a great sea called Tethys reaching in Mesozoic and Eocene times from the present Mediterranean area eastwards through the region occupied later by the young folded ranges of Asia Minor, Armenia, the Hindu-Kush and Himalaya, etc., out to the Malaya. Without venturing into details of advances and retreats of the sea it may be said that the uprise of the fold mountains of Asia Minor, Armenia, the Elburz Range and the Hindu-Kush left the part of that sea to the north of this more or less isolated as the Pontic brackish lake, losing its former connection via the Turgai low-line with the Arctic Ocean probably in Oligocene times and becoming much modified by the sinking of the southern parts of the Black and Caspian Seas (*q.v.*) which are both deep. Apart from these two depressions the land shelves easily from land to sea around the northern parts of the Black and Caspian Seas while the shallow Aral Sea is a part of the Pontic lake, now cut off by lowland from the north-east of the Caspian Sea. Balkhash is a freshwater lake on higher land farther east now, at any rate, without outlet, whatever may have been the condition of things in the past.

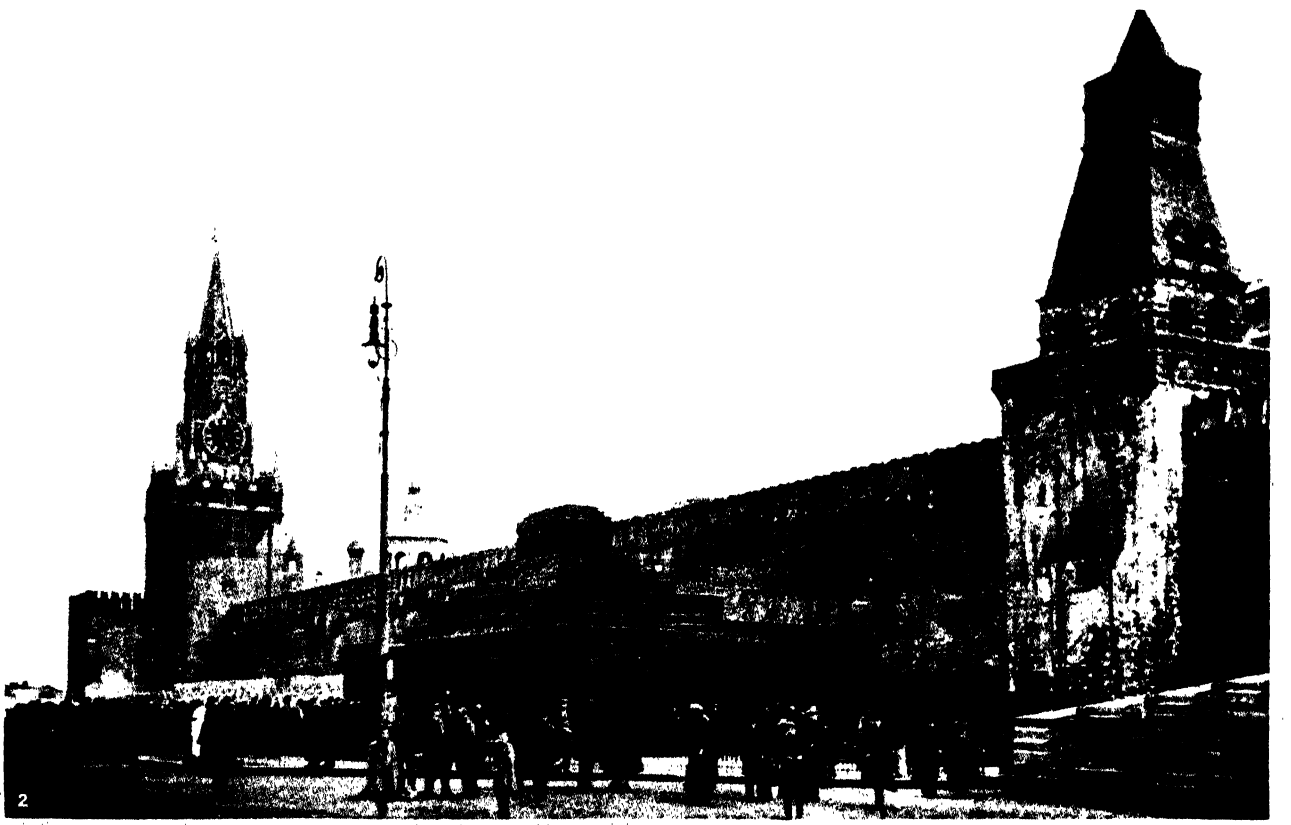
We thus have a series of enclosed seas and lakes (*q.v.*) of which Balkhash, the Aral and the Caspian have no outlet, and the two latter are salt, while the Sea of Azov communicates with the Black Sea through a break in the mountain line between the Caucasus and the Yalta mountains of the Crimea, and the Black Sea has communicated with the Egean and the Mediterranean since the sinking of the former. The rivers Dnieper (strictly 1,064 m. or with minor windings 1,328 m.), and Don (strictly 980 m. or with minor windings 1,123 m.), both flow south-eastwards for a considerable distance and then turn sharply south-westward to the Black Sea, probably as a consequence of the recent dominance of flow towards the Egean following the sinking of the latter. Prior to that sinking it is thought that the Danube for a time made its way eastward across the lowland to the Caspian Area which it may have reached via the curious Manych depression. The Volga (1,977 m. or with minor windings 2,107 m.), is the longest river of Europe flowing broadly east-south-east parallel to the axis of the Moscow basin and meeting the Kama as it turns south below Kazan. On its course southward it has a sharp eastward loop with Samara at the head opposite the southward bend of the Don, and quite near it, the Volga bends south-east, thus continuing the previous line of the Don, and so it reaches its delta on the Caspian Sea. The great rivers of the Aral basin, the Amu-Darya or Oxus and the Syr Darya have already been mentioned and the relation of their courses to structural lines has been indicated.

Lakes.—Apart from the borders of the Pacific, Mongolia, Sinkiang, Afghanistan, Persia and the Caucasus, the Russian Area is really great lowland broken only by the Ural mountains and the residual heights on the Angara block. It is a region of great lakes and inland seas, of which the north-west European group is discussed in the article Europe, while the Caspian, Aral, Balkhash and Baikal are subjects of separate articles. As there are immense tracts covered by glacial clays, there are areas, for example, in the south-east of the Ob basin, with myriads of small lakes in the hollows.

The Caucasus (*q.v.*) *and Transcaucasia* form very distinct regions structurally and physically, the Armenian mountain-knot being separated from the Caucasus by a relatively low narrow line occupied by the river Rion on the west and the river Kur on the east, but a long stretch of this "low line" is well over 1,500 ft. above sea. This line has to the east the deep basin of the southern Caspian and westward the deep basin of the southern Black Sea.

GLACIATION

The Pleistocene Ice Age affected Russia profoundly and its effects have been studied more particularly in European Russia. In north Russia river-drainage has re-established itself post-glacially to a greater extent than in Finland, which lay near the Scandinavian ice centre of the time. A great morainic belt may be traced between the Petchora-Vychegda-Northern Dwina basin and the Kama-Vyatka basin, and this belt continues south-westward past Kostroma, Moscow and the northern watershed of the Dnieper and Pripet system into Poland. North-west of this great belt, in the west, are many great remnants of moraines enclosing lake or swamp areas. To the south of it are swamp-areas such as the Pripet basin, the Riazan district and the tongue between Volga and Oka before they join. Boulder clay stretches some way south of the great morainic belt above mentioned, and this extension is enormously increased by the occurrence of great tongues of boulder clay in the basins of the Don and Dnieper on the left banks of their long north-west-south-east sections. In each case these boulder-clay extensions are much dissected by streams as would be expected on an area with impervious floor. The main morainic belt and the more southerly morainic limit above described are sometimes held to represent two separate glacial advances, the former being the more recent.



There seems little doubt that the Caucasus and the great highlands of Central and north-east Asia (including the Verkhoyansk arc and the Stanovoi range, as well as part of the Angara plateau) were centres of Pleistocene glaciation, but towards the north-east the low precipitation probably limited the extent of the glaciers. Beyond the boulder-clay zone follows the *loess*, an aeolian deposit due to the outblowing winds from an ice sheet or other cold centre. They pick up fine-grained material from terminal moraines across which they blow out and deposit this over a wide zone as a porous deposit in which, frequently, grasses have grown and decayed, leaving vertical tubes up which water may be brought, and depositing organic matter which has promoted the fertility of loess when it is exploited by man. Loess occupies practically the whole of South Russia and interlocks with the two tongues of boulder clay, sending north a broad tongue between the Don and the left bank feeders of the Dnieper to Orel, forming a region much poorer in streams than the boulder-clay tongues on its two flanks. East of the boulder-clay tongue of the Don basin, the loess reaches as far north as the Vyatka river and eastward into Turkestan. In Asiatic Russia the loess seems to occur mainly along the foot of the western highlands and across Turkestan right towards the Caspian.

CLIMATE

The essential feature of the climate of the U.S.S.R. is its continental character; the regions of somewhat more temperate type became independent states after 1917. From the western border to the mountains fringing the Pacific and from the Arctic to the mountain zone of Central Asia, this great stretch of land lies open to the winds, the Urals being too low to form an effective climatic barrier, though they have some influence on isotherms and especially on isohyets. Oceanic influences play some part in the west, but the Arctic Ocean to the north has practically no moderating effect. Even if eastern Russia were not cut off from the ocean by a mountain fringe, moderating influences would hardly be felt, since the winds blow off shore most of the year and moreover the Sea of Okhotsk is under the influence of a cold Polar drift and is a region of floating ice and fog. During the long winter the land mass of Asiatic Russia becomes extremely cold especially towards the north-east, and the cold, dry, heavy air which settles above it so intensifies the high pressure belt of Central Asia that it is attracted northwards. Lake Baikal and the region to the east of it have a January pressure of 30·5″. The north-east coast of the Arctic lies north of the 30·1″ isobar and a belt of high pressure extends from Asiatic Russia in a south-west direction. The most intense tongue of January high pressure stretches west along lat. 50° N. and forms a vortex of variable winds. To the north of it the prevailing winds are south and west, while to the south of it in the steppes and steppe-deserts of European South Russia and of Turkestan the winds

SCENES AND CITIES OF OLD AND NEW RUSSIA

1. Moscow, within the Kremlin. The bell-tower, Ivan the Great (Ivan Veliki) (*c.* 1600), and the church of St. John the Divine are in the centre. The famous Tsar Bell (Tsar Kolokol), the largest bell in the world, stands in front of the tower. The building to the left is the Cathedral of the Archangel Michael, 15th century, in which the bodies of all the early tsars are buried. The church in the rear and to the right of St. John's is the church of the Assumption of the Virgin
2. Moscow, Sverdlov Place. This square, formerly Theatre Place, is one of the largest and most beautiful in the city, with theatres on three sides and gardens on the fourth. It was renamed in honour of the first chairman of the All-Russian Central Executive Committee. The building in the background, with the pillared façade, is the Dom Soyúzov, or House of the Trade Unions
3. Moscow, bird's-eye view towards the Kremlin. On the right is the winding Moskvá river, with its cast-iron bridge; to the left, in the background, is the walled Kremlin, with its many cupolas and minarets. The buildings of the new capital show a mixture of modern Occidental and traditional Oriental forms
4. Moscow, Lubiansky Avenue, a commercial street in the centre of the city, where the House of the Moscow Communist Economy is situated
5. A Russian peasant's house at Uglitch, in the province of Yaroslavl, one of the most ancient and interesting Russian towns. Many of its old buildings date back to the 14th century
6. *Leningrad* (St. Petersburg), showing the water front. Leningrad is built on the islands and banks of the Nevá river

are north, north-east and east, so that severe winter cold is carried far to the south. The region west of the Ob river is under the influence of the Icelandic low-pressure system of western Europe.

The general high pressure relations such as outlined above last from August to April. Thus about half of Russia has a winter of six months' duration, while from Yenisei eastwards there stretches a vast area of permanently frozen ground extending from the Arctic to the south of lat. 50° N. only southern Kamchatka and the Maritime provinces of the Far Eastern Area lying outside this zone, which extends westwards from the south of the Gulf of Taz to the open Murmansk coast. In this permanently frozen zone winter lasts 6 to 9 months or more and summer is too short to thaw the ground to any depth. Forest and tundra cover much of it, and in a few places, notably in the Yakutsk area there is some cultivation of potatoes and hardier cereals on the upper, temporarily thawed soil above the permanently frozen subsoil. The line marking the southern limit of the duration of winter for a period varying from 3 to 6 months extends westwards from the Tian Shan, passing well to the south of the Sea of Aral and crossing the Caspian and the Sea of Azov, so that their northern portions lie within it, and just skirting the north of the Black Sea. The effect of this prolonged winter on the life of the people is profound; agricultural and outdoor occupations (*e.g.*, building) are impossible, river navigation ceases and sledge transport takes its place. Terrible wind and snow storms occasionally sweep with great violence across the plains even in the southern steppe and the Ukraine, and cattle and sheep perish in great numbers.

In a great country depending mainly on agriculture this prolonged annual pause constitutes a very serious drawback. Its complex psychological and physical effects on the individual are also profound, especially when monotonous diet and insufficient vitamin supply accompany it. For an interesting account of the effects of severe climate on human personality *see* Czaplicka, *Aboriginal Siberia*, 1914. The deterioration of the tribes pushed to the north-east and of the Russian settlers in Kamchatka are patent and extreme cases and the slow cultural development of the Russian race must be in part attributed to climatic causes. The only regions with a winter frost of one month or less are the south-east coast of the Crimea, the malarial east coast strip of the Black Sea and the arid coastal regions of the eastern and western shores of the South Caspian. The Lenkoran district of the south-west Caspian shore, with an annual rainfall averaging 40 inches is an interesting example of micro-climate due to local relief. The warm Atlantic drift influences the winter of European Russia and her only all the year round open port is the recently built Murmansk on the Arctic coast. The prevailing westerly winds modify winter conditions in north and central European Russia, so that winter isotherms have a general north-west to south-east trend. The coldest winter in the world (as yet recorded) is experienced at Verkhoyansk in lat. 67° 30′ N., 134° E., 3,000 miles east from the Atlantic, where the average January temperature is −59° F, and where it dropped to −90° F in February 1892, the lowest temperature ever observed.

There is no direct insolation in winter, since it lies within the Arctic circle, night radiation from the snow covered earth is intense in the clear, dry atmosphere and, as Verkhoyansk lies in a valley bottom, inversion of temperature intensifies the cold. Woeikof attributes the fact that Sagastyr on the Arctic Ocean, in 73° 32′ N. has an av. Jan. temp. 25° F warmer than that of Verkhoyansk to the stronger winds on the flat and treeless tundra and to the absence of temperature inversion. S. Obruchev ("Discovery of a Great Range in North-Eastern Siberia," *Geographical Journal*, 1927, vol. 70) suggests that the Pole of Cold may extend over the Upper Indigirka. Another local relief effect is the cold temperature experienced immediately east of the Scandinavian mountains. A general feature of the Russian winter south of the Arctic circle is the clear bright sunshine and the absence of cloud, the maximum of cloudiness being experienced in autumn, except in the Far Eastern Area, where summer is the season of maximum cloud, and in the south of the Ukraine, the Kazakstan steppe and the Central Asiatic Republics where winter, though not very cloudy, is the season of greatest nebulosity. In three regions, the western Caucasus and west trans-Caucasia, the district between Lake Balkhash and the Tian Shan and in a belt on the left bank of the Amur from Blagovyeschensk to its mouth, spring is the cloudiest season. The general prevalence of clear skies in spring is a noticeable feature.

Seasonal Contrasts.—Summer is everywhere hot, and there is no place in European Russia, from Astrakhan to Archangel where the summer temperature does not reach 86° F. In Asiatic Russia the summer isotherm of 68° F goes through Omsk, Krasnoyarsk and Irkutsk, turns north to Yakutsk and then bends south to Vladivostok. Even the mouths of the Ob, Yenisei, Lena and Kolyma, in 70° N. lat. have an av. July temp. of 40° to 50° F. Verkhoyansk has an av. July temp. of 60° F and a maximum of 93° F has been recorded. The highest July averages and also the highest maxima are experienced in Turkestan, where 105° F and even higher temperatures have been observed. The av. July temp. for Southern Turkestan is over 86° F. Thus the range of temperature between winter and summer is great, the maximum, 118·6° F being near the pole of cold, from which it diminishes in a series of concentric rings. The line of the range of 79° F passes along the Arctic coast westwards roughly from Chaun Bay, cuts off the Taimyr peninsula and bends southwards along the course of the Yenisei, crosses the Upper Tunguska in an easterly loop and then curves westward to the Upper Yenisei. It makes a sharp bend north-eastwards round Lake Baikal, passes south again and then east to the mouth of the Sungari. The lines of equal range to the west of this have a general north-south trend, each having wide curves first to the east and then to the west as far as the Urals. West of the Urals the lines are less sinuous. The range at Moscow is 54° F and at Petrograd 48·6° F. The range at Batum on the west coast of the Black Sea drops to 30·8° F. The geographical distribution of great temperature ranges in Russia indicates that the determining factor of range is the intensity of winter.

These figures, showing a great range of temperature in regions of prolonged winter, indicate what a dislocation the brief spring brings to the life of Russia and how great is the strain on plant, animal and human life to secure adaptability. In European Russia the last days of frost are experienced for the most part in April, but north of lat. 55° N. in May and progressively later towards the north. In Asiatic Russia spring sets in at the end of April in the south and progressively later towards the north. Thus on a line from Yakutsk, passing north of Beresov on the Ob, south of Mezen and through Kola the average date of thawing on the rivers is May 21st. On a line extending from Sredne Kolimsk through the confluence of the Butyntai and Yana rivers, bending south over the plateau and turning north to Obdorsk the date is May 31st; on the upper Lena and its delta and at the mouth of the Yenisei, the thaw does not set in until the second week in June. The date of freezing of rivers in Russia varies from December near the north coast of the Black Sea, and for the northern part of the Caspian and the Sea of Aral to November on the northern coast.

In Asiatic Russia the date of freezing varies from November in the south to September for the Taimyr peninsula and the region east of Yana Bay. We thus have a picture of an unlocking of the winter grip setting in about April in the south and at dates varying from early May in the west to late June in the north-east, with a period of possible vegetation activity at its maximum in the south-west and rapidly diminishing towards the north-east. The melting of the snows and the consequent flooding of the roads and river banks and the coming of the spring rains, slight though their quantity may be, disorganise traffic. The badly constructed roads become seas of mud, the frozen marshes turn to quaking bogs and the rivers are at first obstructed by blocks of ice. On the lower courses of the rivers flowing to the Arctic blocks of ice brought by the warmer water from the earlier thawing upper courses are heaped upon the still frozen river, and as this latter melts and begins to flow the banks are flooded and ice blocks are carried on to the land to the accompaniment of deafening

crashes of the great blocks as they are hurled against one another.

A set-back to spring occurs in the second half of May, most sharply felt in Siberia, where the "icy saints' days," as they are called, are so blighting that it is impossible to cultivate the apple and the pear. This return of frost is experienced frequently in the Ukraine in a belt lying south of the extension of high pressure. Northerly and easterly winds may bring such biting frost that the leaves of the oak are shrivelled in an hour or two. It is significant to note that the maximum pressure conditions of April in the Polar region are succeeded by minimum pressure conditions in June. (This phenomenon of late spring frosts is by no means confined to Russia.)

Precipitation.—Evaporation from melting snows and drying surfaces keeps the spring temperature lower than the autumn temperature except in Turkestan and the steppes to the north of it, where snow does not lie because of the exposure of this treeless region to violent winter winds. In these regions, therefore, in accordance with the greater spring altitude of the sun, spring is warmer than autumn. The snow covering is thickest in the taiga belt (often 3 ft.) and in the west, under the influence of occasional cyclones, may form drifts of very great depth. The thin snow covering of Asiatic Russia melts in spring. Except in the extreme north of European Russia, in the deserts and steppes east of the Caspian roughly south of lat. 48° N., and in trans-Caucasia and the east coast strip of the Black Sea, summer is the season of maximum precipitation. The Pacific coastal strip, under the influence of the south-east monsoon has a particularly wet, stormy, cool summer unfavourable to agriculture, the maximum fall being in August. In Asiatic Russia east of the Yenisei and in the northern part from the west of the lower Yenisei to the Urals July and August are the rainiest months, a condition unfavourable to grain crops.

In a belt lying north of the steppe-desert and of the Caspian, east of a line curving through Astrakhan, Kazan and Bogoslovsk, and stretching west to the Altai, June and July are the wettest months. This belt terminates south of lat. 60° N. in the west and north of it in the east. To the west of it June is the wettest month in the south and August in the north, while in the central and western zone beyond, July is the month of greatest rainfall. To the north of this region July and August are the wettest months. Thus in many regions a wet August follows a severe winter. Winter rainfall is kept at a minimum by the prevalence of outblowing winds from the dry high pressure area, but in summer pressure conditions are reversed. Autumn, with its transition to the frost régime, is, like spring, a season of interruption of communications both by road and river, sometimes involving interruption of telegraphic communication because of the impossibility of getting over the roads to carry out repairs. Precipitation except near the Caucasus range and the coastal range of the east against which the south-east monsoon impinges, is fairly uniform, averaging about 20 inches in the central belt west of the Urals and 15 inches in that belt east of the Urals extending to the Pacific coastal ranges. Regions with such a rainfall may be humid in conditions of minimum evaporation, especially if the soil is clayey or icebound; they are arid in conditions favouring evaporation and dispersion of soil moisture.

In the tundra region of the north it sinks to 8 inches, while south of the central belt, in a region which includes the south of European Russia and the Central Asiatic Republics and the steppes and semi-deserts to the north of them, the prevailing winds throughout the year are from the dry north-east and rainfall therefore is scanty, in some places as low as 4 inches per annum, and agriculture depends on irrigation. A special problem of Russian agriculture is the irregularity of the amount of spring rainfall, complicated by the fact that this irregularity occurs in regions where the length of the snow covering varies from year to year in dependence on violent winds. A combination of poor snow covering and deficient spring rains leads to the terrible famines which are a recurrent scourge of south-east Russia. Related to this irregularity are such problems as the increasing desiccation of Turkestan, the present shallowness of streams which were navigable within recent historic times, and the drainage of marshes in the north by the slow elevation of the land. A general feature of the summer rainfall and of the May and June rainfall of the steppe is its liability to fall in sudden heavy showers, often accompanied by thunderstorms. This results in a quick run off of the water so that the effective moisture is small. In 1882 in Kursk province a heavy storm in July deposited within half an hour an amount of rain equal to 25% of the normal annual rainfall. Forest cutting in the upper courses of streams has greatly increased the denuding action of streams.

Certain regions form distinct climatic units. In this group, of course, fall the valley regions of the mountain zones, each valley often having a different exposure and different altitude. The east coast of the Black sea under the lee of the Caucasus has a milder climate and its rainfall (60 inches per annum) is of the same type as that of the west coasts of the Mediterranean, in dependence on the special pressure systems over the Black Sea. The region round Lake Baikal is much influenced by the presence of that body of water, especially in December before freezing sets in, when the combined influences of open water and of the liberation of latent heat during freezing cause the isotherms to loop north-eastwards around the lake. The special features of the eastern coastal region are discussed under Far Eastern Area (*q.v.*) and for those of the Arctic fringe *see* POLAR REGIONS.

SOILS AND THEIR INFLUENCE

Soil study or *Pedology* as a scientific discipline owes its present position largely to Russian research, which has demonstrated that the soil is a distinct entity dependent on regional and climatic factors for its evolution and type. The vast extent of the Russian empire and the importance to its life of the Chernozyom (*Chernozëm*) or Black Earth, gave special opportunities for studying the characteristics of soil under widely differing climatic, geological, topographical and biological conditions. Foremost among these workers was V. V. Dokuchaiev (1846–1903) whose researches, published 1879–1883, included a cartography of Russian soils. The Dokuchaiev Institute of Soils in Leningrad published in 1926 a detailed map in colour of the soils of Russia compiled under the direction of K. D. Glinka and L. I. Prasolov, with the assistance of S. S. Neustruev, B. B. Polynov and N. I. Prochorov. Glinka's work on soils is of world-wide importance and the publication in 1928 by the Department of Agriculture of the United States of America of an English translation of his classic "The Great Soil Groups of the World and their Development" makes his results available for the first time to English speaking peoples.

An important series was published in English in 1927 by the Russian Academy of Sciences and includes thirteen pamphlets by different Russian soil scientists on various aspects of pedology affecting Russia. Fallou and Richtofen had previously recognized the importance of the study of the regional distribution of soils, but the definite connection of present climatic conditions with the geography of soil distribution was first laid down by Dokuchaiev and afterwards developed by N. Sibirtsev and K. D. Glinka. Russian scientists were pioneers in the detailed study of vertical sections of soils, which reveals important morphological characters of the various layers dependent to a large extent on climate. This study of soil horizons owes much also to Japanese and American investigators, while later the work of microbiologists (*e.g.*, S. N. Vinogradski and V. L. Omelianski) and of students of colloidal action (*e.g.*, K. K. Gedroiz) much widened the scope of study. The accompanying soil maps of Russia are based on the maps prepared by Glinka and Prasolov.

The Tundra.—The first main group is the tundra zone stretching across the whole of northern Russia. The name *tundra* implies treeless as opposed to forest lands, and two main zones can be noted. As one goes north-eastwards in Asiatic Russia, the climatic conditions become increasingly dry and precipitation ultimately reaches a minimum and there is much arid clayey and stony dry tundra, but in the remainder of the northern tundra zone there is

greater annual precipitation. Scanty though it may be, this precipitation is often sufficient to cause the soils to be classed as humid, owing to low temperatures, slight evaporation and the permanent freezing of the sub-soil which seriously limits the draining off of surface water. The excessively moistened horizon above the frozen sub-soil, which thaws during the brief summer and turns the region into an impassable quaking bog, is called "talik"; it is coloured by ferric rusty spots and wedges of humus. This "glei" horizon of tundra soils retains its motley colouring when dried. The vegetative mass of moss, lichen and dwarf shrub tends to form peat, and "hillock tundra" is apparently due to the formation of a frozen core which cuts off the moisture supply of the surface moss, thus causing it to die. The decomposition of vegetation causes denudation and cracking, with ultimate gradual disintegration of the hillocks, between which the surface water collects and runs off.

Remarkable features of tundra soil are the "polygon" or "medallion" type and the "spot" type. The former, tesselated soils, are due to cracking of the surface layer during drying with consequent drainage of water along the cracks, removing fine particles and sometimes depositing stones, so that sandy and occasionally stony streaks separate the polygons. "Spotty" tundra may be due to compression of the semi-liquid mass of earth between the frozen sub-soil and the newly freezing surface; this semi-liquid mass breaks through to the surface and forms spots deprived of vegetation; in other places it is apparently due to the action of wind. Peat formation is observed at the highest latitudes in the Arctic regions; except where the ice and snow cover is permanent. The frozen sub-soil and the severe climate make agriculture impossible here and the tundra is the land of the wild reindeer and the nomad reindeer breeder, who takes his herds to the south during summer and to the north during winter and supplements his dependence on the reindeer for food, transport and clothing by a little fishing in the summer and by occasional hunting. Huts erected on this frozen sub-soil sometimes cause thawing with a development of a consequent upward fountain, the water of which may freeze into solid ice. Remains of birches and spruces have been found beneath peat hillocks on the tundra.

The forest stretched much further northwards at some post-glacial stage (the "Atlantic" phase in western Europe), when the climate was warmer than it is now, but the advance of tundra on forest has been encouraged by human destruction of the thinner fringe of "island" forest to the north, which helped Sphagnum bog to swamp the forest fringe. Towards the west, under the influence of the Atlantic, the tundra belt is narrow; it increases in width towards the east under the influence of the continental Asiatic winter, and thrusts much farther south in Kamchatka, partly because of the height of the land and partly under the influence of cold ocean currents from the north; oceanic influences thus playing an entirely different rôle in the east. South of the tundra bog begins a zone of scattered dwarf spruce and birch trees, transitional forms to the trees of the taiga zone. In Asiatic Russia a belt of vast marshy plain covered with dwarf birch lies south of the tundra belt. Along the river valleys, better protected from the wind, which induces winter evaporation and thus hinders their growth, and also better drained so that sub-soil ice is not so near the surface, the forest pushes northward. In the immediate vicinity of the streams, forest is denuded by the blocks of ice brought down in spring.

THE FOREST ZONES

Podzol.—The coniferous forest (taiga) belt and much of the mixed coniferous and deciduous belt are characterised by podzolised soils. Podzol or ash-coloured soils are developed in conditions where the moistening of the upper soil horizons is sufficient to ensure the percolation of water into deeper horizons, and where there is sufficient, but not excessive evaporation so that the percolating solutions are drawn upwards. Forest conditions, which prevent rapid or excessive evaporation and which at the same time ensure moistening of the soil are peculiarly favourable to podzol formation, though this type of soil has also been found in meadow and meadow-moor regions. Owing to strong transpiration, the sub-soil under forest is drier than that under herbaceous vegetation, and the level of sub-soil water is therefore lower under forest. At the same time the upper horizon under forests is moistened by better preservation of the snow covering and by lower evaporation under the shade of leaves and forest bedding.

The main morphological characteristic of podzol is the presence of two horizons, an eluvial upper horizon A, which is comparatively deprived of colour and leached, with sandy particles, and an underlying eluvial horizon B, more intensely coloured, having an increased clayey content and chemically enriched with hydrates of sesqui-oxides and with humus. The upper horizon may be divided into a layer containing undecomposed organic matter (*e.g.*, hyphae of fungi), a greyish humus layer and a whitish horizon almost deprived of humus and enriched with silicic acid. The B horizon may have an upper coffee-coloured layer, with precipitated humus substances and a lower more yellow or rust-coloured layer with precipitation of iron hydroxide. This horizon may sometimes consist of *ortstein*, a compact indurated ferro-humus layer. The process of leaching to which the upper horizon of the soil is subjected is known as podzolisation and varies in degree, sometimes being indicated by almost imperceptible spots and at the other extreme by a compact whitish streak of a schistose character. The colloidal nature of humus plays an important part in the development of podzolisation. The type of parent rock is also important, the morphology of clayey, sandy-loamy and sandy podzolised soils varying greatly. The exact processes of podzol formation are still a subject of dispute; for an account of various theories *see* S. S. Neustruev, "Genesis of Soils" 1927, Pt. III. of *Russian Pedological Investigations*. This podzol zone is very extensive and broadens out in Asiatic Russia so that it reaches from the tundra in the north to the plateau region in the south.

The term *Rendzina* is applied to soils derived from the weathering of calcareous rocks.

Bog Soils.—There are vast regions that are intercalated among the forests covered by bog, especially in the west. Bog soils are formed where the pores of the soil are filled with moisture for a prolonged period, in regions of slight evaporation and marked atmospheric precipitation. The organic matter, paludinous herbaceous growths (Carex, etc.) and paludinous moss (Sphagnum, etc.) and sometimes the remains of alder, dwarf-birch, etc., instead of decomposing into humus, becomes enriched with carbon and transformed into peat. Micro-organisms play a large part in this carbonisation process, which penetrates to varying depths and which, where moisture rich in oxygen exists in deeper layers, may be superimposed on a humus layer. As a result of evaporation on the surface of the swamped soil, iron is precipitated in the upper soil-horizon directly beneath the peaty layer in the form of nodules of bog-iron ore. Bog-iron ore has been worked in a primitive way from very early times in Russia. The swamps and marshes have played a twofold part in history; they hindered the development of communications, but they frequently formed retreats for the Slavs and the Finns in early times. Novgorod escaped destruction by the Tatar horde in the 13th century because the Tatars could not cross the marsh in the rainy summer, and the strategic importance of the Pripet marshes has been evident from early days. Today the peat bogs have great commercial importance, for Russian scientists have invented a method of using peat fuel in the production of electricity.

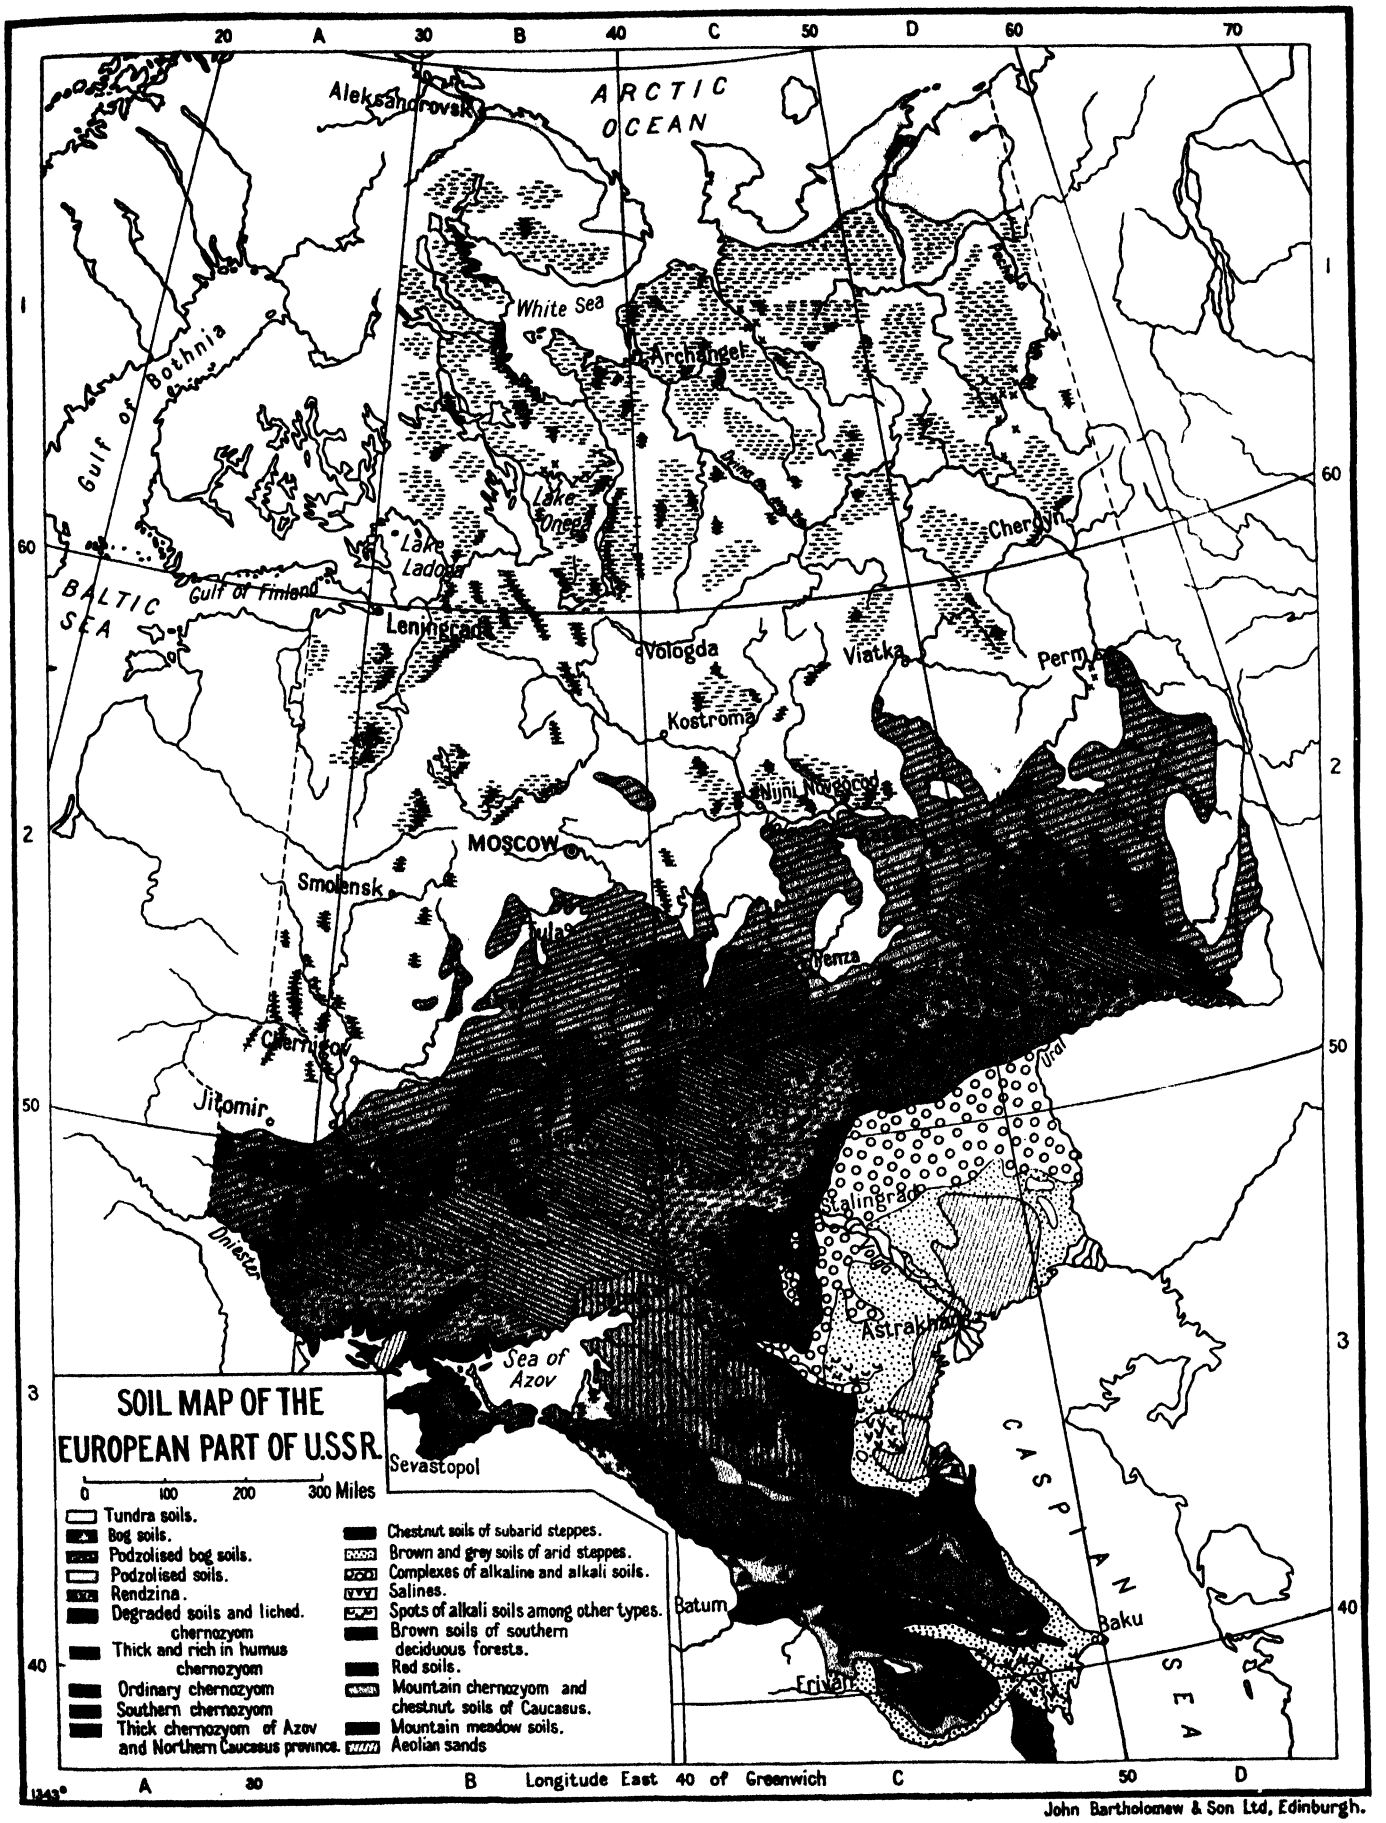
The forest and marsh zone of European Russia is of peculiar interest historically, for it was in this less attractive region that the Slavs settled after the devastation of the fertile steppe by nomad Turkic hordes, and it was in this region that the Great Russian race consolidated the kingdom of Moscow, which afterwards re-absorbed the steppe. Here, too, various small minorities, Finnish and Turkic, were able to retain their national individuality even to the west of the Urals, and are now separate cultural units within the Russian state. The forests of this belt are subject to two forms of climatic zoning, a north to south zone related to temperature and a west to east zone related to decreasing humidity. The beech just makes an appearance in the Podolian bend of the Ukraine, but penetrates no further east, except in the moister regions of the Crimea and the Caucasus. The oak approaches, but

does not cross, the Urals, while the Siberian pine, larch and cedar penetrate from Asiatic Russia into the extreme north-east of European Russia.

Concerning north to south distributions, one notes that the oak appears south of a line drawn through Pskov, Kostroma, Kazan and Ufa, though islands of oak penetrate further to the north. Profitable production of apple, pear and cherry is roughly coincident with the oak belt. Hornbeam does not penetrate much beyond the northern boundary of the Ukraine, though maple and ash accompany the oak almost to its northern limit. The lime tree combines the two zones, preferring the east and not as a rule extending further north than lat. 62°–64° N. Apricots and walnuts, on the other hand, prefer the west, reaching 50° N. lat. in eastern Ukraine and spreading further north to the west.

Coniferous Deciduous Zones.—The Siberian coniferous zone is characterised by its wider north to south extent, by the great fringe of stunted birch to the north, where trees a hundred years old may be but a few feet high and are thickly encrusted with lichens, and by certain distinct varieties of conifers, *e.g.*, the silver fir, stone pine and the Siberian larch. In the virgin forests of the valleys and lowlands of Western Siberia are larches, pines and silver firs, mingled with birch and aspen, while poplar and willow fringe the streams. In this region are the *urmans*, dense thickets of trees often rising from a treacherous carpet of thickly interlaced grasses, concealing deep marshes, impassable except in winter. In the south-eastern trans-Baikal region, under the influence of the drought of the Gobi steppe, the forest thins out. The distribution of spruce and Scotch pine, the chief trees of the coniferous forest, depends largely on the parent rock. Spruce grows best on clayey, but not boggy, soil and is therefore closely related to the distribution of glacial boulder clay, while Scotch pine spreads best on sand and peat.

In the Bryansk district, on the cretaceous marl and phosphorite sand, near the southern limit of the coniferous forest, spruce is found with an admixture of oak, Norway maple, poplar, birch and elm. Along the river valleys of the steppe are interesting southward-extending strips of forest, oak growing on the high right bank and Scotch pine on the low sandy left bank. On some soils where sand lies above clay, the spruce, which is tolerant of shade, grows among the taller pines. Pine forests occur on loess covered chalk on the right bank of the Volga and in Voronezh, Kursk and Kharkov, and with them are certain rare plants, possibly relics of the Ice Age. A general characteristic of the oak is that it does not tolerate complete podzolisation and requires greater warmth than spruce, thus it penetrates north into the coniferous zone along river valleys where the soil is warmer and less podzolised and gives way to spruce on the interfluvial clay-lands. The earliest agricultural development in Russia took place in the region of the heavy clay soil of Moscow, as the first period of relying on forest wealth for trade gave way to dependence on local cultivation of crops in view of the closing of the trade channel to the Black Sea and Caspian by Mongol invaders. Agriculture involved forest clearing by cutting or burning, more frequently the latter because the charcoal helped to make the soil productive. Before a good yield could be obtained, many years of careful cultivation and manuring were necessary, and the population constantly tended to drift to the more fertile black earth region, while of late years the population on the clay soils (podzol) has been more and more diverted from agriculture to industry.



Cereals, chiefly barley, rye and oats, with flax and hemp, potatoes and cabbages and recently grass and lucerne are the chief crops. Some wheat is grown, but not so successfully as farther south. Intensity of cultivation thins out markedly to the north and in Siberia hardly exists, the long severe winter and the liability to recurrent frost in spring being unfavourable. Timber exploitation and hunting of fur-bearing animals are of ancient importance. Cattle breeding and dairying are developed in many parts. Human settlement in the northern hunting, fishing and forest-products belt is usually along the river valleys and the shores of lakes and seas, the peat bog watersheds being uninhabited. On the glacial soils of the central watershed the valleys are humid and cold and settlement is on the warmer, drier morainic hills, where the season for ripening crops is 10 days longer than in the valley bottoms. The podzol zone of Asiatic Russia is sparsely peopled in view of the severity of climatic conditions, and averages one inhabitant per square kilometer. This is a misleading way to put it since settlement is usually concentrated on the alluvial river strips and vast expanses of virgin forest have no settlements. Hunting and fishing are the main occupations, with cattle-breeding in the bog meadow belt lying east and west of the great bend of the Lena, on the alkaline podzol. Berry-bearing plants are found everywhere in this zone, whortleberry and arctic bramble spreading far into the north, while raspberries and currants form a luxurious undergrowth in many coniferous forest regions.

Black Earth.—The chernozyom (black earth) formations lie south of the podzol forest zone. Their origin was a subject of much discussion in the early days of soil study, though Glinka states that the Russian peasant had long ago arrived at the conclusion now generally held that chernozyom has been developed through the modification of an original material by the decay of animal and vegetable remains. Dokuchaiev in *The Russian Chernozyom* (1883) enunciated the view now generally accepted. Owing to the wide extent of chernozyom on loess, loess-like loams and loess-like clays it was once thought that chernozyom was a humus-coloured loess. But chernozyom is now known to occur on granites and andesites, on chalk, on Permian, Jurassic and other limestones, on Upper Permian marls, on Tertiary siliceous clays, and even on sands and sandstones, provided that the latter are rich in complex minerals.

The essentials for the formation of chernozyom are high evaporation with consequent desiccation of the soil during summer (high temperature with a high saturation-deficit) and long freezing of the soil in winter. During winter, water accumulates in the soil and provides for luxuriant spring vegetation, this moisture being exhausted by the end of May or the middle of June. The resulting drought retards the decay of the steppe grass (stipa), whose strongly developed root-systems provide abundant humus. The essential characteristic of chernozyom is its rich humus content, thick and rich chernozyom yielding 10 to 13% or more in southern latitudes, and 6 to 10% in northern latitudes, 6 to 10% is also the average content of ordinary chernozyom, while northern and southern chernozyoms yield 4 to 6%. The map shows that the central belt has the greatest humus content and that there is a decrease to north and south. During the intense summer evaporation there is a powerful ascending current of water in the soil, gypsum and calcium carbonates being deposited in separate horizons.

Morphologically a chernozyom profile consists of an upper humus horizon and a horizon of carbonate accumulation. "Thick" when applied to chernozyom denotes thickness of the humus horizon, though the limit of the underlying horizon is sometimes hardly distinguishable owing to its containing wedges, spots and veins of humus. It should be noted that chernozyom is found on mountain slopes (*e.g.*, in Turkestan and Trans-Caucasia), the height at which it will occur being determined by the climatic conditions at the foot of the mountain. If forested podzol occurs in this region, no black earth will exist on the mountain, but if the mountain rises from desert or desert steppe, chernozyom will occur on the mountain provided the altitude is sufficient.

Loess.—Loess, a fine grained porous deposit of material accumulated under the influence of winds blowing out from an ice-sheet across its marginal moraines, is widespread in South Russia and Turkestan. It gives rise to different soil types, the chernozyom being carried farther into moist conditions on loess because the porosity of loess drains off the superfluous water. Under arid conditions grey semi-desert and desert soils are formed on loess. When moister and milder conditions of climate supervened during the "Atlantic" phase of climate after the great retreat of the glaciers, forests sprang up in the regions affected, though apparently less on loess than elsewhere. Under forest the humus was removed by displacement of sesqui-oxides and colloidal clay from upper to deeper horizons, the resulting soil being termed degraded or liched (leached) chernozyom. The map shows this belt stretching in a south-west to north-east direction in European Russia and

John Bartholomew & Son Ltd, Edinburgh.

extending into Asiatic Russia as far as the Altai mountains, with a few patches further to the east as far as the trans-Baikal region. A tongue of it extends as far north as Perm and another tongue extends northwards on the left bank of the Vyatka. The oak forest is characteristic of the northern belt of degraded chernozyom in European Russia and there are three stages of development, the belt where the forest spread at the expense of the steppe and was continuous until man interfered, the belt of island-like clumps of oak near the rivers, and the steppe belt, where forest is found in the ravines only and the plateau is left to steppe vegetation. This latter belt has had interesting historic relations; the Slavs took to the forested ravines and left the plateaux to the nomad grazers, and to the present day village settlements run continuously along the ravines. The proximity to river water was an attraction, though ravine streams often disappear in summer except after heavy showers.

On plateau land enclosed in the angle between two rivers, upland oak occurs (*e.g.*, the Voronezh province oak used by Peter the Great for ship-building). Associated with the plateau oak forest are ash, lime, maple and elm. The fertility of the rich black earth is such that many years of continuous cropping hardly affects it and it is this zone which made Russia a famous grain-exporting region even in the time of Greek and Roman dominion. The islands and ravine strips of oak cease south of lat. 48° N., and of the line from the Stalingrad (Tsaritsyn) bend of the Volga to the Urals south of lat. 52° N. Patches of oak occur near the left bank of the Volga from the bend to 52° N. Thus the Pontic steppe was left free from forest and was a highway for nomad invaders. For types of agriculture, difficulties and history of the region *see* Ukraine and Black Earth Region (Central). In Asiatic Russia the railway runs through the chernozyom belt where Russian settlement has been intense since the latter part of the 19th century. The more easterly extensions of the steppe black earth lie in the zone of recurrent droughts and terrible famines, and under stress of famine conditions the ancient tradition of persistent wheat sowing on the three-field system is giving way to cultivation of maize and potato and to many-field systems; irrigation schemes are also being developed.

Drought Soils.—Chestnut-colour, brown-desert and grey-desert soils are developed under conditions of insufficient moisture. The chestnut-coloured soil fringes the black earth zone on the south, and, since its humus content may be 3 to 5%, it is very productive if sufficient moisture is available, and is specially favourable to the production of the harder wheats. It demands careful working and much forethought, however, in view of its position in a sub-arid zone liable to irregular recurrence of drought. With increasing aridity alkaline and saline soils occur. Capillary rising of water to the surface and subsequent evaporation and deposition of salt cause the development of saline soils. Snow-white salt efflorescences of sulphates and chlorides frequently cover a soft friable "puffed" layer containing separate salt crystals. Irrigation of the *tugai* or flood plains of Turkestan has resulted in a distribution of salt on the surface and an evolution through puffed layers to a hard, grey, porous, loamy crust (*takyr*). The micro-relief of the saline soils in the Aralo-Caspian basin and in Turkestan has encouraged salt accumulation, salt collects in hollows containing brackish ground-water. Alkaline soils appear to be derived from saline soils through the diminution of salt content. This has an important bearing on palaeogeography, though Vilenski's suggestion that all alkali soils were salines before the post-glacial period seems to need modification.

Mountain Soils.—Mountain soils are of much interest since they show a vertical distribution bearing somewhat the same relation to zonal soil distribution on the plains as vertical climatic zones bear to latitudinal ones. The relation is complicated by rain and river denudation and by glacial erosion. For the forest and other zones associated with the Caucasus, *see* NORTH CAUCASIAN AREA; GEORGIA; ARMENIA; AZERBAIJAN and DAGHESTAN. In the trans-Baikal and southern regions of the Far Eastern Area the mountain forest is linked in type with that of Manchuria. (*See* FAR EASTERN AREA.) In the Altai forest there is a relict oasis of the Tertiary deciduous forest.

Brown Soils.—The brown soils of deciduous forests differ from those of the arid steppes, which have a greyish tinge. Forest brown earths are formed under the influence of a temperate climate with fluctuations from year to year in the amount of rainfall so that the leaching of the soil, and consequently the humus content, varies. They have a neutral or slightly alkaline reaction and therefore readily dispersible humus bodies do not occur. Glinka and Ramann hold different views on the question of these brown earths, the former being doubtful as to the advisability of classifying them as independent soil types.

Red Soils.—The exact systematic position of the red soils in the Batum area is not definitely decided; they are not true laterite, though they may belong to the laterite type. In most cases the profile consists of a red and yellow coloured lower horizon and a brownish upper humus horizon. Glinka considers that the red-coloured and motley-coloured horizons of the Batum and Chavka soils are relict red soils from the Tertiary epoch, while the overlying more or less humus-coloured layers may be slightly podzolised soils. The probability of this hypothesis has been strengthened by the finding of similar relict soils in the Far Eastern Area, in the eastern Ural region, in the Kirghiz steppe and even in the centre of European Russia. These relict soils are partly sub-tropical red soils and partly kaolin-laterite, kaolin-bauxite and bauxite-laterite. Bauxite regions are important for the development of the aluminium industry. The red soils of the Batum region are very fertile and are specially suitable for tea plantations.

In conclusion it should be noted that Russian soil scientists, while regarding climatic zoning as a predominant factor in the formation of soil types emphasise the complicated interplay of other factors, parent rock, relief and its evolution, geological history, biological factors, and so on.

Dokuchaiev also considered that the age of the parent rock and the length of time during which soil formation in particular conditions had been in progress were both important factors, thus podzolisation tends to end in the production of podzol from chernozyom, while saline soils represent the youthful stage of alkaline soils. The concept of finality is, however, very rarely tenable in the complex and interdependent relations of organism and environment.
